COMPLAINT OF PUBLIC SERVICE ELECTRIC AND GAS COMPANY AGAINST PJM INTERCONNECTION, L.L.C.

Public Service Electric and Gas Company ("PSE&G") hereby submits this complaint ("Complaint") against PJM Interconnection, L.L.C. ("PJM") pursuant to section 206 of the Federal Power Act ("FPA"), 16 U.S.C. § 824e, and Rule 206 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.206. PSE&G is submitting this Complaint because PJM did not follow its rules when conducting a competitive transmission solicitation to resolve operational performance issues at Artificial Island. PSE&G requests that the Commission order PJM to comply with its rules in this and all future transmission solicitations under Order No. 1000.[1]

SUMMARY

Artificial Island is PJM's first major competitive solicitation for transmission under its Order No. 1000 rules. "Artificial Island" refers to the transmission and generation infrastructure associated with the second largest nuclear complex in the United States, including the Salem 1

[1] *Transmission Planning and Cost Allocation by Transmission Owning and Operating Pub. Utils.*, Order No. 1000, FERC Stats. & Regs. ¶ 31,323 (2011), *order on reh'g*, Order No. 1000-A, 139 FERC ¶ 61,132, *order on reh'g and clarification*, Order No. 1000-B, 141 FERC ¶ 61,044 (2012), *affirmed sub. nom. S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d 41 (D.C. Cir. 2014).

and 2 and Hope Creek nuclear generating units that have a total generating capacity of 3818 MW. Artificial Island has historically been stability-constrained and special operating procedures have been used to maintain stability in the area. PJM proposed to mitigate these limitations through a competitive transmission solicitation that commenced in April 2013.

PJM's Order No. 1000 rules for transmission solicitations use a "sponsorship model" under which potential transmission solutions are proposed by sponsors, not by PJM. The process begins when PJM posts information on the transmission problem and requests proposals to address it. Prospective transmission developers then have the opportunity to submit proposals during a defined "proposal window" (ranging from 30 to 120 days). After the window closes, PJM can request additional information from the project sponsors. The sponsors must respond within ten days if they want to remain in the solicitation, but they cannot modify their proposal in response to PJM's request (or at any time after the window closes). PJM staff then evaluates and compares the proposals and, after seeking stakeholder input, PJM selects the more efficient and cost-effective proposal. If, however, none of the proposals represents the more efficient or cost-effective solution, PJM re-posts the solicitation or, if there is insufficient time to do that, PJM proposes its own solution and designates the incumbent transmission owner to build it. This is the only situation in which PJM may craft its own solution under its rules.

PJM did not, however, follow this process when conducting the Artificial Island solicitation. Rather than evaluating and comparing the proposals and selecting the best one, PJM unilaterally modified all of them. PJM removed major line segments from several proposals. It added static VAR compensators to many of them. It fixed the proposals that failed to meet its posted criteria so they would pass the criteria. After making all these changes, PJM sought stakeholder comment on a short list of four PJM-modified proposals and then recommended one

of the proposals to the PJM Board. The Board did not accept that recommendation, but rather allowed one sponsor to modify its proposal to include a cost cap. The Board then invited the other short-listed sponsors to submit cost caps as well. PJM then conducted more evaluations and requested more information. That process continues today, nearly two years after it started, with no conclusion or even a recommendation.

The competitive transmission process envisioned by Order No. 1000 cannot succeed if the regions do not follow their solicitation rules. The Commission gave each region significant flexibility in implementing the reforms associated with removing federal rights of first refusal, but it required each of them to have clear and transparent rules for conducting solicitations and selecting a winner from among the competing proposals. PJM emphasized the clarity and transparency of its rules when it complied with Order No. 1000. Additionally, PJM emphasized the limitations on its role in the process—specifically, its role as an independent evaluator of competing solutions, not the entity crafting those solutions. PJM also emphasized the importance of not allowing bidders to modify their proposals after the proposal window closed. PJM said this would "chill" the competitive process and give one bidder an "unfair advantage" over the others.

Because PJM did not adhere to this process, the Commission should grant the Complaint and order PJM to follow its rules in this solicitation and all future ones. If PJM believes that no proposal submitted during the proposal window represents the more efficient or cost-effective solution, it can re-post the solicitation. When doing so, it can provide more guidance to potential sponsors based on the experience of its first major solicitation.

PSE&G appreciates that there are growing pains with implementing any significant new process. PSE&G also believes that PJM has acted in good faith and is no doubt trying to achieve

an end result that it believes reasonable. But it is the competitive process that is relied upon to produce reasonable results in this area and that process can succeed only if the rules are clear and they are followed. If PJM believes its rules need improvement, it can discuss its concerns with stakeholders and, as appropriate, file proposed amendments with the Commission. But in the meantime it must follow the rules. Artificial Island was lauded as the initial test of those rules and that test will fail if the rules continue to be abandoned.

BACKGROUND

I. THE PARTIES

PSE&G is a public utility organized under the laws of New Jersey. PSE&G transmits and distributes electricity and distributes natural gas in its franchise service territory in northern and central New Jersey. PSE&G owns electric transmission facilities in New Jersey that are under the operational control of PJM, including ownership—either sole or joint—of facilities interconnected to the Salem and Hope Creek nuclear generation facilities in southern New Jersey.

PJM is a Commission-approved Regional Transmission Organization ("RTO"). PJM is a transmission provider under, and the administrator of, the PJM Open Access Transmission Tariff ("Tariff"). Also, through the Tariff and the Amended and Restated Operating Agreement of PJM Interconnection, L.L.C. ("PJM OA"), PJM operates energy and capacity markets, plans regional transmission expansion improvements to maintain grid reliability and relieve congestion, and conducts the day-to-day operations of the transmission system in the PJM region. Under Schedule 6 of the OA, PJM is responsible for developing PJM's transmission expansion plan in accordance with Commission-approved requirements.

II. COMPETITIVE TRANSMISSION FRAMEWORK UNDER ORDER NO. 1000

In Order No. 1000, the Commission ordered public utility transmission providers to reform their existing transmission planning and cost allocation practices. The reforms included

the elimination of federal rights of first refusal ("ROFRs") for incumbent transmission owners and a requirement to adopt a framework for the submission and evaluation of regional transmission projects proposed by incumbent and nonincumbent transmission owners. Order No. 1000 at P 7. The Commission found that federal ROFRs discourage nonincumbent transmission owners from participating in the planning process because, among other reasons, projects they propose could be taken by the incumbents once the benefits are identified. *Id.* at PP 229, 257. The Commission stated that the framework for submitting and evaluating transmission projects could include a competitive solicitation process to solicit projects or project developers. *Id.* at P 259.

The Commission did not mandate a specific framework, but allowed regional flexibility in developing the processes. *Id.* at P 322. The Commission, however, provided guidance on features of the framework. For example, the Commission required the framework to include (1) appropriate qualification criteria for determining an entity's eligibility to propose a project; (2) a form by which a prospective sponsor would provide information in sufficient detail to allow the proposed project to be evaluated in the regional transmission planning process, including a specific date by which proposals must be submitted; and (3) a transparent and not unduly discriminatory process for evaluating the proposals. *Id.* at P 293.

With respect to the obligation for the framework to require a specific date by which proposals must be submitted, the Commission disagreed with arguments that this would undermine the "iterative nature" of the planning process and stated that "[w]ithout some reasonable limitation on the submission of new information, public utility transmission providers would never be able to complete the analysis needed to complete their region's transmission

plan." *Id.* at P 327. But the Commission allowed each region to propose rolling or flexible dates if it could support such a proposal. *Id.*

The Commission ruled that the Order No. 1000 revisions—including the framework for submitting and evaluating projects—would apply to new transmission facilities, which the Commission defined as "those transmission facilities that are subject to evaluation, *or reevaluation as the case may be*, within a public utility transmission provider's local or regional transmission planning process" after the effective date of the Order No. 1000 compliance filing. *Id.* at P 65 (emphasis added). The Commission recognized that transitional issues could arise regarding which projects are subject to Order No. 1000 and directed transmission providers to explain in their compliance filings how they will determine which projects are subject to the requirements of Order No. 1000. *Id.* The Commission required the Order No. 1000 compliance filings establishing the framework to be submitted within twelve months after the effective date of Order No. 1000. *Id.* at P 792.

III. PJM'S ORDER NO. 1000 COMPLIANCE FILINGS

On October 25, 2012, PJM submitted its Order No. 1000 compliance filing. *PJM Interconnection, L.L.C.*, Docket No. ER13-198-000, PJM Compliance Filing (Oct. 25, 2012) ("October 2012 Compliance Filing"). A key component of this filing was a solicitation process for new transmission facilities ("Solicitation Process") to comply with the Order No. 1000's directives regarding nonincumbent transmission providers. This process adopted a "sponsorship model" under which pre-qualified entities—both incumbents and nonincumbents—would propose transmission solutions during a "proposal window" and PJM would evaluate the proposals and select the project and the entity to construct the project. *Id.* at 13-14, 22-23. This competitive transmission process applied to three broad categories of new transmission facilities, including long- and short-term reliability projects and market efficiency projects. *Id.* at 54-59.

The Commission accepted PJM's proposal window process with an effective date of January 1, 2014. *See PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214 (2013) ("March 2013 Compliance Order"), *order on reh'g*, 147 FERC ¶ 61,128 (2014).

The proposal window process was established primarily through the addition of Section 1.5.8 to Schedule 6 of the PJM OA. In a nutshell, under this process:

- Entities must first pre-qualify with PJM for the right to submit proposals under specific pre-qualification requirements, PJM OA, Schedule 6, § 1.5.8(a);

- PJM then posts a request for proposals that (1) identifies and explains the existing transmission limitations that need to be resolved; and (2) establishes the window of time in which pre-qualified entities are allowed to submit their proposals, *id.*, §§ 1.5.8(b) & (c);

- Any proposals submitted during the window must contain specified technical and other relevant information about the proposed project, including cost estimates, projected construction and in-service date, and the proposing entities' ability to construct the project, *id.*, § 1.5.8(c)(1)-(3);

- After the window closes, PJM staff must post a description of the proposals on the PJM website, *id.*, § 1.5.8(d);

- PJM staff must then evaluate the proposals submitted during the window in accordance with the criteria set forth in Sections 1.5.8(e) and (f) and, after consultation with PJM's Transmission Expansion and Advisory Committee ("TEAC"), present to the PJM Board its recommendation of the "more efficient or cost-effective transmission enhancements and expansions" to be included in the transmission expansion plan, *id.*;

- If PJM staff determines that none of the solutions would be the more efficient or cost-effective approach, PJM staff has two options: (1) repost a new request for proposals and start a new open window process; or (2) if there is insufficient time for a new proposal process, propose a specific project to resolve the problem and assign construction of the project to the incumbent transmission owner, *id.*, § 1.5.8(g); and

- Finally, the PJM Board must approve PJM's staff's recommendations based on the studies and analyses performed by PJM staff, *id.*, § 1.6(a).[2]

[2] PJM indicated that it would provide further details about its evaluation process in the PJM Manuals, *see PJM Interconnection, L.L.C.*, Docket No. ER13-198-000, Motion for Leave to Answer and Answer of PJM *(cont'd)*

PJM emphasized certain limitations on its role in the Solicitation Process when describing these tariff provisions. PJM emphasized that sponsors, not PJM, were responsible for crafting the solutions. PJM's role was to "evaluate and compare all proposals" and then "select the projects . . . for PJM Board review and approval," not create its own proposals. October 2012 Compliance Filing at 54-56; *see also id.* at 67-68. PJM stated that its "'sponsorship' proposal is designed to give both incumbent transmission owners and nonincumbent developers an opportunity to propose new and innovative projects. It is not designed, nor intended, to award bid-based contracts based on PJM-proposed solutions." *PJM Interconnection, L.L.C.*, Docket No. ER13-198-000, Motion for Leave to Answer and Answer of PJM Interconnection, L.L.C. at 9 (Sept. 5, 2013) ("September 2013 Answer"); *see also id.* at 13 ("PJM's sponsorship model is based on incumbent transmission owners and nonincumbent developers proposing a project based on identified violations. It is not intended to designate a PJM-proposed solution on a bid-based model.").

The one exception to PJM's limited role is triggered where no proposal is deemed the more efficient or cost-effective approach *and* there is no time for PJM to re-post the project. In that limited situation, PJM can fashion its own proposal and award it to the incumbent. PJM OA, Schedule 6, Section 1.5.8(g) sets forth the process as follows:

> If the Office of the Interconnection determines that none of the proposed Long-lead Projects received during the Long-lead Project proposal window would be the more efficient or cost-effective solution to resolve a posted violation, *or* system condition, the Office of the Interconnection may re-evaluate and re-post on the PJM website the unresolved violations, *or* system conditions pursuant to Section 1.5.8(b), provided such re-evaluation and re-posting would not affect the ability of the Office of the Interconnection to timely address the identified reliability need. In the event that re-posting and conducting such re-evaluation

Interconnection, L.L.C. at 54 (Jan. 29, 2013) ("January 2013 Answer"), but no significant details, pertinent to this Complaint, were added.

> would prevent the Office of the Interconnection from timely addressing the existing and projected limitations on the Transmission System that give rise to the need for an enhancement or expansion, the Office of the Interconnection shall propose a project to solve the posted violation, *or* system condition for inclusion in the recommended plan and shall present such project to the Transmission Expansion Advisory Committee for review and comment. The Transmission Owner(s) in the Zone(s) where the project is to be located shall be the Designated Entity(ies) for such project.

PJM OA, Schedule 6, § 1.5.8(g) (emphasis in original); *see also* January 2013 Answer at 57 ("PJM only will propose 'unsponsored' projects when required to *timely* meet reliability needs").

In addition to the limitations on PJM's role, PJM also proposed material limitations on the rights of bidders. One critical limitation is that bidders are prohibited from submitting "a new project proposal or modifications to a proposed project once the proposal window is closed." PJM OA, Schedule 6, § 1.5.8(c)(4). PJM stated that this limitation was designed to "prevent proposers from having a second bite at the apple after a proposal window has closed" because that "would provide an unfair advantage to those entities . . . and would chill PJM's ability to gather additional information that would enable it to make a better evaluation." January 2013 Answer at 55. PJM further underscored the importance of this limitation, stating: "This is the very reason why the *stakeholders were insistent* that proposers not be permitted to modify or change their proposal after the close of the proposal window." *Id.* (emphasis added). The Commission agreed with PJM and accepted this limitation. *See* March 2013 Compliance Order at P 297.

When submitting its amended compliance filing on July 22, 2013, PJM again stressed the importance of this limitation:

> Once the proposal window closes, no additional proposals or amendments to proposals by the proposer may be submitted or considered for inclusion in the recommended plan. Given the highly competitive nature of the proposal window process, if entities were permitted to submit proposals outside the proposal window, they potentially could have access to additional information, including proposals submitted during a proposal window, which would give them an undue

> advantage over entities that submitted timely proposals. Such a practice would be unfair to the entities that submitted proposals during the proposal windows and undermine the proposal process.

PJM Interconnection, L.L.C., Docket No. ER13-198-000, Second Compliance Filing Letter at 8-9 (July 22, 2013) ("July 2013 Compliance Filing") (footnote omitted).

IV. THE ARTIFICIAL ISLAND SOLICITATION

A. Operational Issues at Artificial Island

Artificial Island is a nuclear generation and transmission complex located in Salem County in southern New Jersey, along the Delaware River. Artificial Island has three nuclear generating units—Salem 1 and 2 and Hope Creek—with a total generating capacity of 3818 MW. It is the second largest nuclear generating complex in the United States. The two Salem units are owned jointly by subsidiaries of PSEG Power LLC and Exelon Corp., and the Hope Creek plant is owned by a subsidiary of PSEG Power LLC, specifically, PSEG Nuclear LLC. All three units are operated by PSEG Nuclear LLC. Although the nuclear generating facilities are owned by PSE&G and Exelon, they are located in the PJM transmission zone of Atlantic City Electric Company.

The three nuclear generating units at Artificial Island are connected to the PJM 500 kV transmission system through one 500 kV circuit to PECO's Peach Bottom substation in Pennsylvania and three 500 kV circuits to PSE&G's New Freedom substation in New Jersey, which continues from New Freedom through one 500 kV circuit to PSE&G's Dean substation. The first substation on the 500 kV circuit to Peach Bottom is the 500 kV Red Lion substation across the Delaware River, which is owned by Delmarva Power & Light Co. ("DPL"). The Red Lion substation connects to the PJM 230 kV system in Delaware, which includes DPL's Cedar Creek and Cartanza substations. A diagram depicting the Artificial Island complex and a map showing the location of Artificial Island are attached as Attachments 1 and 2.

PJM is experiencing operational performance challenges in the Artificial Island area. Artificial Island has historically been stability-constrained, and special operating procedures have been used to maintain stability in the area for the past several years. Also, scheduled or forced outages on the 500 kV transmission circuits at Artificial Island can require a significant reduction in the output of the generating units and potentially cause 500 kV voltage criteria to be violated. There are, however, no identified reliability violations to date. PJM's planning studies through 2022 do not show reliability violations associated with Artificial Island.

B. The Artificial Island Proposal Window

To mitigate these operational limitations, PJM selected Artificial Island as the first test of its Solicitation Process. PJM opened the proposal window for Artificial Island in April 2013, one month after the Commission accepted the Solicitation Process in its March 2013 Compliance Order. Although PJM's compliance tariff would not take effect until January 1, 2014, PJM stated that existing transmission projects would comply with these revisions "to the extent feasible and practicable" and identified Artificial Island as "a good opportunity to implement a proposal window consistent with the revisions proposed in its October 25 [Order No. 1000 Compliance] Filing." July 2013 Compliance Filing at 3-4; *see also* October 2012 Compliance Filing at 81-82 (stating that projects in the planning cycle when the Commission issues its order "will be evaluated under the new rules to the extent feasible."); Order No. 1000 at P 65 (requiring transmission providers to specify which projects would be subject to the new rules).

In anticipation of applying the Order No. 1000 processes to Artificial Island, in March 2013 PJM announced that it would use the window proposal competitive solicitation process proposed in its October 2012 Compliance Filing to identify projects to resolve the operational issues at Artificial Island. Attachment 3, TEAC 3/7/13, slide 52. Consistent with the Order No. 1000 process, pre-qualified bidders—both incumbents and nonincumbents—were informed

that they would be allowed to propose projects within a 60-day window, and PJM would evaluate those proposals for inclusion in its transmission expansion plan. *Id.* PJM later determined that the window for Artificial Island proposals would open on April 29, 2013 and close on June 28, 2013. Attachment 4, TEAC 4/11/13, slide 20.

On April 29, 2013, PJM posted a Problem Statement and Requirements Document for the Artificial Island Proposal Window ("Artificial Island RFP"). Attachment 5. The Artificial Island RFP stated that its purpose was to seek technical solutions to improve PJM's operational performance in the Artificial Island area under a range of anticipated system conditions. *Id.* at 1. The Artificial Island RFP identified the following five objectives for the Artificial Island Proposal Window:

1. Generate maximum power (3818 MW total) from all AI Units (Salem1: 1253MW, Salem-2: 1245MW, Hope Creek: 1320MW) without a minimum MVAr requirement from the AI. Full maximum power must be maintained under both the baseline and all N-1 outage conditions of 500kV transmission lines in the AI area. For both the baseline and N-1 outage conditions, AI voltage must be maintained within operating limits and stable for all NERC Category B and C contingencies. NERC Category C3 contingencies "N-1-1 contingencies" do not need to be run on top of the N-1 outage condition.
2. Maximum MW output from AI should not be affected by the simultaneous outage of Power System Stabilizers (PSS) of Artificial Island units Hope Creek and Salem-2. The Salem-1 PSS is assumed to be on for all scenarios.
3. Reduce operational complexity.
4. Improve Artificial Island stability.
5. Maintain PJM System Operating Limits (SOLs)

Id. at 2.

The Artificial Island RFP also required the following timeline for the Artificial Island Proposal Window:

- Monday, 4/29/2013, Opening of the Artificial Island Proposal Window.

- Friday, 6/28/2013, Close of the Artificial Island Proposal Window.
- All proposals and pre-qualification documentation due by 6/28.

Id. at 3. Consistent with PJM's filings in its Order No. 1000 compliance proceeding, the Artificial Island RFP informed bidders that "[a]ny proposals received after close of the proposal will not be accepted." *Id.* at 4.

In response to the Artificial Island RFP, twenty-six timely proposals were submitted by seven entities—VEPCo/Dominion Power, Transource, FirstEnergy, PHI/Exelon, Northeast Development/LS Power, Atlantic Wind, and PSE&G. The proposed projects mostly included new 500 kV or 230 kV transmission lines and improvements, but one entity (Dominion) proposed to add a new switching station including eight breakers, two Thyristor Controlled Series Compensation ("TCSC") devices, and a Static VAR Compensator ("SVC"). Dominion's TCSC/SVC proposal is referred to as the "Dominion 1A" project.[3] A slide describing each of the 26 proposals is attached hereto as Attachment 6.

C. PJM's Initial Evaluation of Artificial Island Proposals

After the proposal window closed, PJM posted on its website all of the proposals submitted during the open window, consistent with the process established in the October 2012 Compliance Filing. PJM staff, in consultation with PJM's TEAC, began reviewing and evaluating the proposals in accordance with the criteria stated in the Artificial Island RFP and Sections 1.5.8(e) and (f) of Schedule 6 of the PJM OA.

PJM staff then deviated from evaluating the projects and modified them instead. Attachment 7, TEAC 5/19/14, slides 40-42. Rather than rejecting proposals that did not satisfy

[3] PJM developed a taxonomy for referring to the proposals, in which the proposing party was designated by a number and its proposals were designated with letters. For example, Dominion's three proposals were labeled 1A, 1B, and 1C, and Transource's two proposals were labeled 2A and 2B.

the technical criteria, PJM staff modified them so they would pass the criteria. For example, PJM staff increased the capacity of the SVC in Dominion's 1A proposal from 500 MVAR to 750 MVAR because the 500 MVAR SVC failed to resolve the reliability problem. *Id.*, slides 44 & 45. Similarly, staff added the SVC component to the 500 kV and 230 kV transmission line proposals because the proposals—after being modified by PJM staff—failed to pass the criteria without an SVC. Attachment 7, TEAC 5/19/14, slides 65-66, 74-75, 83-84, 94-95, 103-04, 114-15, 123-24, 132-33, 142-43, 151-52, 160-61, 169-70; Attachment 8, TEAC 12/11/13, slide 56.

PJM staff made other major modifications as well. Staff also added an SVC to all of the transmission line proposals. Attachment 7, TEAC 5/19/14, slides 65-66, 74-75, 83-84, 94-95, 103-04, 114-15, 123-24, 132-33, 142-43, 151-52, 160-61, 169-70. PJM staff also modified most of the transmission line proposals to remove line segments that PJM staff did not consider necessary. *Id.* Staff made other less significant modifications to the proposals, *e.g.*, to add or remove breakers and to add dead-end structures. *Id.*

PJM staff presented its evaluation of the proposals at the May 19, 2014 TEAC meeting. PJM staff was candid about the fact that it had modified each of the proposals and specifically listed the modifications it made to each proposal. *Id.*, slides 40-42. PJM staff short-listed two general categories of proposals among the modified proposals, both of which involved transmission lines to increase Artificial Island's connections across the Delaware River to the Delmarva Peninsula: (1) the addition of a new 500 kV transmission line from Artificial Island to DPL's Red Lion substation, and (2) the addition of a new 230 kV transmission line from the Salem substation to DPL's 230 kV system in Delaware—sometimes called the "Southern Crossing" proposal. *Id.*, slides 181 & 197. Both of these short-listed proposals involved two options. The 500 kV line proposals included either (a) a line from the Hope Creek substation to

Red Lion or (b) a line from Salem to Red Lion. *Id.* Also, the Southern Crossing 230 kV lines included either an aerial or a submarine crossing of the Delaware River. *Id.* The 500 kV line proposals included Dominion's 1C proposal and PSE&G's 7K proposal (Hope Creek to Red Lion), as well as PHI/Exelon's 4A proposal, LS Power's 5B proposal, and Transource's 2C proposal (Salem to Red Lion). *Id.* The Southern Crossing 230 kV proposals included LS Power 5A, Transource 2B, and Transource 2A (submarine), as well as LS Power 5A and Dominion 1B (aerial). *Id.*

PJM staff did not short-list Dominion's 1A proposal to add TCSCs and an SVC at 500 kV substations in New Jersey. *Id.* PJM staff concluded that there were stability concerns and Nuclear Regulatory Commission ("NRC") concerns with this proposal. *Id.*, slide 45. PSEG Nuclear has argued that the proposal would increase (not reduce) operating complexity and would not eliminate the need for operating guides in the Artificial Island area—the primary objective of the Artificial Island RFP. Attachment 9, PSEG Nuclear Comments. Furthermore, as PSEG Nuclear stated, the proposal relies on an untested technology in the switchyard of the second largest nuclear generation complex in the United States. To PSE&G's knowledge, there are few, if any, SVCs with a capacity of 750 MVAR in use in the United States and the integrated TCSC/SVC solution proposed by Dominion has never been used anywhere else in the United States, making it a poor candidate to test at Artificial Island. *Id.*

After receiving feedback from the TEAC, PJM staff recommended PSE&G's 7K proposal, which (as modified) was a new 500 kV transmission line from Hope Creek to Red Lion and a 650MVAR SVC at New Freedom. Attachment 10, 6/16/14 TEAC, slides 30-36. PJM staff explained that it had short-listed four projects: Southern Crossing – submarine; Southern Crossing – overhead; Salem to Red Lion 500 kV; and Hope Creek to Red Lion 500 kV. *Id.* PJM

determined that the 500 kV line proposals were "more robust" than the 230 kV Southern Crossing proposals. *Id.*, slide 28. PJM also recommended the Hope Creek to Red Lion 500 kV line proposal over the Salem to Red Lion proposals. *Id.*, slide 30. PJM staff then recommended that PSE&G be designated the responsibility to construct the Hope Creek to Red Lion 500 kV line (except for upgrades to the Red Lion substation, which were assigned to PHI) and that PSE&G construct the new SVC at the New Freedom substation. *Id.*, slides 31-36.

PJM allowed interested parties to submit comments to the proposed recommendation and announced that the PJM staff's recommendation of the PSE&G project would be presented to the PJM Board at its July 22, 2014 meeting. *Id.*, slide 36.

D. Comments on Staff's Recommendation and the PJM Board's Response

Several parties submitted comments in response to PJM staff's recommendation. Two in particular are worth noting here.

First, PHI/Exelon focused its comments on the concern that PJM did not follow its Solicitation Process. Attachment 11, PHI/Exelon July 14, 2014 Letter. PHI/Exelon stated that PJM "did not follow the process that was laid out in their October 25, 2012 and July 22, 2013 Order No. 1000 Compliance filings" but instead resorted to "different processes" that "are not transparent to participants and could be problematic in the future if they are not corrected." *Id.* at 1. According to PHI/Exelon, rather than applying its Order No. 1000 "sponsorship" model, PJM instead "chose to modify all project submittals and, at the end of the day, selected the project closest to the one created by PJM." *Id.* at 1-2. Although PHI/Exelon commended PJM for "tr[ying] very hard to distinguish all short listed proposals," PHI/Exelon stated that "it is particularly difficult to distinguish amongst these plans [because they] were essentially all developed by PJM." *Id.* at 2.

Second, LS Power submitted comments that modified its own proposal and also criticized PJM staff's decision to recommend PSE&G's 500 kV proposal. Attachment 12, July 8, 2014 Letter. Although PJM staff expressly found that the 500 kV solution was "more robust," LS Power asserted that PJM staff had erred in concluding that the 500 kV line proposal and the Southern Crossing 230 kV proposal were equivalent in cost and further asserted that it could build its Southern Crossing proposal at a lower cost than PJM staff estimated. *Id.* LS Power then proposed to modify its Southern Crossing proposal by adopting a $171 million construction cost cap, despite the fact that the proposal window closed more than a year earlier. *Id.*

The PJM Board did not approve the staff's recommendation at its July 22, 2014 meeting, but rather reopened the process. Attachment 13, PJM's July 23, 2014 Letter. The Board explained that LS Power "has *modified* its proposal to place a fixed cap on the costs associated with the project" and stated that, although this cap should have been "presented to PJM in a more timely fashion," the Board invited the four "finalist" bidders—PSE&G, Transource, LS Power, and Dominion—to "supplement their proposals in light of LS Power's proposal." *Id.* at 1 (emphasis added). The Board did not mention the Dominion 1A proposal (which had not been short-listed), but stated that it would be "reaching out to the Nuclear Regulatory Commission to discuss technical issues associated with certain proposals impacting nuclear switchyards." *Id.* at 2. The Board also stated that "Order 1000, which guided our competitive bidding initiative on this project, has created entirely new processes which are especially challenging when evaluating transmission solicitations as complex as those required for the Artificial Island stability issues." *Id.*

Subsequently, on August 12, 2014, PJM sent a letter to the four "finalist bidders" inviting them to "supplement" their proposals "to submit final terms of project costs." Attachment 14,

PJM's August 12, 2014 Letter at 1-2. The letter also added the previously-rejected Dominion 1A proposal to the short list without explaining why it was being added. *Id.* The letter stated that, if the finalists wanted to supplement their (now five) proposals in terms of cost, they "must include sufficient detail for PJM to evaluate the details of its cost proposal, including the specific details surrounding any costs cap that a proposer wishes to submit." *Id.* at 2. PJM stated that the supplemental proposals were due on September 12, 2014. *Id.* PJM identified the following five projects as the finalists: (1) Dominion 1A (TCSC/SVC); (2) Dominion Project 1C (Hope Creek to Red Lion 500 kV line); (3) Transource 2B (Southern Crossing 230 kV – submarine); (4) LS Power 5A (Southern Crossing 230 kV – submarine); and (5) PSE&G 7K (Hope Creek to Red Lion 500 kV line). *Id.* at 1.

In addition, on August 29, 2014, PJM sent a letter to Chief Judge Wagner asking Judge Wagner to engage the Commission's Alternative Dispute Resolution ("ADR") process and appoint Judge Sterner to be present as a "neutral, non-decisional observer" at PJM's discussions with the four finalist bidders. Attachment 15, August 29, 2014 Letter at 1. The letter outlined the process that PJM intended to follow in discussions with the four finalists, Judge Sterner's expected role in that process, and guidelines for PJM governing the conduct of the discussions. Among other things, the letter asked Judge Sterner to provide a final report on the discussions and publish the report in Docket No. MD14-1. *Id.* at 3. Although the purpose of the ADR process was "to ensure fairness and due process," Judge Sterner was not asked to examine or ensure that PJM complied with the rules for its Order No. 1000 competitive solicitation processes.

E. Evaluation of the Supplemental Proposals and Further PJM Modifications

The four finalists resubmitted their five proposals on September 12, 2014. LS Power, Transource, and PSE&G all modified their proposals to add a cost cap, but Dominion declined to

add a cost cap to either of its two remaining proposals. Attachment 16, TEAC 12/9/14, slide 22. Commencing on October 22nd and lasting through November 3rd, four "fact-finding" sessions were convened at FERC before Administrative Law Judge Sterner. During these sessions, PJM probed each finalist regarding its re-submitted proposal. Judge Sterner observed these discussions and, on December 3, 2014, he published his report on the discussions as requested in PJM's August 29, 2014 letter to Chief Judge Wagner. *See Artificial Island Order 1000 Transmission Solicitation*, 149 FERC ¶ 63,017 (2014).

PJM staff then proceeded to conduct further evaluation of the finalist proposals, much of which focused on examining Dominion's previously-rejected 1A proposal. PJM conducted several studies and inquiries directed solely to this proposal, including discussions with the NRC, as well as an examination of the performance of the TCSC under several scenarios, the engagement of a consultant to study Sub Synchronous Resonance ("SSR"), and an examination of the flexible alternating current transmission system ("FACTS") used in Dominion's 1A proposal. Attachment 17, TEAC 10/9/14, slides 42-46; Attachment 16, 12/9/14, slides 8-12.

On December 9, 2014, the four finalist bidders made additional presentations regarding their supplemental proposals. At this meeting, PSE&G, along with PSEG Nuclear and Transource, presented their concerns regarding the Dominion 1A proposal**.**

The timeline for final PJM decision on the Artificial Island Transmission Solicitation has continued to slip. At the November TEAC meeting, PJM stated that it would make its recommendation on the finalist proposals in January 2015. Attachment 18, TEAC 11/11/14, slide 63. However, at the January TEAC meeting, PJM cancelled a January 21, 2015 meeting scheduled for PJM staff to submit its recommendation, and has not indicated when its staff will be in a position to make a recommendation. Attachment 19, TEAC 1/7/15, slide 102. Instead,

PJM is conducting multiple further evaluations. These evaluations include: (i) finalizing a relay clearing time study associated with Fiber Optic Ground wire ("FOG wire") installation for shorter clearing times, (ii) receiving and finalizing Sub Synchronous Resonance ("SSR") Study, and (iii) engaging a third party to review studies associated with the Dominion 1A proposal. *Id.*, slides 101-02.

In addition to these further evaluations, PJM may be contemplating further unilateral modifications to the proposals. It is PSE&G's understanding from statements made by PJM staff that it is considering taking two important features from PSE&G's 7K proposal—FOG wire installation and optimization of generator step up ("GSU") tap adjustments—and adding those features to the remaining proposals to make them more attractive. *See id.*, slides 101-02. PJM staff has indicated that adding these two features to the line proposals would eliminate the need for an SVC, which is a feature PJM itself proposed yet was criticized by several entities as undermining the central purpose of the solicitation (to increase operational flexibility). We are hopeful that our understanding is incorrect, but, if not, it represents another departure from the rules and a troubling example in which key aspects of one sponsor's proposal are appropriated and given to other sponsors.

ARGUMENT

I. PJM DID NOT COMPLY WITH ITS TARIFF SOLICITATION PROCESS

PJM did not follow its Solicitation Process in two fundamental respects. First, PJM unilaterally modified each proposal, rather than, as required, evaluating them and selecting the best proposal or, if none qualified as such, reposting the solicitation. Second, PJM allowed LS Power to modify its proposal more than one year after the proposal window closed and after PJM staff had recommended another proposal. Each violation is significant standing alone and, when taken together, created a process with no discernible standards.

A. PJM Exceeded Its Authority by Unilaterally Modifying All the Proposals

PJM's role is to "evaluate and compare all proposals" and then "select the projects . . . for PJM Board review and approval." October 2012 Compliance Filing at 54-56; *see also id.* at 67-68. PJM's role is not to modify those proposals as PJM deems appropriate. "PJM's 'sponsorship' proposal is designed to give both incumbent transmission owners and nonincumbent developers an opportunity to propose new and innovative projects. It is not designed, nor intended, to award bid-based contracts based on PJM-proposed solutions." September 2013 Answer at 9. PJM OA, Schedule 6, Section 1.5.8(d) says this quite clearly: "The Office of the Interconnection shall *review* all proposals submitted during a proposal window and determine and *present* to the Transmission Expansion Advisory Committee the proposals that merit further consideration for inclusion in the recommended plan" (emphasis added).

PJM did not do this. It unilaterally modified all the proposals. It added SVCs to all the transmission line projects. It changed the configuration of several projects by deleting major line segments. It considered proposals that did not satisfy its own criteria and, instead of rejecting them, changed them to remedy their deficiencies. This extra-tariff process continues to date and, as indicated, may include appropriating key elements of one sponsor's proposal and giving it to the other sponsors.

This is not the Solicitation Process that the Commission approved. PJM proposed one, and only one, exception to its "sponsorship model." If PJM determines that none of the proposals are "the more efficient or cost-effective solution to a posted violation or system condition," then PJM may repost the violation and open a new window or—if time does not allow for a new window—craft the optimal solution itself and designate the incumbent Transmission Owner to build it. *Id.*, § 1.5.8(g). But the tariff does not authorize PJM to change

the proposals that it is evaluating. "PJM only will propose 'unsponsored' projects when required to *timely* meet reliability needs." January 2013 Answer at 57 (emphasis added).

PJM has not explained why it believes it has the right to unilaterally modify all the proposals, but it is possible that PJM is relying on the following passage of Section 1.5.8(d): "Based on review and comment by the Transmission Expansion Advisory Committee, the Office of Interconnection may, if necessary conduct further study and evaluation. The Office of the Interconnection shall post on the PJM website and present to the Transmission Expansion Advisory Committee the revised enhancements and expansions for review and comment." PJM OA, Schedule 6, § 1.5.8(d). The word "revised" in this sentence does not, however, give PJM authority to do what it did here. It merely gives PJM the right to consider the views of the TEAC on "the proposals that merit further consideration," *id.*,—i.e., the short list initially proposed by PJM—and then revise that short list in response to the concerns of the TEAC. It does not give PJM authority to modify all of those proposals unilaterally. If it did, there would be no point in requiring PJM to "re-evaluate and re-post" the solicitation if none of the proposals were efficient and cost effective. *Id.*, § 1.5.8(g). PJM could just change them all, as it did here. As PHI/Exelon stated, PJM "chose to modify all project submittals and, at the end of the day, selected the project closest to the one created by PJM." Attachment 11, Exelon/PHI Letter at 2.

PJM represented to the Commission that the Solicitation Process "is sufficiently detailed from start to finish for stakeholders to understand why a particular transmission is selected or not selected in the RTEP for cost allocation purposes." October 2012 Compliance Filing at 71. It is "not a 'black box' selection process," PJM claimed. January 2013 Answer at 51. Those statements were true of the process accepted by the Commission, but not of the process that PJM actually implemented. The "different processes" actually used by PJM were "not transparent to

participants" and "did not follow the process that was laid out in [PJM's compliance filings]." Attachment 11, Exelon-PHI Letter at 1.

B. PJM Violated the Tariff by Allowing LS Power to Modify Its Bid

The Solicitation Process prohibits bidders from modifying their proposals after the proposal window closes. Although PJM can request additional information after the window closes, "[i]n response to the Office of the Information's request for additional reports or information, the proposing entity *(whether an existing Transmission Owner or Nonincumbent Developer)* may *not* submit a new project proposal or modifications to a proposed project once the proposal window is closed." PJM OA, Schedule 6, § 1.5.8(c)(4) (emphasis added). The Artificial Island RFP complied with this limitation, expressly informing all potential bidders that there was a 60-day window in which to submit proposals and that "[a]ny proposals received after close of the proposal *will not be accepted*." Attachment 5, Artificial Island RFP at 4 (emphasis added).

The reason for this restriction is, as explained by PJM, to protect the integrity of the competitive process:

> Given the highly competitive nature of the proposal window process, if entities were permitted to submit proposals outside the proposal window, they potentially could have access to additional information, including proposals submitted during a proposal window, which would give them an undue advantage over entities that submitted timely proposals. Such a practice would be unfair to the entities that submitted proposals during the proposal windows and undermine the proposal process.

July 2013 Compliance Filing at 9. It would also "adversely impact the planning process as well as reliability," "provide an unfair advantage to those entities" submitting untimely modifications, and "chill PJM's ability to gather additional information that would enable it to make a better evaluation." January 2013 Answer at 54-55. The Commission agreed with PJM and approved the limitation. *See* March 2013 Compliance Order at P 297; *see also Sw. Power Pool, Inc.*, 144

FERC ¶ 61,059 at P 294 (2013) ("Order No. 1000 does not require a public utility transmission provider to provide an opportunity to potential transmission developers to remedy deficiencies in project proposals" and "extending the cure period beyond the bidding window could significantly delay the Transmission Owner Selection Process."); *ISO New England Inc.*, 143 FERC ¶ 61,150 at PP 297, 307-12 (2013) (approving requirement that transmission proposals must be submitted by the deadline specified in the posting by the ISO).

LS Power's addition of a cost cap to its Southern Crossing 230 kV proposal—which LS Power made more than one year after the window closed—was a clear modification to LS Power's proposal. The PJM Board recognized this, stating that "LS Power *has modified its proposal* to place a fixed cap on the costs associated with the project." Attachment 13, July 23, 2013 Letter at 1 (emphasis added). The Board did not, however, explain why it permitted this modification. All bidders were aware that PJM would give "special emphasis" to cost caps offered by proposing entities. PJM so stated in its January 2013 Answer—two months before the Artificial Island window—in direct response to an LS Power protest. January 2013 Answer at 52 ("special emphasis" will be "given by PJM should a cost cap be voluntarily offered by the developer").

II. THE COMPETITIVE TRANSMISSION REGIME ESTABLISHED BY ORDER NO. 1000 WILL NOT SUCCEED IF THE REGIONS DO NOT FOLLOW THEIR RULES

The filed rate doctrine requires RTOs, like all public utilities, to follow the requirements of their own tariffs. *E.g.*, *City of Vernon*, 109 FERC ¶ 61,369 at P 27 (2004) ("[T]he CAISO is required to follow its tariff."). The Commission "expect[s] transmission providers . . . to know what is in a tariff and to follow its rates, terms and conditions." *Midwest Indep. Transmission Sys. Operator, Inc.*, 118 FERC ¶ 61,212 at P 90 (2007). The Commission "expect[s] [an RTO] to rely on the filed rate and to ensure that its Business Practice Manuals are consistent with the

[MISO Tariff]." *Id.*; *see also Shetek Wind Inc. v. Midwest Indep. Transmission Sys. Operator, Inc.*, 138 FERC ¶ 61,250 at PP 48, 52 (2012) (explaining that, "[t]o the extent that MISO did not follow its interconnection study approach according to the Tariff, it violated those Tariff provisions" and finding "a clear violation of the Tariff"). The Commission has encouraged market participants to bring tariff violations to the Commission's attention. *See Preventing Undue Discrimination and Preference in Transmission Serv.*, Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 at P 806 (2007) ("Once the tariff language is in place, transmission customers can, and should, bring to the Commission's attention any failure by the transmission provider to follow its tariff."). The Commission will fashion an appropriate remedy for any such tariff violations. *See Midwest Indep. Transmission Sys. Operator, Inc.*, 118 FERC ¶ 61,212 at P 95 ("[F]aced with a public utility's violation of its own tariff, the Commission must examine the factual situation, balance the equities, and craft an appropriate remedy.").

The obligation of RTOs to follow their own tariff rules is particularly critical to the success of Order No. 1000's efforts to remove barriers to transmission development. A central goal of these reforms—remedying undue discrimination—cannot be achieved unless transmission development solicitation rules are clear and are followed by the transmission provider. *See* Order No. 1000 at P 162. The Commission has explained that "inadequate transparency requirements" can "increase[] the opportunities for undue discrimination . . . and make[] instances of undue discrimination more difficult to detect." Order No. 890, *Preventing Undue Discrimination and Preference in Transmission Serv.*, 118 FERC ¶ 61,119 at P 51 (2007).

In evaluating PJM's initial Order No. 1000 compliance filing, the Commission held that it was unacceptable that PJM's proposed tariff revisions did not specify what factors PJM would consider when selecting transmission projects. *See* March 2013 Compliance Order at P 312.

The Commission explained that "[t]his lack of specificity may permit PJM to use an unduly discriminatory evaluation process to select transmission projects in the regional transmission plan for purposes of cost allocation" and therefore required PJM to specify the factors it would consider. *Id.* The Commission has also recognized in other contexts that clear tariff rules prevent RTOs from unduly discriminating among market participants. *See Shetek Wind Inc.*, 138 FERC ¶ 61,250 at PP 30, 49, 102-03 (finding that MISO violated its tariff's rules governing interconnection requests and that "a lack of transparency and fairness" may have resulted in undue discrimination).

Ensuring that RTOs follow their own tariff rules is also essential to facilitating the construction of new infrastructure. The transmission planning and siting process has enough uncertainty and conflict without enduring challenges to solicitation outcomes because the rules are not followed. Transmission infrastructure cannot be financed and built on a timely basis with that uncertainty. That is why the Commission has insisted on clear tariff rules that "balance the goal of limiting opportunities for undue discrimination while fostering the development of . . . needed investment." *See id.* at P 101.

PSE&G is sympathetic to the fact that the Artificial Island solicitation was PJM's first major solicitation and that PJM may believe that, in retrospect, some of its existing tariff rules could be improved. But there is an established process for that: the changes should be discussed with stakeholders and, consistent with PJM's FPA section 205 filing rights, submitted to the Commission as proposed amendments to take effect *prospectively*. *See, e.g.*, *Tenaska Power Servs. Co. v. Midwest Indep. Transmission Sys. Operator, Inc.*, 106 FERC ¶ 61,230 at P 53 (2004) ("[I]f Midwest ISO were to find that its methodology . . . is inadequate and needs to be changed, it should vet any changes through its stakeholder process and, if necessary, file proposed tariff

language with the Commission."); *accord Midwest Indep. Transmission Sys. Operator, Inc.*, 109 FERC ¶ 61,129 at P 5 (2004).

III. THE TIMING OF THE ARTIFICIAL ISLAND SOLICITATION DOES NOT EXCUSE PJM'S FAILURE TO FOLLOW ITS OWN RULES

PJM's Order No. 1000 compliance filing stated that "PJM *commits* herein that depending upon the stage of the planning cycle, PJM will implement whatever provisions proposed herein can be implemented without restarting a planning cycle" and that proposals received prior to the effective date of the new rules "will be evaluated under the new rules to the extent feasible." October 2012 Compliance Filing at 81-82 (emphasis added). PJM made this commitment before it solicited proposals to address the Artificial Island reliability problems. Then, in the July 2013 Compliance Filing, PJM reaffirmed this commitment: "as PJM indicated in the October 25 Filing, PJM is implementing the new proposal window process to the extent feasible and practicable under its current process." July 2013 Compliance Filing at 3. PJM then committed to apply the new process to Artificial Island. "PJM determined that [Artificial Island] offered a good opportunity to implement a proposal window consistent with the revisions proposed in [PJM's Order No. 1000 compliance filing]." *Id.* at 3-4; *see also PJM Interconnection, L.L.C.*, Docket No. ER15-639-000, FPA Section 205 Filing at 7 (Dec. 16, 2014) (explaining that the Artificial Island proposal window "utilized the study process proposed under Order No. 1000"). PJM described the Artificial Island solicitation as a "pilot" of the new proposal window rules. September 2013 Answer at 17.

The Commission accepted PJM's representations in approving PJM's transition proposal and PJM is therefore bound to them. *See, e.g.*, *Linden VFT, LLC v. N.Y. Indep. Sys. Operator, Inc.*, 141 FERC ¶ 61,008 at P 28 (2012) (evaluating whether New York ISO fulfilled its promise to provide a type of grandfathered treatment to certain generators and concluding that it had);

Cal. Indep. Sys. Operator Corp., 119 FERC ¶ 61,076 at P 149 (2007) (evaluating whether CAISO had honored a promise to address seams issues in a particular filing and concluding that it had); *Cal. Indep. Sys. Operator Corp*., 106 FERC ¶ 61,179 at P 167 (2004) ("[W]e direct the ISO to honor its commitment to post an updated, conformed tariff on its website within 30 days following the acceptance of its subsequent compliance filing in this proceeding."). PJM's commitment to follow the tariff process was particularly important here because there were no pre-existing tariff rules to follow regarding competitive transmission solicitations. An RTO is "not authorized to implement whatever policies or procedures that it chooses as long as they are not specifically prohibited." *Shetek Wind Inc.*, 138 FERC ¶ 61,250 at P 49.

In addition to these commitments, the formal tariff process was triggered when PJM reevaluated the proposals in 2014. Order No. 1000 held that its new rules would apply to new projects and pre-existing projects that were reevaluated after the effective date of the RTO's proposal. *See* Order No. 1000 at P 65 (holding that the new rules would apply to "those transmission facilities that are subject to evaluation, *or reevaluation* as the case may be, within a public utility transmission provider's local or regional transmission planning process" after the effective date of an RTO's compliance filing) (emphasis added). PJM's consideration of Artificial Island proposals extended well past the January 1, 2014 effective date of its Order No. 1000 compliance filing and, importantly, after January 1, 2014 PJM made numerous material modifications to the proposals it had received. PJM then reevaluated the proposals, as modified. This reevaluation continues today.

IV. RELIEF REQUESTED

The Commission should grant the Complaint and direct PJM to follow its rules in the Artificial Island solicitation and all future solicitations. If PJM believes that none of the proposals submitted in 2013 represents the more efficient or cost-effective solution, PJM can re-

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

post the Artificial Island solicitation and provide any additional guidance to prospective sponsors that PJM deems appropriate based on the experience it has gained over the last two years. PSE&G understands that granting this relief will delay the process somewhat, but the process has already languished for nearly two years, there is no other tariff-based remedy for the violations that have occurred, and the remedy is nondiscriminatory because it does not favor one bidder over another.

ADDITIONAL INFORMATION REQUIRED BY COMMISSION REGULATIONS

I. CORRESPONDENCE AND COMMUNICATIONS

PSE&G requests that all communications and correspondence with respect to the Complaint be directed to the following individuals and that these individuals be included on the Commission's official service list for this proceeding.

Jodi L. Moskowitz
Deputy General Counsel/Chief NERC Officer
Vilna Waldron Gaston
Associate General Regulatory Counsel
PSEG Services Corporation
80 Park Plaza, T5G
Newark, NJ 07102
Tel.: (973) 430-6409
Fax: (973) 430-5983

II. OTHER PROCEEDINGS

The issues presented in this proceeding are not pending in any other forum in which PSE&G is a party.

III. DOCUMENTS AND OTHER THINGS SUPPORTING THE COMPLAINT

In accordance with Rule 206(b)(8) of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.206(b)(8), all documents supporting the facts in the Complaint are attached to the Complaint.

IV. NEGOTIATIONS AMONG THE PARTIES

In accordance with Rule 206(b)(9) of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.206(b)(9), PSE&G states that it has not initiated any formal dispute resolution procedures prior to filing the complaint. However, PSE&G participated in the proceedings before Administrative Law Judge Sterner in Docket No. MD14-1-000 and PSE&G recently informed PJM of its intent to file this Complaint. PSE&G does not believe that alternative dispute resolution would be effective at resolving the dispute in this proceeding.

V. FINANCIAL IMPACT

PSE&G is unable to quantify the aggregate dollar impact of PJM's violations because the primary harm from the violations is to the Solicitation Process and the resulting impact on transmission investment. PSE&G may also suffer financial harm if its proposal is not ultimately selected due to tariff violations committed when PJM reopened the process to consider proposal modifications after its staff had already recommended that the Board adopt PSE&G's proposal; however, this financial harm cannot be precisely quantified at this time.

VI. SERVICE AND FORM OF NOTICE

In accordance with Rule 206(c) of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.206(c), PSE&G is simultaneously serving a copy of this filing on PJM Interconnection, L.L.C.:

PJM Interconnection, L.L.C.	)	
	)	

NOTICE OF COMPLAINT
(January __, 2015)

Take notice that on January __, 2015, Public Service Electric and Gas Company ("PSE&G") filed a formal complaint against PJM Interconnection, L.L.C. ("PJM") pursuant to section 206 of the Federal Power Act, 16 U.S.C. § 824e, and Rule 206 of the Commission's Rules of Practice and Procedure, 18 U.S.C. § 385.206, alleging that PJM has violated its rules governing competitive transmission solicitations.

PSE&G certifies that copies of the complaint were served on PJM and on the contacts for PJM, as listed on the Commission's list of Corporate Officials.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 C.F.R. §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. The Respondent's answer and all interventions or protests must be filed on or before the comment date. The Respondent's answer, motions to intervene, and protests must be served on the Complainants.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible online at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the website that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).

Kimberly D. Bose
Secretary

PJM©2013

Artificial Island Stability Background

Max generation power output for stable operation is expressed as:

$$P_{max} = (V_t \times E_i) / X_d$$

- V_t is system voltage
  - More is theoretically better, but has operational limits
- E_i is internal machine voltage
- X_d is system impedance
  - Smaller is better

PJM©2013

Artificial Island Stability

- Stability Requirements
  - Artificial Island Operating Guide (AIOG)
  - Minimum MVAR output requirements from Hope Creek, Salem 1&2

- Reliability Issues
  - High voltage

PJM©2013

Artificial Island Proposal Window

- Goals
  1. System Performance
     - Outage conditions - improve system performance and AI stability margin under N-1 (forced or unforced)
     - Normal conditions - Improve system performance and stability margin under normal system conditions
  2. AIOG
     - Eliminate the AIOG

PJM©2013

Pre-Qualification & Timeline

- See Today's Planning Committee Presentations
  - Pre-Qualification Submittal
  - CEII & NDA Requirements
  - Possible window timeline

PJM©2013

Artificial Island Proposal Requirements

- Sponsoring entity information
  - Company name, contact information etc.
- Project Description
  - Include scope, interconnection points, configurtion (e.g. overhead, underground, AC/DC etc>), ROW, high level project schedule including CPCN, engineering, construction start, and in-service date
  - Project cost estimate

PJM©2013

Artificial Island Proposal Requirements

- Technical Report
  - Include assumptions and calculations demonstrating the efficacy of the project
    - Report should include information about the origin of power flow case and any modifications, station single line drawings and results of any sensitivity studies
    - Modeling information such as conductor type, calculated impedances, contingency files, *.idev files and dynamic files

PJM©2013

Artificial Island Case Development

- PJM coordinating development and benchmark of critical system condition cases to the current case
  - Cases will be available in PSS/E v32.1.1 (*.sav format)
  - Power flow case and dynamics data file
  - Other environment files (.snp, .dll and .rsp)

PJM©2013

Artificial Island Window – Information Communication

- Communication
  - PJM.com
    - http://www.pjm.com/planning/rtep-development/expansion-plan-process/ferc-order-1000.aspx
  - Currently all communication through email to RTEP@pjm.com
  - Upon the opening of the Artificial Island window, an email will be sent to the PC and TEAC email distribution lists and also posted to PJM.com
  - PJM will distribute information to the registered Artificial Island RTEP Window participants VIA email or posting to the secure PJM.com page with an email notification to go retrieve the information

PJM©2013

Artificial Island Window – Security

- Security
  - All CEII will be encrypted using PGP encryption
  - CEII will be distributed using a self extracting (*.exe) encrypted file
    - From a user perspective, this is similar to the familiar self extracting ZIP file, but the user will be asked for a security code.
      - E.g. PJM posts the files to the secure Artificial Island window section of PJM.com. Users download “Artificial Island Information (CEII).exe” to their local environment
      - Once downloaded, the user will be prompted for a security code
    - Security codes, per PJM Policy, are required to be distributed through a contextless email message.
      - E.g. PJM distributes the security code that will be used to access the CEII by the Artificial Island Window participants in the “Artificial Island Information (CEII).exe” file.

Email: RTEP@pjm.com with any questions or clarifications and include a reference to Artificial Island Window

REQUEST FOR PROPOSAL - Improve Artificial Island Area System Performance

I. Purpose of Proposal

PJM seeks technical solution alternatives (hereinafter referred to as "Proposals") to improve PJM Operational Performance in the Artificial Island area under a range of anticipated system conditions and to eliminate potential planning criteria (PJM, NERC, RFC, and Local Transmission Owner criteria) violations in the Artificial Island area.

II. Terminology

Artificial Island Area = "AI"
The system consisting of the transmission and generation facilities as depicted in Figure 1- Artificial Island 500 kV network. The Artificial Island includes the Salem #1, Salem #2, and Hope Creek #1 nuclear generation facilities

System Operating Limit = "SOL"
A System Operating Limit (SOL) is defined as:
The value (such as MW, MVAr, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within applicable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:

- Facility Thermal Ratings (Applicable pre- and post-Contingency equipment or facility ratings)
- Transient Stability Ratings or Limits (Applicable pre- and post-Contingency Stability Limits)
- Voltage Stability Ratings or Limits (Applicable pre- and post-Contingency Voltage Stability)
- System Voltage Ratings or Limits (Applicable pre- and post-Contingency Voltage Limits)

Critical Contingency:
The most limiting (i.e. the "worst") contingency.

III. Scope of Work

Objectives

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

1. Generate maximum power (3818 MW total) from all AI Units (Salem1: 1253MW, Salem-2: 1245MW, Hope Creek: 1320MW) without a minimum MVAr requirement from the AI. Full maximum power must be maintained under both the baseline and all N-1 outage conditions of 500kV transmission lines in the AI area. For both the baseline and N-1 outage conditions, AI voltage must be maintained within operating limits and stable for all NERC Category B and C contingencies. NERC Category C3 contingencies "N-1-1 contingencies" do not need to be run on top of the N-1 outage condition.
2. Maximum MW output from AI should not be affected by the simultaneous outage of Power System Stabilizers (PSS) of Artificial Island units Hope Creek and Salem-2. The Salem-1 PSS is assumed to be on for all scenarios.
3. Reduce operational complexity.
4. Improve Artificial Island stability.
5. Maintain PJM System Operating Limits (SOLs)

What PJM Provides:

The following data and related information is required for this project and is expected to be available from PJM:

Modeling Data:

The following data is provided:

1. **Base power flow case.** This case has all lines in service with AI units at maximum real power output. This case has been developed based on the NERC MMWG 2011 Series 2017 Summer Light Load case in PSS/E version 32 (separate file).
2. **Dynamic Case.** This case has been developed based on the NERC SSDWG 2011 Series 2017 Summer Light Load case in PSS/E version 32 (separate files)
3. **Short Circuit Case.** This case has a 2017 short circuit model in PSS/E version 32 and ASPEN *.olr format. (separate file)
4. **Contingency list** to ensure stability in Table 2 – Fault List.
5. **Fault clearing times** for buses at/near the Artificial Island are provided in Tables 3 and 4. Examples of fault clearing time calculation using Tables 3 and 4 are also provided for contingency creation.
6. **Machine Capability Curves** ("D Curves") of the AI Units in Figures 2~4 for reactive power capability at the target MW output.
7. **Description of Salem unit 1 user-defined exciter model (USAC6AU).**

Other Supporting Data:

1. One-line diagram of Artificial Island Area in Fig. 1.
2. Applicable stability criteria (system performance criteria).

3. AI case description (separate file: "Artificial Island Dynamics Case.docx")

Response back to PJM (Deliverables)

1. Description of the proposed solution.
2. Detailed analysis report on proposed solutions, including:
    a) Response plots (e.g. Machine angles over time)
    b) Breaker one-line diagrams to illustrate system topology
    c) Spreadsheets (e.g. Table of system voltages)
    d) High level estimate of:
        i. Time to construct the proposed solutions
        ii. Cost estimates with a description of assumptions (e.g. base cost, risk and contingency (R&C) costs, and total cost)
        iii. Availability of right of ways
3. Equipment parameters and assumptions
    a) All parameters (Ratings, impedances, mileage, etc.)
    b) For reactive devices, settings and outputs
    c) For synchronous machines, MW and MVAR output assumptions
4. Complete set of power flow and dynamic cases containing proposed solutions. If possible, also provide a PSS/E IDEV file so that the modeling of the proposal may be easily applied to other models. This may be difficult for non PSS/E users, please contact PJM with any questions. Provide any other necessary data including critical contingency files to reproduce the proposed solutions. All cases and data files for dynamic simulations should be in PSS/E ver. 32 format.
5. Any other supporting documentation required for the proposal performance validation by PJM.
6. Submission of Deliverables
    a) Preferred - VIA electronic mail to RTEP@pjm.com
    b) Alternate - VIA FedEx to Nancy Muhl, PJM Interconnection, 955 Jefferson Avenue, Norristown, PA 19403

Timeline

Monday, 4/29/2013, Opening of Artificial Island RTEP Proposal window
Friday, 6/28/2013, Close of Artificial Island RTEP Proposal window

- All proposals and pre-qualification documentation due by 6/28

Action	Target Date
PJM distributes RFP to Artificial Island RTEP proposal window participants	4/29/2013
RFP recipients submit questions to PJM	4/29/2013 – 6/28/2013

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

PJM distributes answers to questions to all recipients*	4/29/2013 – 6/28/2013
Recipients submit proposals to PJM**	On or before 6/28/2013
Recipients submit pre-qualification packages to PJM**	On or before 6/28/2013

*PJM will maintain confidentiality of individual proposals for the duration of the window, but will distribute general information to the Artificial Island RTEP proposal window participants

**Any proposals received after close of the proposal will not be accepted.

Stability Performance Criteria

PJM Manual 14B, Attachment G.
http://www.pjm.com/~/media/documents/manuals/m14b.ashx

(a) *Steady state voltage*: pre-fault voltages at selected 500 kV buses should be within operating range in Table 1. This pre-fault voltage must be noted for the following buses:

Table 1 – Steady State Voltage Limits

Bus Name	Bus Voltage	Bus # Identifier	Steady state pre-fault Voltage
Branchburg	500 kV	200002	1.0 – 1.1 p.u.
Deans	500 kV	200006	1.0 – 1.1 p.u.
Keeney	500 kV	200010	1.0 – 1.1 p.u.
New Freedom	500 kV	200012	1.0 – 1.1 p.u.
Peach Bottom	500 kV	200013	1.0 – 1.1 p.u.
Salem	500 kV	200014	1.0 – 1.1 p.u.
Red Lion	500 kV	200027	1.0 – 1.1 p.u.
East Windsor	500 kV	200028	1.0 – 1.1 p.u.
Hope Creek	500 kV	200029	1.0 – 1.1 p.u.
Orchard	500 kV	200063	1.0 – 1.1 p.u.

1. Post-fault steady state voltage shall not be below 0.986 pu at the Salem and Hope Creek 500kV buses.
2. The voltage drop magnitude from pre-trip to post-trip conditions for any of the Artificial Island Units shall not exceed:
    a) 2% - Salem Unit 1 and Unit 2
    b) 2.5% - Hope Creek
3. The operating voltage range of AI generator terminal (25kV bus) is from 0.95 pu to 1.05 pu.

(b) *Transient stability*: PJM's transient stability criteria are applied:

1. Monitored Facilities:
    a) All machines in Artificial Island and neighboring areas. Area numbers in the power flow case to monitor include areas 225, 227, 228, 229, 230, 231, 232, 234, 235, 201 (please refer to the area information embedded in the power flow case to map the area numbers to area names).
    b) PJM 500kV bus voltages (500kV bus voltages in area 225) and Deans, New Freedom, Red Lion and Keeney 230kV bus voltages.
2. Monitored Data Channels
    a) Rotor angles of all machines in the monitored areas. Real and reactive power output, EFD (generator field voltage), speed and terminal voltage of machines in area 225 (PJM) must be monitored in the simulation.
    b) PJM 500kV bus voltages (500kV bus voltages in area 225) and Deans, New Freedom, Red Lion and Keeney 230kV bus voltages are also monitored.
    c) Monitored facilities and data channel information for the given cases are stored in the snap shot file (.snp) in dynamics case. If proposed solutions include new dynamic devices and/or topology, proper data channels need to be included in the snap shot file to monitor stability.
3. Fault List
    a) See “Fault List” section below.
4. Overall test procedure:
    a) A minimum of fifteen (15) seconds time domain simulation shall be conducted for each contingency.
    b) The system must be stable for all faults considered.
    c) Rotor angles should be represented in relative quantities with respect to a reference machine’s rotor angle. In the dynamics case, a reference machine shall be set to Sea Brook unit 1 (bus 105568)
    d) If the system performance simulation is stable but the maximum angle swing of any unit (relative to the reference generator) exceeds 120 degrees, a safety margin test is performed.
    e) Safety margin test procedure: Delay fault clearance by a half cycle and re-run the simulation. The case is not considered secure if the system is unstable for the delayed fault clearance.
    f) Post-fault transient voltages at AI 500 kV buses shall not be below 0.7 pu after fault clearing.

(c) *Damping*:

1. Monitored Facilities:
    a) Same facilities to those in transient stability.
2. Monitored Data Channels:
    a) Rotor angles.
3. Fault List
    a) See “Fault List” section below.
4. Overall test procedure

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

a) Fifteen (15) seconds time domain simulation shall be conducted for each contingency.
b) Damping ratio of rotor angle is calculated for the period of 10~15 seconds using a modal analysis tool (e.g. PSSPLT modal analysis tool).
c) Damping ratio shall be above 3% and remains above 3% until the end of the simulation.
d) If nonlinearity is significant for the period of 10 to 15 seconds, it is necessary to extend the time domain simulation to longer time to capture system linear characteristics.

Fault List

All of the following faults, at a minimum, must be simulated whenever "Fault List" is referenced in the procedure above. If proposed solutions require modification of existing contingencies and/or creation of new contingencies due to topology changes, the modified and/or new contingencies should be added in the fault list with proper fault IDs.

Table 2 - Fault List

Artificial Island One-line Diagram

Figure 1 - Artificial Island Area 500 kV Network

Fault Clearing Times

All fault clearing times are in cycles.

Table 3 - Fault Clearing Times

Station	Faulted Line /Transformer	Fault Clearing Times (cycles)			
		Three phase or SLG fault on Line/Transformer with Normal Clearing	Delayed Clearing Due to Stuck Breaker		Three phase or SLG fault on Bus with Normal Clearing
			Local Station Clearing	Remote Station Clearing	
Hope Creek	5037	[redacted]			
	5015, 5023				
Salem*	5024, 5021				
Orchard	5039, 230kV Transformer				
Red Lion	5015, 230kV Transformer				
East Windsor	5022				
	5038				
New Freedom	5038				

*Note: for a fault on 5037 near Salem (e.g., contingency IDs 5a and 5b), please use the information for Hope Creek station related to 5037.

Table 4 – Transfer Trip Delay

Line	From	To	Transfer Trip Delay (cycles)*
5037	Hope Creek	Salem	[redacted]
5015	Hope Creek	Red Lion	
5023	Hope Creek	New Freedom	
5024	Salem	New Freedom	
5021	Salem	Orchard	
5039	Orchard	New Freedom	
5015	Red Lion	Hope Creek	
5038	New Freedom	East Windsor	

5022	East Windsor	Deans	[redacted]

*Note: it is assumed that the transfer trip delay is the same at both ends of the line unless both cases are specified in the table.

Examples of fault clearing time calculation using Tables 3 and 4 for contingency creation

Three Phase Bus Fault

Suppose a bus fault occurs at Salem bus [redacted] with no outages. The fault will clear in [redacted] cycles by opening breakers [redacted]

Line Fault and Transfer Trip

Suppose a line fault occurs on 5024 near Salem. The fault will clear at Salem by opening breakers [redacted] and [redacted] in [redacted] cycles. The transfer trip delay for 5024 is [redacted] cycles. Therefore, the fault at New Freedom will clear in [redacted] cycles [redacted]).

Line Fault with Breaker Failure

Suppose a line fault occurs on 5024 near Salem. Breaker [redacted] opens in [redacted] cycles but [redacted] fails to open. To clear the fault, breakers [redacted] and [redacted] will open after [redacted] cycles. At New Freedom, the fault clears in [redacted] cycles.

Line Fault with Breaker Failure involving remote station clearing

Suppose a line fault occurs on 5038 near New Freedom. Breaker [redacted] and [redacted] at New Freedom open in [redacted] cycles and breaker [redacted] at East Windsor opens in [redacted] cycles but breaker [redacted] at East Windsor fails to open. To clear the fault, breakers [redacted] will open after [redacted] cycles. At Deans, the fault clears in [redacted] cycles.

Salem unit 1 User-defined Exciter Model (USAC6AU – Modified ESAC6A)

The user-written model USAC6A is a modified version of the PSSE standard model ESAC6A. The difference between the USAC6A and ESAC6A is in the way the non-windup limit is applied on the lead-lag block (STATE(K+2)). In the USAC6A model, the implementation of the non-wind up limit on STATE(K+2) is consistent with the recommendation as given in the IEEE 421.5 2005 standard.

Table 5 – USAC6AU model parameter description

CONs	#	Value	Description

Data format in the dyr file:
IBUS, 'USRMDL', ID, 'USAC6AU', 4, 0, 0, 23, 5, 0, CON(J) to CON(J+22) /

Document Revision History

April 29, 2013
Original File Posted

April 30, 2013
Table 2 – Fault List updated
Table 3 – Fault Clearing Times updated
Table 4 – Transfer Trip Delay updated
Figure 1- Updated Deans bus number in the Figure from 20006 to 200006

May 3, 2013
Added a short circuit model in Aspen *.olr format
Added a Description of Salem unit 1 user-defined exciter model (USAC6AU), which includes a new Table 5 and Table 6
Described the operating voltage range of AI generator terminal (25kV bus) - from 0.95 pu to 1.05 pu

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

Artificial Island Proposal Window

PJM Special TEAC

Artificial Island Review

05/19/2014

Version 2

PJM©2014

Artificial Island Problem Statement Summary

- Generate maximum power from the AI under both the baseline (N-0) and maintenance (N-1) assumptions

- Satisfy applicable planning criteria

  – http://pjm.com/~/media/planning/rtep-dev/expan-plan-process/ferc-order-1000/rtep-proposal-windows/redacted-artificial-island-problem-statement.ashx

PJM©2014

Artificial Island Proposal Window Timeline

Announcement

- Announce window and potential timeline
- Request CEII/NDA submittals from anticipated participants
- Request Designated Entity Pre-Qualification

PSS/E v32 Case Development

Initial PSS/E v32 case created

- Benchmarking in Progress
- Develop and benchmark critical system condition cases

Window Opened

(4/29/2013 - 60 Day Duration)

- Open the "Artificial Island" RTEP Proposal Window
- Complete problem statement available
- Analytical files available

Coordinate with Window Participants and Receive Solution Proposals

- Coordination VIA www.pjm.com
- Data, Information
- Questions & Answers

Proposal Window Closed on 6/28/2013

PJM Evaluates Solution Proposals

PJM©2014

Past Timeline

- 9/13/2012 – PJM discusses the Artificial Island with PJM Stakeholders
- March 2013 - TEAC Previewed conceptual timeline and next steps for an Artificial Island Proposal Window
- 4/29/2013 – Artificial Island Proposal Window Opened
- 6/28/2013 – Artificial Island Proposal Window Closed
- July 2013 through April 2014 – PJM discusses the details of project performance, cost and constructability

PJM©2014

Proposals Overview

- 26 Proposals received from 7 individual entities
- **Cost Estimates:** Approximate range of $100 M to $1.5 B
- **Technology:** Static Var Compensator (SVC), Thyristor Controlled Series Compensation (TCSC), High Voltage Direct Current (HVDC) transmission line, (AC) transformers, (AC) overhead transmission line, underground/underwater cable transmission line, circuit breakers and associated protection equipment
- **Voltages:** 230 and 500kV
- **Station Connections:** Broad diversity of proposed methods to connect to existing stations or construct new stations as needed
- **Routing:** Wide variety of proposed methods to route new transmission over/under existing rights of way (ROW) or through new ROW

PJM©2014

Artificial Island Project Proposal Overviews

PJM©2014

Project ID	TO	Cost ($)	Major Components	Supporting info
P2013_1-1A	Virginia Electric and Power Com	$ 133	500 MVAR SVC near New Freedom	Two (2) Thyristor Controlled Series Compensation (TCSC) Devices near New Freedom

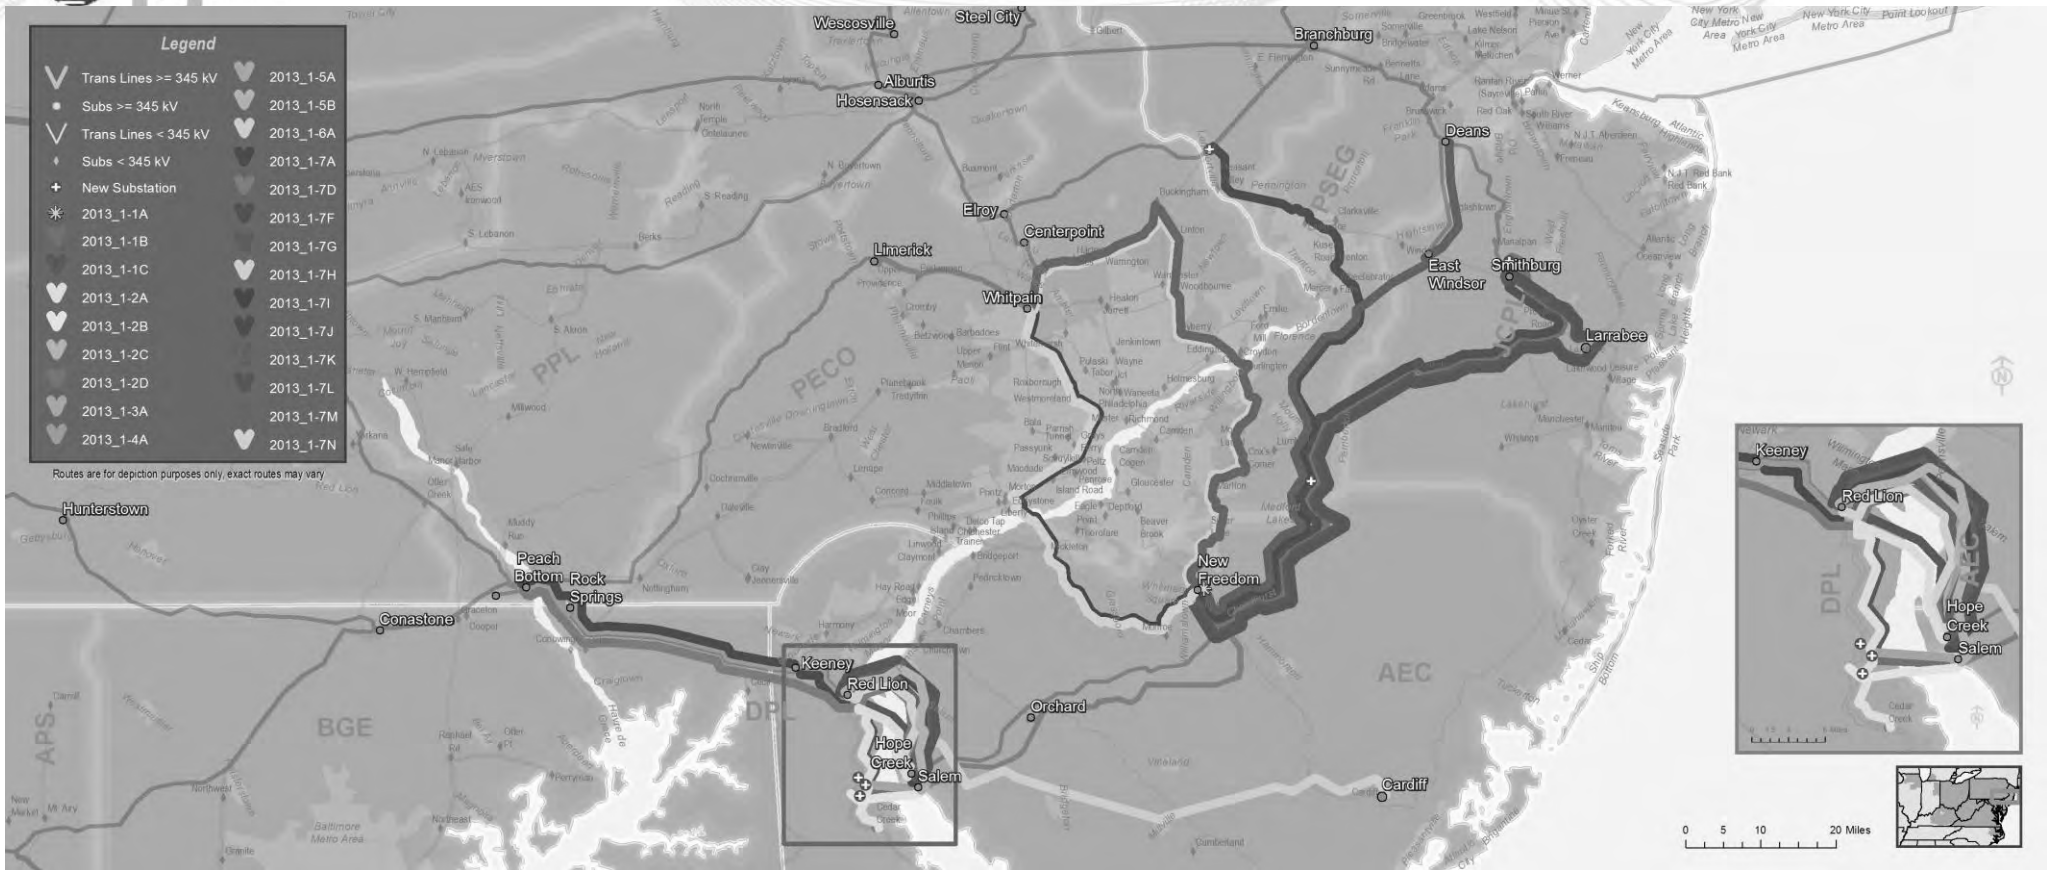
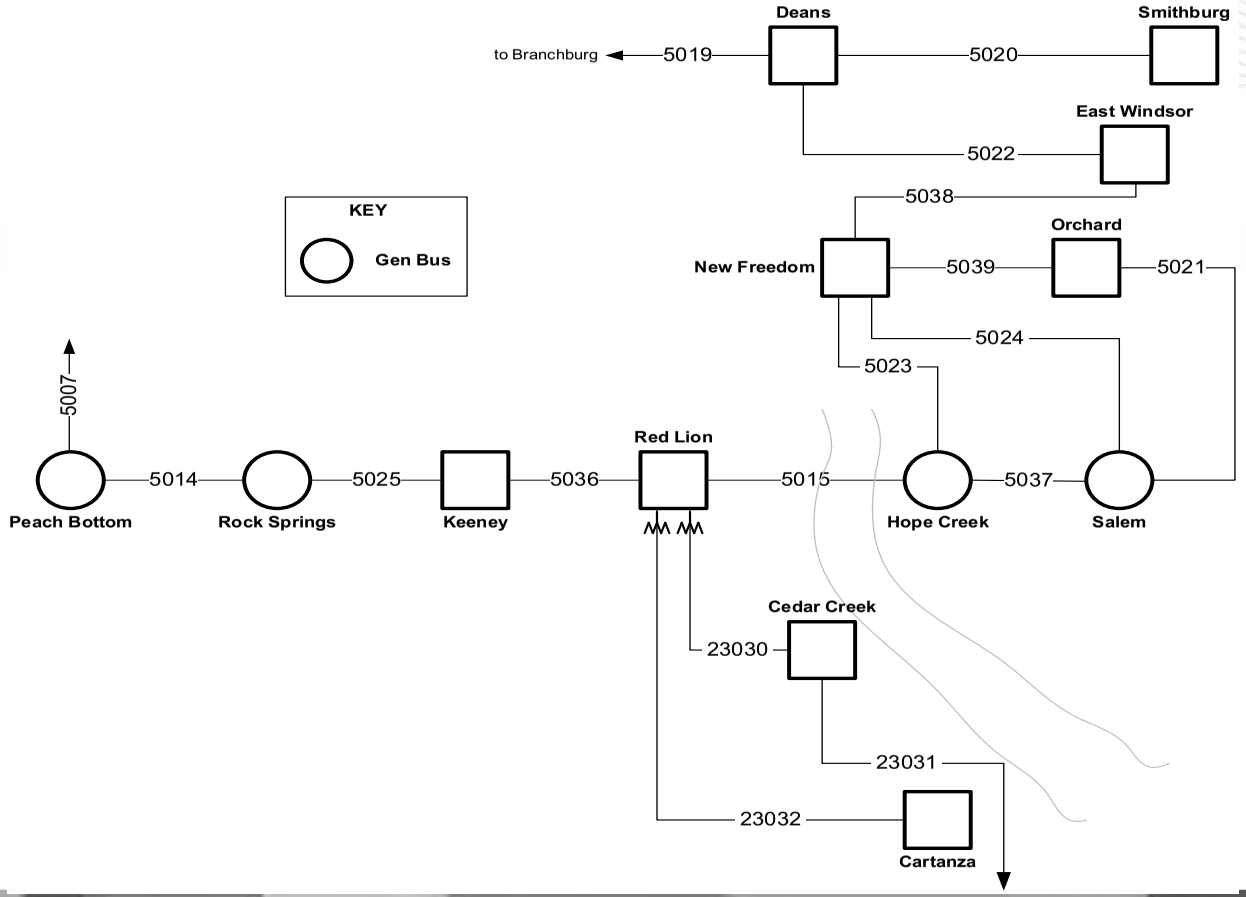
P2013_1-7N	PSE&G	$ 1,289	New Freedom - a new Station on the Branchburg-Elroy 500 kV line ("5017 Junction") & Salem-Hope Creek - Red Lion 500 kV lines w/ Hope Creek - Red Lion (new);	

Artificial Island Proposals



Artificial Island Area Network

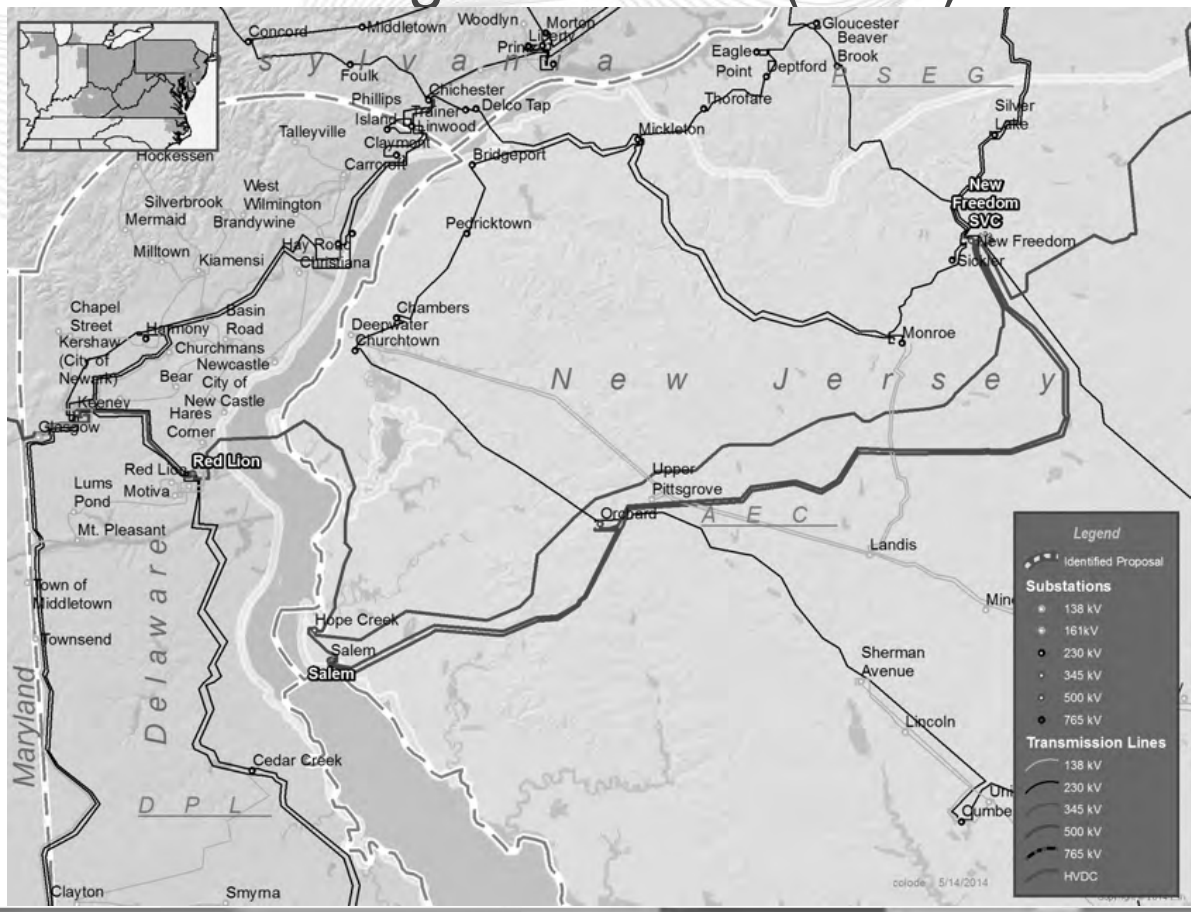


PJM©2014

SI-SSA-0010-0099

Dominion Virginia Power (DVP) 1A

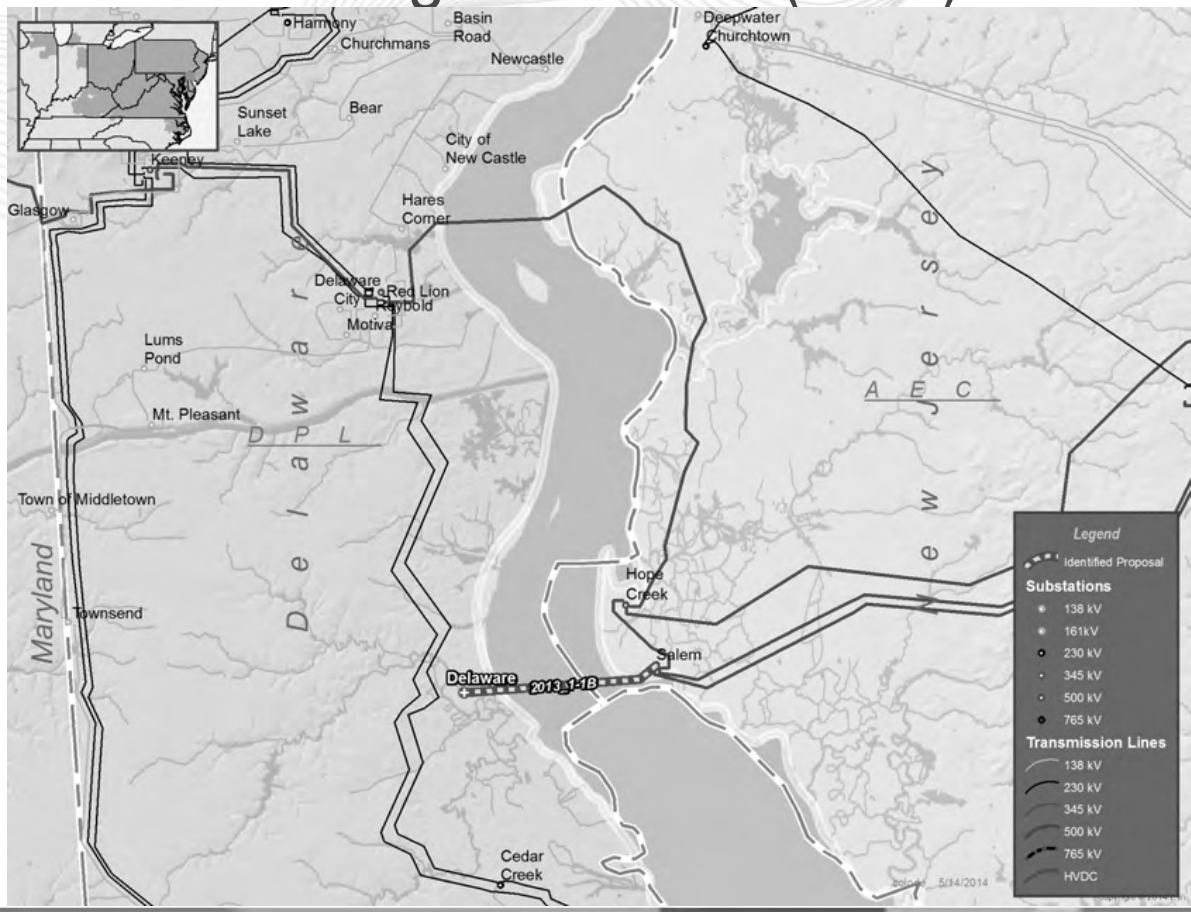
- New switching station cutting the 5023 and 5024 lines near New Freedom substation that includes
  - a 500kV SVC (+500 to -300 MVAr)
  - Two Thyristor Controlled Series Compensation (TCSC) devices
- Proposed Cost Estimate: $130MM



PJM©2014

Dominion Virginia Power (DVP) 1B

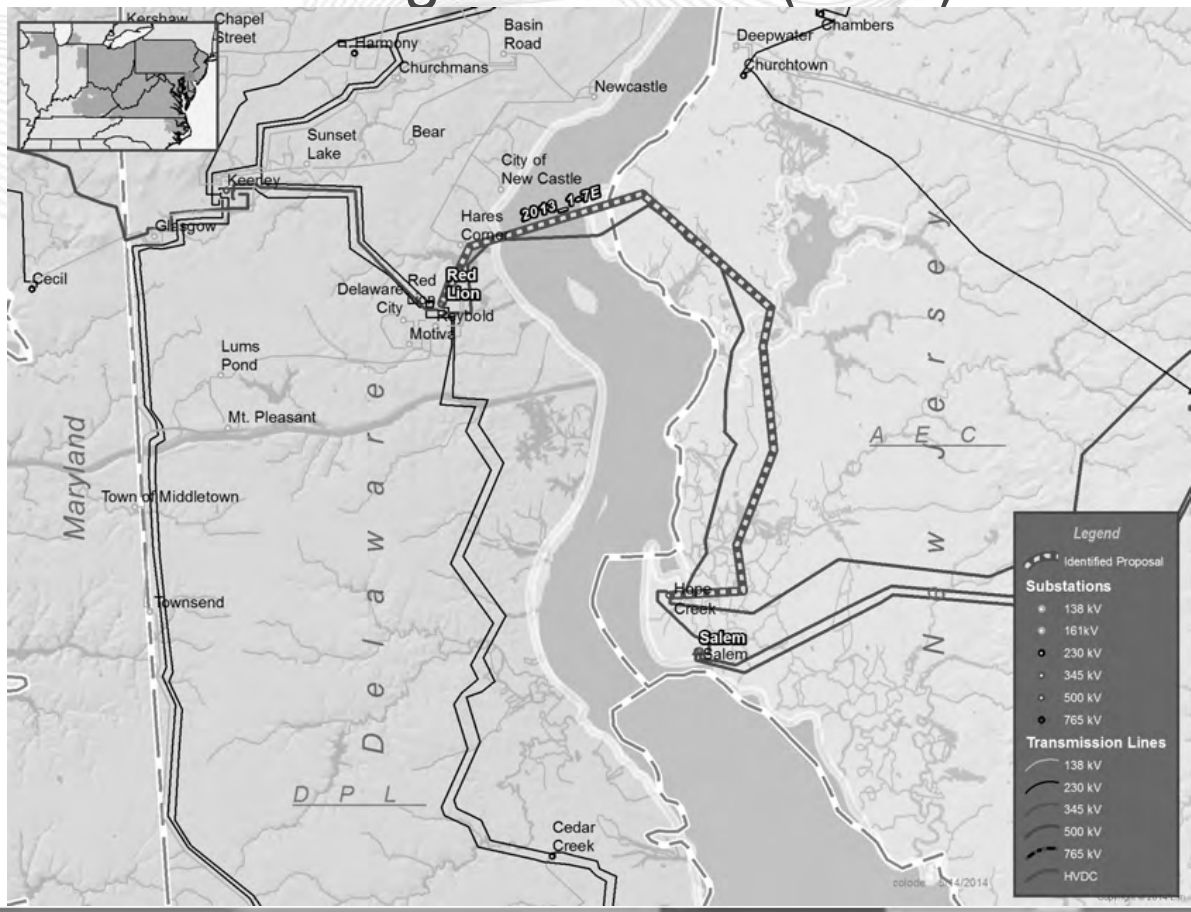
- Install a new 500kV line from Salem 500kV to a new station in Delaware
- Aerial crossing of the Delaware river
- New substation in Delaware that taps the existing Red Lion to Cartanza 230kV and Red Lion to Cedar Creek 230kV lines
- Proposed Cost Estimate: $133MM



PJM©2014

Dominion Virginia Power (DVP) 1C

- Expansion of Hope Creek substation
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Second Hope Creek to Salem tie line
- Reconfiguration of Red Lion substation into a breaker and a half scheme
- Proposed Cost Estimate: $199MM

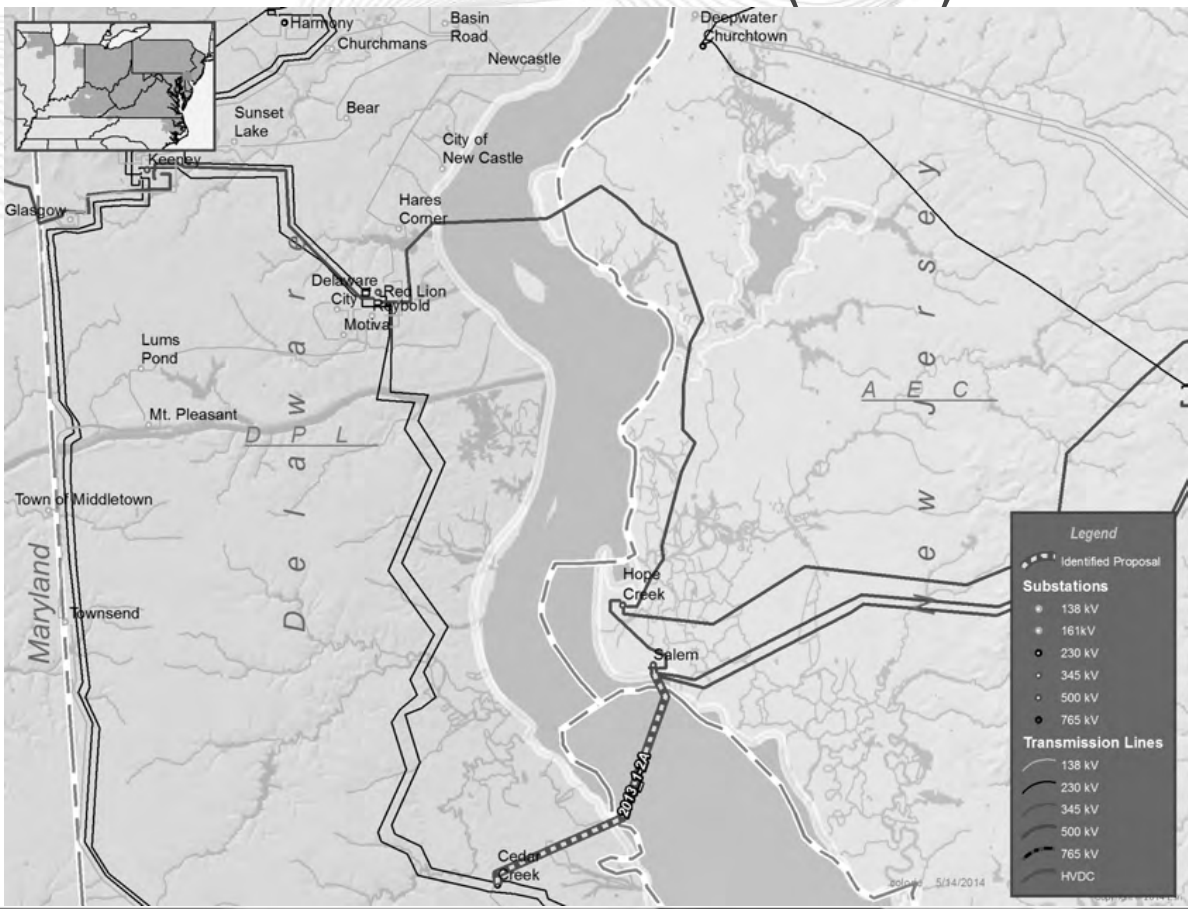


PJM©2014

SI-SSA-0010-0102

Transource (AEP) 2A

- Expansion of the Salem substation
- New substation near Artificial Island with two 500/230 kV autotransformers
- Submarine line under the Delaware river
- Expand existing Cedar Creek substation to accept the new line and to loop in the Red Lion – Cartanza 230kV line
- Proposed Cost Estimate: $213-$269MM

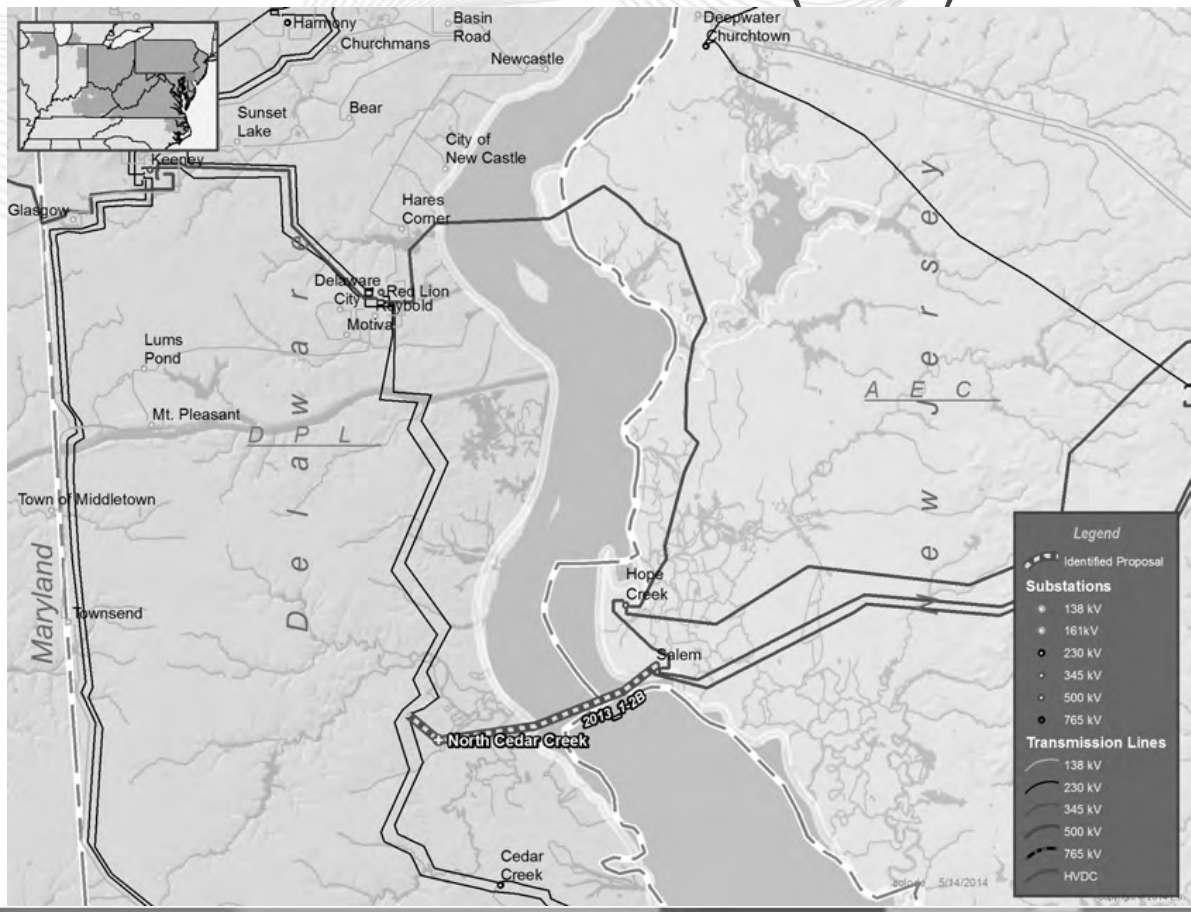


PJM©2014

SI-SSA-0010-0103

Transource (AEP) 2B

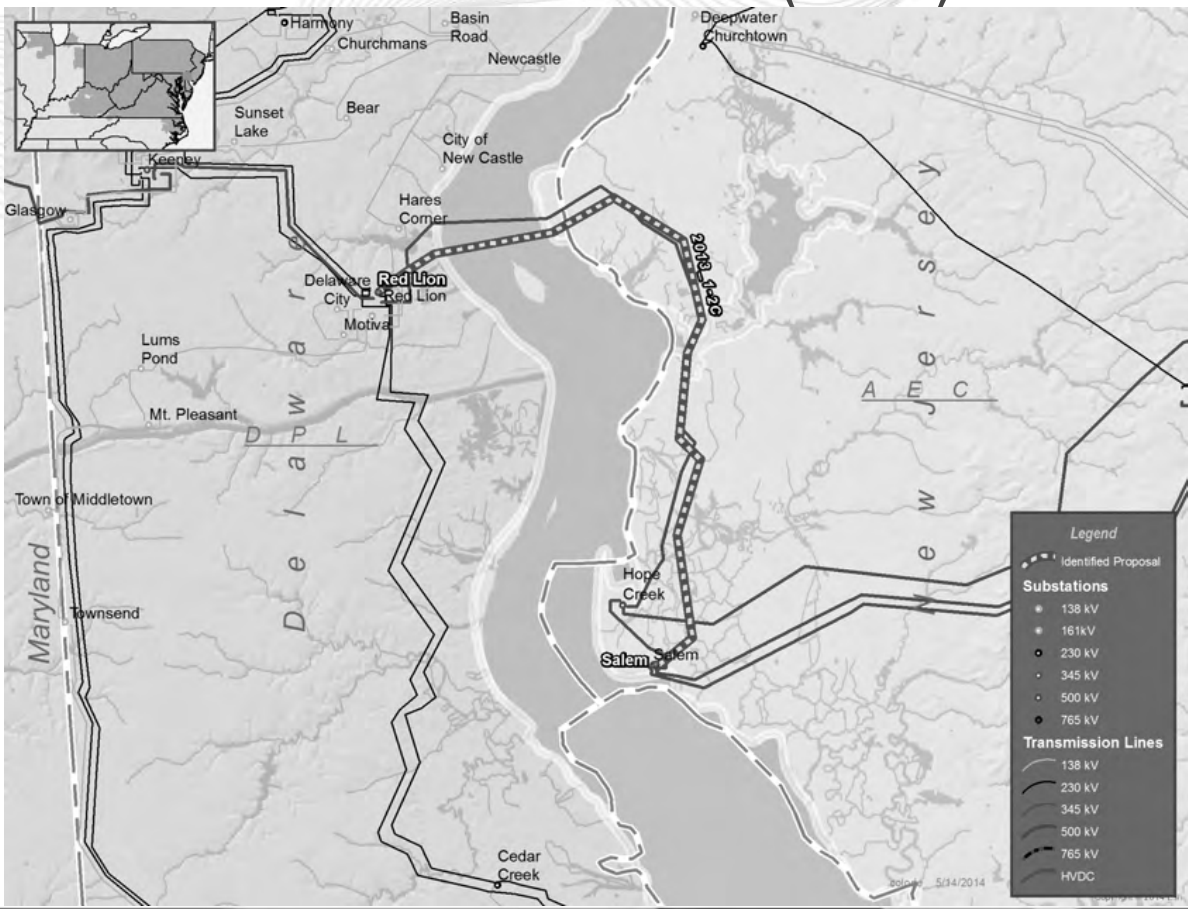
- Expansion of the Salem substation
- New substation near Artificial Island with two 500/230 kV autotransformers
- Submarine line under the Delaware river
- New substation in Delaware that taps the existing Red Lion to Cartanza 230 kV and Red Lion to Cedar Creek 230 kV lines
- Proposed Cost Estimate: $165-$208MM



PJM©2014

Transource (AEP) 2C

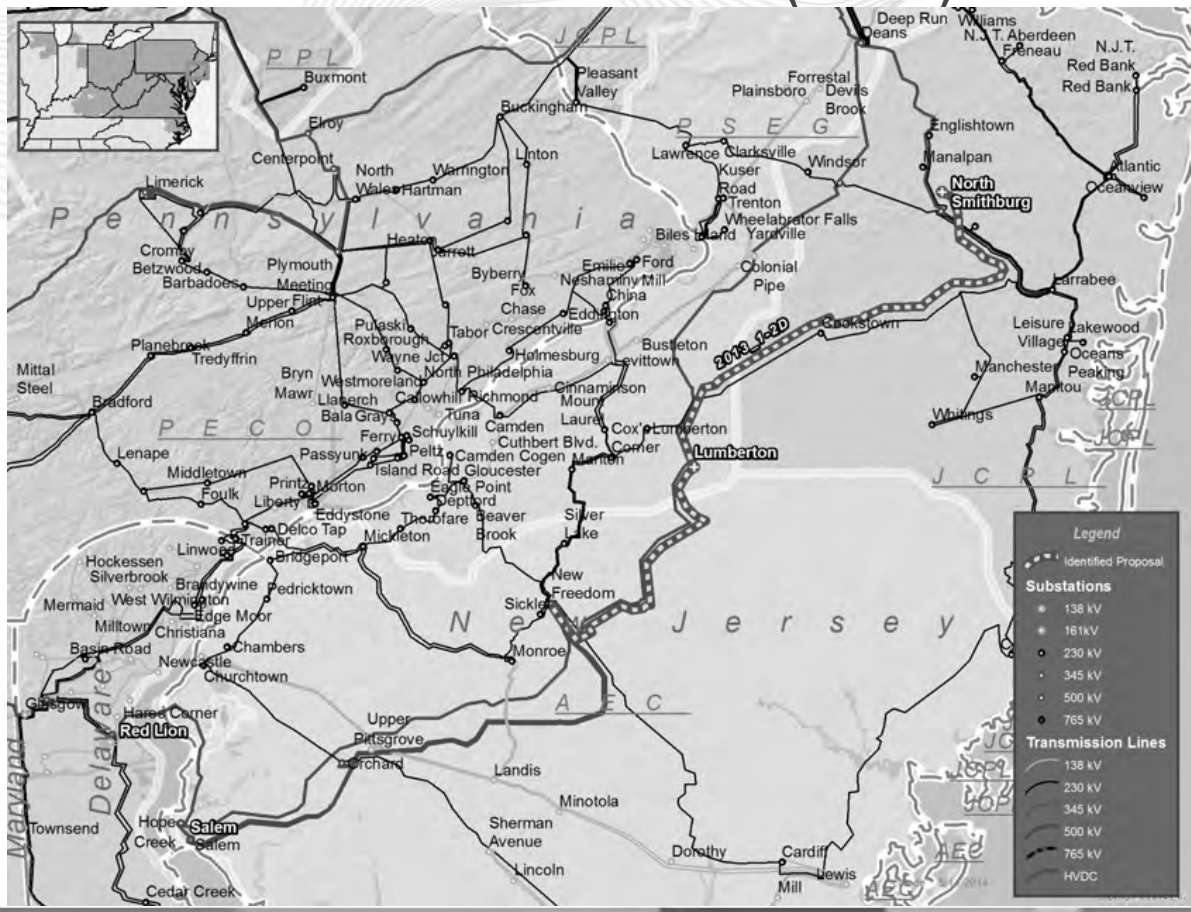
- Expansion of Salem substation
- Move 5024 and 5021 line bays within Salem substation
- 17 mile 500kV line from Red Lion to Salem
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Reconfiguration of Red Lion substation into a breaker and a half scheme
- Proposed Cost Estimate: $123-$156MM



PJM©2014

Transource (AEP) 2D

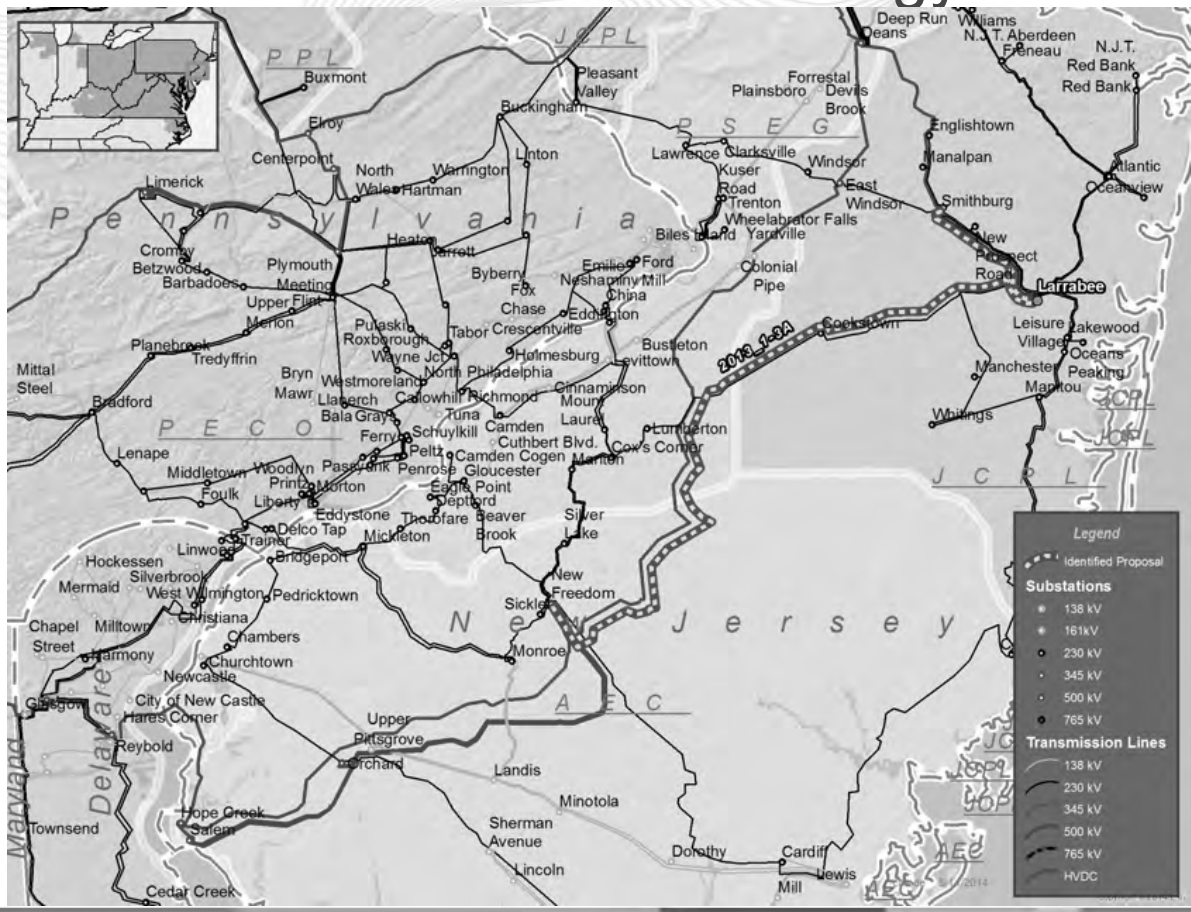
- Install a new 500kV line from New Freedom to Lumberton to North Smithburg
- New 500/230 substation east of Lumberton
- Second Hope Creek to Salem 500kV tie line
- Proposed Cost Estimate: $788-$994MM



PJM©2014

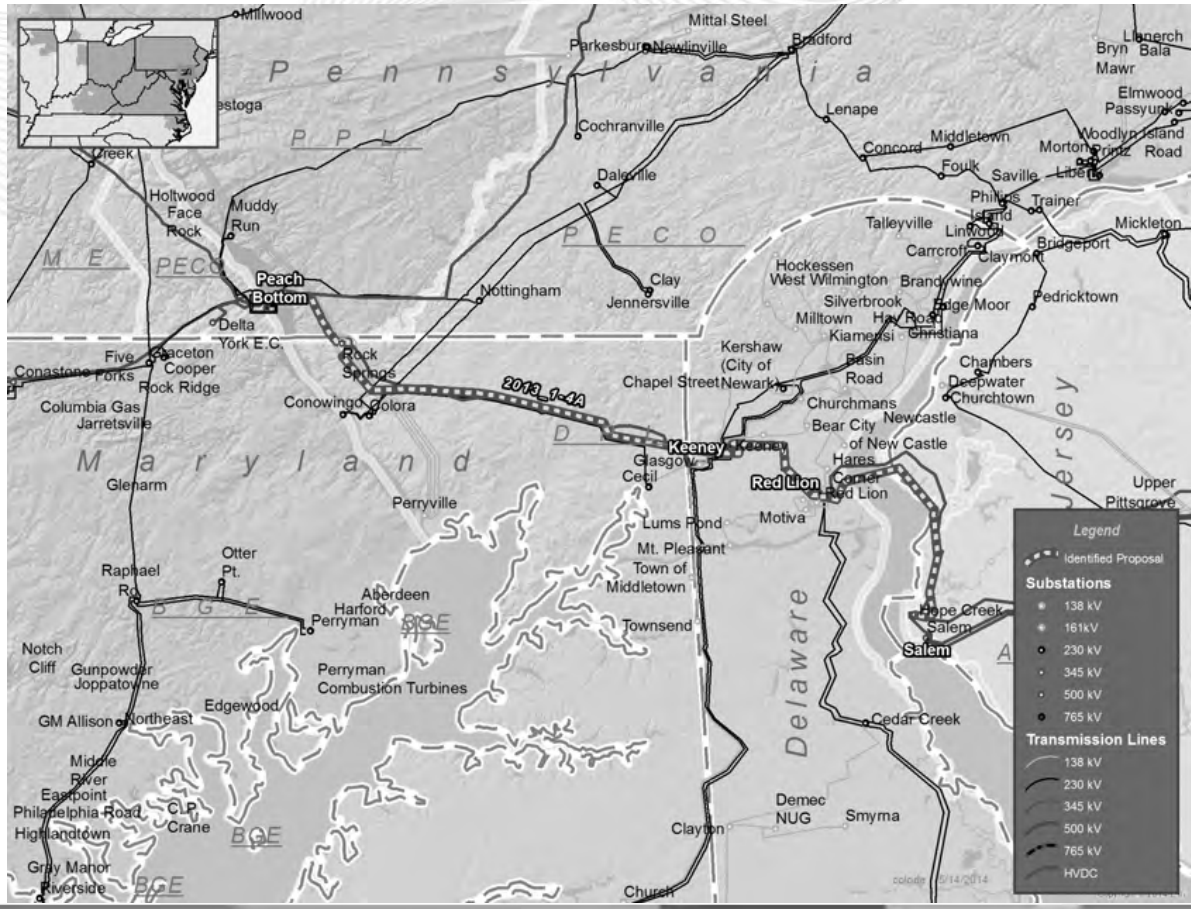
FirstEnergy 3A

- Install a new, New Freedom to Smithburg 500kV line with a loop into Larrabee substation
- Install two new 500/230 auto-transformers at Larrabee
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Proposed Cost Estimate: $452MM



PHI / Exelon 4A

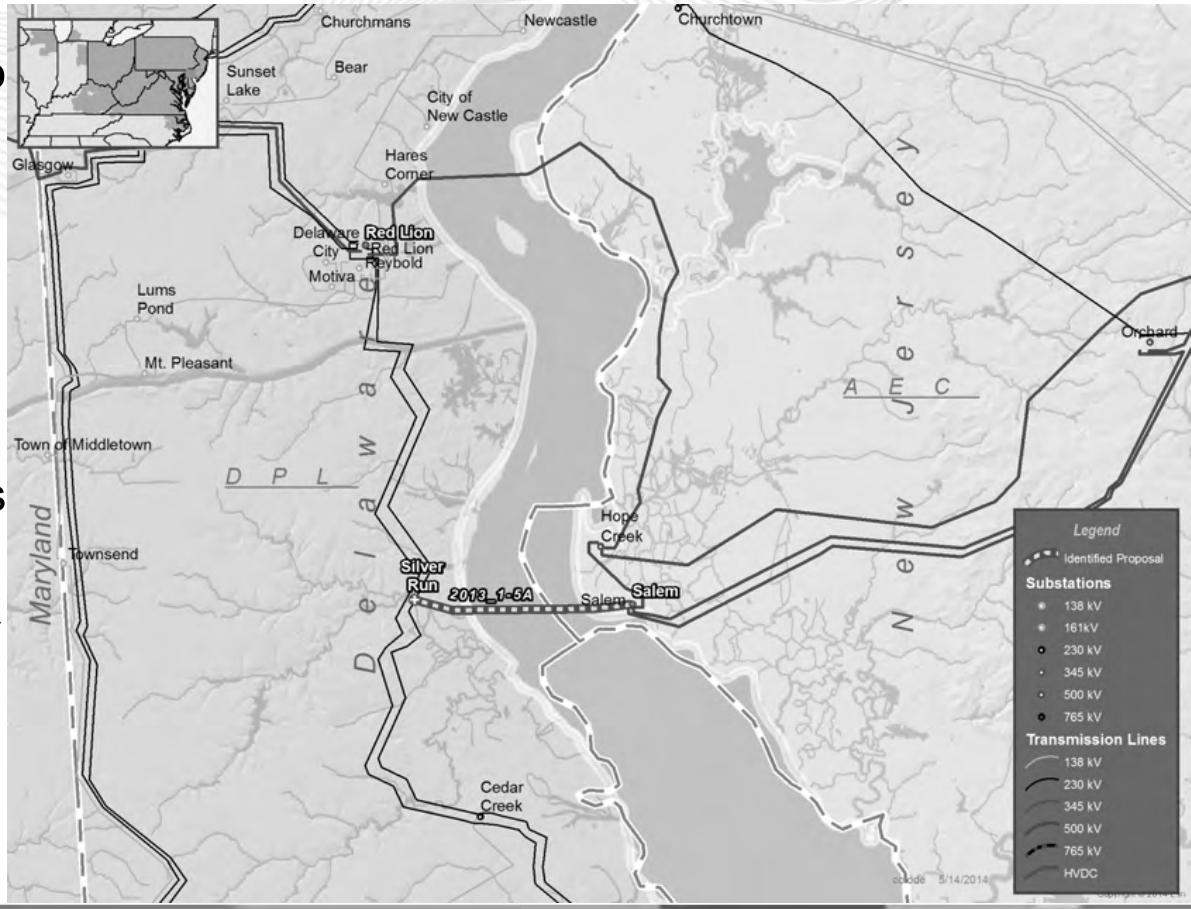
- Install a new Peach Bottom to Keeney to Red Lion to Salem 500kV line
- Remove existing Keeney to Red Lion 230 kV circuit
- Reconfigure the existing 230 kV line from Hay Road to Red Lion to terminate at Keeney instead of Red Lion
- Re-conductor the Harmony to Chapel Street 138 kV line
- Proposed Cost Estimate: $475MM



PJM©2014

LS Power 5A

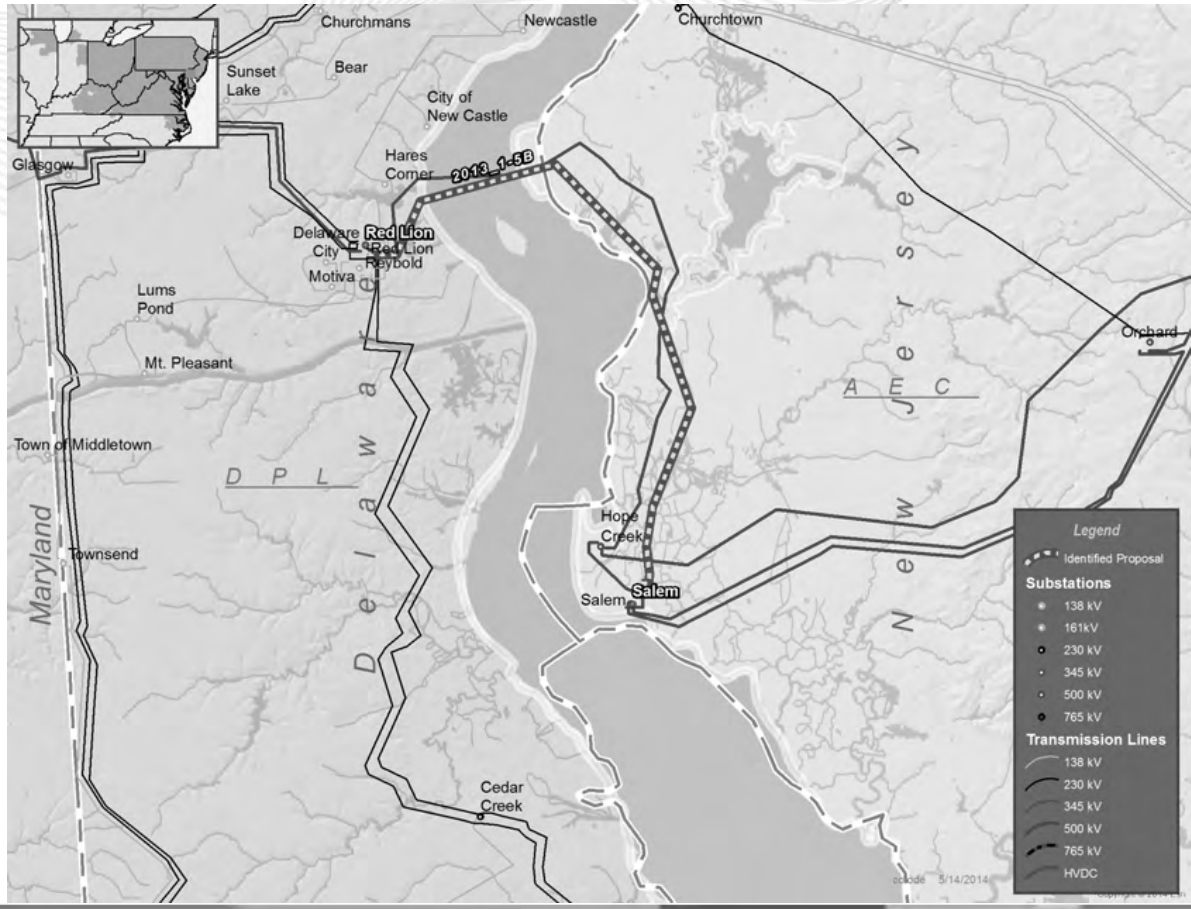
- Expansion of the Salem substation to the south to include a new 500/230kV auto-transformer
- Submarine or aerial line over the Delaware
- New substation in Delaware that taps the existing Red Lion to Cartanza 230 kV and Red Lion to Cedar Creek 230 kV lines
- Proposed Cost Estimate: $116 - $148MM



PJM©2014

LS Power 5B

- Expansion of Salem substation
- 17 mile 500kV line from Red Lion to Salem
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Expansion of Red Lion substation ring-bus
- Proposed Cost Estimate: $170MM

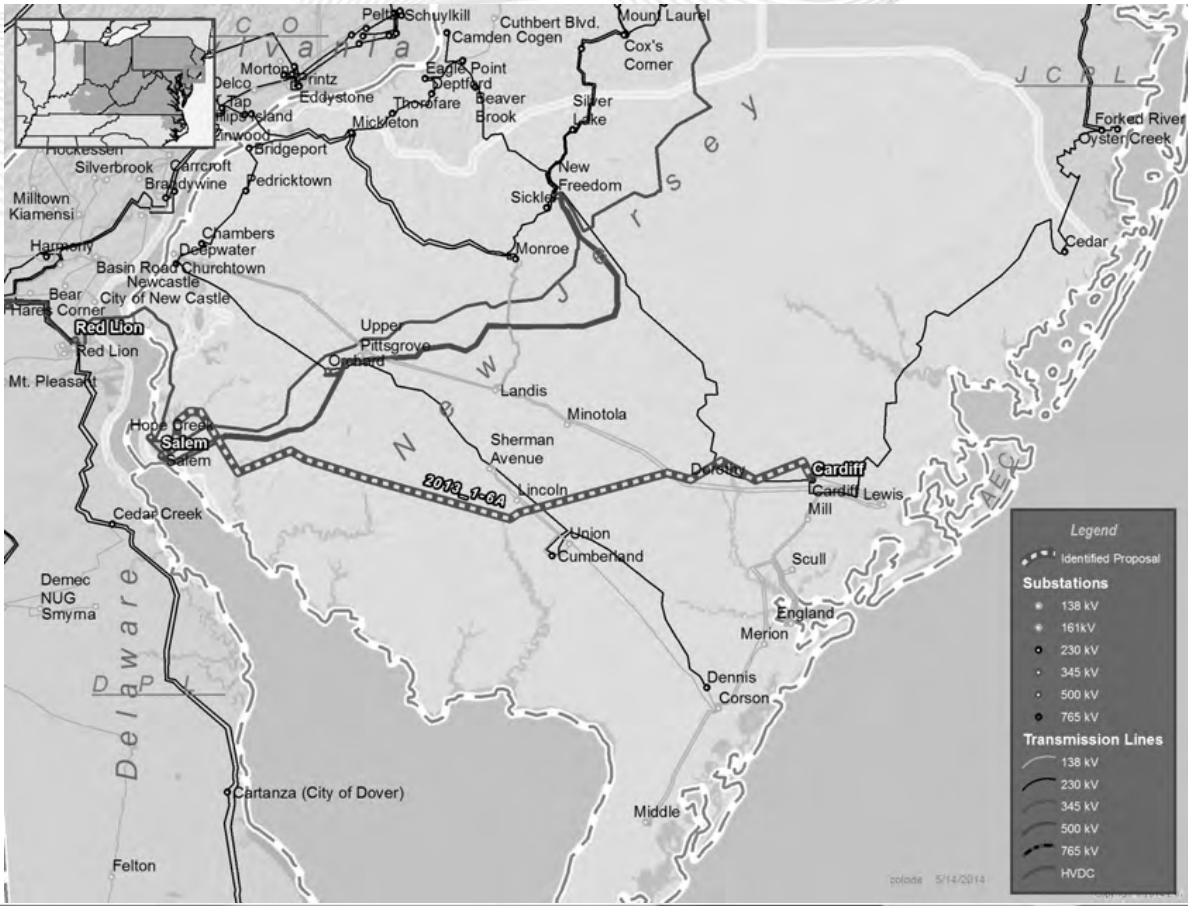


PJM©2014

SI-SSA-0010-0110

Atlantic Wind 6A

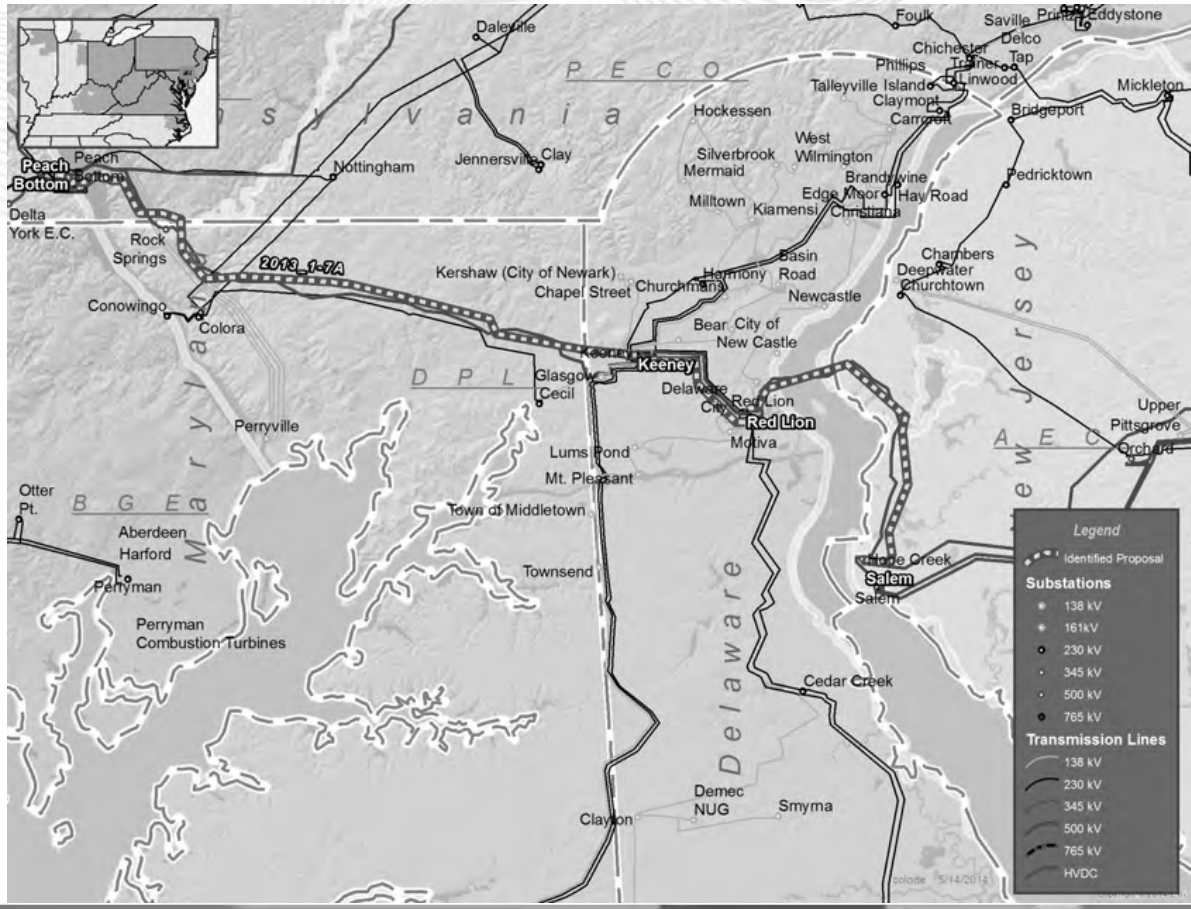
- Install a HVDC converter station near the Artificial Island
  - Install a SVC at the new Artificial Island HVDC station
- Install a HVDC converter station near the existing Cardiff 230 kV
- Install a 320kV HVDC line from the new Artificial Island HVDC station and the new HVDC station near Cardiff 230kV
- Proposed Cost Estimate : $1,012MM



PJM©2014

PSE&G 7A

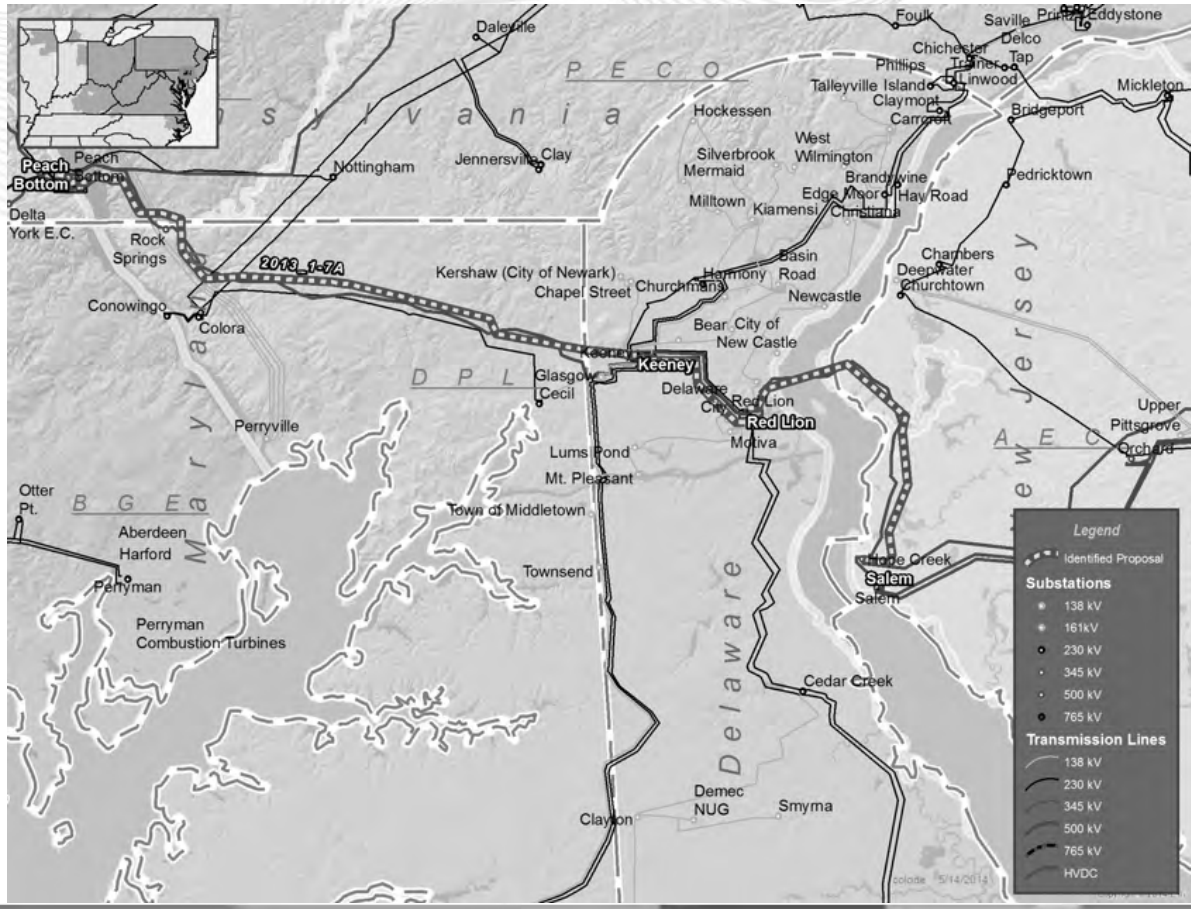
- Second Salem to Hope Creek tie line
- Install a new Hope Creek to Peach Bottom 500 kV line on existing right of way
- Proposed Cost Estimate: $1,371MM



PJM©2014

PSE&G 7B

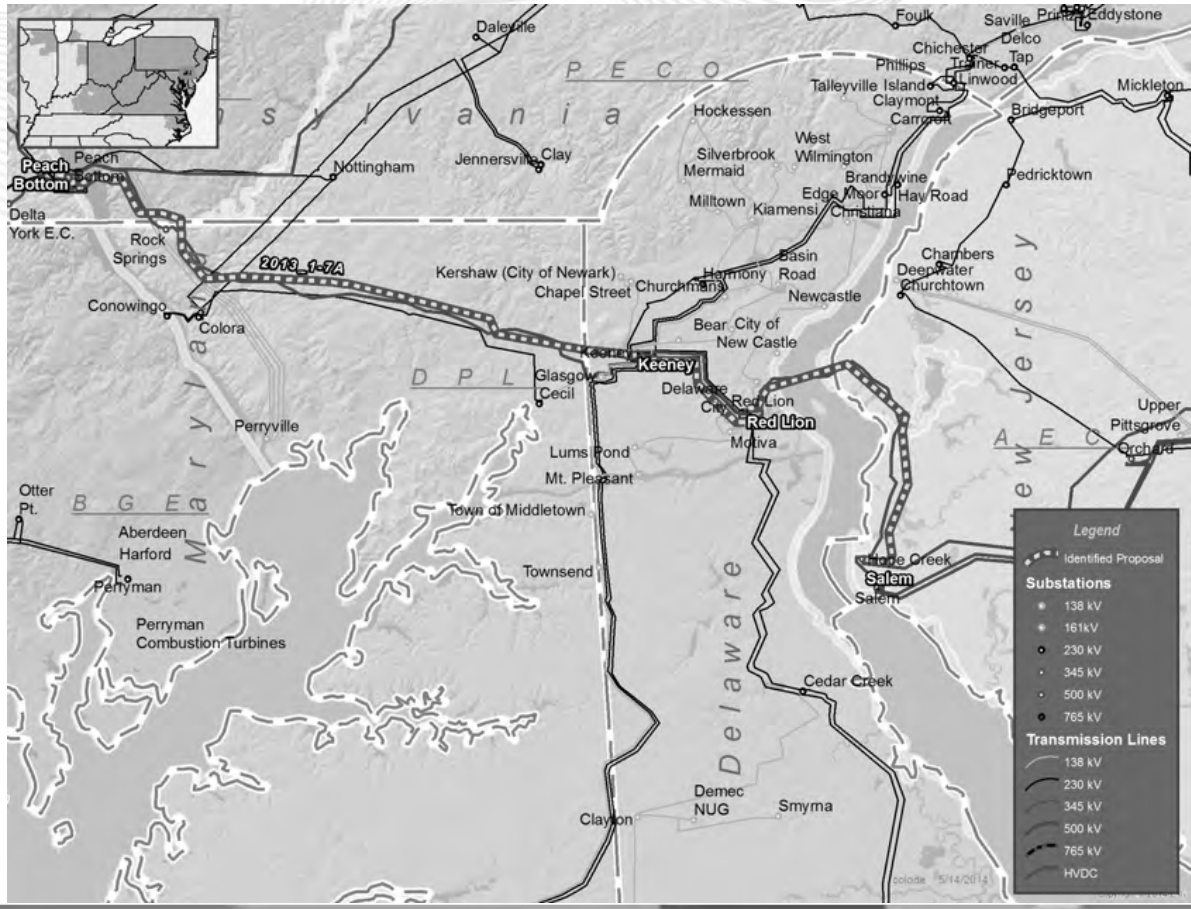
- Second Salem to Hope Creek tie line
- Install a new Hope Creek to Keeney to Peach Bottom 500 kV line on existing right of way
- Tie 5036 and 5025 lines together to open a bay position at Keeney substation
- Proposed Cost Estimate: $1,372MM



PJM©2014

PSE&G 7C

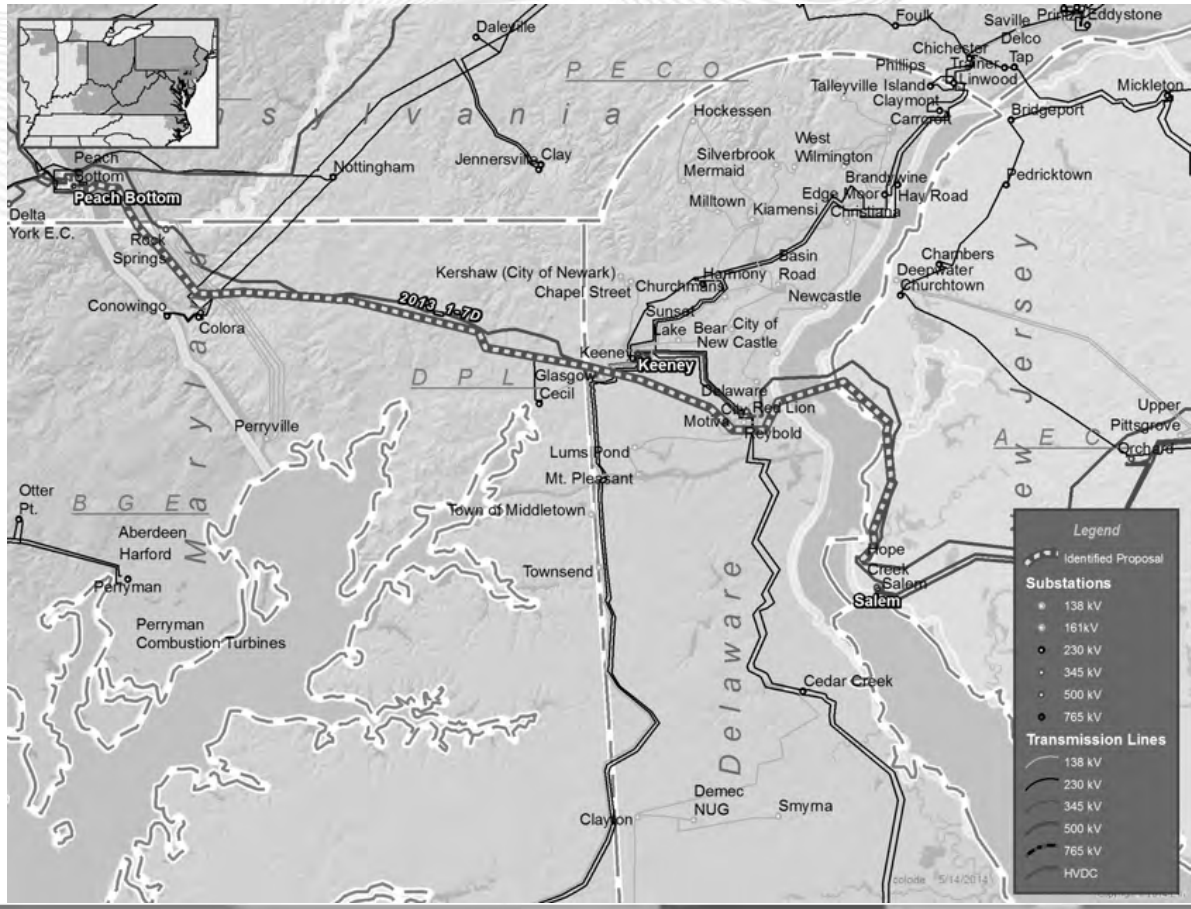
- Second Salem to Hope Creek tie line
- Install a new Hope Creek to Red Lion to Peach Bottom 500 kV line on existing right of way
- Tie 5036 and 5015 lines together to open a bay position at Red Lion substation
- Proposed Cost Estimate: $1,372MM



PJM©2014

PSE&G 7D

- Second Salem to Hope Creek tie line
- Install a new Hope Creek to Peach Bottom 500 kV line on new right of way
- Proposed Cost Estimate: $831MM

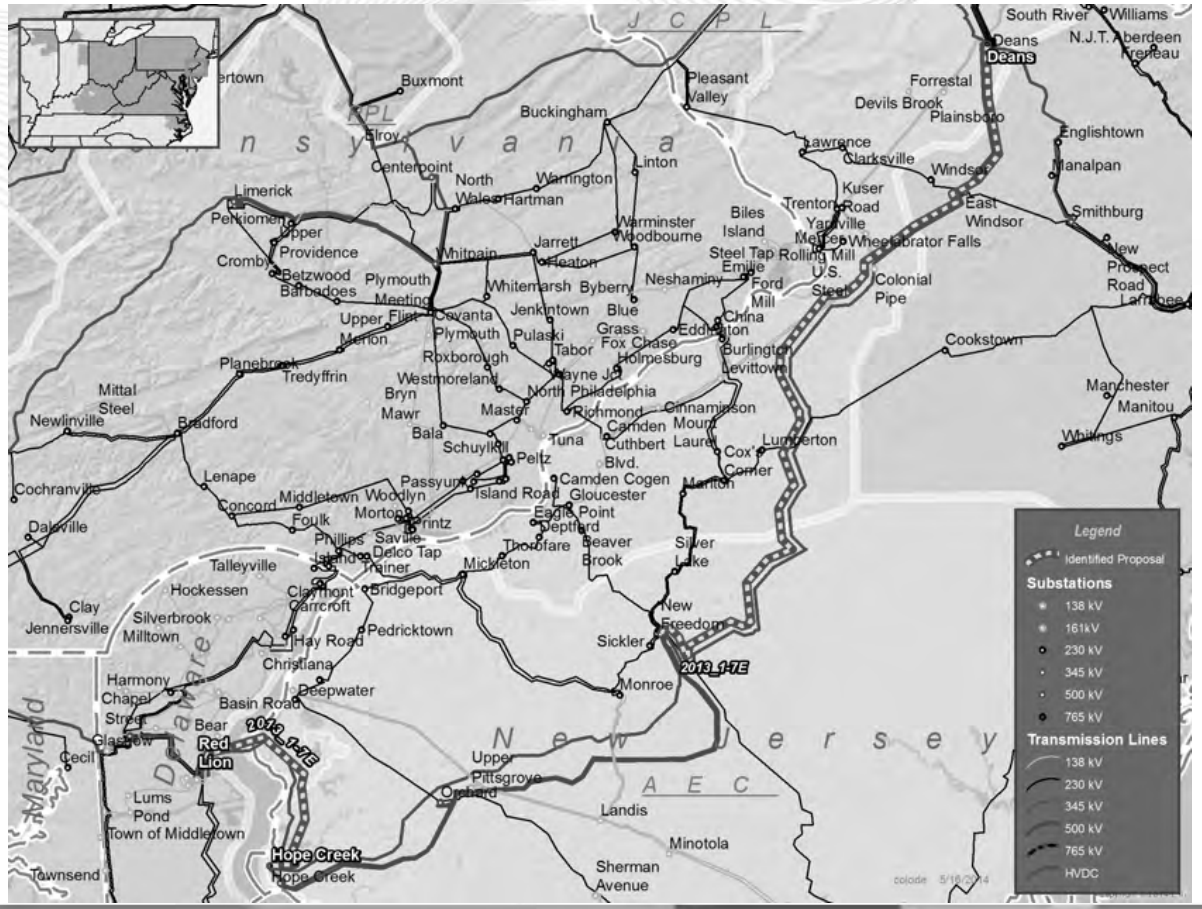


PJM©2014

SI-SSA-0010-0115

PSE&G 7E

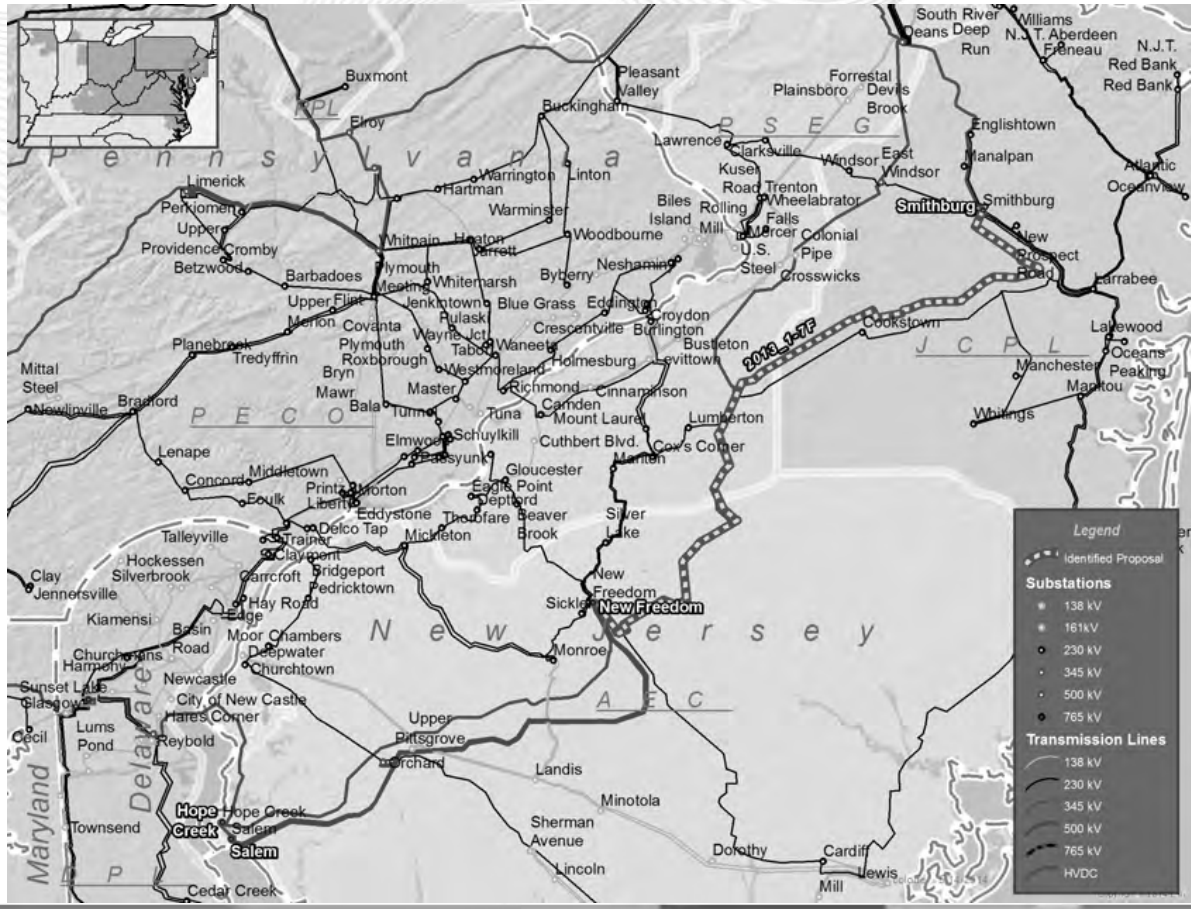
- Second Salem to Hope Creek tie line
- Install a new 500kV line Deans to New Freedom
- Proposed Cost Estimate: $692MM



PJM©2014

PSE&G 7F

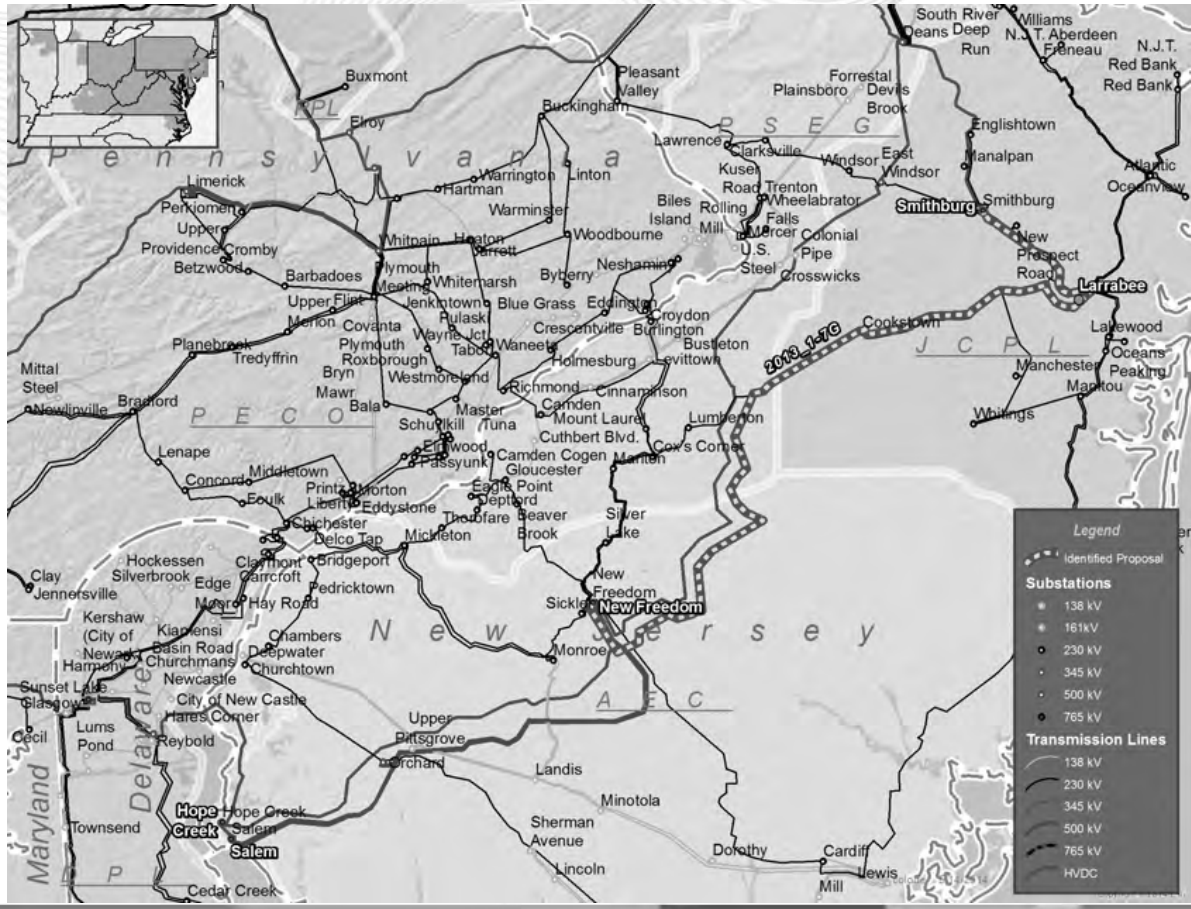
- Second Salem to Hope Creek tie line
- Install a new Smithburg to New Freedom 500kV line
- Proposed Cost Estimate: $879MM



PJM©2014

PSE&G 7G

- Second Salem to Hope Creek tie line
- Install a new Smithburg to Larrabee to New Freedom 500kV line
- Expand Larrabee substation to accept the new 500kV connection
- Proposed Cost Estimate: $1,034MM



PJM©2014

PSE&G 7H

- Second Salem to Hope Creek tie line
- Install a new Whitpain to New Freedom 500kV line using a northern route
- Proposed Cost Estimate: $1,177MM

PJM©2014

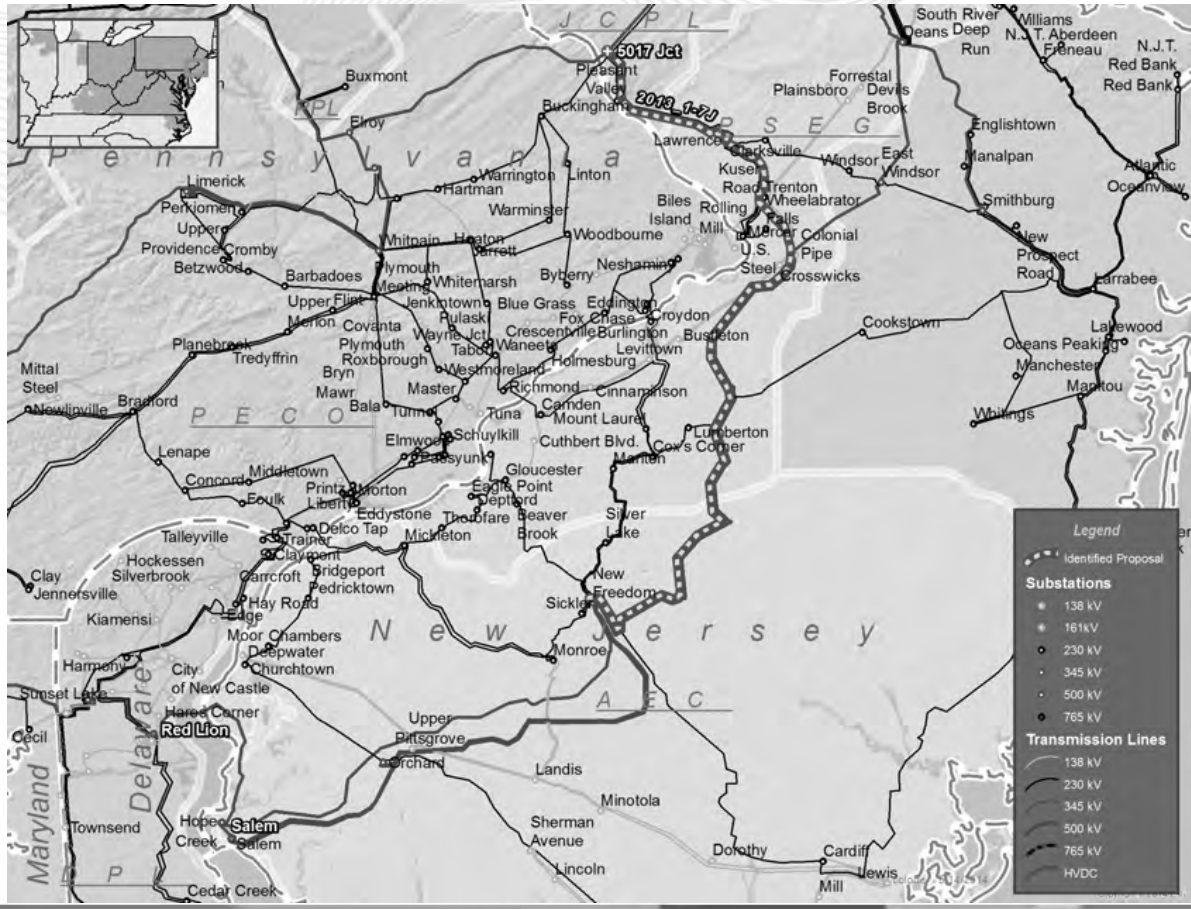
PSE&G 7I

- Second Salem to Hope Creek tie line
- Install a new Whitpain to New Freedom 500kV line using a southern route
- Proposed Cost Estimate: $1,353MM

PJM©2014

PSE&G 7J

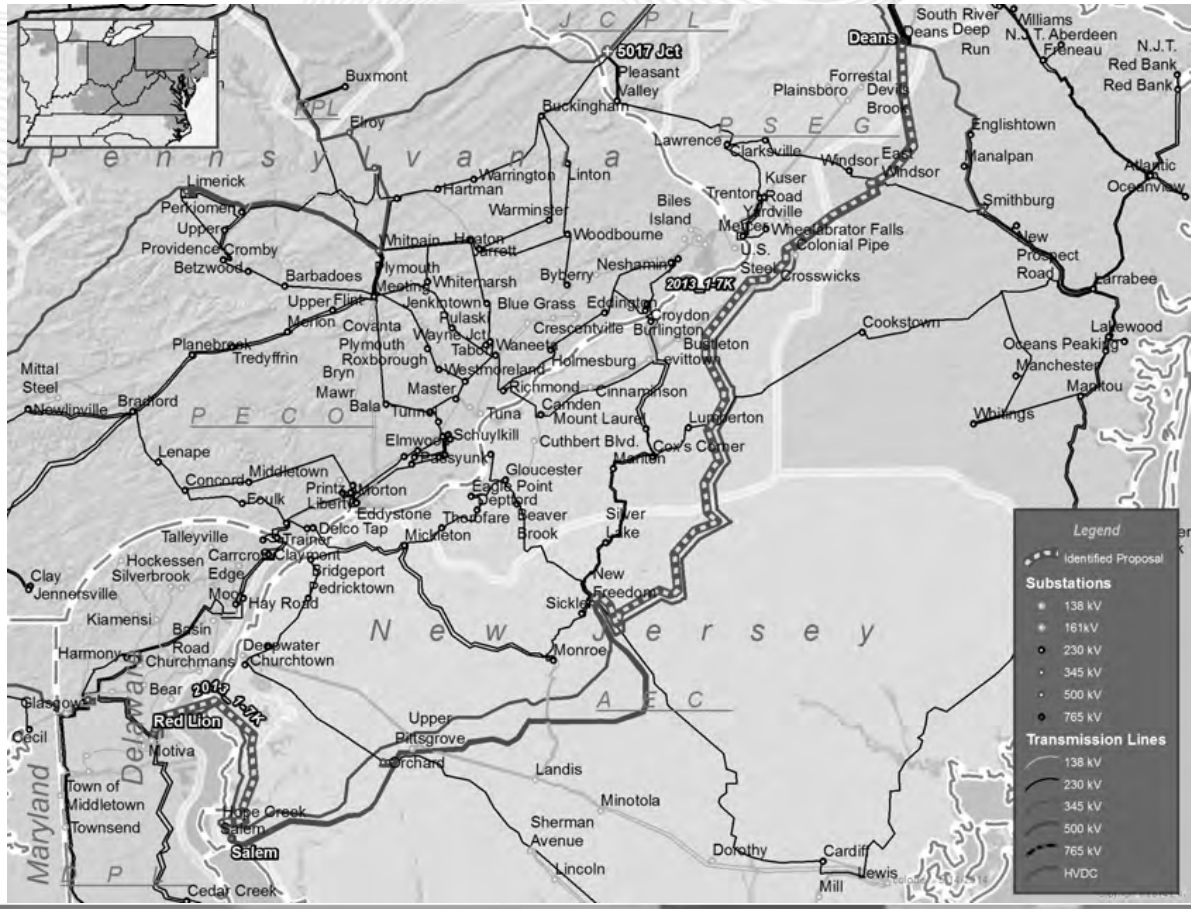
- Second Salem to Hope Creek tie line
- New substation at the 5017 junction site cutting the 5017 Elroy to Branchburg line
- Install a new 5017 Junction to New Freedom 500kV line
- Proposed Cost Estimate: $915MM



PJM©2014

PSE&G 7K

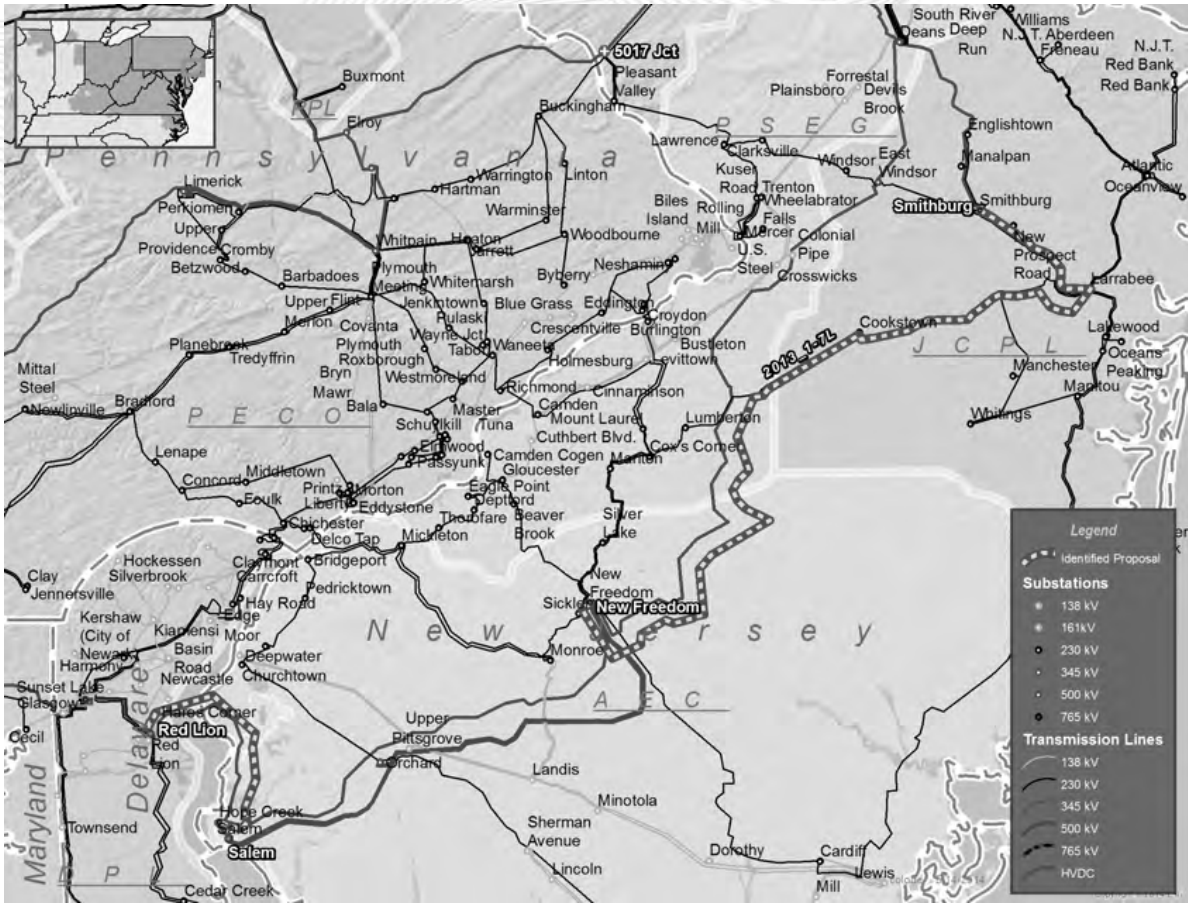
- Second Salem to Hope Creek tie line
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Install a new Deans to New Freedom 500kV line
- Proposed Cost Estimate: $1,066MM



PJM©2014

PSE&G 7L

- Second Salem to Hope Creek tie line
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Install a new Smithburg to New Freedom 500kV line
- Proposed Cost Estimate: $1,250MM



PJM©2014

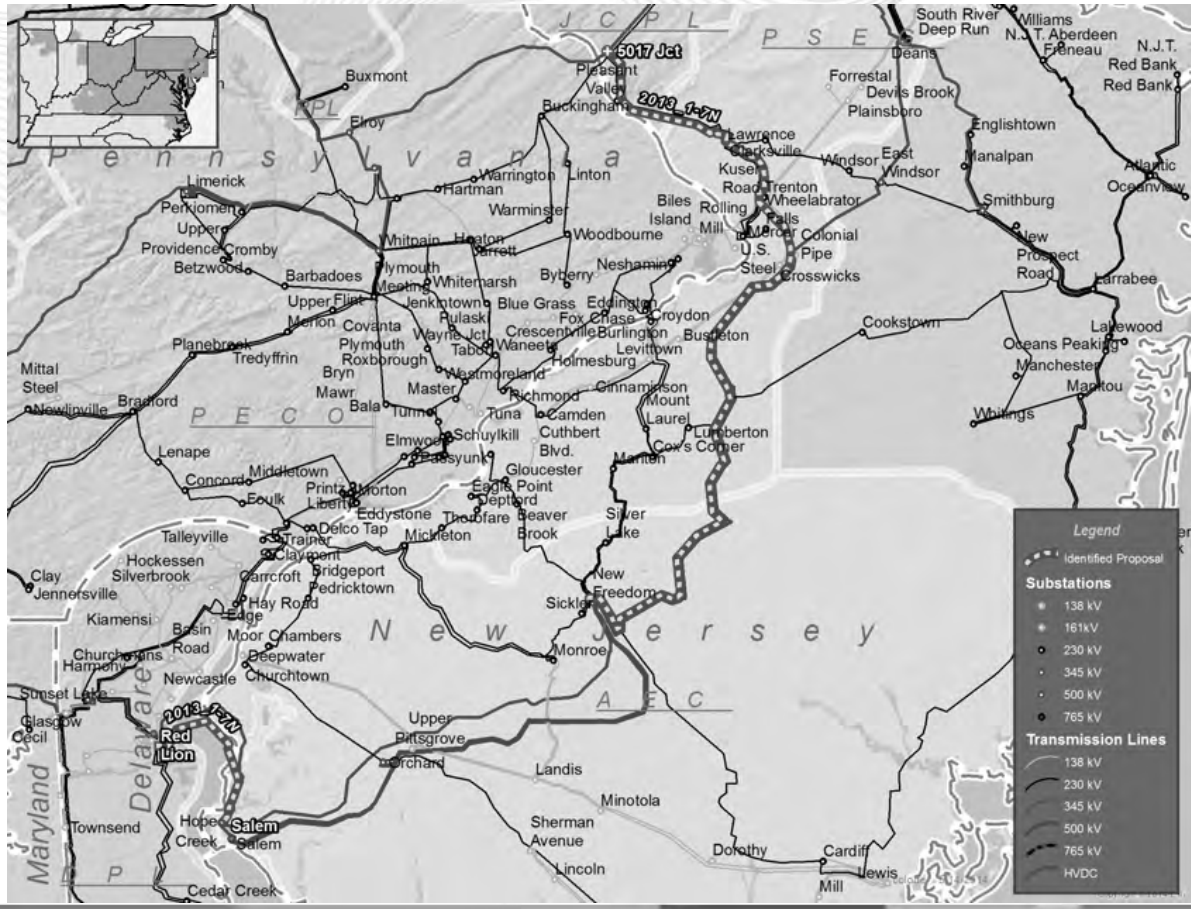
PSE&G 7M

- Second Salem to Hope Creek tie line
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- Install a new Whitpain to New Freedom 500kV line using a northern route
- Proposed Cost Estimate: $1,548MM

PJM©2014

PSE&G 7N

- Second Salem to Hope Creek tie line
- 17 mile 500kV line from Hope Creek to Red Lion
  - Parallels existing 5015 Red Lion to Hope Creek 500 kV line
- New substation at the 5017 junction site cutting the 5017 Elroy to Branchburg line
- Install a new 5017 Junction to New Freedom 500kV line
- Proposed Cost Estimate: $1,289MM



PJM©2014

Artificial Island Project Evaluation

PJM©2014

Evaluation of Proposals

Objectives

- ✓ Achieve desired system performance
- ✓ Minimize initial project cost
- ✓ Assess risk factors to minimize impact to cost and schedule
- ✓ Minimize impact to transmission operations
- ✓ No adverse impact to nuclear licensing

PJM©2014

Evaluation of Proposals – PJM Approach

- Performed extensive technical analysis
  - Stability, thermal, voltage, short circuit, market efficiency
  - Studied all solutions as is and with modifications

    Initial analysis showed only two of the highest cost solutions worked as submitted
- Engage outside engineers to perform constructability review
  - *focus on physical, cost, schedule, RoW, siting, permitting*
- Met with all proposers for clarification as needed
- Met with AI nuclear plant representatives
- PJM Operations review
- PJM independent cost evaluation
- Met with equipment manufacturers

PJM©2014

Artificial Island Evaluation Considerations

- Primary Considerations
  - Technical Analysis
    - Thermal
    - Stability
    - Short-circuit
    - Voltage
    - NERC Cat-D Contingencies
  - Cost Factors
    - Cost effectiveness
    - Market efficiency
    - PJM estimated costs
- Secondary Considerations
  - Schedule
    - Permitting
    - Construction
    - Long lead time equipment
  - Project Complexity
    - Line crossings
    - Outage requirements
    - Modifications to other transmission facilities
    - Modification to Artificial Island substations
    - Modifications to Red Lion substation
  - Right of Way and Land Acquisition
    - No eminent domain in Delaware
    - New right of way required
    - Substation land required
  - Siting and Permitting
    - Wetlands impact
    - Public opposition risk
    - Delaware river crossing
    - Land permitting
    - Historic and scenic highway
  - Operational Impact
    - Artificial island facility requirements
    - Ongoing maintenance
    - Blackstart
    - Route diversity

PJM©2014

Project Modifications

PJM©2014

Project Modifications

- Identified and implemented by PJM
- Modification Examples to Improve Performance
  - Move connection point to eliminate a critical fault
  - Add SVC to improve stability performance
- Modification Examples to reduce cost and improve constructability
  - Remove proposed new breakers that aren't needed to pass applicable criteria testing
  - Remove proposed transmission that isn't needed to pass applicable criteria testing

PJM©2014

Modification Summary

		Southern Crossing Lines (Submarine)			Southern Crossing Lines (Overhead)		Red Lion to Artificial Island Lines						
							From Salem			From Hope Creek			
		LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - Overhead	Dominion 1B - 500kV Overhead	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion 1C - Red Lion to Hope Creek (Remove RL - HK)	PSE&G 7K- Red Lion to Hope Creek (Remove RL - HK)
Modifications	**SVC Additions at Orchard, NF, AI**	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓*	✓*
	Moved Connection At Salem or Hope Creek						✓						✓
	Removed proposed breakers					✓				✓		✓	✓
	Removed proposed Transmission										✓	✓	✓

* SVC option at AI is excluded.

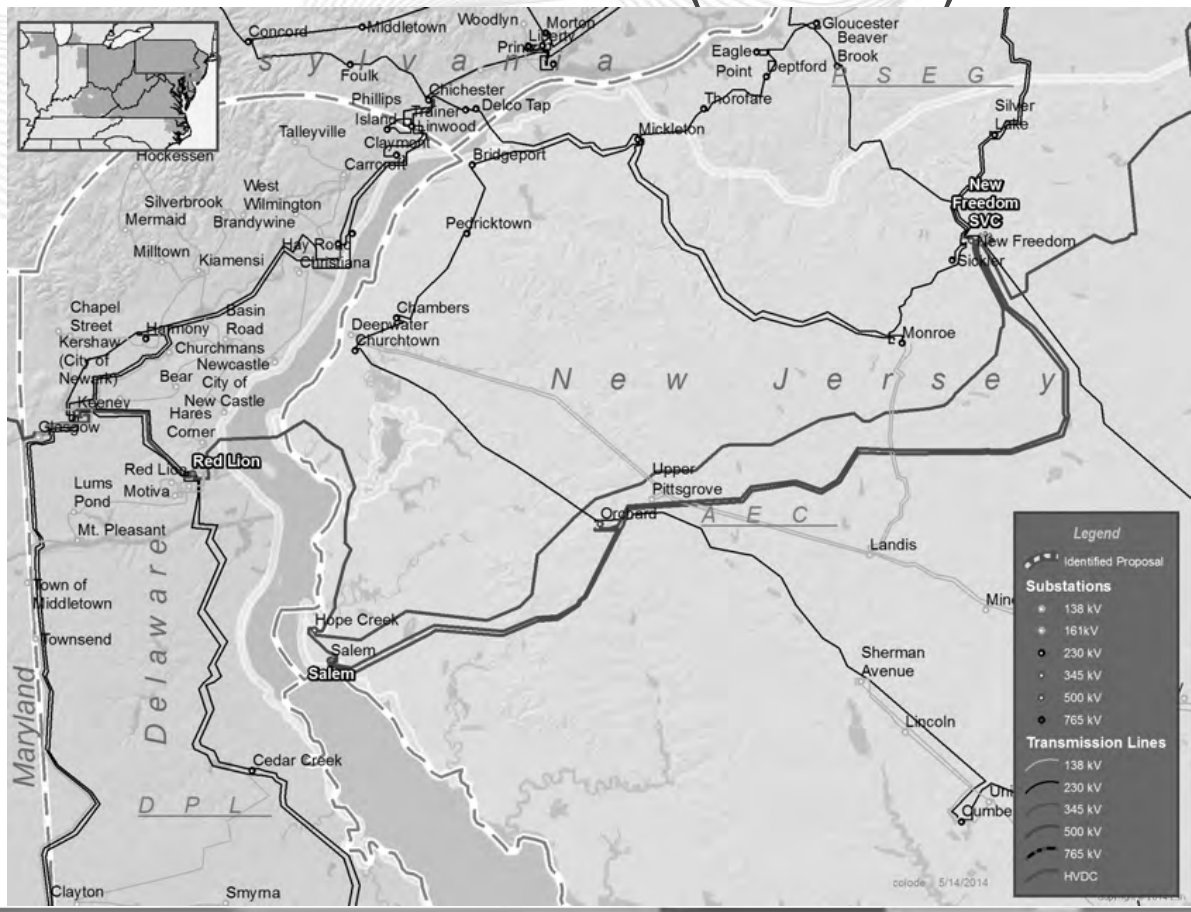
PJM©2014

Dominion (VEPCO) 1A

- New switching station cutting New Freedom to Hope Creek and New Freedom to Salem (5023 and 5024) lines. Two Thyristor Controlled Series Compensation (TCSC) devices at the new station.

- PJM modifications
  - Changed SVC size



PJM©2014

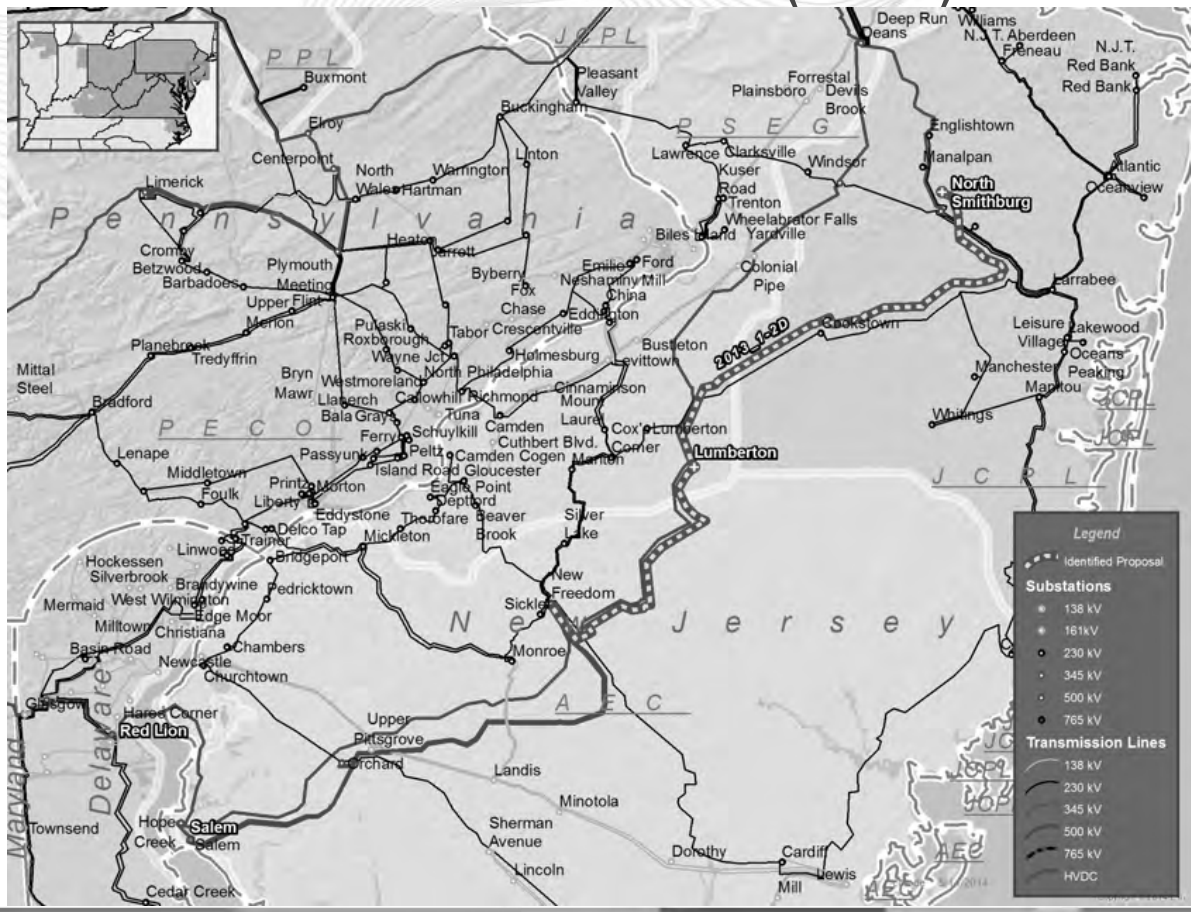
DVP 1A – Technical Analysis

- Stability Performance
  - Failed required performance
    - Failed as proposed by project sponsor. Did not satisfy stability criteria for a three phase fault with normal clearing with AI units at unity power factor under 5038 maintenance outage condition
  - Passed required performance when SVC size increased to 750MVAr to achieve acceptable performance.
  - Stability performance is not as good as 230kV options + SVC or as good as 500kV options + SVC.
  - Anticipate nuclear regulatory concerns in approving this configuration.

PJM©2014

Transource (AEP) 2D

- Lines between:
  - New Freedom to Lumberton
  - Lumberton to North Smithburg
  - Hope Creek to Salem tie
- Estimated costs higher than other proposals



PJM©2014

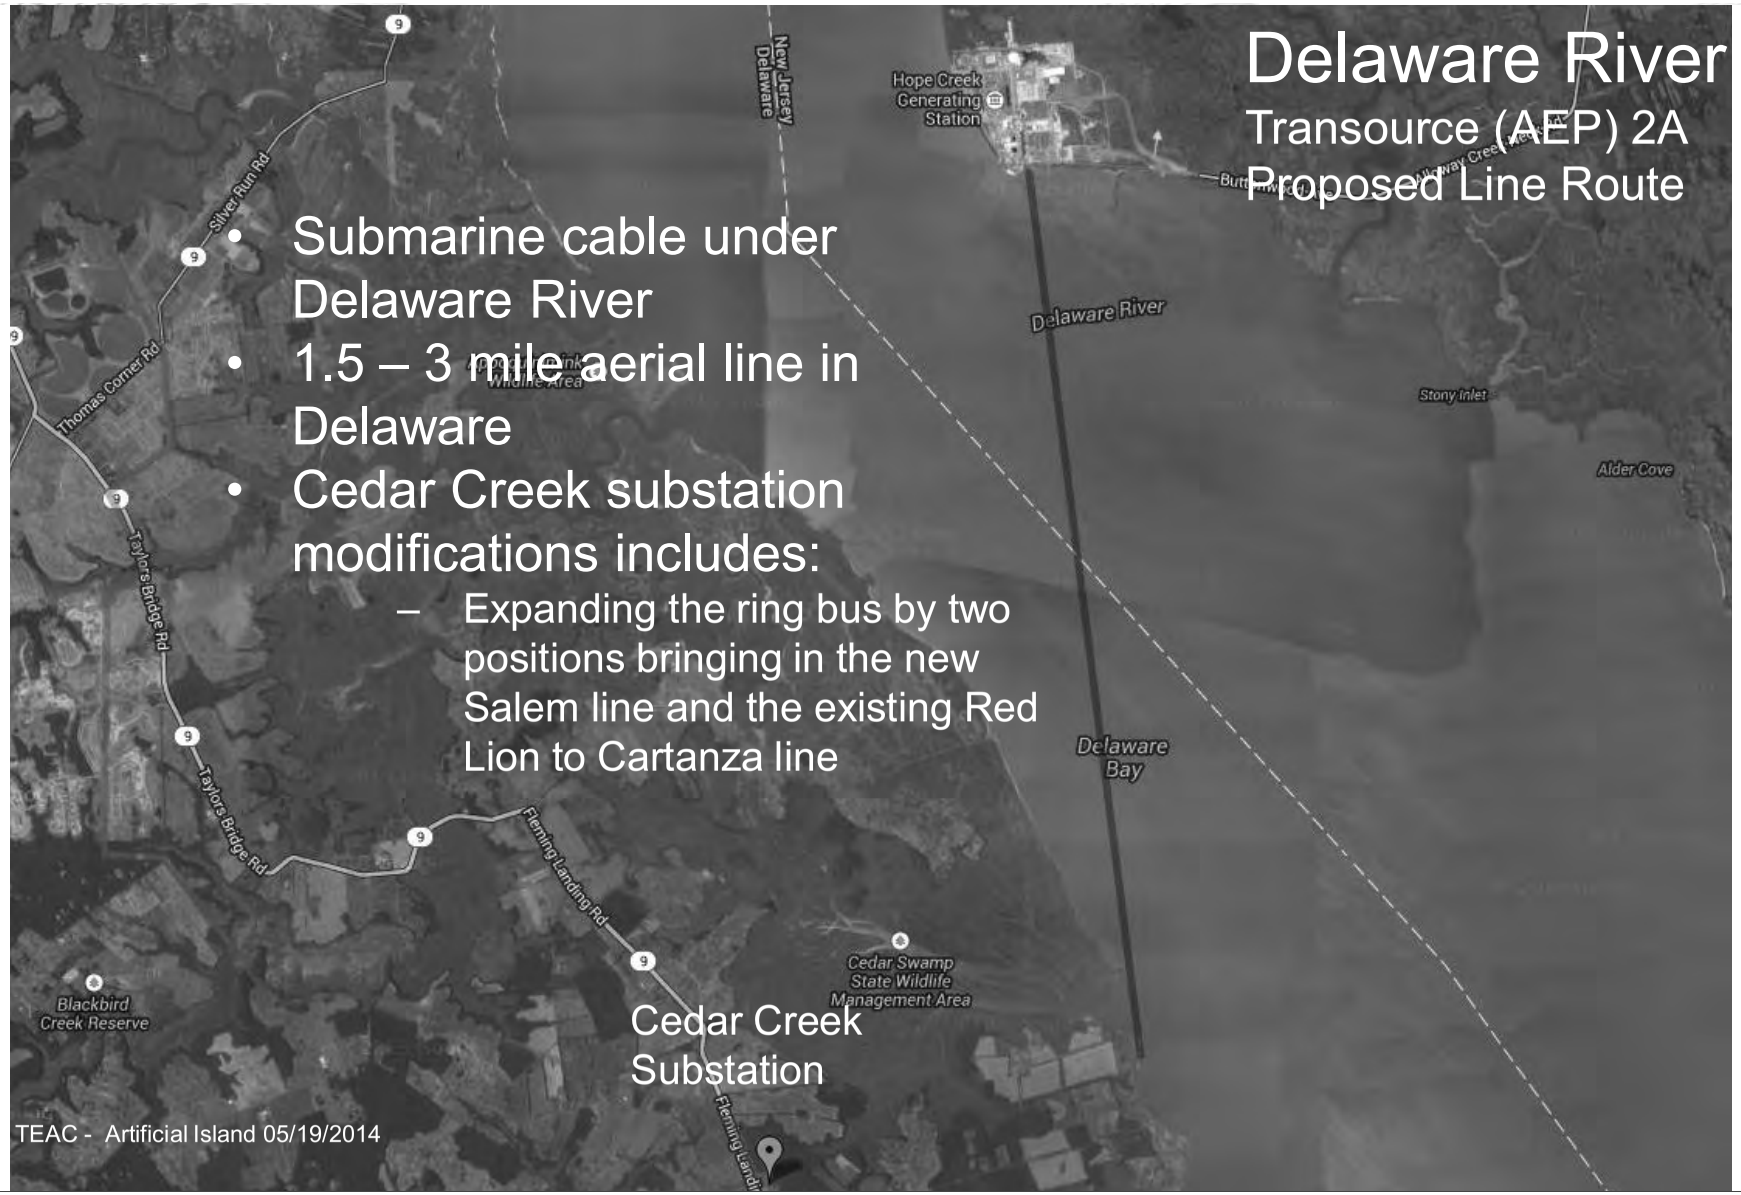
Delaware River

Transource (AEP) 2A Proposed Line Route



- Submarine cable under Delaware River
- 1.5 – 3 mile aerial line in Delaware
- Cedar Creek substation modifications includes:
  - Expanding the ring bus by two positions bringing in the new Salem line and the existing Red Lion to Cartanza line

Transource (AEP) 2A - Cost Factors

PJM Estimated Cost: $366-$446 (million)

- 5.7 circuit miles of submarine cable (two cables per phase plus one spare cable)
- Six 500/230kV auto-transformers

Proposed Cost Estimate: $213-269 (million)

Market Efficiency Analysis Sensitivity Study

- Scenario:
  - New path from the AI to Delaware (on the Cedar Creek - Catanza / Red Lion – Catanza path)
- Results:
  - Approximate benefit to cost ratio of 0.25
  - Approximately $92 million over 15 years

Outage Cost

- 230kV outage during substation cut-in

PJM©2014

Transource (AEP) 2A - Project Schedule

Proposed Schedule 42 months (items run concurrent)

- Permitting: 24 months
- RoW acquisition: 12 months

Schedule Criteria

- Permitting
  - CPCNs in two states and Army Corps of Engineers
- Long Lead Time Materials
  - Auto-transformers and submarine cable
- Construction
  - Specialized equipment needed for submarine cable installation
  - Could be impacted by restrictions due to endangered species and shipping traffic

PJM©2014

Transource (AEP) 2A - RoW and Land Acquisition

Right of Way and Land Acquisition Criteria

- No Eminent Domain in Delaware
  - Approximately 3 miles of right of way needs to be acquired in Delaware
- New Right of Way Required
  - Approximately 3 miles of right of way needs to be acquired in Delaware
- Substation Land Required
  - Land in New Jersey will need to be acquired for the new substations

PJM©2014

Transource (AEP) 2A - Siting and Permitting

Siting and Permitting Criteria

- Wetlands Impact
  - Permits required to cross the Delaware state lands on the river coast
  - Impacts approximately 10 acres of forested wetlands
- Public Opposition Risk
  - Submarine crossing of the Delaware river does not incur any new view-shed impact
  - Some opposition to any river crossing is expected
- Historic and Scenic Highway
  - Not applicable
- Delaware River Crossing
  - Numerous approvals and permits required:
    (a few major permits are listed below)
    - Delaware River Basin Commission approval required
    - Delaware and New Jersey CPCNs required
    - US Army Corps of Engineers Section 404 and 10 authorizations
    - Multiple US Fish and Wildlife permits required
    - National Marine Fisheries Service

PJM©2014

Transource (AEP) 2A - Operational Impact

Operational Impact Criteria

- Artificial Island Facility Requirements
  - PJM Operations Review
    - Request to minimize impact to existing transmission facilities
  - Salem/Hope Creek Facility Owner Feedback
    - Request to minimize outage and physical impacts to existing transmission facilities
    - Salem is space constrained so expansion needs to incorporate maintenance access to substation equipment
    - Salem control house is a part of plant facilities and access is constrained
- Blackstart
  - 230kV connection may provide additional benefit
- Route Diversity
  - Project route is new and does not parallel an existing line
- Ongoing Maintenance
  - Auto-transformers as line component may increase outage frequency
  - Salt spray concern with proximity to Delaware river

PJM©2014

Transource (AEP) 2B

- Line between new substation near Artificial Island and new substation in Delaware

- Permitting: 34 months
- Design and Construction: 50 months
- Property Acquisition: 0 months

Schedule Criteria

- Permitting
  - CPCNs in two states and Army Corps of Engineers
- Long Lead Time Materials
  - No significant long lead time equipment required
- Construction
  - Could be impacted by restrictions due to endangered species and shipping traffic

PJM©2014

PHI / Exelon 4A - RoW and Land Acquisition

Right of Way and Land Acquisition Criteria

- No Eminent Domain in Delaware
  - All project have approximately 0.5 miles of right of way to either expand or acquire in Delaware
    - Land is coastal and under state jurisdiction
  - Red Lion substation expansion is on land currently owned by PHI
- New Right of Way Required
  - As participants in the LDV agreement, party has a right of way agreement for the new line
- Substation Land Required
  - Red Lion substation expansion will be done on land currently owned by PHI.

PJM©2014

PHI / Exelon 4A - Siting and Permitting

Siting and Permitting Criteria

- Wetlands Impact
  - Permits required to cross the Delaware state lands on the river coast
  - Impacts approximately 350 acres of forested wetland
- Public Opposition Risk
  - View-shed impacts minimal as this is adjacent to the existing 5015
  - Some opposition to any river crossing is expected
- Historic and Scenic Highway
  - No impact
- Land Permitting
  - USFWS right of way permit to cross Supawna National Wildlife Refuge required
- Delaware River Crossing
  - Numerous approvals and permits required:

  (a few major permits are listed below)
  - Delaware River Basin Commission approval required
  - Delaware and New Jersey CPCNs required
  - US Army Corps of Engineers Section 404 and 10 authorizations
  - Multiple US Fish and Wildlife permits required
  - National Marine Fisheries Service

PJM©2014

PHI / Exelon 4A - Operational Impact

Operational Impact Criteria

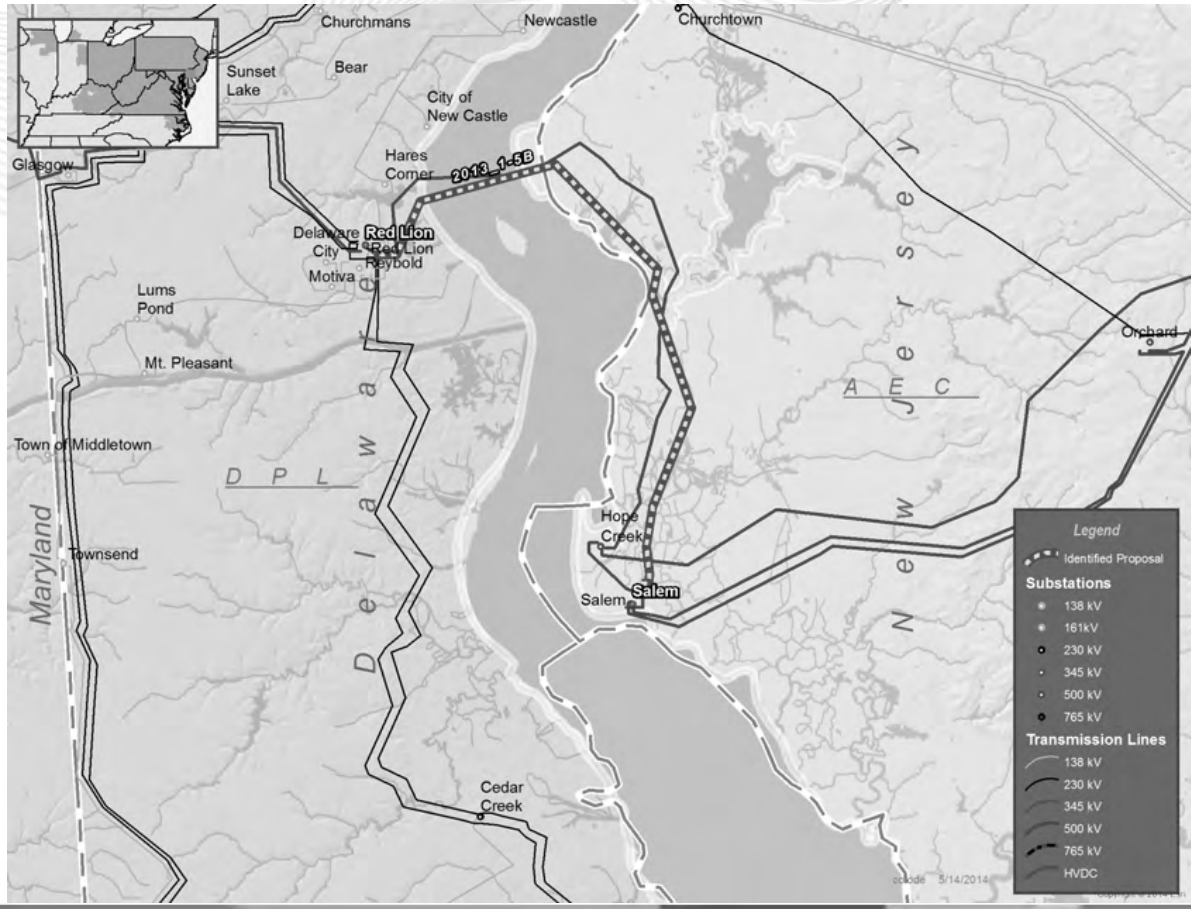
- Artificial Island Facility Requirements
  - PJM Operations Review
    - Request to minimize impact to existing transmission facilities
  - Salem/Hope Creek Facility Owner Feedback
    - Request to minimize outage and physical impacts to existing transmission facilities
    - Salem is space constrained so expansion needs to incorporate maintenance access to substation equipment
    - Salem control house is a part of plant facilities and access is constrained
- Blackstart
  - No blackstart advantage
- Route Diversity
  - Project route is parallels the existing 5015 line
- Ongoing Maintenance
  - Salt spray concern with proximity to Delaware river

PJM©2014

LS Power 5B

- New 500kV Line between Salem and Red Lion substations

- PJM modifications
  - Technical:
    - Added SVC
  - Constructability:
    - Dead-end towers added around line crossing
    - New Salem connection as a full bay



PJM©2014

LS Power 5B – Technical Analysis

- Stability Performance

  – Failed required performance
    - Failed as proposed by project sponsor.
    - Did not satisfy stability criteria for a three phase fault with AI units at unity power factor under 5015 maintenance outage condition.

  – Passed required performance
    - Passed as proposed with the addition of an SVC at Orchard, New Freedom or Artificial Island.

PJM©2014

Artificial Island

LS Power 5B
Salem Expansion

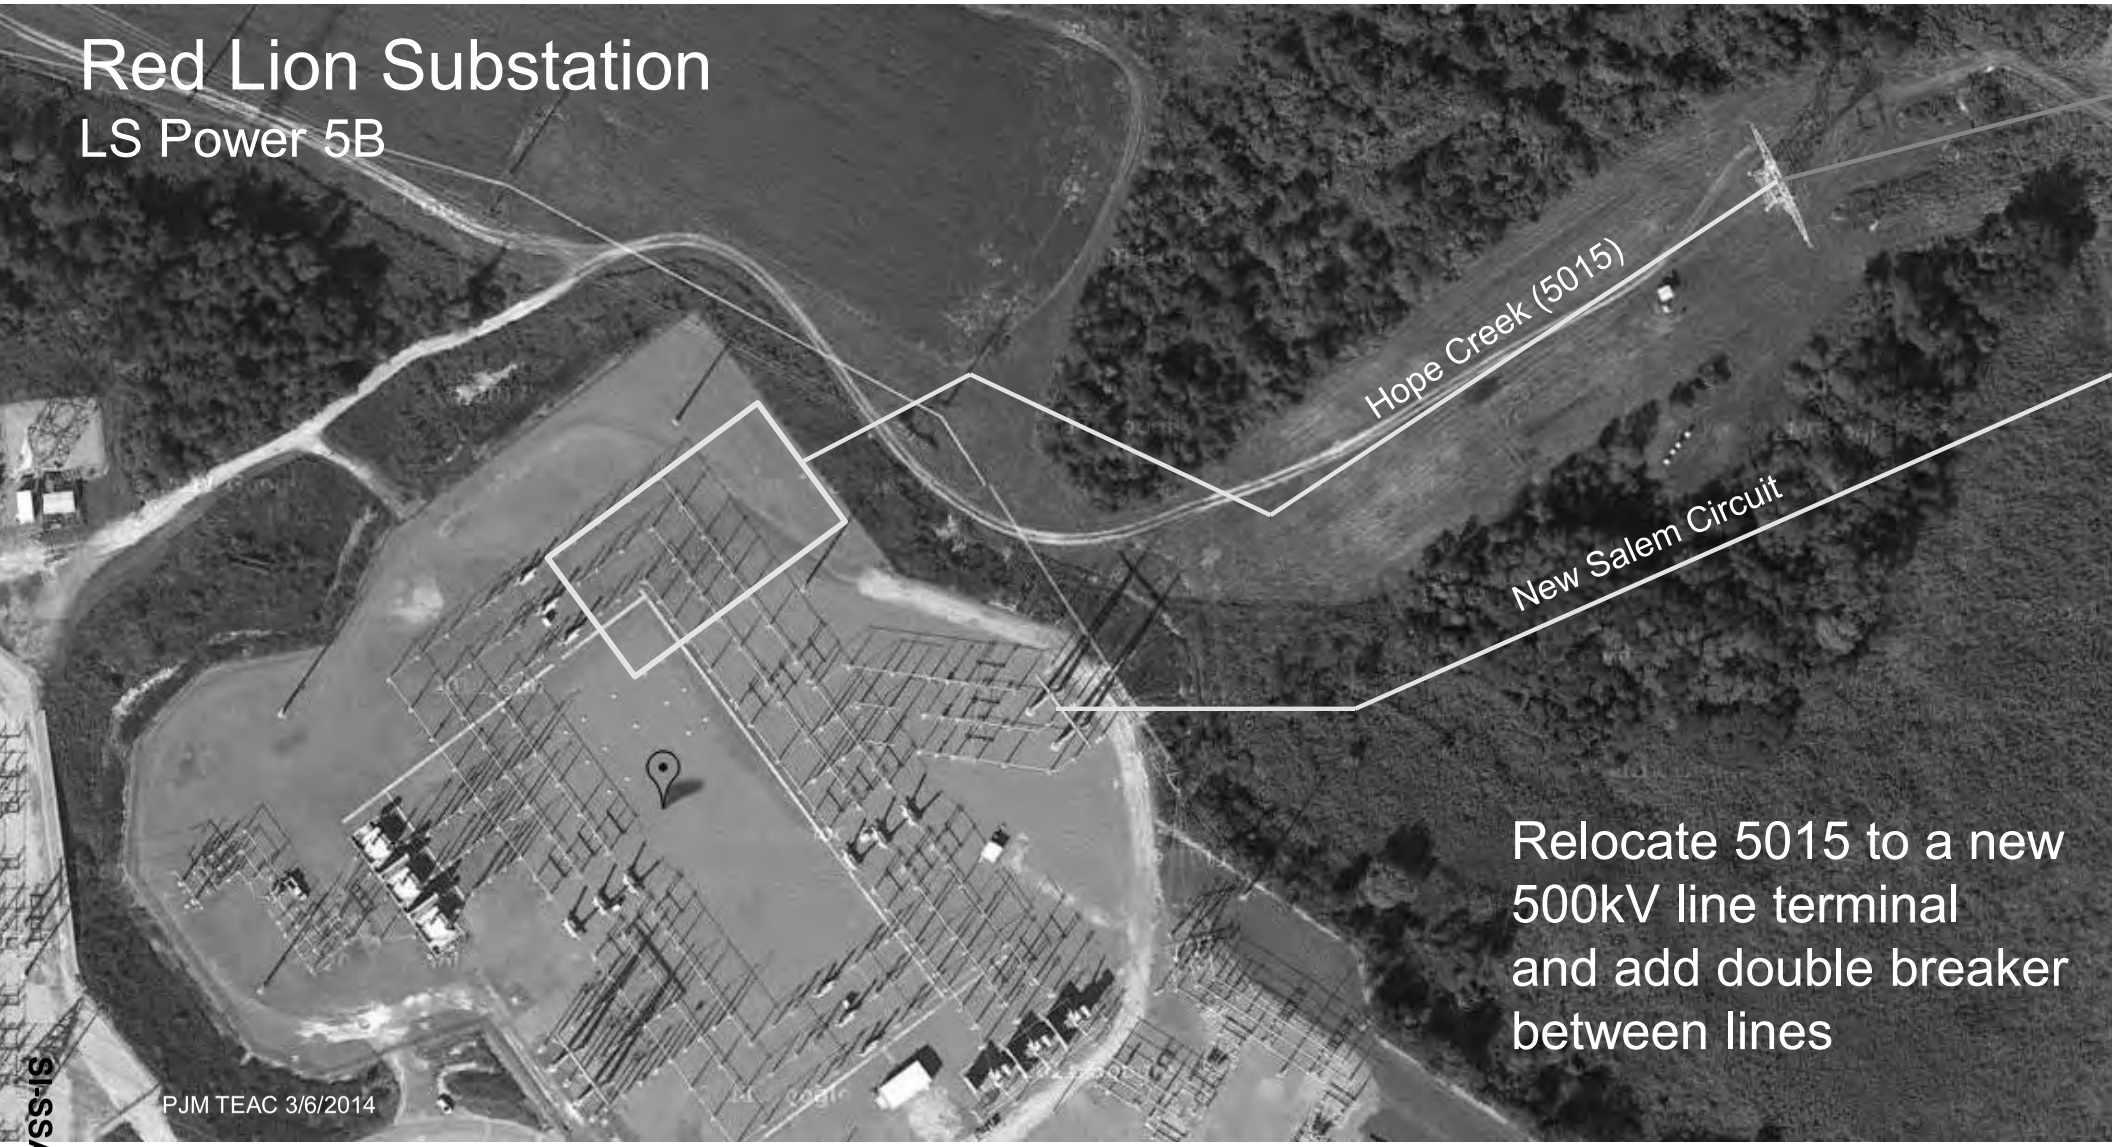
Required Outages:

- Cut-in of new bay at Salem
- 5037 outage to cut over to new bay
- Raising the 5015 and 5023 lines at crossing points

SI-SSA-0010-0215

Red Lion Substation

LS Power 5B



Relocate 5015 to a new 500kV line terminal and add double breaker between lines

LS Power 5B - Cost Factors

PJM Estimated Cost: $221-$269 (million)

- New 17 mile 500kV line
- Aerial Delaware river crossing

Proposed Cost Estimate: $171 (million)

Market Efficiency Analysis Sensitivity Study

- Scenario:
  - New 500 kV path from the AI to Red Lion
- Results:
  - Approximate benefit to cost ratio of 0.15
  - Approximately $57 million over 15 years

Outage Cost

- 5015 outage estimated at 30 days

PJM©2014

LS Power 5B - Project Schedule

Proposed Schedule 60 months (items run concurrent)

- Permitting: 27 months
- Design and Construction: 60 months
- Property Acquisition: 18 months

Schedule Criteria

- Permitting
  - CPCNs in two states and Army Corps of Engineers
- Long Lead Time Materials
  - No significant long lead time equipment required
- Construction
  - Could be impacted by restrictions due to endangered species and shipping traffic

PJM©2014

LS Power 5B - RoW and Land Acquisition

Right of Way and Land Acquisition Criteria

- No Eminent Domain in Delaware
  - All project have approximately 0.5 miles of right of way to either expand or acquire in Delaware
    - Land is coastal and under state jurisdiction
  - Red Lion substation expansion is on land currently owned by PHI
- New Right of Way Required
  - Will need to either negotiate with the LDV parties or negotiate with individual land owners and public entities
- Substation Land Required
  - Red Lion substation expansion will be done on land currently owned by PHI.

PJM©2014

LS Power 5B - Siting and Permitting

Siting and Permitting Criteria

- Wetlands Impact
  - Permits required to cross the Delaware state lands on the river coast
  - Impacts approximately 350 acres of forested wetland

PJM©2014

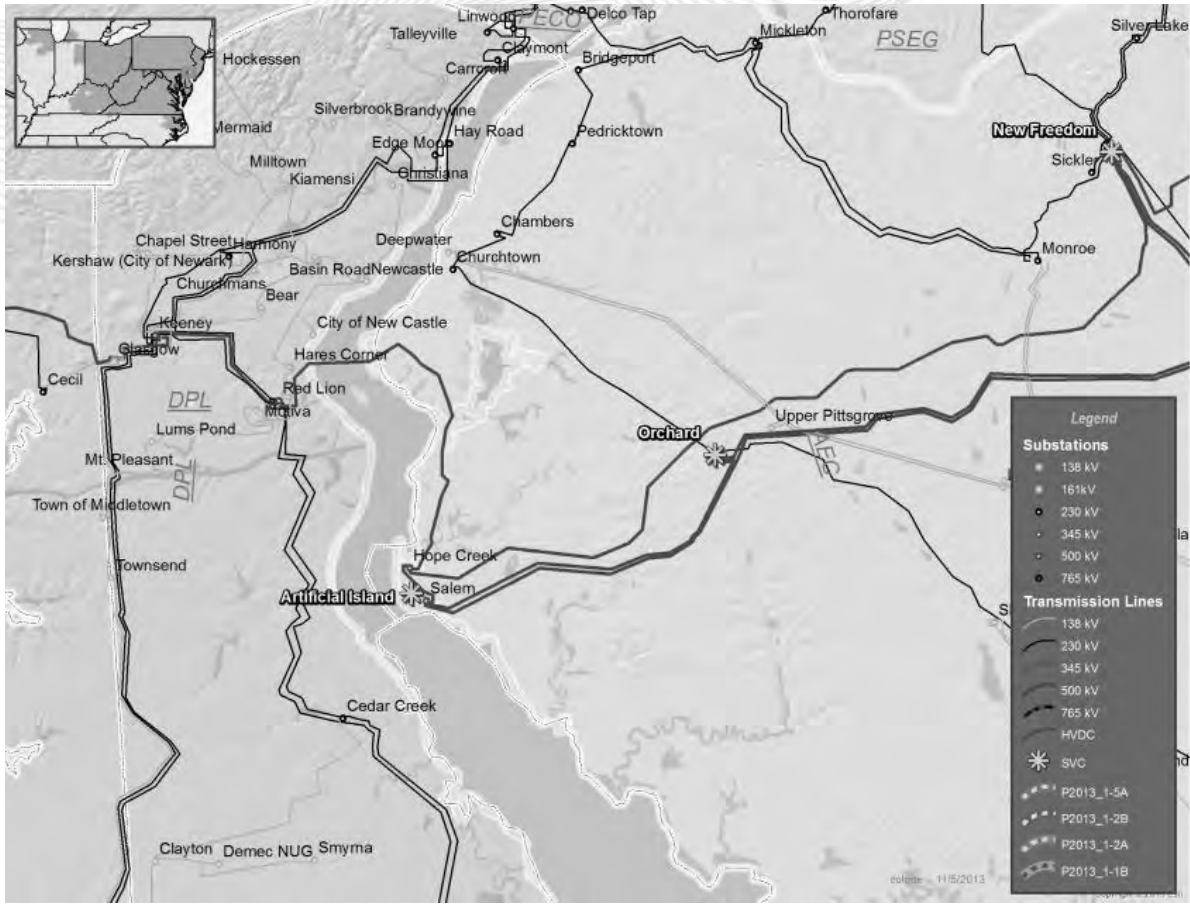
SVCs

- SVC Locations Considered:
  - New Freedom
  - Orchard
  - Artificial Island
- Schedule Estimate 36 months
  - SVC lead time of 24 months
  - Permitting and land acquisition 6 months
- Cost Estimate $80 million
  - SVC $60 million



PJM©2014

SVC Constructability Analysis

- No determining factor difference between the Orchard or New Freedom SVC
  - Project complexity
    - Expansion of existing substations at either Orchard or New Freedom
  - Land acquisition
    - New land purchase at Orchard
    - PSE&G owns adjacent land at New Freedom
  - Siting and permitting will be similar between the two projects
  - Cost and schedule estimates are the same

- Artificial Island
  - Anticipated nuclear regulatory concerns in approving this device at Artificial Island

PJM©2014

Consolidated Summary

SI-SSA-0010-0270

Artificial Island Technical Summary

		Southern Crossing Lines (Submarine)			Southern Crossing Lines (Overhead)		Red Lion to Artificial Island Lines						
							From Salem			From Hope Creek			
		LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - Overhead	Dominion 1B - 500kV Overhead	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion 1C - Red Lion to Hope Creek (Remove HC-S 2nd Tie)	PSE&G 7K- Red Lion to Hope Creek (Remove HC-S 2nd Tie)
Technical Analysis Criteria	**Stability**	Maximum angle swing range of 80 - 112 degrees, dependent on solution and SVC location			Maximum angle swing range of 80 - 110 degrees, dependent on solution and SVC location		Maximum angle swing range of 77 - 102 degrees, dependent on solution and SVC location						
	Thermal	Preliminary analysis indicates no thermal overloads			Preliminary analysis indicates no thermal overloads		Preliminary analysis indicates no thermal overloads						
	Market Efficiency Results	Approximate $92 M cost savings over 15 Years			Approximate $92 M cost savings over 15 Years		Approximate $57 M cost savings over 15 Years						
	Short Circuit	Three overdutied 230 kV breakers		No overdutied breakers	Three overdutied 230 kV breakers		No overdutied breakers

Southern Crossing Lines – Project Complexity

Criteria	Project Class	Southern Crossing 230kV Lines (Submarine)			Southern Crossing Lines (Overhead)	
	Proposal	LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - 230kV Overhead	Dominion 1B - 500kV Overhead
	Sub-Criteria					
Project Complexity	Line Crossings	None	None	None	None	Generator lead line
	Outage Requirements	New bay tie-in at Salem	Relocation of 5024 line at Salem	Relocation of 5024 line at Salem; Cedar Creek ring-bus expansion	New bay tie-in at Salem	New tie-in at Salem will necessitate a unit outage; Breaker installation may require multiple Salem outages.
	Modification to other Transmission Facilities	Cutting the two 230kV lines into the new Delaware substation	Cutting the two 230kV lines into the new Delaware substation; installing one new span on the 5024 line.	Expanding the Cedar Creek ring bus by two positions to bring in the new Salem line and the existing Red Lion to Cartanza line; installing one new span on the 5024 line.	Cutting the two 230kV lines into the new Delaware substation	Cutting the two 230kV lines into the new Delaware substation

Southern Crossing Lines – Project Complexity

	Project Class	Southern Crossing 230kV Lines (Submarine)			Southern Crossing Lines (Overhead)	
Criteria	Proposal	LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - 230kV Overhead	Dominion 1B - 500kV Overhead
	Sub-Criteria					
Project Complexity	Modification of Artificial Island Substations	New bay and auto-transformer to the south in Salem	New bay for 5024 line to the south in Salem	New bay for 5024 line to the south in Salem	New bay and auto-transformer to the south in Salem	Installing two breakers into the open middle bay in Salem
	Modification of Red Lion Substation	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable

PJM©2014

AI to Red Lion Lines – Project Complexity

Criteria	Project Class	Red Lion to Salem 500kV Lines			Red Lion to Hope Creek 500kV Lines			
	Proposal	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion Red Lion to Hope Creek w/ 2nd tie removed	PSE&G Red Lion to Hope Creek w/ 2nd tie removed
Project Complexity	Line Crossings	5023, 5021, 5024 lines	5015 and 5023 lines	5023 line	5015 line; aerial tie has multiple crossings	5015 line	None	None
	Outage Requirements	5015 line position changing at both ends; Raising the three 500kV lines	Raising 5015 line and moving it to the new position at Red Lion. Relocation of 5037 line at Salem; Raising the 5023 line	Relocating the 5024 and 5021 lines at Salem; New line crosses the 5023 line.	Multple 500kV outages to convert the Red Lion ring bus to a breaker and a half scheme; New line crosses the 5015 line; Outages to suppor the new Hope Creek to Salem tie	Multple 500kV outages to convert the Red Lion ring bus to a breaker and a half scheme; New line crosses the 5015 line; Outages to suppor the new Hope Creek to Salem tie; 5037 into new position at Hope Creek	5015 line position changing at Red Lion. New bay tie-in at Hope Creek	5015 line position changing at Red Lion. New bay tie-in at Hope Creek
	Modification to other Facilities	Impacts detailed in other sub-criteria	Installing one new span on the 5037 line.	Use of the existing 5021 for a number of spans and build a new portion of 5021 along that length; installing one new span for the 5024 line	Impacts detailed in other sub-criteria	Impacts detailed in other sub-criteria	Impacts detailed in other sub-criteria	Impacts detailed in other sub-criteria

PJM©2014

AI to Red Lion Lines – Project Complexity

Criteria	Project Class	Red Lion to Salem 500kV Lines			Red Lion to Hope Creek 500kV Lines			
	Proposal	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion Red Lion to Hope Creek w/ 2nd tie removed	PSE&G Red Lion to Hope Creek w/ 2nd tie removed
Project Complexity	Modification of AI Subs	New bay to the south in Salem	New bay for 5037 line to the north in Salem	New bay for 5024 line to the south and relocate 5021 line in Salem	New bay in Hope Creek and a new tie between Hope Creek and Salem	New bay in Hope Creek and a new tie between Hope Creek and Salem; moving the 5037 into the existing open bay at Hope Creek	New bay in Hope Creek	New bay in Hope Creek
	Modification of Red Lion Sub	Moving 5015 line into new ring-bus position	Moving 5015 line into new ring-bus position	Moving 5015 line into new ring-bus position	Rebuilding the substation as a double bus - double breaker scheme	Rebuilding the substation as a breaker and a half scheme	Moving 5015 line into new ring-bus position	Moving 5015 line into new ring-bus position

PJM©2014

Southern Crossing Lines – Cost Factors

Criteria	Project Class	Southern Crossing 230kV Lines (Submarine)			Southern Crossing Lines (Overhead)	
	Proposal	LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - 230kV Overhead	Dominion 1B - 500kV Overhead
	Sub-Criteria					
Cost Factors	PJM Estimated Project	$248-$302	$257-$313	$366-$446	$211-$257	$233-$283
	Proposed Project Costs	$148	$165-$208	$213-269	$116	$133
	Market Efficiency	Approximately $92 over 15 years			Approximately $92 over 15 years	
	Outage Cost	230kV outage during substation cut-in	230kV outage during substation cut-in	230kV outage during substation cut-in	230kV outage during substation cut-in	230kV outage during substation cut-in

Note: Costs are for the line project only; SVC costs are not included.

PJM©2014

AI to Red Lion Lines – Cost Factors

	Project Class	Red Lion to Salem 500kV Lines			Red Lion to Hope Creek 500kV Lines			
Criteria	Proposal	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion Red Lion to Hope Creek w/ 2nd tie removed	PSE&G Red Lion to Hope Creek w/ 2nd tie removed
	Sub-Criteria							
Cost Factors	PJM Estimated Project	$216-$263	$221-$269	$232-$282	$242-$294	$249-$304	$211-$257	$211-$257
	Proposed Project Costs	$181	$171	$123-156	$199	$297		
	Market Efficiency	Approximately $57 over 15 years			Approximately $57 over 15 years			
	Outage Cost	5015 outage estimated at 30 days	5015 outage estimated at 30 days	5015 outage estimated at 14 days	5015 outage estimated at 40 days	5015 outage estimated at 40 days	5015 outage estimated at 14 days	5015 outage estimated at 14 days

Note: Costs are for the line project only; SVC costs are not included.

Artificial Island Timeline

- **Today - Monday, May 19th Special TEAC**
  - **3 hour stakeholder technical meeting**
  - **In-person at PJM CTC**
- Monday, June 2nd – Due date for stakeholder comment/feedback (14 day comment period)
- June 5th TEAC
- **Monday, June 16th – PJM review of stakeholder comment/feedback and final decision meeting**
  - **Special TEAC Webex / Teleconference**
- Comment Period to the PJM Board (36 days for comment period)
- July 10th TEAC
- **Tuesday, July 22nd – PJM Board meeting**
  - **Artificial Island solution recommendation to the PJM Board**

Appendix

SI-SSA-0010-0289

Technical Overview

PJM©2014

Minimum AI voltage for 230kV proposals

Comparison Method:
Assume 1.065 p.u. at the AI (unstable below 1.065), solve the power flow for the corresponding Salem and Hope Creek MVAr output. Simulate the combination of the most critical fault and outage. Do not assume the addition of an SVC.
Result:
Measure the maximum machine angle swing.
All 230 kV proposals pass the stability criteria.

Group	Project ID	230 kV Transmission Solution	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing (deg.)
1.1	**P2013_1-5A**	LS Power	**1.065 pu**	1044	5015*	14b**	**102**
1.1	**P2013_1-2B**	Transource (AEP)	**1.065 pu**	965	5015	14b	**105**
1.1	**P2013_1-2A**	Transource (AEP)	**1.065 pu**	940	5015	14b	**110**
1.2	**P2013_1-1B**	DVP	**1.065 pu**	926	5015	14b	**115**

5015*: Hope Creek – Red Lion 500kV line
14b**: single-line-to-ground fault on the new line from Salem w/ delayed clearing due to stuck breaker

PJM©2014

230kV proposal comparison - 5015 outage

Comparison Method:
For each proposal, assume a fixed MVAr output at the Artificial Island, solve the power flow for the corresponding Artificial Island bus voltages. Simulate the combination of the most critical fault and outage. Do not assume the addition of an SVC.
Result:
Measure the maximum machine angle swing.
All 230 kV proposal pass the stability criteria.

Group	Project ID	230 kV Transmission Solution	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing (deg)
1.1	**P2013_1-5A**	LS Power	1.065	1044	5015	14b	**102**
1.1	**P2013_1-2B**	Transource (AEP)	1.071	1044	5015	14b	**95**
1.1	**P2013_1-2A**	Transource (AEP)	1.074	1044	5015	14b	**95**
1.2	**P2013_1-1B**	DVP	1.074	1044	5015	14b	**97**

5015*: Hope Creek – Red Lion 500kV line
14b**: single-line-to-ground fault on the new line from Salem w/ delayed clearing due to stuck breaker

PJM©2014

230kV proposal comparison – 5038 outage

Comparison Method:
For each proposal, assume a fixed MVAr output at the Artificial Island, solve the power flow for the corresponding Artificial Island bus voltages. Simulate the combination of the most critical fault and outage. Do not assume the addition of an SVC.
Result:
Measure the maximum machine angle swing.
All 230 kV proposal pass the stability criteria.

Group	Project ID	230 kV Transmission Solution	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing (deg)
1.1	**P2013_1-5A**	LS Power	1.044	832	5038*	2b**	**121**

2b**: single-line-to-ground fault on Hope Creek-Red Lion 500kV line w/ delayed clearing due to stuck breaker

PJM©2014

230kV+ SVC proposal comparison

Comparison Method:
For each proposal, assume the addition of an SVC at each of three locations. Simulate the combination of the most critical fault and outage.
Result:
Measure the maximum machine angle swing.
All 230 kV proposals with SVC additions pass the stability criteria with greater margin than without SVCs.

Project ID	230 kV Transmission Solution	SVC option	AI 500kV Bus Voltage	AI MVAr Output	Critical Outage	Critical Contingency	Maximum Angle Swing
P2013_1-5A-SVC	LS Power	Artificial Island	1.042	728	5015	14b	80

Artificial Island Analytical Evaluation
Load Flow Analysis Update

- Load Flow Analysis
  - 230 kV Transmission Solutions
    - No thermal or voltage violations identified for summer peak case
  - New 500 kV transmission from the Artificial Island to Red Lion 500 kV
    - No thermal or voltage violations identified for summer peak case

PJM©2014

Artificial Island Analytical Evaluation
Short Circuit Analysis Update

- Short Circuit Analysis
  - 230 kV Transmission Solutions
    - Several 50 kA circuit breakers overdutied at Red Lion 230 kV
  - New 500 kV transmission from the Artificial Island to Red Lion 500 kV
    - No new overdutied breakers identified

PJM©2014

Cost Factors

PJM©2014

Constructability Review – PJM Cost Estimates

- PJM performed a per-unit cost estimate analysis
- Major components account for 70% - 90% of estimated material and construction costs
  - Submarine cable at $5.3 million per mile
  - 500kV aerial at $3.6 million per mile
  - Aerial Delaware river crossing at $100 million
  - 500/230kV auto transformer at $7.8 to $10.5 million per phase

PJM©2014

Constructability Review – PJM Cost Estimates

- Costs independently estimated in collaboration with PJM outside consultants
  - Engineering at 2.5%
  - Project management at 5%
  - Contingency range from 15% to 40%

- Estimate Sources
  - RTEP project cost estimates and actuals
  - Inputs from multiple outside consultants
  - Industry sources

PJM©2014

PJM Cost Estimates

Class	Proposals	PJM Estimate	
Southern Crossing Lines (Submarine)	LS Power 5A - Submarine Option	$ 248	$ 302
	Transource 2B - North Cedar Creek	$ 257	$ 313
	Transource 2A - Cedar Creek Expansion	$ 366	$ 446
Southern Crossing Lines (Overhead)	LS Power 5A - Overhead	$ 211	$ 257
	Dominion 1B - 500kV Overhead	$ 233	$ 283
Red Lion to Salem Lines	PHI/Exelon 4A - Red Lion to Salem	$ 216	$ 263
	LS Power 5B - Red Lion to Salem	$ 221	$ 269
	Transource 2C - Red Lion to Salem	$ 232	$ 282
Red Lion to Hope Creek Lines	Dominion 1C - Red Lion to Hope Creek	$ 242	$ 294
	PSE&G 7K- Red Lion to Hope Creek	$ 249	$ 304
	Dominion – Red Lion to Hope Creek (No New Bus Tie)	$ 211	$ 257
	PSE&G – Red Lion to Hope Creek (No New Bus Tie)	$ 211	$ 257

Artificial Island Analytical Evaluation Recap

- Recap of Previous November 2013 TEAC Update
  - 230 kV Transmission Solutions
    - Assuming the same AI Voltage, observe the AI MVAr output and maximum angle swing
      - Less AI MVAr output means more MVAr margin.
      - Less angle swing correlates to a larger stability margin
    - Given the same AI MVAr output compare the maximum angle swing
      - Less angle swing correlates to a larger stability margin
  - SVC Locations
    - Evaluate the effectiveness of the SVC locations by observing AI MVAr output and maximum angle swing
      - Less angle swing correlates to a larger stability margin

SI-SSA-0010-0313

"HVDC" Solution - P2013_1-6A

- P2013_1-6A
  - HVDC from the AI to Cardiff
  - SVC near the AI
  - Cost estimated by project sponsor at $1,012 M
- Project characteristics
  - HVDC + SVC
- Performance
  - Only passes criteria testing with significant real power flowing on the proposed HVDC from the AI to Cardiff
  - This solution fails the stability test without significant MW flow on the proposed HVDC facility from the AI to Cardiff
- Next Steps
  - Further analysis deferred based on cost and initial performance evaluation of alternative proposals

PJM©2013

SI-SSA-0010-0316

TCSC + SVC Alternative

- P2013_1-1A
  - SVC @ New Freedom + two Thyristor Controlled Series Compensation (TCSC) devices near New Freedom
  - Estimated by project sponsor at $133 M
- Project characteristics
  - No new physical outlet from the Artificial Island
  - Relies on redundant breaker configurations at four 500 kV locations
    - Seven redundant breakers and associated station equipment required
- Performance
  - Did not pass testing criteria with the proposed +500 MVAR SVC near New Freedom 500 kV
  - Passed testing criteria with a larger +750 MVAR SVC near New Freedom 500 kV
- Next Steps
  - Further analysis deferred based initial performance evaluation of alternative proposals

Artificial Island to Red Lion 500 kV Solution Evaluation without SVC

Comparison Method:
Assume 1.055 p.u. at the AI (unstable below 1.055), solve the power flow for the corresponding Salem and Hope Creek MVAr output. Simulate the combination of the most critical fault and outage. Do not assume the addition of an SVC.

Result:
Measure the maximum machine angle swing.
All AI-Red Lion 500kV options are stable under the assumption of 1.055 pu at AI 500kV bus.
All 500 kV transmission from the Artificial Island to Red Lion 500 kV pass the stability test under the 1.055 pu assumption.

Project ID	Project Sponsor	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing (deg.)
P2013_1-5B	LS Power	**1.055 pu**	913	5015	14b2	**109 (stable)**
P2013_1-2C	Transource	**1.055 pu**	927	5015(1)	14b2(3)	**109 (stable)**

Artificial Island to Red Lion 500 kV Solution Evaluation without SVC

Comparison Method:
For each proposal, assume a fixed MVAr output at the Artificial Island, solve the power flow for the corresponding Artificial Island bus voltages. Simulate the combination of the most critical fault and outage. Do not assume the addition of an SVC.

Result:
Measure the maximum machine angle swing.
All AI-Red Lion 500kV proposals show similar performance given the same AI MVAr output.
All 500 kV transmission from the Artificial Island to Red Lion 500 kV pass the stability criteria.

Project ID	Project Sponsor	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing (deg)

500kV + SVC proposal comparison with SVC

Comparison Method:
For each proposal, assume the addition of an SVC at each of three locations. Simulate the combination of the most critical fault and outage.
Result:
Measure the maximum machine angle swing.
All AI-Red Lion 500kV + SVC options show similar performance.
The AI-Red Lion 500kV + SVC options show better performance than 230k+SVC options.
The Artificial Island SVC location has the best stability performance.

Project ID	Project Sponsor	SVC option	AI 500kV bus voltage	AI MVAr output	Critical Outage	Critical Contingency	Maximum Angle Swing
P2013_1-5B-SVC	LS Power	Artificial Island	1.040	667	5015	14b2	77
		Orchard	1.040	667	5015	14b2	98

SI-SSA-0010-0323

(500kV to Red Lion + SVC) vs. (230kV + SVC)

Comparison Method:
For each proposal, assume the addition of an SVC at each of three locations. Simulate the combination of the most critical fault and outage.
Result:
Observe the maximum machine angle swing.
The AI-Red Lion 500kV+SVC options show marginally better performance than the 230k+SVC options.
All evaluated proposals with SVC noted below pass the stability criteria with greater margin than without SVCs.

500kV+SVC options

Artificial Island Analytical Observations

- Similar to the November TEAC review of the 230 kV proposals, the AI - Red Lion 500kV proposals without SVC pass the stability test under the assumption of 1.055pu at AI 500kV bus.

- The addition of an SVC improves the performance of all of the 230 kV and AI – Red Lion 500 kV proposals

- The 230 kV and AI - Red Lion 500kV proposals with SVC pass the stability test under the unity power factor assumption at the AI.

PSEG Nuclear LLC

December 8, 2014

PJM Interconnection, L.L.C.
Attention: Steven Herling
955 Jefferson Avenue
Norristown, PA 19403

Re: PSEG Nuclear Comments for December 9th TEAC
Discussion Regarding Artificial Island Open Window

Dear Mr. Herling:

PJM Interconnection, L.L.C. (PJM) has invited all PJM stakeholders to submit comments regarding the Artificial Island open window process in connection with the scheduled TEAC special meeting scheduled for December 9th. As the party that may be most directly impacted by the ultimate decision in this open window process, PSEG Nuclear LLC (PSEG Nuclear) now submits the following Comments regarding Dominion's Project 1A, which uses both TCSC and SVC technology (hereinafter referred to as the Dominion TCSC Proposal).

I. EXECUTIVE SUMMARY

PJM previously determined the Dominion TCS Proposal to be technically deficient, yet it is once again being considered by PJM among the various finalist proposals. This proposal includes an application that combines thyristor controlled series compensation (TCSC) technology with Static VAR Compensators as a means to ensure transient angular stability for AI. This proposal attempts to address stability via active, substation-based components in lieu of constructing an additional conventional transmission line.

PSEG Nuclear believes the approach set forth in the Dominion TCSC Proposal poses considerable risk to the regional 500kV system and to the nuclear units themselves at Artificial Island by relying on a technology that has never been used or tested at this scale in the United States. The Dominion TSCS Proposal can pose the risk for sub-synchronous resonance, which could have serious consequences for the nuclear units. In addition, and most importantly, based on the potential consequences of failure of this new technology, the Dominion TCSC Proposal poses an unevaluated risk to overall nuclear safety.

PSEG Nuclear relies on the following key considerations in reaching this conclusion:

- Dominion's TCSC project is inconsistent with AI RFP requirements and presents substantial challenges in ensuring compliance with the NRC licensing basis for the plant relative to offsite power sources;

- The use of the second largest nuclear site in the U.S. as a test bed for a first of its kind transmission design is problematic and presents potentially dire consequences; and

- The Dominion TCSC Proposal introduces complex circuit elements with subsequent new active failure modes that increase the potential for sub-synchronous resonance (SSR) phenomena that can damage generation equipment.

- Finally, should PJM ultimately decide to select this proposal, it would need to ensure adequate indemnification protection for PSEG Nuclear associated with SSR-related damage and/or lost generation. This is an issue that has not yet even been discussed.

These considerations, which are detailed in the comments below, must be factored into PJM's overall assessment of the competing AI transmission proposals to arrive at a technically and economically defensible path forward. PSEG Nuclear submits that careful consideration of these points counsel against selection of the Dominion TCSC Proposal.

II. COMMENTS

A. Dominion's TCSC Presents Substantial Challenges in Ensuring Compliance With the NRC Licensing Basis for the Plants Relative to Offsite Power Sources.

The goal of the transmission enhancement being pursued by PJM in the current open window process is to simplify the complexity and operational challenges presented by operations under the current Artificial Island Operating Guide (AIOG). Yet, as explained below, the TCSC project proposed by Dominion not only undermines the Artificial Island RFP objective of AIOG simplification/elimination, it raises significant issues for compliance with AI's nuclear licensing requirements relative to offsite source reliability.

Current operation of the Salem and Hope Creek nuclear generating stations at Artificial Island must accommodate the challenging transient stability margins inherent in the grid configuration in the vicinity of the AI facility. This is accomplished through strict adherence to the AIOG, which governs aspects of plant operation that have a direct impact on maintaining angular stability under any NERC mandated contingency (e.g., minimum plant MVAR output, power system stabilizer availability, trip-a-unit logic). The worst case line contingency for the site is a stuck breaker fault on the 5015 line between Hope Creek and Red Lion.

Compliance with the AIOG inherently ensures compliance with key nuclear licensing requirements with respect to offsite transmission sources, as follows:

- First, the Salem and Hope Creek nuclear units' operation must comply with 10 CFR 50 Appendix-A General Design Criterion (GDC) 17 which requires that a plant's offsite sources:

> ..be designed and located so as to minimize to the extent practical the likelihood of their simultaneous failure under operating and postulated accident and environmental conditions.... provisions shall be included to minimize the probability of losing electric power from any of the remaining supplies as a result of, or coincident with, the loss of power generated by the nuclear power unit or the loss of power from the transmission network.

- Second, NRC NUREG-0800, Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants, provides the primary guidance to NRC reviewers responsible for ensuring that a licensee complies with NRC regulations. Chapter 8 of NUREG-0800 provides review guidance regarding the design, analysis and testing of the offsite electrical system such that it meets the requirements of GDC 17. NUREG-0800 Chapter 8 states:

> The results of the grid stability analysis must show that loss of the largest single supply to the grid does not result in the complete loss of preferred power. The analysis should consider the loss, through a single event, of the largest capacity being supplied to the grid, removal of the largest load from the grid, or *loss of the most critical transmission line*. This could be the total output of the station, the largest station on the grid, or possibly several large stations. (Emphasis added).

- Third, of particular relevance to the consideration of projects to address the AI FRP requirements, NRC NUREG-0800 further states:

> The (NRC) reviewer should verify that adequate procedures, administrative controls, and protocols are in place to ensure that *no modifications to the offsite power system circuits credited for satisfying GDC 17 are implemented by offsite transmission system operating authorities, responsible for maintenance, modification, and operation of the offsite transmission grid, without the performance of a proper safety evaluation.* The safety evaluation of transmission system modifications is required to ensure that the transmission grid configuration, stability, and capability remain within the assumptions of the plant safety analyses. (Emphasis added).

If the Dominion TCSC Proposal is selected by PJM, stability of the system upon a fault on the critical 5015 line will no longer be ensured by the predominantly passive physics of protection provided by the AIOG, but will be predicated on the instantaneous operation of a first-of-a-kind scale of TCSC installation in coordination with an associated static VAR compensator (SVC) installation. As such, the selection of the Dominion TCSC Project could pose challenges relative to the existing licensing basis of the nuclear plants with regard to offsite power source.

B. Use of the Second Largest Nuclear Site in the U.S. as a Test Bed for First of its Kind Transmission Design Is Unacceptable and Presents Potentially Dire Consequences.

If selected by PJM, the Dominion TCSC Proposal would essentially use the second largest nuclear installation in the country as a test bed for a first of a kind application of advanced transmission components that have limited operating experience and track record in the world. Nowhere on the PJM system or, for that matter in the United States, has an integrated TCSC-SVC solution been developed to the scale proposed or used to control transient stability to the extent required for Artificial Island. Moreover, PJM is considering the approach of scaling this first of a kind technology up to compensation levels never used before, and to integrate its response with active SVCs to address stability constraints in a region of the system that has substantial challenges relative to maintaining and ensuring transient stability.

There is a significant lack of any real-world operational experience with the performance and reliability of the TCSC technology in question, especially with respect to the scale of its use in this proposal. This lack of operational experience, combined with the critical response time necessary for this solution to meet its performance objective, makes it imperative that PJM accurately model not only the "data sheet" performance of the system but also perform "real-world" sensitivity analyses to model non-ideal performance of the TCSC-SVC system (e.g., response delays, adverse timing interactions between TCSC and SVC components, non-optimum transient compensation levels, effects of inadvertent actuation, sensitivity to changing system conditions)).

Further, any theoretical benefits of such first of a kind technology use must be weighed against the consequences of the new technology not just failing, but failing at the second largest nuclear installation in the United States. In the event that this first of a kind technology application fails to operate, or does not function as modeled under a challenging contingency such as a fault on 5015, the likely consequences to the Salem and Hope Creek nuclear units would be greater than currently analyzed per GDC 17. Currently, operation under the AIOG ensures stability of offsite sources following any anticipated grid contingency. Under the TCSC proposed design, failure of these active devices in responding to a limiting grid contingency could cause one or more of the AI nuclear units to lose synchronism with the system, which could in turn result in the following cascading events:

- The immediate loss of offsite power to all three units resulting in the automatic shutdown of the units and post-transient reactor cool down operations using emergency diesel generators.
- The tripping of 3800 MW at Artificial Island may lead to a partial or system-wide black-out (PJM spinning reserve is only 1200 MW). This in turn can pose similar loss of grid challenges to regional nuclear plants.

- The physical impact/damage to the nuclear turbine generator(s) from falling out of synchronism would likely require a significant and indeterminate period to correct.

Based on the potential cascading events described above, reliance on this first of a kind technology will introduce a consequence of failure beyond that currently analyzed for the nuclear units at Artificial Island.

C. Dominion TCSC Proposal May Potentially Trigger Additional NRC Review And Impose Additional Design and Licensing Costs.

In evaluating any changes to nuclear plant equipment, processes or procedures, PSEG Nuclear must evaluate the change per 10 CFR 50.59, *Changes, tests and experiments*, to determine if the change is outside the bounds of the licensing basis of the plant and requires NRC approval prior to implementing the change. This is generally referred to as "a 50.59 review." Given that the AIOG is considered a critical design document for the site, a 50.59 review is required to implement any change to the document. The 10 CFR 50.59 review assesses a proposed change against prescribed questions relative to its impact on the safety-bases upon which the NRC has licensed the plant. Of these questions, the two that are directly challenged by the design being considered by PJM are:

> *Does the change create a possibility for a malfunction of a Structure, System or Component (SSC) important to safety with a different result than any previously evaluated in the final safety analysis report (as updated)?*[1]
>
> *Does the change result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the final safety analysis report (as updated)?* [2]

Regarding the first question above, given that the scope and magnitude of the TCSC-SVC solution being considered by PJM has never before been developed anywhere in the United States, modeling assumptions for this project are incapable of being validated through real-world operating experience. Therefore, the failure modes and associated consequences of the proposed solution cannot be considered fully vetted. In light of this, PSEG Nuclear would need specific technical insights into the design and modeling of the solution, well beyond what has been publicly provided by Dominion, in order to properly address this question.

Similarly, relative to the second 50.59 review question, consequences of failure of the TCSC/SVC solution, as described in the previous section, pose a significant challenge in addressing this question, especially in light of the fact that loss of offsite power is considered one

[1] Code of Federal Regulations, Title 10 Part 50.59 – Changes, Tests and Experiments
[2] 10CFR50.59

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

of the largest contributors to core damage frequency in terms of Probabilistic Risk Assessment to a nuclear plant.[3]

Based on these two questions, formal PSEG Nuclear and possible NRC review and acceptance of the subject design will be necessary before any substantial changes to the AIOG and its associated operational guidelines can be made. This review will need to be conducted to the extent necessary to satisfy any NRC inquires relative to the station's assessment of the design against the above 50.59 questions. Based on the recent publication of NUREG CR 7175, *Susceptibility of Nuclear Stations to External Faults*, the NRC has a heightened interest in vulnerabilities of nuclear plants to offsite grid disturbances. Based on this heightened level of licensee oversight in grid issues, NRC's assessment of licensee's changes relative to offsite source reliability will be also be heightened. This may extend to the point where the NRC assesses the adequacy of the TCSC design as an independent validation of the review performed by PSEG Nuclear. Considering the scope and complexity of this solution, and that the issue is a matter of first impression, such effort will likely result in additional review and processing fees being imposed on PSEG Nuclear as the licensing entity that must respond to any NRC questions and directions related to this change.

Given the above, PSEG Nuclear submits that any and all review costs, including any NRC fees, associated with this effort should be borne by Dominion. Accordingly, PJM should take such costs and schedule impacts into consideration in identifying overall project costs associated with the Dominion TCSC Proposal.

Until a safety determination can be made by PSEG Nuclear that is deemed acceptable for the regulator, Salem and Hope Creek operations would still need to comply with the AIOG as currently configured despite the status of TCSC-SVC system installation. Potential operation of the nuclear units at AI per the requirements of the current AIOG alongside operation of the subject TCSC-SVC installation would likely be incompatible to system operations and would negate the ultimate goal of the Artificial Island open window process.

D. The Dominion TCSC Proposal Introduces The Risk of Sub-Synchronous Resonance Phenomena That Can Damage Generation Equipment.

Introduction of series compensation for the first time into a congested region of the system like EMAAC poses significant concern regarding sub-synchronous resonance (SSR). The potential for SSR can result from series compensated networks and, if unmitigated, can result in opposing torques to prime movers resulting in prompt and extensive turbine-generator rotor shaft cracking. Generators most at risk to SSR are those that are electrically closer to the series capacitor and those that are long shaft / multi-mass turbine generators. The characteristics

[3] Nuclear Regulatory Commission - NUREG/CR-6890 Vol. 1 – Reevaluation of Station Blackout Risk at Nuclear Power Plants – Analysis of Offsite Power Events 1986-2004 – Published 2005

of the proposed project and its proximity to large nuclear generating units directly support the potential of developing SSR in the region of Artificial Island. Another phenomenon, Sub-Synchronous Oscillation (SSO), can occur when fast acting controllers of active power system components (e.g. TCSC or SVC controllers) have an unintended resonant point close to the system electrical resonance. SSO can result in rapidly growing currents or voltages on the system potentially challenging the design limits of transmission components.

In order to assess whether regional generators are susceptible to SSR, complex analyses must be performed based on system data, as well as extensive dynamic inertial machine data from potentially affected turbine generator systems. These data are often times not readily available, subject to change, or are of unknown accuracy and validity. It is not clear how PJM can conduct a complex assessment of SSR on regional generators, given that the critical input data to such analyses have questionable fidelity to the actual machines.

The subject SSR analysis is not a one-time effort, but must be routinely performed as the regional system changes due to upgrades, changes in regional generating units and planned and emergent outages. Planned and unanticipated system changes may have profound impacts on the tuning of the SVCs and thyristor control algorithms associated with the series capacitors. PJM must be able to accurately model all planned and forced outages and configuration changes in the region and promptly factor these changes into the configuration and tuning of TCSC-SVC controls to assure proper stability protection and prevent potentially catastrophic SSR-induced turbine shaft cracking in regional generators. PJM currently does not have these SSR concerns in this portion of their system and likely has little, if any, in-house expertise on the phenomenon or the analytical studies necessary to ensure that these issues are avoided. It is not clear how PJM can perform these complex studies on demand to meet unexpected system conditions and maintain this proposed solution in an "operable" state.

E. Should PJM Decide to Select the Dominion Proposal, PJM Must Ensure Adequate Indemnification Protection for PSEG Nuclear Associated with SSR Related Damage and/or Loss of Generation.

As mentioned above, PJM has limited, if any, experience in the application of series compensation and the associated SSR analyses that accompany this technology. Given that SSR can quickly damage generation resources and lead to cascading outages, the presence of SSR characteristics must be independently monitored in real time. In addition, depending on the results of SSR analyses and/or mandates by Nuclear Electric Insurance Limited (NEIL), some means of SSR trip protection of potentially vulnerable units may be necessary. It is not apparent to PSEG Nuclear who will be responsible for the installation and maintenance of any forced tripping protection (e.g., torsional relays, SSR current relays) on the units at AI, if they are deemed to be required. Any increased risk fees that may be mandated by NEIL due to the potential for SSR and its impact on main turbine shafts should be borne by Dominion. Also, if

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

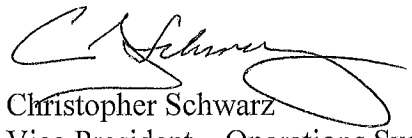
forced tripping is required, PJM needs to address the issue of providing indemnification to PSEG for any lost generation in response to spurious or legitimate SSR-based tripping of one or more PSEG Nuclear units must be addressed.

Finally, and most importantly regarding implementation of this design, it will need to be explicitly clear to PSEG Nuclear that, assuming PJM selects the Dominion 1a proposal as its preferred solution, PJM and/or Dominion will 1) take full responsibility for addressing any discovered turbine generator shaft cracking at the AI units in response to independent indications of SSR and 2) provide indemnification for all repair and lost generation associated with repair/replacement of damaged turbine generator shafts/components.

III. CONCLUSION

The risks associated with a first of a kind design such as that proposed by Dominion are not conducive to nuclear safety and overall reliability of the transmission system. Rather, when one objectively weighs the risks associated with the subject proposal and the consequences resulting from potential adverse impacts on nuclear safety and grid reliability, as described above, the Dominion TCSC Proposal should not be the recommended solution. The potential consequences arising from a failure of the proposed design to provide both stability and SSR protection when called upon are simply unacceptable from a nuclear safety perspective.

Very truly yours,



Christopher Schwarz
Vice President – Operations Support
PSEG Nuclear

Exelon / PHI Feedback

- PHI/Exelon: Eliminate the need (and cost) for an SVC by:
  - Alternative # 1 - Install a 2% reactor in the neutral of the 500kV (wye grounded) side of the two Salem generator-step-up transformers (GSU) or Install a 1% neutral reactor to the 500kV side of the two Salem and the Hope Creek GSUs
  - Alternative # 2 - Employ a back-to-back circuit breaker scheme to interconnect the PHI/Exelon proposed 500kV line to the Salem Substation.
- PJM determined that the suggested modifications would only address phase to ground faults and there are three phase faults that would still be unstable and not improved by the back-to-back breakers or neutral reactors
- Reactors also have additional negative impacts that would need be considered

PJM©2014

Transource Feedback

- Feedback at the 5/19/2014 AI Technical Review regarding the potential Hope Creek – Red Lion proposal
  - Transource was concerned that the potential Hope Creek – Red Lion transmission solution would not solve all stability requirements
  - Resolution: PJM worked with Transource to update their technical assumptions and this concern was found to not be an issue

PJM©2014

Artificial Island Recommendation

PJM©2014

Evaluation Considerations

- Performed extensive technical analysis
  - Stability, thermal, voltage, short circuit, market efficiency
  - Studied all solutions as is and with modifications

    Initial analysis showed only two of the highest cost solutions worked as submitted
- Engaged outside engineers to perform constructability review
  - *focus on physical, cost, schedule, RoW, siting, permitting*
- Met with all proposers for clarification as needed
- Met with AI nuclear plant representatives
- PJM Operations review
- PJM independent cost evaluation
- Met with equipment manufacturers

PJM©2014

Evaluation Considerations

- Primary Considerations
  - Technical Analysis
    - Thermal
    - Stability
    - Short-circuit
    - Voltage
    - NERC Cat-D Contingencies
- Secondary Considerations
  - Schedule
    - Permitting
    - Construction
    - Long lead time equipment
  - Project Complexity
    - Line crossings
    - Outage requirements
    - Modifications to other transmission facilities
    - Modification to Artificial Island substations
    - Modifications to Red Lion substation
  - Cost Factors
    - Cost effectiveness
    - Market efficiency
    - PJM estimated costs
  - Right of Way and Land Acquisition
    - No eminent domain in Delaware
    - New right of way required
    - Substation land required
  - Siting and Permitting
    - Wetlands impact
    - Public opposition risk
    - Delaware river crossing
    - Land permitting
    - Historic and scenic highway
  - Operational Impact
    - Artificial island facility requirements
    - Ongoing maintenance
    - Blackstart
    - Route diversity
    - Performance

PJM©2014

Determination of Proposal Short List

- Overall, there were 26 proposals
  - 2 projects passed the initial analytical screen without modification
  - Through evaluation of the various proposals, PJM staff found that many of the proposals could be made more effective and efficient with some modification and the addition of other components
  - Screened proposals (with the PJM modifications) based on performance and cost

PJM©2014

Determination of Proposal Short List

- PJM focused on a short list of evaluations that included several projects in each of these four categories:
  - Southern Crossing – Submarine
  - Southern Crossing – Overhead
  - Salem to Red Lion 500 kV
  - Hope Creek to Red Lion 500 kV

PJM©2014

AI Final Project Recommendation Approach

- Primary Considerations
  - Technical Analysis
  - Cost Factors
  - Project Schedule

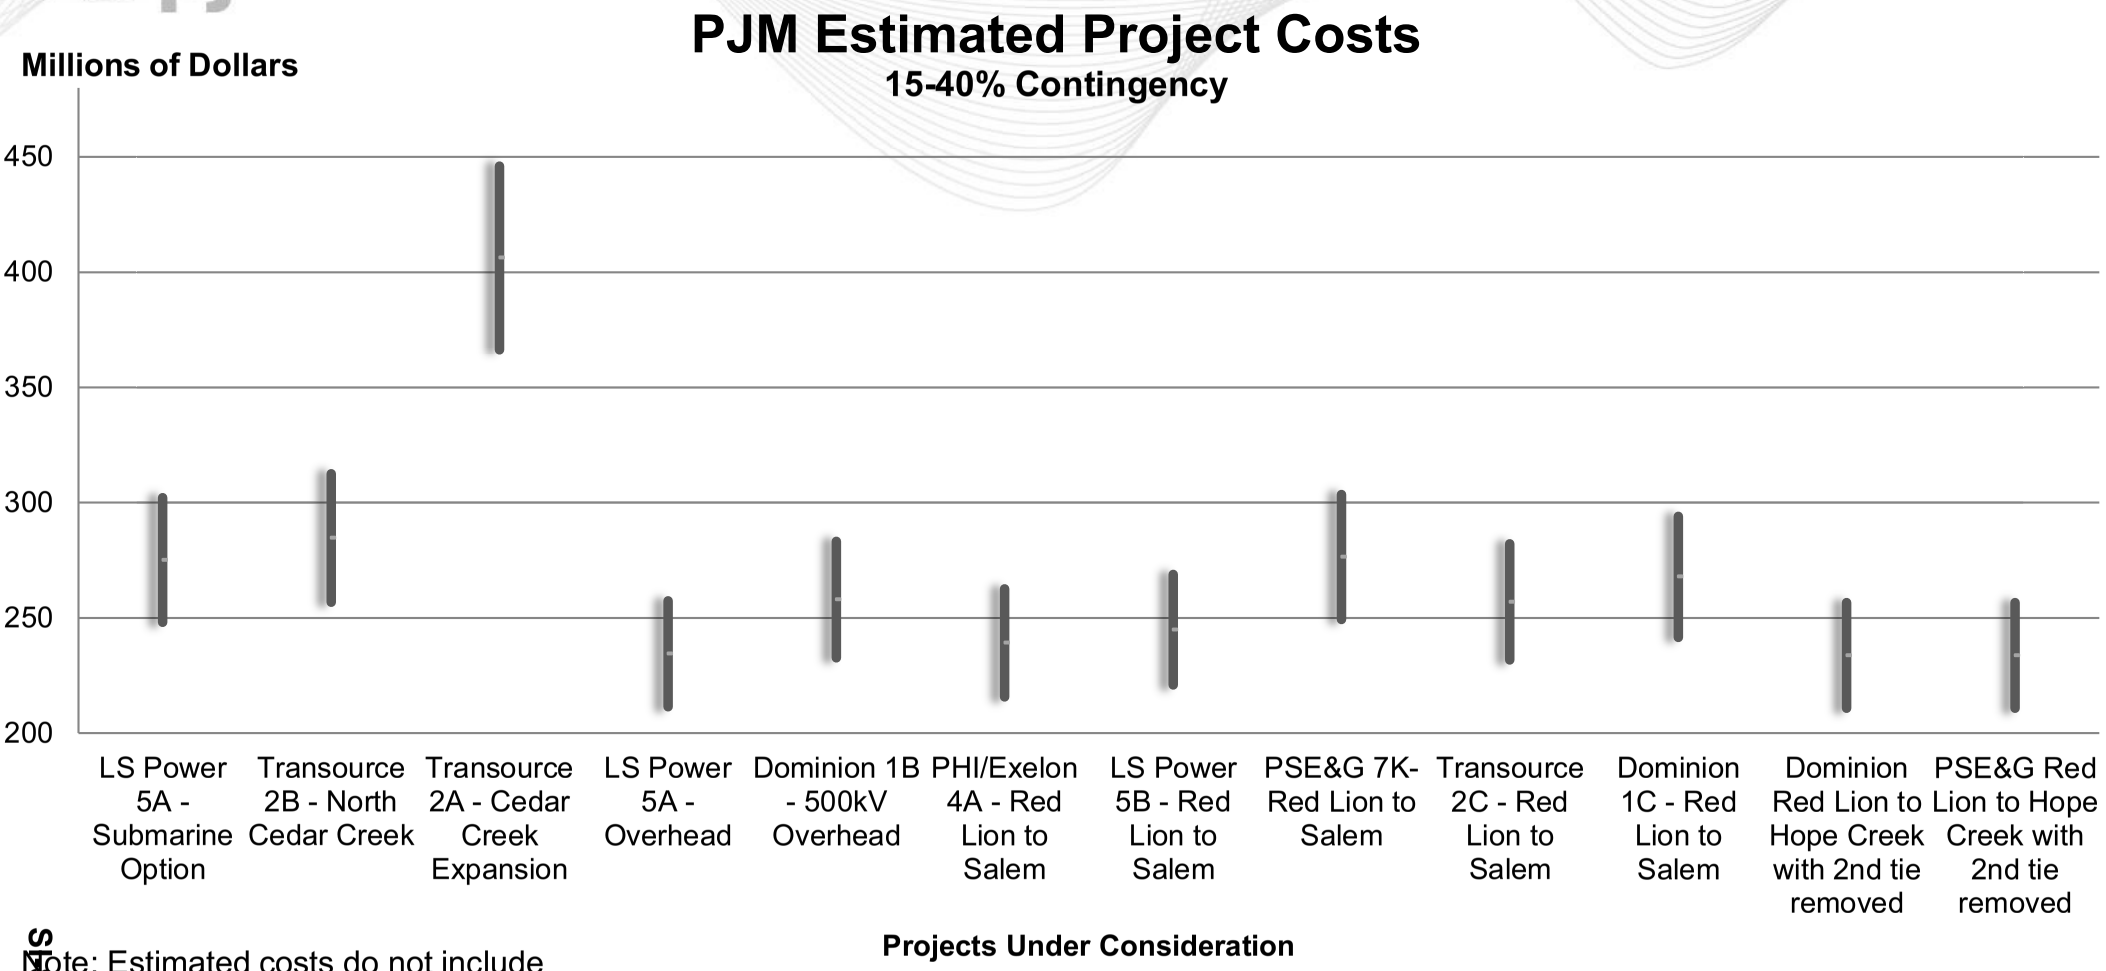
PJM©2014

Technical Analysis

- All projects on the short list, with PJM modifications included, satisfied the required criteria including:
  - Stability: Angle swing (including with AI generation at unity power factor)
  - Load flow, short circuit, voltage, NERC cat-D contingencies
- Additional analysis
  - Market efficiency
  - Additional reliability benefits

PJM©2014

PJM Cost Estimates



Note: Estimated costs do not include the SVC cost estimate

Project Schedule

- Permitting
  - Delaware River Crossing
    - Represents the greatest component of schedule risk for all projects
  - Land Permitting
    - All projects will face challenges
      - Red Lion to Artificial Island
        - » Supawna Meadows National Wildlife Refuge
        - » State wildlife management areas
      - Southern crossing lines
        - » State wildlife management areas
    - Public opposition can be expected with all of the alternatives

- Siting and permitting for a new river crossing will be a major component in the project schedule for all projects under consideration

PJM©2014

Differentiating Factors

- Evaluation of risks to cost and schedule
  - Project complexity
    - Modifications to Artificial Island
    - Line Crossings
    - Outage Requirements

PJM©2014

Project Complexity

- Modification of Artificial Island substations
  - Salem
    - Constrained with limited space for expansion. Proposed alternatives out of Salem would need to ensure continued maintenance access to station aux transformers
    - All protection and control equipment located inside the secure area of the generating station. There is limited spare conduit from the substation into the station for control wiring.
  - Hope Creek
    - Available land for expansion to the north
    - Protection and control equipment located in a separate control building in the substation.

- A new line from Hope Creek without impacts to Salem is considered more constructible

PJM©2014

Project Complexity

- Line Crossings
  - All 500kV projects interconnecting at Salem substation included a line crossing
  - Line crossings create operational complexity and the potential for a multiple facility trip event
    - Referenced in NRC Regulations, General Design Criteria-17

- Solutions with no line crossings are preferable

PJM©2014

Project Complexity

- Outage Requirements
  - All projects require outages to support construction
  - Artificial Island to Red Lion solutions would require outages to the 5015 line
    - 5015 line outages are challenging to schedule
  - All projects would require coordination of 500kV and 230kV facility outages
  - PJM operational analysis to manage impact to system configuration to support any outage required to support construction
    - Reactive devices
    - AI SPS
    - Coordination with planned generation and transmission outages

- A solution that minimizes outage requirements during construction is preferred

PJM©2014

Differentiating Factors

	Project Class	Southern Crossing 230kV Lines (Submarine)			Southern Crossing Lines (Overhead)		Red Lion to Salem 500kV Lines			Red Lion to Hope Creek 500kV Lines			
Criteria	Proposal	LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - 230kV Overhead	Dominion 1B - 500kV Overhead	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K- Red Lion to Hope Creek	Dominion Red Lion to Hope Creek w/ 2nd tie removed	PSE&G Red Lion to Hope Creek w/ 2nd tie removed
	Sub-Criteria												
Risks to Cost and Schedule													
Project Complexity	Line Crossings												
	Outage Requirements												
	Modification of AI Subs												

PJM©2014

Additional Factors in Project Selection

- Artificial Island to Red Lion 500kV solutions are more robust and provide greater power transmission capacity as compared to the 230kV southern crossing solutions
  - Under normal system conditions, southern crossing solutions would provide little system support
  - Artificial Island to Red Lion 500kV solutions improve voltage drop for loss of 500kV facilities

- An Artificial Island to Red Lion 500 kV line is a more robust solution than a southern crossing line

PJM©2014

Criteria	Project Class	Southern Crossing 230kV Lines (Submarine)			Southern Crossing Lines (Overhead)		Red Lion to Salem 500kV Lines			Red Lion to Hope Creek 500kV Lines			
	Proposal	LS Power 5A - Submarine Option	Transource 2B - North Cedar Creek	Transource 2A - Cedar Creek Expansion	LS Power 5A - 230kV Overhead	Dominion 1B - 500kV Overhead	PHI/Exelon 4A - Red Lion to Salem	LS Power 5B - Red Lion to Salem	Transource 2C - Red Lion to Salem	Dominion 1C - Red Lion to Hope Creek	PSE&G 7K-Red Lion to Hope Creek	Dominion Red Lion to Hope Creek w/ 2nd tie removed	PSE&G Red Lion to Hope Creek w/ 2nd tie removed

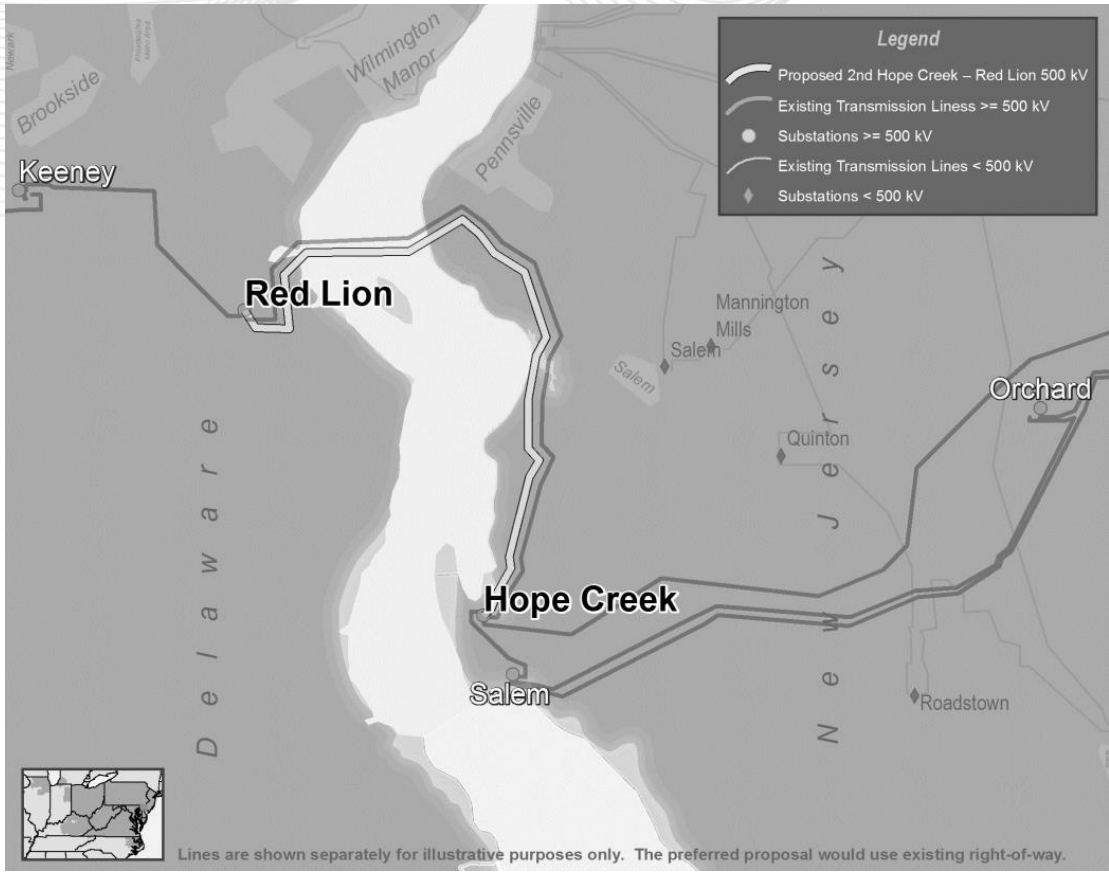
SI-SSA-0010-0370

Project Recommendation

- In consideration of all factors PJM staff will recommend for inclusion in the RTEP:
  - A new 500kV circuit from Hope Creek to Red Lion



PJM©2014

Project Designation Differentiating Factor

- PSE&G and Dominion proposed solutions that included a new 500kV line from Red Lion to Hope Creek. FirstEnergy proposed a Red Lion to Hope Creek facility but declined construction designation.

- Right of Way Acquisition
  - The LDV agreement provides for usage of existing right of way along the recommended project path
    - PSE&G is a party to the LDV agreement
    - 8.5 miles of the right of way in New Jersey would need be expanded
  - Dominion will need to acquire right of way for the entire route of the line

PJM©2014

Project Designation

- Assign designation of the Hope Creek – Red Lion 500 kV transmission line to PSE&G

- Assign the necessary connection facilities to accommodate the new transmission facility:
  - Red Lion 500kV station upgrade to PHI
  - Hope Creek 500kV station upgrade to PSE&G

PJM©2014

SVC Considerations

- An SVC is a required component to achieve the necessary project performance
  - Locations at Artificial Island, Orchard and New Freedom were studied and all achieved the required performance

- New Freedom and Orchard locations have the lowest estimated cost and would not require construction at Artificial Island

PJM©2014

SVC Differentiating Factors

- PSE&G New Freedom switching station has available property to accommodate the SVC

- New Freedom has stronger system ties to both the PJM 500kV and 230kV systems as compared to the Orchard location

PJM©2014

SVC Recommendation

- Construct an SVC at New Freedom 500 kV substation
  - Facilities design will determine the technical parameters

- Designate SVC upgrade at New Freedom to PSE&G

PJM©2014

Artificial Island Recommendation

- At the Tuesday, July 22nd PJM Board meeting, PJM staff will recommend for inclusion in the RTEP:
  - Hope Creek to Red Lion 500 kV transmission line designated to PSE&G
    - Associated substation work at Hope Creek designated to PSE&G
    - Associated substation work at Red Lion designated to PHI
  - SVC at New Freedom 500 kV designated to PSE&G

PJM©2014

Next Steps

- Detailed facility design
- Finalize review and recommendations on the protection issues raised around current directional carrier blocking scheme (DCB)

Note: Please supply any written comments to the PJM Board through RTEP@PJM.com

Re: PJM Process for Evaluating Competitive Artificial Island Proposals

Dear Mr. Schneider and Mr. Boston:

PHI and Exelon appreciate the relentless effort by PJM Transmission Planning Staff in bringing closure to the competitive Artificial Island (AI) proposal process. Although the PJM decision is not what we would prefer, PHI and Exelon, nevertheless, will not challenge or raise issues regarding the decision. But, as we have expressed earlier, PHI and Exelon remain concerned about the AI solicitation, evaluation and selection processes. Applying our learnings from the AI process, PHI and Exelon would like to work with PJM to improve the process for future proposals.

PHI and Exelon process concerns start with the problem statement and the specific project requirements outlined by PJM. The need for clarity and specificity is evident in that none of the 26 proposals hit the PJM target and met the need. Additionally, PJM did not follow the process that was laid out in their October 25, 2012 and July 22, 2013 Order No 1000 FERC Compliance filings for facilitating a competitive transmission expansion solicitation, but resorted to different processes. These alternate processes are not transparent to participants and could be problematic in the future if they are not corrected.

To comply with the FERC Order No. 1000 requirement to eliminate the Federal Right of First Refusal (ROFR), and to establish a competitive solicitation process for transmission projects, PJM made substantial changes to Schedule 6 of the Operating Agreement. Specifically, PJM adopted a sponsorship model in which qualified entities would submit project proposals during an open window. PJM would then evaluate and validate these proposals, compare their expected performance, and determine the best proposal amongst those submitted. If none of the proposed solutions resolve the violation, depending on the time constraints, PJM could either repost the violation and open another solicitation window, or develop an optimal solution and designate the incumbent transmission owner(s) to build the PJM solution. PJM did not follow this process.

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

Following the filed process would likely have resulted in a significant reduction of more than a year's worth of hard work performed by, and expenses incurred by, all participants. Instead, PJM Transmission Planning chose to modify all project submittals and, at the end of the day, selected the project closest to the one created by PJM.

With respect to the selection process, PJM used the cost estimates submitted by the proposers to screen all 26 proposals and short listed the less expensive proposals. While we understand the need by PJM Staff to narrow the proposals, if PJM was going to follow such a process, PJM should have made that clear before developers submitted their proposals, not after. Furthermore, the detailed cost estimates that PHI and Exelon, as well as others, provided were essentially cast aside and replaced by an independent contractor estimates when compared with other proposals. While we understand that there were no developer cost estimates for all the modified proposals, and PJM needs some 'sanity check' on cost estimates, following a defined process and clarifying PJM's expectations at the outset would have saved time and money by all parties involved.

PJM tried very hard to distinguish all short listed proposals. The effort is commendable as it is particularly difficult to distinguish amongst these plans that were essentially all developed by PJM. Going forward, PHI and Exelon suggest that decision metrics be developed and provided to all Stakeholders prior to the submittal of proposals so that developers know in advance how PJM will evaluate various projects. While we understand that PJM needs some flexibility to apply and weigh metrics and some metrics contain subjective components, their early visibility provides Stakeholders the necessary guidance and clarity for developing the right proposal that would meet PJM's needs. As a result, significant effort and expenses could be saved.

Finally, PHI and Exelon thank the PJM Board for their consideration and are ready and willing to work with PJM Transmission Planning to improve the competitive proposal process.

Sincerely,

David Velazquez

The PJM Board of Managers
PJM Interconnection, L.L.C.
955 Jefferson Avenue
Valley Forge Corporate Center
Norristown, PA 19403-2497

RE: PJM Artificial Island Project Selection

Dear PJM Board of Managers:

We write regarding the PJM Interconnection, L.L.C. ("PJM") Staff's request that you approve the Hope Creek – Red Lion transmission solution ("Staff Solution") to address identified system stability needs related to Artificial Island. We commend the Board of Managers and the PJM Staff for initiating a competitive process with the policy goal of finding the more efficient or cost effective project. This process has resulted in the identification of several alternatives that could address the stated system needs. While we know the PJM Staff and its consultants have worked tirelessly over the past year to evaluate these alternatives, the resulting Staff recommendation falls short from a transparency perspective and fails the above-stated policy goal. We strongly believe that the Staff Solution, if implemented, will materially disadvantage the PJM system and electric consumers in PJM when compared to the Southern Crossing solution proposed by Northeast Transmission Development,[1] a member of the LS Power Group of companies (the "LS Power Solution").

It appears that the Staff's recommendation was founded upon the conclusion that the Staff Solution and the LS Power Solution are equivalent to each other from a cost standpoint. This conclusion was simply incorrect and inconsistent with the information presented by the independent consultants engaged by Staff.[2] While PSE&G estimated the cost of its project to be $297 million and we estimated the upper end of the LS Power Solution to be $148.6 million, the Staff attributed construction costs in the range of $211 - $257 million for either project. We appreciate that predicting the costs of constructing a project of this type is a difficult task, and that it is not unusual for actual costs to exceed the estimate. However, even taking into account the uncertainties inherent in any cost estimation process, there are real and

[1] LS Power Proposal "5A" consisting of a new connection between Salem and Silver Run (new) with an overhead or submarine crossing of the Delaware River.

[2] GAI Consultants, Inc. estimates the cost/mile for overhead 500 kV to be $5 million/mile versus Staff's stated assumption of $3.6 million/mile. GAI Consultants included an adder of $1 million/mile due to the specialized construction practices required given the extensive wetlands and limited access for the Staff Solution, which Staff did not appear to consider. UC Synergetic, LLC identifies $56 million in compensatory mitigation required for a comparable crossing of federal lands as is required for the Staff Solution, which Staff did not appear to consider.

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

material differences between the reasonably expected costs of constructing the Staff Solution as compared to the reasonably expected costs associated with the LS Power Solution, and these differences were not in our view properly accounted for in the selection process.

In order to remove any cost uncertainty from the selection process, and to guarantee that the ratepayers receive the benefit of the real and material cost advantages offered by the LS Power Solution, we will agree to cap the construction cost of the LS Power Solution (overhead or submarine) at $171 million. This approach, which could be implemented by way of a covenant in the Designated Entity Agreement for this project, will guarantee $40 to $90 million of savings relative to the Staff's cost estimate for the Staff Solution and almost $130 million relative to the significantly higher cost estimate provided by PSE&G, the entity to which PJM proposes to assign the Staff Solution.[3] Please note that the $171 million figure mentioned above is a cap on the amount of construction costs we would be permitted to claim. If the actual construction costs come in at or below our upper-end estimate of $148.6 million, which we continue to believe is reasonable, the savings to the ratepayers will be significantly greater.

Moreover, the Staff's recommendation appears to reflect Staff's difficulty in consistently applying non-cost evaluation criteria in accordance with the PJM Operating Agreement.[4] As identified in Exhibit A, the LS Power Solution is either superior or equal to the Staff Solution for each of the criteria listed in the PJM Operating Agreement. Although we understand that achieving a high degree of certainty while evaluating proposed alternatives is a challenging undertaking, it appears that Staff may have made certain arbitrary judgments regarding critical aspects of the LS Power Solution (as compared to the Staff Solution) that are not supported by the PJM Operating Agreement criteria. For instance, the Staff did not appear to appropriately consider key factors that favor the LS Power Solution such as schedule, right-of-way, route diversity, black start, market efficiency, feasibility, and system outage requirements.[5] We urge the Board of Managers to reconsider how these criteria were applied, in order to ensure compliance with the PJM Operating Agreement.

In summary, relative to the Staff Solution, the LS Power Solution will:[6]

- Be $40 to $130 million lower in cost based on a firm construction cost cap (and offer even greater savings if, as expected, construction costs come in below the agreed cap);

[3] It is important that the Board look independently at Staff's cost estimate assumptions. In 2012, in selecting among competing projects, PJM estimated the cost of the Byron – Wayne transmission project to be $109.6 million relative to Commonwealth Edison's original estimate of $275 million and subsequently revised estimate of $140 million. After approval from PJM, Commonwealth Edison filed for incentive rates at FERC estimating the cost to be $277 million. See *FERC ER14-1556*.

[4] The PJM Operating Agreement identifies four criteria that PJM should consider in determining the more efficient or cost effective solution. See *PJM Operating Agreement, Schedule 6, Section 1.5.8(e)*

[5] PJM previously identified route diversity and right-of-way requirements as key differentiating factors for project selection among alternatives in Illinois in 2012. See *TEAC Recommendations to the PJM Board, PJM Staff Whitepaper, October 16, 2012*.

[6] See *Northeast Transmission Development Comments in response to the PJM RTEP – 2013 Artificial Island Proposal Window dated June 2, 2014*.

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

- Provide $35 million more in market efficiency benefits;
- Be able to be placed in service one to two years earlier;
- Require no new private rights-of-way;
- Utilize a new route (for which all private rights-of-way have been secured), thereby avoiding placement of the critical outage and contingency in the same corridor;
- Provide black start benefits;
- Avoid outages of the 5015 (Hope Creek – Red Lion) 500 kV transmission line; and
- Not face the potentially insurmountable risks associated with significant wetland impacts and the crossing of the Supawna Meadows National Wildlife Refuge.

Based on the foregoing, we believe that the ratepayers in the PJM system will receive materially greater economic benefits and assume less execution risk if the PJM Board selects the LS Power Solution as the most efficient and cost effective solution to the identified need, and designates it as the Designated Entity to construct and own the project. As noted above, we are offering to guarantee these benefits by agreeing to cap the construction cost of the LS Power Solution. In any case, we stand ready to advance this project with the utmost priority immediately upon assignment from the PJM Board.

Respectfully,

NORTHEAST TRANSMISSION DEVELOPMENT, LLC

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

Exhibit A

PJM OPERATING AGREEMENT CRITERIA

LS Power Solution vs. Staff Solution

In accordance with the PJM Operating Agreement,[1] PJM shall consider the following criteria in determining the more efficient or cost effective solution.

1. *The extent to which a [project] would address and solve the posted violation, system condition, or economic constraint.*

   PJM has identified that both projects address and solve the system condition identified through the Artificial Island Proposal Window.

2. *The extent to which the relative benefits of the project meets a Benefit/Cost Ratio Threshold of at least 1.25:1 as calculated pursuant to Section 1.5.7(d) of this Schedule 6.*

   Although neither project meets the 1.25:1 ratio, the LS Power Solution has been identified to have $35 million more in market efficiency benefits than the Staff Solution. In addition to higher benefits, the LS Power Solution will be lower cost and, based on LS Power's cost guarantee, will be supported by a firm construction cost commitment. As a result, the Benefit/Cost Ratio for the LS Power Solution is more than double the Benefit/Cost Ratio for the Staff Solution.

3. *The extent to which the [project] would have secondary benefits, such as addressing additional or other system reliability, operational performance, economic efficiency issues or federal Public Policy Requirements or state Public Policy Requirements identified by the states in the PJM Region.*

   The LS Power Solution has numerous secondary benefits identified by PJM including providing black start benefits, route diversity, and higher economic efficiency benefits.

   The Staff Solution, in contrast, has several detriments as it will create more NERC Category-D contingencies, locate the critical contingency and outage for the Artificial Island stability issue within the same corridor, and require an extensive outage of the 5015 (Hope Creek – Red Lion) 500 kV transmission line.

   Staff has characterized the 500 kV transmission line as "more robust" and providing greater power transmission capacity. The characterization of "more robust" is unrelated to the issue being resolved – PJM has found that all of the solutions are comparable in resolving the stability concern. While a 500 kV transmission line will be rated at a higher capacity, the market efficiency analysis proves the LS Power Solution to be of a greater market benefit.

4. *Other factors such as cost-effectiveness, the ability to timely complete the project, and project development feasibility.*

[1] See *PJM Operating Agreement, Schedule 6, Section 1.5.8(e).*

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

Other factors also clearly favor the LS Power Solution.

The LS Power Solution will be $40 to $130+ million lower cost and be able to be placed in service one to two years in advance of the Staff Solution.

All of the private right-of-way has been secured for the LS Power Solution as compared to over 8 miles of new right-of-way that would need to be acquired for the Staff Solution.

Both solutions require a crossing of the Delaware River. The LS Power Solution has mitigated the risk associated with permits and approvals given that both an overhead and submarine installation could be considered. Development of the Staff Solution may not be feasible given the potentially insurmountable risks associated with tens to hundreds of acres of wetland impacts and the crossing of the Supawna Meadows National Wildlife Refuge.[2]

Staff has identified space may be somewhat more limited or constrained at Salem as compared to Hope Creek; however, there are no physical limitations preventing expansion of either substation. Furthermore, the LS Power Solution could originate at Hope Creek to the extent it was beneficial.

[2] PJM has identified a technically viable, cost-comparable alternative (LS Power Solution) that addresses the Artificial Island electrical reliability issues without crossing the Supawna Meadows National Wildlife Refuge or impacting tens to hundreds of acres of wetlands. The existence of a practicable alternative that avoids these impacts will make it difficult, if not impossible, to obtain the necessary freshwater wetlands permit in New Jersey and right-of-way grant from the U.S. Fish and Wildlife Service that would be required for the Staff Solution.

20150129-5080 FERC PDF (Unofficial) 1/29/2015 10:54:03 AM

Attachment 13

2750 Monroe Blvd
Audubon, PA 19403-2497

Steven R. Herling
Vice President – Planning

July 23, 2014

Dear TEAC Members:

The PJM Board of Managers has evaluated more than 25 proposals to resolve grid stability problems in the area known as Artificial Island, including a proposal recommended by PJM staff. The Board has received a wide range of comments from interested stakeholders including issues related to electrical performance, environmental impact and cost allocation. In addition, LS Power has modified its proposal to place a fixed cap on the costs associated with the project.

The Board appreciates the analyses and comments submitted by various stakeholders through an entirely new competitive process guided by FERC Order 1000. To ensure a thorough and fair review, given the complexities of the issues, the Board has determined that it will take the matter under advisement and defer a selection at this time. To further inform the Board, PJM staff will be undertaking the following supplemental steps:

1. PJM will review, in an open stakeholder session with the Transmission Expansion Advisory Committee, our response to the specific issues raised in the letters submitted to us. We will review how issues raised in letters submitted to the Board were initially addressed and will note any issues that require further analysis. Finally we will present the rationale behind the Board's decision to defer a selection at this time;

2. As noted, LS Power has submitted a fixed cost cap on its proposal as part of its letter of July 8, 2014. While we will be working on changes in our process to ensure that any future proposals are presented to PJM in a more timely fashion, the Board feels it appropriate to allow the four "finalist" bidders to have the opportunity to supplement their proposals in light of LS Power's proposal. (Those bidders are Public Service Electric and Gas, Transource Energy, LS Power and Dominion.) The project costs included in any such supplemental proposals to PJM will be factors considered in the final selection for an Artificial Island solution. However, the Board has reiterated that cost is only one of several considerations that will drive a final decision.

3. PJM will be reaching out to the Nuclear Regulatory Commission to discuss technical issues associated with certain proposals impacting nuclear switchyards.

4. In order to ensure fairness and transparency, and to enable necessary discussions with any of the qualifying entities wishing to supplement their proposal, PJM is exploring ways to enhance our process. Additional information will be provided once we examine any submittals we receive.

The Board appreciates stakeholders' patience during this process. Order 1000, which guided our competitive bidding initiative on this project, has created entirely new processes which are especially challenging when evaluating transmission solutions as complex as those required for the Artificial Island stability issues. For these reasons, the Board is outlining these additional steps to ensure that the most technically effective and cost-efficient proposal to solve the Artificial Island stability issues is selected.

Steve Herling

RE: Artificial Island Supplemental Proposal Request

Project P2013_1-1A - Two (2) Thyristor Controlled Series Compensation (TCSC) Devices near New Freedom[1] (Dominion)

Proposal P2013_1-1C - Install a new 500kV line from Hope Creek - Red Lion without Salem Hope Creek 2nd Tie (Dominion)

Proposal P2013_1-2B - Two (2) 500/230 transformers near Salem and loop in Red Lion - Cartanza 230 and Red Lion - Cedar Creek 230 kV (Transource)

Proposal P2013_1-5A - New 230 kV station that taps existing Cedar Creek - Red Lion 230kV and Cartanza - Red Lion 230kV, submarine and overhead (LS Power)

Proposal P2013_1-7K New 500kV Hope Creek - Red Lion Line, without Salem-Hope Creek 2nd Tie (PSE&G)

Dear Proposer,

At the July Board meeting, the PJM Board deferred selection for the Artificial Island project solution in order to obtain additional information. PJM staff will be gathering additional information from those entities that have proposed projects that have passed the various levels of analysis undertaken by staff as laid out at the May 19 TEAC meeting. As described in the July 23rd letter to the TEAC, finalist bidders will have the opportunity to supplement their proposals.

[1] Based on Dominion's July 16th letter, PJM has determined that it would be appropriate to seek additional information as outlined above regarding the Dominion 1A project.

PJM is inviting you as a "finalist" bidder (Proposer) to submit final terms of project costs. We reiterate that cost is only one of several considerations that will be a factor in the final selection for the AI Project Proposal Window. This request is not open for Proposers to make changes to the project scope. The scope of a submission must be limited to factors that specifically address project cost. If a Proposer wishes to supplement its proposal in terms of cost, the Proposer must include sufficient detail for PJM to evaluate the details of its cost proposal, including the specific details surrounding any cost cap that a proposer wishes to submit. Submission of a cost cap is not required but if a Proposer wishes to submit a cost cap, the Proposer must be explicit in identifying the scope of the work that is included and excluded from the project cost or cost cap. Any contractual terms and conditions that would apply to the proposed project cost or cost cap must also be specified in the submission.

Each project's scope of work under consideration is that which was studied by PJM with respect to performance criteria including PJM modifications as noted on the attached diagrams and as discussed at the May 19 TEAC meeting. Any supplemental proposal must be consistent with the attached diagrams. Proposers must affirm the project schedule based on scope with PJM modifications and projected in-service date.

Further, it has been brought to PJM's attention that the State of Delaware public utility regulations may restrict the ability of a developer to site and construct new transmission in Delaware if the Proposer does not currently have a service territory as established by the state commission in the area of their project. Therefore, PJM requests that all Proposers who have submitted projects that require construction within the state of Delaware, provide a detailed response, including legal references, as well as confirmation from the Delaware Public Service Commission or the Office of the Delaware Attorney General regarding Proposer's legal ability to site and construct transmission in the State of Delaware consistent with its project proposal.

If you wish to supplement your proposal, the submission must be sent to PJM at RTEP@pjm.com no later than close of business on September 12, 2014 for consideration.

We appreciate your continued cooperation as we move forward on the Artificial Island competitive solicitation process.

Very truly yours,

Steven Herling
Vice President – Planning

VIA FEDERAL EXPRESS

The Honorable Curtis L. Wagner, Jr.
Chief Administrative Law Judge
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: Status Report – Artificial Island Solicitation
Appointment of Facilitator
Docket No. MD14-1

Dear Chief Judge Wagner:

Pursuant to Rule 604(d) of the Commission's Rules of Practice and Procedure,[1] this submittal will provide an outline of the requested scope of a dispute resolution proceeding, for which PJM Interconnection, L.L.C. ("PJM") seeks ALJ-ADR assistance from your office.[2]

Following PJM's request to Your Honor to engage the Commission's non-evaluative Alternative Dispute Resolution ("ADR") process and your appointment of Administrative Law Judge Steven L. Sterner, PJM has spoken with Judge Sterner regarding PJM's request.[3] During that discussion, PJM explained its desire to have an Administrative Law Judge ("ALJ") present in a non-decisional role to ensure the fairness and due process surrounding PJM's discussions with the four final bidders of the Artificial Island Proposal Window regarding the supplemental material submitted by each bidder with the final terms of their project costs. This correspondence provides a summary of the matter and outlines PJM's expectations with regard to Judge Sterner's role as a neutral, non-decisional observer.

I. Background

As part of PJM's compliance with Order No. 1000, PJM proposed to implement a proposal window process to permit both incumbent transmission owners and non-incumbent developers the opportunity to submit project proposals through a proposal window. If the project is included in the regional transmission expansion plan ("RTEP') and the "proposer" meets the qualification

[1] 18 C.F.R. § 604(d) (2013).

[2] This communication is submitted under Rule 604(d). *See* 18 CFR § 385.604(d) (2013).

[3] Judge Sterner shall serve as a "neutral" consistent with Rule 604(c).

criteria, the proposer may be designated construction, ownership and financial responsibility for its proposed project.

In April 2013, PJM opened a 60-day proposal window[4] to solicit projects from stakeholders to address operational performance issues around Artificial Island.[5] PJM received 26 proposals from seven different entities. The proposals ranged in cost from just over $100 million to over $1,500 million. The proposals included flexible alternating current transmission system ("FACTS") devices, high-voltage direct current ("HVDC") lines, new overhead and underground/underwater 230 kV lines and new overhead 500 kV lines. For over a year, PJM staff completed extensive technical evaluations of each proposal. Based on the results of the analytical screening and the estimated cost of each proposal, PJM began to focus on a subset of proposals. The subset of proposals included both southern Delaware River crossings (overhead and submarine) that terminated at the existing 230 kV system in Delaware and new 500 kV lines from either Hope Creek or Salem substations to the Red Lion 500 kV substation in Delaware. On May 19, 2014, PJM presented to the stakeholders in the context of the Transmission Expansion Advisory Committee ("TEAC"), a detailed summary of PJM's evaluation of the submitted proposals. At the June 2, 2014 TEAC, PJM presented the project proposal (a new 500 kV line from the Hope Creek substation to Red Lion substation) and the name of the designated entity (Public Service Electric and Gas Company) it planned to recommend to the PJM Board of Managers ("PJM Board") at the July Board meeting.

At the July Board meeting, PJM briefed the PJM Board on PJM's evaluation of the Artificial Island proposals. In addition, the PJM Board reviewed ten (10) letters submitted from proposers, state commissions and stakeholders commenting on PJM's proposed recommendation. Included in those letters was a late-filed submission by Northeast Transmission Development, LLC ("LS Power") proposing to cap construction costs associated with its project. Based on its review, the PJM Board determined to take the matter under advisement and deferred selection of the Artificial Island project solution pending PJM staff gathering additional information from the following four final bidders: Virginia Electric and Power Company, Transource Energy, LLC, LS Power and Public Service Electric and Gas Company.

II. The ADR Process:

By letter dated August 12, 2014, each bidder was notified of their status and invited to supplement their submissions with the final terms of their project costs only. PJM will evaluate the details of each bidder's cost proposal, including the specific details surrounding any cost cap that a bidder may wish to submit. In anticipation of the variability of the responses PJM expects to receive and the complexity of evaluating cost submittals (particularly the terms of any

[4] The proposal window process was proposed and accepted by the Commission as part of PJM's compliance with Order No. 1000, effective January 1, 2014. *See PJM Interconnection, L.L.C., et al.*, 147 FERC ¶ 61,128 (May 15, 2014); *PJM Interconnection, L.L.C., et al.*, 146 FERC ¶ 61,030 (Jan. 16, 2014); *PJM Interconnection, L.L.C., et al.*, 142 FERC ¶ 61,214 (Mar. 22, 2013).

[5] Artificial Island is the area in Southern New Jersey where the Salem and Hope Creek nuclear generation is located. Historically, the area has been constrained. Stability of the generation has been ensured through the use of operating procedures.

proposed cost caps), PJM has requested to engage an ALJ through the Commission's Dispute Resolution Services to serve in a non-decisional role to ensure due process and fairness as PJM undertakes the final discussions with the finalists on their proposals prior to final submission of PJM staff's recommendation to the PJM Board. To that end, Judge Sterner has invited PJM to outline the process requested, including the PJM's expectations regarding Judge Sterner's role in that process. PJM appreciates the Judge's thoughtful suggestion and has prepared, in consultation with Judge Sterner, the following scope for Your Honor's consideration:

- PJM anticipates Judge Sterner's role as a neutral, non-decisional observer of the *process* PJM utilizes in discussing with the four final bidders the supplemental proposals submitted on September 12, 2014. Judge Sterner's presence either through direct attendance at meetings (either at FERC or an offsite location) or reviewing of agendas and proposed questions, if personal attendance at a particular meeting is not possible, would ensure that PJM's line of inquiry is consistent with each of the bidders and that no bidder is given an undue advantage in their presentation to PJM.
- Judge Sterner will not serve in a decision-making role nor is this process intended to be conducted as a settlement conference or a matter for traditional dispute resolution. Judge Sterner will be observing and commenting on PJM's process but not attempting to bring parties together to seek common ground or otherwise drive toward any particular substantive outcome.
- Judge Sterner will observe and comment upon, as described below, the fairness of the process undertaken by PJM through these final negotiations but not attempt to influence PJM staff's substantive recommendation or the final PJM Board decision in any way. To that end, PJM will seek Judge Sterner's timely feedback throughout the process, as appropriate, regarding PJM's comparable treatment and dissemination of information to all bidders. Given this role, Judge Sterner's comments on the process will be directed solely to PJM as PJM crafts or undertakes these meetings and will not be simultaneously reported to the developers in attendance or those not in attendance.
- PJM will not be required to follow the Judge's recommendations.
- Judge Sterner will provide a report to PJM and will publish the final report on eLibrary under Docket No. MD14-1 upon completion of the process or earlier, as mutually agreed upon by Judge Sterner and PJM. The Judge's report will help inform the PJM Board on the fairness of the process and serve as a valuable tool for guiding such future negotiations undertaken in implementing Order No. 1000's call for competitive solicitation processes. PJM's goal is to submit its recommendation to the PJM Board for consideration at the Board's December 2014 meeting.
- It is understood that Judge Sterner accepts the process to date and will oversee only these final information sessions. His presence may not be used by any participant as a judgment on any of the steps undertaken by PJM as part of this competitive solicitation prior to his formal involvement in this matter in overseeing the meetings referenced above.
- Because the discussions will involve a review of proprietary cost information, it is understood that the discussions of each party's September 12 submittal will be treated as

confidential. Accordingly, all communications and information provided under this process shall be treated in accordance with Rule 606 of the Commission's Rules of Practice and Procedure.[6]

- The involvement of Judge Sterner and the Commission's ADR process in this matter does not provide any party with rights of discovery or rights to be in attendance at meetings where confidential information of other parties is being discussed.
- All finalists will be asked to sign a letter agreeing to engage in fact finding sessions in the presence of Judge Sterner and OALJDR staff regarding the supplemental information provided by them in response to PJM's August 12, 2014 letter. Should any party refuse to sign a letter, PJM will decide the merits of that party's submittal based solely on the submitted documentation without any additional communications.
- PJM will prepare a meeting schedule that will attempt as much as possible to accommodate Judge Sterner's availability either in person or by telephone.
- Pursuant to 18 CFR §385.604(f), Judge Sterner will provide Your Honor with periodic Status Reports, as needed. The reports shall advise Your Honor of the progress and developments in this matter. In order to maintain the confidentiality of the matters herein, the reports will not be filed in FERC's eLibrary. Upon conclusion of the process, Judge Sterner shall issue a notice ending this alternative dispute resolution proceeding.

In addition to the above, PJM anticipates the following guidelines governing the conduct of any discussions undertaken with the four finalists:

- Each finalist will be asked to attend non-public fact finding sessions to answer questions by PJM staff or its consultant(s), (if a consultant is retained by PJM) in the presence of Judge Sterner and his staff. PJM shall determine whether to meet with finalists, individually or collectively, in the presence of Judge Sterner to maintain the confidentiality of proprietary information.
- The purpose of the fact finding sessions will be to ask questions regarding the terms of each bidder's project costs, including specific details about their cost cap, if applicable.
- At PJM's discretion, such fact-finding sessions may be conducted either as face-to-face meetings or teleconference calls.
- Nothing in these procedures prevents PJM from gaining additional information from other entities who have not submitted proposals, such as state commissions and the Nuclear Regulatory Commission. To the extent any additional non-confidential information impacts the PJM staff's recommendation, the results of those discussions will be reported by PJM to all stakeholders through PJM's report to the TEAC.
- The procedures outlined above governing meetings relative to the developer's September 12 submittals (and their underlying submittal) do not prohibit incidental procedural and administrative communications with individual bidders throughout this process.

[6] 18 C.F.R. § 385.606 (2013).

- PJM requests that this matter be lodged as a non-public docket.
- Following completion of this process, PJM Staff will prepare a final report for presentation to the TEAC and the PJM Board with a final recommendation.

We look forward to working with Judge Sterner and your OALJDR staff in this unique structure. We appreciate your consideration. To the extent any additional authorizations are needed for us to engage Judge Sterner in this helpful role as we implement the first-in-the-nation competitive solicitation process, pursuant to the Commission's Order No. 1000, we would seek your assistance in obtaining same.

Should you wish to discuss this further or need additional information, please contact Craig Glazer at 202-423-4743 or by e-mail at craig.glazer@pjm.com or PJM Counsel, Pauline Foley, at 610-666-8248 and pauline.foley@pjm.com.

Thank you.

Sincerely,

Pauline Foley
Assistant General Counsel

Meeting Agenda and Format

PJM©2014

Meeting Format and Agenda

- Evaluation update - PJM
- Project Presentations – Finalist Proposers
- Break
- General Artificial Island Q&A session

PJM©2014

Artificial Island Analysis Summary
Recent Activities

PJM©2014

Summary of Actions Taken by PJM

- Requested and received supplemental cost proposals from finalist proposing entities
- Conducted meetings with finalist proposing entities and FERC Administrative Law Judge
- Performed additional performance analysis of the TCSC project
- Gathered input from permitting and regulatory entities
- Met with FACTS based device industry representatives
- Performed additional constructability reports

PJM©2014

FERC Administrative Law Judge Letter

- Conducted meetings to ensure PJM has a clear understanding of the terms and conditions of the responses to PJM's offer
- Provided an overview of the process followed at the meetings
- Affirmed that meeting formats and durations were the same for all four Proposing Entities
- Concluded that all Proposing Entities were treated equally under the process
- http://elibrary.ferc.gov/idmws/file_list.asp?accession_num=20141203-3013

PJM©2014

Performance Analysis Summary

PJM©2014

FACTS Device Industry Representative Meetings

- PJM met independently with FACTS based device industry representatives
  - Expand PJM's understanding of the technology and implementation
    - Typical applications
    - Operation
    - Modeling
    - Failure modes
    - Construction timeframes
  - Summary:

    (1) TCSC components are employed in the industry with high reliability;

    (2) TCSC application is a variant of existing FACTS installations using similar components (see 1 above)

PJM©2014

TCSC Performance Analysis

- PJM Simulations
  - Validated the performance of the TCSC under several failure and outage mode scenarios
    - Critical pre-contingency outage conditions
    - Critical faults
    - Assumed combinations of failure modes and outage conditions
    - Performance

PJM©2014

TCSC Outage and Failure Mode Evaluation

	TCSC on 5023	TCSC on 5024	SVC at New Freedom	Stability	line outage in pre-contingency	Note
Assume TCSC Outage - simulate as open circuit	outage	outage	in	unstable	Two line outages	N-2-1 Beyond criteria
	outage	in	in	stable	One line outage	N-1-1
	in	outage	in	stable		N-1-1
Assume TCSC Failure - simulate as 0% compensation	failure	failure	in	unstable		N-1-3 Beyond criteria
				unstable		N-1-3 Beyond criteria
	failure	in	in	stable		N-1-2 Beyond criteria
				stable		N-1-2 Beyond criteria
	in	failure	in	stable		N-1-2 Beyond criteria
				stable		N-1-2 Beyond criteria
	failure	failure	in	stable	no line outage	N-3 Beyond criteria
	failure	in	in	stable	no line outage	N-2 for two un-related elements - Beyond criteria
	in	failure	in	stable	no line outage	N-2 for two un-related elements - Beyond criteria
Assume SVC outage	in	in	outage	stable	no line outage	N-1-1
	in	in	outage	unstable	One line outage	N-2-1 Beyond the criteria
	in	in	outage	unstable		N-2-1 Beyond the criteria

PJM©2014

TCSC Performance Analysis

– Dominion 1A TCSC project proposal includes double breaker installations at four existing substations

- During study, it was determined that one proposed breaker at Hope Creek could be removed from the project scope with no impact to performance

PJM©2014

TCSC Analysis – SSR Study

- Engaged consultant to perform a Sub-Synchronous Resonance (SSR) study
  - Expected to be complete and posted at the end of December

PJM©2014

Constructability Analysis Summary

PJM©2014

Constructability Reports - Permit Comparison

- Report was commissioned that compares the permitting challenges between the Red Lion to Artificial Island project against those of the southern Delaware crossing projects.
  - Permitting issues identified are consistent with prior constructability reviews and stakeholder comments
  - National Environmental Policy Act (NEPA) review potential risk
  - Risk factors are such that neither has clear advantage in terms of siting and permitting hurdles to overcome
  - Final report has been posted on pjm.com

PJM©2014

Constructability Reports – Dominion 1A

- Report was commissioned to review the Dominion 1A FACTS based device project
  - Identified permitting challenges for the proposed project locations
    - Three of the four sites will face significant permitting challenges
  - Proposed project cost was evaluated
    - Concluded that the contingency applied could be greater due to some risk factors
  - Final report will be posted on pjm.com

PJM©2014

Permitting and Regulatory Agency Discussions

- NJ DEP
  - Permitting issues identified are consistent with prior constructability reviews and stakeholder comments

- NRC
  - No concerns raised about the use of FACTS-devices in the vicinity of Artificial Island
  - Nuclear licensee (PSEG Nuclear) will need to perform a 10CFR50.59 Safety Evaluation. If the evaluation concludes that there is a nuclear safety impact and a Technical Specification change is required, then NRC approval is required.

PJM©2014

Permitting and Regulatory Agency Discussions

- US Army Corps of Engineers
  - Discussed the NEPA process and Army Corps of Engineers' role
  - Southern Delaware crossing
    - Depth of 70 feet below mean low water required for a submarine cable within the shipping channel (based on 45ft depth in shipping channel and 25 ft. burial depth for cable)
  - Red Lion to Hope Creek line
    - Navigational concerns associated with tower foundations would need to be addressed
  - Identified that both routes face significant routing and permitting hurdles

PJM©2014

Non-Incumbent Developers in Delaware

- Questions were raised about the ability of non-incumbent developers to build and operate transmission infrastructure in Delaware

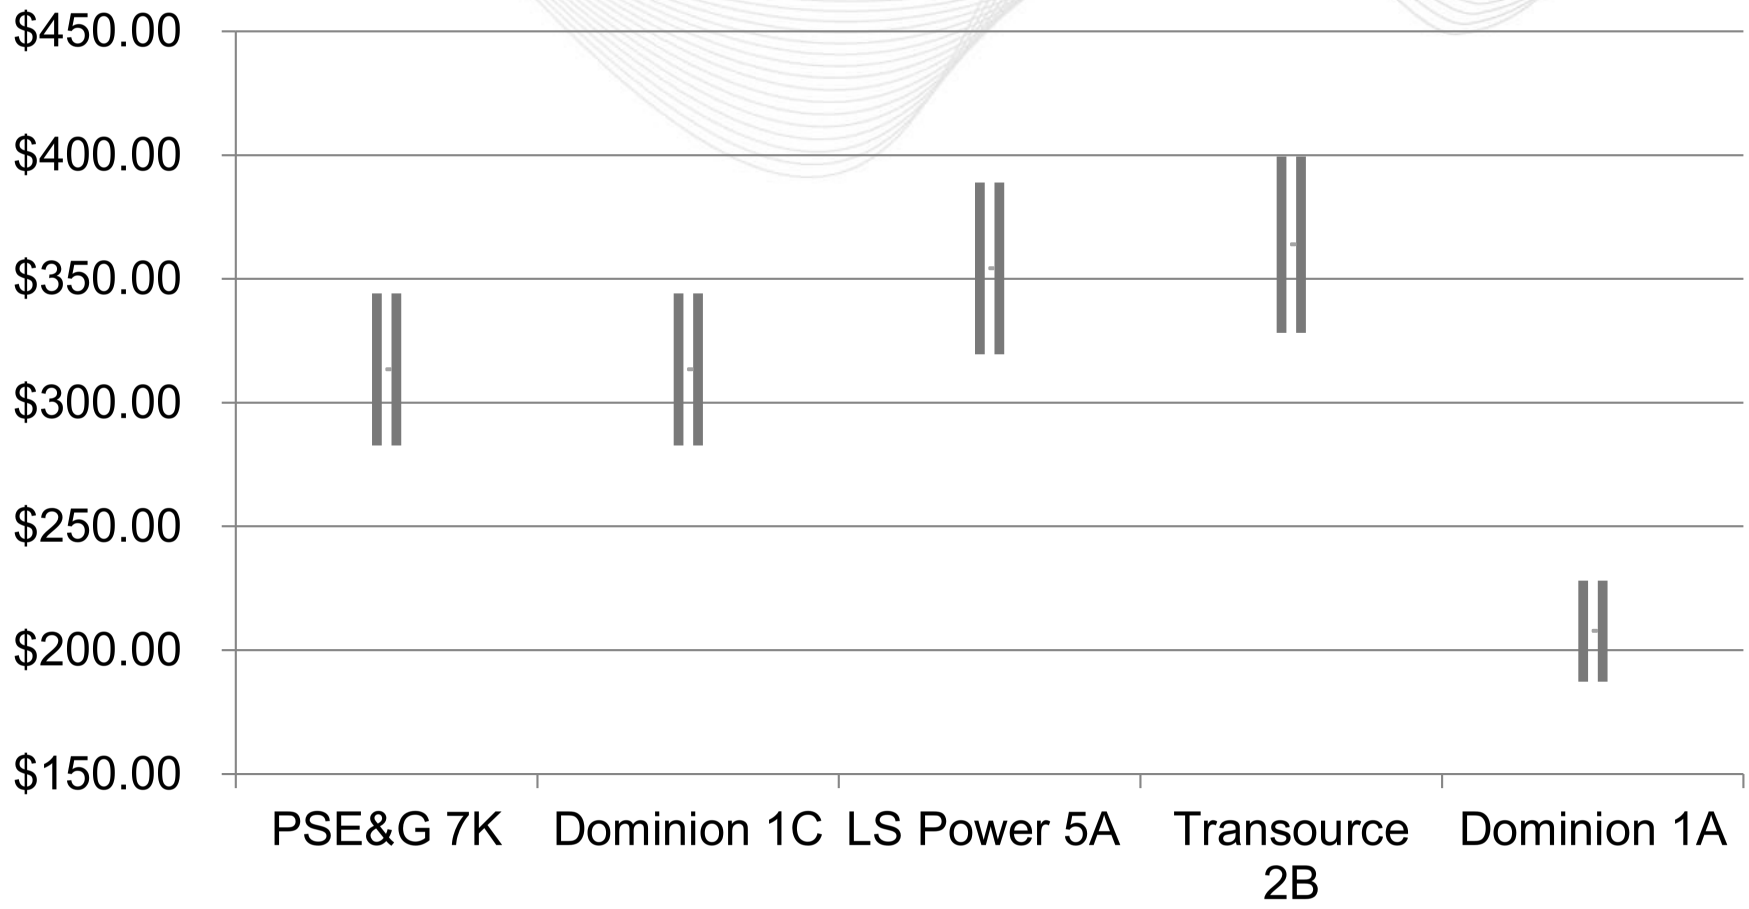
- Delaware issued an order affirming a non-incumbent's ability to construct, own and operate, subject to having to apply for a CPCN for specific project.

PJM©2014

Cost Estimate Summary

PJM©2014

PJM Cost Estimates



- Estimates are in millions of dollars

Cost Estimates Incorporating Cost Containment/Cap

- Total cost estimates that combine Proposing Entity cost containment numbers with PJM cost estimates
  - Costs estimates provided by Proposing Entities for project components within their cost containment mechanisms utilized
  - PJM cost estimates used for project components outside of proposed cost containment mechanisms

PJM©2014

Cost Estimates Incorporating Cost Containment/Cap

LS Power 5A	
Cost Containment	$146
Salem Expansion	$61.3 - $74.7
SVC Cost Estimate	$71 - $86
Project Total	$278 - $307

Transource 2B	
Cost Containment	$203 - $255
New Salem Substation	$41
Salem Expansion	$14.3 - $17.4
SVC Cost Estimate	$71 - $86
Project Total	$329 - $404

Dominion 1A	
Cost Containment	$0
Project Cost Estimate	$187 - $228

PSE&G 7K	
Cost Containment	$221
Red Lion Expansion	$4.9 - $6.0
SVC Cost Estimate	$71 - $86
Project Total	$297 - $313

Dominion 1C	
Cost Containment	$0
Project Cost Estimate	$211.7 - $257.7

PJM©2014

Supplemental Information Summary

PJM©2014

Supplemental Information Request Timeline

- 08/12 – Letter sent to Proposing Entity ‘finalists’ to provide opportunity to supplement their proposals
- 09/12 – Supplemental information submitted to PJM by all ‘finalists’
- 09/18 – Redacted versions of the supplemental information is posted to PJM.com
- Oct 22 through Nov 3 – Meetings with FERC Administrative Law Judge and finalists to review and confirm information

PJM©2014

LS Power Cost Containment Mechanism

- Costs included under the containment mechanism
  - Permits and government approvals
  - Land acquisition
  - Environmental assessment and mitigation
  - Engineering
  - Equipment, supplies and other material procurement
  - All development and construction activities

PJM©2014

LS Power Cost Containment Mechanism

- $146 Million

- Physical scope of work included under proposed mechanism
  - Aerial or submarine line
  - New substation located near the existing 230kV right-of-way in Delaware

- Physical scope of work not included under proposed mechanism
  - Salem substation modifications
    - New bay position
    - New 500/230kV transformer
  - 230kV turning poles cutting the two Delaware transmission lines

PJM©2014

LS Power Cost Containment Mechanism

- Costs not included under the containment mechanism
  - Financing costs
  - AFUDC
  - Additions and modifications to the project scope due to
    - "any material change in the enforcement, interpretation of application of any statue, rule, regulation, order or other applicable law existing.."
    - "any Breach or Default by PJM of its obligations under the DEA or any request by PJM to delay or suspend any activities associated with the Project".
    - "any breach, default, interference or failure to cooperate by any Transmission Owner in connection with the Interconnection Coordination Agreement or interconnection agreement"

PJM©2014

Transource Cost Containment Mechanism

- Proposed tiered cost containment mechanism
  - Up to $243 Million: entitled to recover all FERC approved ROE plus incentives
  - Portion from $243 to $299.8 million: forego 50% of any FERC approved ROE incentives
  - Above $299.8 million: forego 100% of any FERC approved ROE incentives

- Physical scope of work included under proposed mechanism
  - 230kV submarine cable from Salem substation to new substation in Delaware
  - New substation located near the existing 230kV right-of-way in Delaware
  - New 500/230kV substation adjacent to Salem substation

- Physical scope of work not included under proposed mechanism
  - Modifications in and near Salem substation
    - New bay position at Salem
  - 230kV turning poles cutting the two Delaware transmission lines

PJM©2014

Transource Cost Containment Mechanism

- Transource provided a contingency amount of $52.3 million which is included in the second tier of their cost containment mechanism
  - Some specific contingency items identified (redacted)
  - General 10% project contingency

PJM©2014

PSE&G Cost Containment Mechanism

- $221 Million

- Physical scope of work included under proposed mechanism
  - Aerial 500kV line from Hope Creek to Red Lion substations
  - Upgrade work at Hope Creek to create the new line bay

- Physical scope of work not included under proposed mechanism
  - Upgrade work at Red Lion to create the new line bay

PJM©2014

PSE&G Cost Containment Mechanism

- Costs included under the containment mechanism
  - All project costs with exceptions as noted below
  - Clarity is needed on what is meant by “all project costs”

- Costs not included under the containment mechanism
  - Costs associated with PJM modifications or additions to the scope of work
  - Costs incurred from the following events deemed outside of the control of PSE&G:
    - Changes in applicable laws and regulations
    - Obtaining governmental approvals and permits
    - Obtaining necessary property rights to construct the Project
    - Environmental permitting, remediation and mitigation
    - Orders of courts or action or in action by governmental agencies

PJM©2014

Dominion Supplemental Information

- Dominion did not provide a cost containment mechanism, but rather provided reasons for confidence in their ability to meet cost estimates and elaborated on project management approach and past experience with transmission projects
  - Red Lion to Hope Creek: agreed with PJM's cost estimate of $242 to $292 million
  - FACTS based solution: provided a revised cost estimate of $174.1 million
    - $86.4 million based upon vendor not-to-exceed budget prices

PJM©2014

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Calpine Corporation, Dynegy Inc., Eastern Generation, LLC, Homer City Generation, L.P., NRG Power Marketing LLC, GenOn Energy Management, LLC, Carroll County Energy LLC, C.P. Crane LLC, Essential Power, LLC, Essential Power OPP, LLC, Essential Power Rock Springs, LLC, Lakewood Cogeneration, L.P., GDF SUEZ Energy Marketing NA, Inc., Oregon Clean Energy, LLC and Panda Power Generation Infrastructure Fund, LLC, Complainants, v. PJM Interconnection, L.L.C., Respondent.	)	Docket No. EL16-49-000

MOTION TO INTERVENE AND COMMENTS IN PARTIAL SUPPORT OF THE PSEG COMPANIES

Pursuant to Rules 212 and 214 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission" or "FERC"), 18 C.F.R. §§ 385.212, 385.214, the PSEG Companies[1] (PSEG Power LLC ("PSEG Power");[2] Public

[1] The PSEG Companies are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). The principal and executive offices of PSEG are located at 80 Park Plaza, Newark, New Jersey 07102. PSEG is a public utility holding company engaged in, among other things, the generation of electric energy, and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

[2] PSEG Power is a wholesale energy supply company that integrates its generation asset operations with its wholesale energy, fuel supply, energy trading and marketing, and risk management functions through three principal subsidiaries: (i) PSEG Nuclear LLC ("PSEG Nuclear"), which owns and operates nuclear generating stations; (ii) PSEG Fossil LLC ("PSEG Fossil"), which develops, owns, and operates domestic fossil-fuel fired and other non-nuclear generating stations; and (iii) PSEG ER&T, which is described below.

20160411-5311 FERC PDF (Unofficial) 4/11/2016 4:36:39 PM

Service Electric and Gas Company ("PSE&G");[3] and PSEG Energy Resources & Trade LLC ("PSEG ER&T")[4]) submit this motion to intervene and comments in partial support of the above captioned complaint[5] against PJM Interconnection, L.L.C ("PJM") alleging that PJM's Open Access Transmission Tariff ("Tariff") is unjust and unreasonable because it does not include provisions to prevent the artificial suppression of prices by existing uneconomic generation resources not needed for reliability that are the beneficiaries of out-of-market revenues. As shown below, the PSEG Companies respectfully submit that the Complainants have effectively demonstrated that the current PJM Tariff is not just and reasonable because it fails to mitigate capacity market offers for units owned by subsidiaries of FirstEnergy Corporation ("FE") and American Electric Power Company, Inc. ("AEP") that will receive subsidies under Power Purchase Agreements ("PPA"), funded through non-bypassable distribution surcharges, recently approved by the Ohio Public Utility Commission ("PUCO"). The PSEG Companies submit, however, that more simplified mitigation procedures can be applied than those proposed by Complainants. Specifically, the Commission need not address the complex issues associated with changing the scope of the existing "minimum offer price rule" ("MOPR") at this time; instead, the Commission can directly mitigate the offers submitted by the FE/AEP units. In addition, mitigation can be accomplished through

[3] PSE&G is a public utility company organized under the laws of the State of New Jersey. PSE&G is presently engaged in, among other things, the transmission and distribution of electricity and the distribution of natural gas in New Jersey. PSE&G owns transmission facilities in PJM Interconnection, L.L.C. ("PJM").

[4] PSEG ER&T, an indirect subsidiary of PSEG, sells power and energy and certain ancillary services at market-based rates. PSEG ER&T markets the capacity and production of PSEG Nuclear's and PSEG Fossil's generating stations, manages the commodity price risks and market risks related to generation, and provides gas supply services. PSEG ER&T is engaged in extensive asset-based energy trading operations throughout the Northeast.

[5] "Complaint Requesting Fast Track Processing," *Calpine Corporation, et al. v. PJM Interconnection, L.L.C.*, Docket No. EL16-49-000 (March 21, 2016) ("Complaint").

simpler and less time-consuming measures than those proposed by Complainants. In support thereof, the PSEG Companies respectfully show as follows:

I. INTRODUCTION

The PUCO recently approved two PPAs covering generating facilities with an aggregated capability of 5,927 MWs owned by subsidiaries of FE and AEP.[6] Other FE/AEP companies with franchised service territories in Ohio with the responsibility to provide "provider of last resort" service to Ohio consumers will be the purchasers under the PPAs. The PPAs provide that the FE/AEP generating companies will be paid (or will be required to pay) the difference between the cost of operating the covered generating facilities and the revenues received by those facilities from the PJM-administered markets for energy, capacity and ancillary services. The PUCO has determined that over the eight year term of the arrangements that payments received are expected to exceed the amounts paid out thus resulting in net benefit to consumers. However, the PUCO acknowledged that for the early years of the PPAs the cost of operating the plants is expected to exceed the PJM market revenues that the plant will earn. When market revenues are insufficient to cover to the cost of operating the plants, shortfall amounts will be collected through non-bypassable charges imposed on AEP/FE distribution customers.

The instant Complaint concerns how the units receiving subsidies under the PPAs should participate in the upcoming Base Residual Auction ("BRA") for capacity that will

[6] *In the Matter of the Application of Ohio Edison Company, the Cleveland Electric Illuminating Company and the Toledo Edison Company for Authority to Provide for a Standard Service Offer Pursuant to R.C. 4928.143 in the Form of an Electric Security Plan*, Case No. 14-1297-EL-SSO (March 31, 2016) ("FE Order*"); In the Matter of the Application Seeking Approval of Ohio Power Company's Proposal to Enter Into an Affiliate Power Purchase Agreement for Inclusion in the Power Purchase Agreement Rider*, Case No. 14-1693-EL-RDR (March 31, 2016) ("AEP Order").

be conducted under the auspices of PJM's Reliability Pricing Model ("RPM"). As shown in the Complaint, the PPA units will be incentivized to bid zero or, at least, at low prices in order to assure that they clear in the auction. First, the units lack any incentives *not* to clear regardless of their actual cost of operation. In contrast to units that are dependent on market revenues to recover their costs and thus can be expected not to bid below their avoidable costs, these units will be fully compensated regardless of the PJM clearing price. Second, the PPAs require that units be bid in a manner that is "not unreasonable."[7] Thus, under the "contract for differences" construct entailed by the PPAs, FE/AEP could be deemed to have acted "unreasonably" if they bid in such a manner that they fail to avail themselves of available market revenues by not clearing. This holds true regardless of the amount of those revenues so that the units have strong incentive to bid as price-takers. Both PJM and the Independent Market Monitor ("IMM") share these concerns.

Further, although FE/AEP may contend that they will have incentives to bid the affected units competitively due to potential market impacts on their other units that do not have PPAs, such a contention would be unavailing or, if accepted, would obviate any possible objection to being mitigated. As shown *supra*, the PPA units have strong incentives to bid in a manner such they will be assured of clearing. If they do clear the auction, they can expect to recover the full cost of operating the affected plants. Before accepting the contention that the impact on the non-PPA units would supply adequate incentives to bid the units in a competitive manner and thus neutralize the strong countervailing incentives to submit bids assured of clearing, the companies would need to demonstrate that the impact on their non-PPA units would clearly exceed the value of the recovering the above-market portion of the PPA payments. Even if this were possible to

[7] FE Order, at 20; AEP Order, at 89.

demonstrate (which is by no means clear), it could not possibly be accomplished before the upcoming BRA thus leaving the auction outcome at risk unless mitigation measures are adopted. Further, if FE and AEP make the assertion that they actually have incentives to bid in a competitive manner and, that assertion is accepted at face value, the companies should not be concerned about reasonable mitigation measures since that would be how they would bid anyway.

As the Complaint further demonstrates, allowing the units to bid in this manner would impact efficient price formation in the PJM capacity market. Based on PJM's own calculations from the last BRA, approximately $990 million in market revenues that would otherwise be associated with a competitive clearing could be eliminated.[8] The basic tenet that underlies the RPM market design is that, over the long run, competitive bids will result in *average* prices commensurate with the cost of new entry for the reference unit. Thus, if developers perceive that bids by subsidized units below competitive levels will be allowed, thus tending to lower average prices, they may be unwilling to commit the necessary capital to build new plants. Further, if regulators in states other than Ohio perceive a need to "protect" capacity resources located within their borders, the breakdown in PJM's capacity markets could increase the number of subsidized units that bid as other states perceive similar actions. As the IMM states, the price suppressive impacts associated with the FE/AEP PPAs will "make it difficult or impossible for generating units without subsidies to compete in the market."[9]

[8] *See* Complaint, Attachment A, Cavicchi Affidavit, P 8 ("Cavicchi Affidavit").
[9] Complaint, at 31 (quoting Bowring AEP Supplemental Testimony at 5; Bowring FE Testimony at 5).

The MOPR was established as part of the RPM construct to prevent "uneconomic entry" by new resources.[10] As the Complaint demonstrates, however, "because PJM's auction clearing mechanism does not distinguish between offers from new and existing resources, and simply clears such offers on a least cost basis, there is not practical difference between the price suppression that will result from below-cost offers for new resources and that which will result from below-cost offers for existing resources."[11] Thus the failure of the MOPR to address the FE/AEP PPAs renders the current PJM mitigation scheme unjust and unreasonable. As relief, the Complaint calls for MOPR modifications that would be sufficiently broad to encompass the PPA units to be placed into effect for the upcoming BRA. The Complaint also proposes methodologies for calculating acceptable floor prices that take account of risks and opportunities associated with the Capacity Performance construct as well as take account of the levels of avoidable costs for the units. The Complaint acknowledges, however, that "permanent" changes to the MOPR should not be put into effect until a PJM stakeholder process has occurred.[12]

The PSEG Companies support the conclusion that the PJM Tariff, and in particular, the MOPR, is not just and reasonable under the Federal Power Act ("FPA") because it fails to mitigate the capacity market offers of the PPA units notwithstanding that FE/AEP have strong incentives to submit offers for the affected units below competitive levels. The PSEG Companies are concerned, however, that there is insufficient time to properly vet the changes proposed by the Complainants to the MOPR before the upcoming 2019-2020 BRA. While the PPAs do pose an "imminent threat" to

[10] *See* Complaint, at 13 (quoting April 2011 Order, 117 FERC ¶ 61,022, P 124).
[11] Complaint, at 24.
[12] *Id.*, at 37.

the upcoming BRA as the Complainants maintain, a simpler and more appropriate solution would be to only mitigate bids from the units covered by the PPAs without attempting to make changes to the language of the MOPR before a broad stakeholder review takes place. The PSEG Companies believe that changes to the MOPR should only be made following the conclusion of a stakeholder process at PJM, or at the minimum, following a more robust review process at the Commission. Neither of these options can be feasibly attempted during the limited time available before the next BRA. In addition, the mitigation methodologies proposed by the Complainants are complex, especially in light of the challenging time constraints. The PSEG Companies submit that, by limiting mitigation just to the units covered by the AEP/FE PPAs, much simpler mitigation methodologies could be employed that would satisfy the basic needs of the upcoming BRA and thus support a competitive outcome.

II. COMMENTS

A. The Complaint Clearly Demonstrates that the Current PJM Tariff is Not Just and Reasonable Because it Fails to Mitigate the PPA Units

As shown in the Complaint and discussed *supra*, the need for the MOPR is predicated upon concerns associated with artificial price suppression due to "uneconomic entry." As also shown *supra*, the detrimental, non-competitive impacts associated with the FE/AEP PPAs are indistinguishable from the harms that the MOPR was designed to forestall. The PPA units will lack incentives to bid competitively and in fact they have exactly contrary incentives to bid in such a manner that they are assured of clearing the auction.[13] As also demonstrated *supra*, the expected impacts on the capacity markets

[13] The PSEG Companies do note that when the complaint was filed, it appeared that the units would also be insulated from penalties associated with PJM's Capacity Performance mechanism. In the final orders, it does appear that the PUCO did shift that risk to the units but also allowed the units to receive the benefit of

appear to be extremely significant – in the range of 990 million dollars in recoveries below the competitive levels for the upcoming BRA.[14] The long-term impacts, moreover, could be even more consequential if investors lose confidence in the PJM capacity markets. Given all these presentations, it must inexorably follow that the current PJM mitigation scheme as applied to the RPM construct is not just and reasonable.

B. The Commission Should Direct PJM to Mitigate the Capacity Offers Submitted by the PPA Units

It is black letter law that, under Section 206 of the FPA, the Commission is obligated to take corrective action when it determines that a rate is not just and reasonable. As stated in a recent Commission case, in instances in which an existing rate has been shown to be unjust and unreasonable, "the Commission would then have determined a just and reasonable replacement rate, whether by accepting [the complainant's] proposal, if supported by record evidence, or implementing its own solution."[15] The PSEG Companies respectfully submit that this is the situation faced by the Commission here. The Commission must therefore devise a remedy to prevent offers submitted by the PPA units from disrupting the upcoming BRA and to prevent the subsidy paradigm created by the PUCO from undermining the entire PJM capacity market construct.

The Complaint calls for the Commission to direct PJM to modify the existing MOPR by adding language that would bring the PPAs within the scope of the

---

any bonus payments. In general, however, the incentives to bid the units to clear the BRA remain intact for the reasons discussed in the text *supra*. Further, because the subsidies will enable the units to undertake capital upgrades to improve performance, the penalty risk associated with the Capacity Performance will be moderated.

[14] Complaint, at 27-28, 41.

[15] *New England Power Generators Ass'n v. ISO New England Inc.*, 153 FERC ¶ 61,222, P 35 (2015).

provision.[16] This response, however, is overly complex given the limited time available to address the problem prior to the upcoming BRA. A simpler approach that would be fully consistent with FERC's statutory authority is for the Commission to adopt a remedy of directly mitigating the PPA units at issue. While the Commission certainly may not act in an unduly discriminatory manner, FPA Section 206 does not require the Commission to act generically if it determines that the rates of specific companies may not be just and reasonable. The Commission, therefore, is not foreclosed from applying mitigation to particular identified units. In fact, there is ample precedent in support of unit-specific mitigation measures as applied to energy and capacity market bids.

Specifically, in *Southern California Edison Co on behalf of Mountainview Power Co., LLC*, 106 FERC ¶ 61,183, *on reh'g*, 109 FERC ¶ 61,086 (2004), the Commission required a specific generating unit that "could change market outcomes by bidding . . . below its costs" and that could benefit as a "net buyer in that market"[17] by depressing clearing prices, to submit energy offers at its marginal costs.[18] In *New York Independent System Operator, Inc.*, 131 FERC ¶ 61,169 (2010), the Commission approved mitigation procedures in NYISO for three specific generators that engaged in abusive market practices. Also, in *Consolidated Edison Company of New York, Inc. (ConEd)*, 96 FERC ¶ 61,095, 61,384 (2001), the Commission approved ConEd's filing, made pursuant to FPA Sections 205 and 206, seeking to expand mitigation of units located in New York City on a temporary basis where the Commission "agreed with ConEd's assertion that the in-City sellers may have market power when there are transmission and reliability

[16] Complaint, at 34-38.
[17] *Id.*, P 63.
[18] *Id.*, P 43.

constraints and supply outside of the constrained area cannot compete for the last increment of demand."[19]

There is no evidence of any "similarly situated" generating units that are recovering out-of-market payments through non-bypassable distribution surcharges other than the PPA units. Accordingly, the Commission is empowered to apply particular mitigation measures only to these units based on the finding that, if not mitigated, clearing prices in the upcoming BRA would be uncompetitive and, therefore, unjust and unreasonable. The generic MOPR language need not be changed at this time and, as a matter of policy, it would be more appropriate for a permanent MOPR change to occur only after the completion of a fulsome stakeholder process at PJM.

C. The Mitigation Methodologies Proposed by the Complainants Are Unnecessarily Complicated

The Complaint proposes two alternative methodologies for mitigation. For units with low levels of avoidable costs, the Complaint alleges that the offer floor should be "based on Net-CONE, which represents the opportunity costs of taking on a [capacity market supply obligation."[20] However, for units with higher levels of avoidable costs, "the level of net going forward costs is a key factor in the calculation [of] *sic* a competitive offer."[21] Moreover, "[i]n each of the two cases of competitive auction offer development described [in the Complaint], key inputs into the calculation are subject to uncertainty."[22] In sum, the methodologies suggested in the Complaint could be difficult and time consuming to administer.

[19] *Consolidated Edison Company of New York, Inc. (ConEd)*, 96 FERC ¶ 61,095, 61,384 (2001).
[20] Cavicchi Affidavit, P 59.
[21] *Id.*, P 60.
[22] *Id.*, P 61.

The PSEG Companies believe that the suggested approaches may work, but offer that the PPA units could be effectively mitigated through simpler methodologies. One approach would be to adopt a set of price floors for the PPA units based upon the previous year's bids which, in fact, occurred only last August. Thus, the mitigated offer amounts could be determined by taking the bids submitted by the units in the previous year (prior to the PPA approvals) and adjusting the previous year's bids for changes in energy market revenues. This could be done through a mechanical process. For example, assume that Unit A with 100 MWs of installed capacity bid at $150 MW-Day in the last BRA. The energy market component of the $150 MW-day bid could be calculated based on energy market revenues received by Unit A in the three years immediately prior to the last BRA at, say, $25 MW-day. The same energy market calculation could then be performed based on the three years prior to the upcoming BRA resulting in, say, $20 MW-Day in energy market revenues. Because the energy revenues decreased by $5 MW-day in this example, the previous year's capacity market bid of $150 MW-day would need to be increased by $5 MW-day, resulting in a mitigated bid floor of $155 MW-day.

Another approach would be to base the bids for the PPA units upon their submittal of projected costs to the PUCO in support of their filing for the PPAs. The detailed data contained in the FE/AEP submittals was confidential and not reviewed by the PSEG Companies. It appears, however, that FE and AEP did conduct projections of the units' operating costs and that they provided this data to PUCO staff. If the IMM were provided this information, it should be possible either to determine a necessary level of capacity market revenues directly from the submittals or, if only total costs are known,

to determine the necessary level of capacity market revenues by backing out an historical average of energy market revenues.

In conclusion, the PSEG Companies support Complainants' assertion that the current PJM Tariff is not just and reasonable in regards to its MOPR provision because it fails to deal with the threats posed by subsidized existing resources. We contend that the Commission should take immediate action to directly address the PPA units and thereby ensure just and reasonable rates in the upcoming BRA. We believe that defining the application of an appropriate MOPR should be achieved through a more robust process of review such as a PJM stakeholder review process or, at a minimum, a technical conference at the Commission. We therefore respectfully request that the Commission direct PJM to initiate a stakeholder process to address these rules with a compliance filing required by the end of 2016 or convene a technical conference. Finally, we recognize the difficulty of implementing the appropriate mitigation levels on these arrangements, and alternatively offer two approaches that utilize previously provided data (from the companies, themselves) as potential approaches to establishing an appropriate bid price for units participating in the markets under the aforementioned PPAs.

III. COMMUNICATIONS

The PSEG Companies request that all pleadings, correspondence and other communications concerning this docket be directed to the following persons:

As to the PSEG Companies:

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C.	)))	Docket No. AD17-11-000

Pre-Technical Conference Comments of Lathrop Craig on Behalf of The PSEG Companies

I. Executive Summary

The PSEG Companies[1] appreciate the opportunity to express our views regarding the pressing need for the wholesale markets in the Northeast to evolve in ways that will incorporate legitimate state public policy objectives. The industry is faced with a significant challenge – the need to bridge the disconnect between market structures designed to provide electricity at the lowest cost – with the actions by states to foster particular state policy goals. Legitimate state public policy objectives such as environmental attributes and system resiliency are not being valued by the markets at this time.

A clear example of this disconnect is the efforts of certain states to fill in the gaps in the wholesale market design by taking steps to preserve the nuclear assets that support the achievement of state policies. Nuclear plants are being financially challenged by current and expected market conditions. Unless the wholesale markets evolve to ascribe value to environmental attributes and system resiliency, nuclear plants will retire prematurely. While the PSEG Companies support the Commission's willingness to discuss approaches for internalizing state public policy goals into market design, it must be acknowledged that the states are in the forefront of addressing the issues facing nuclear generation. Accordingly, until this evolution in wholesale markets occurs, the Commission should not interfere with the operation of state programs to support nuclear power.

II. The Wholesale Energy Markets are Generally Working As Intended But Need to Evolve To Internalize State Public Policy Initiatives

The competitive markets in the Northeast have delivered benefits to customers and society as a whole in the close to two decades that they have been in existence. The choice by

[1] The PSEG Companies are PSEG Power LLC, PSEG Energy Resources & Trade LLC and Public Service Electric and Gas Company.

SI-SSA-0010-0484

some states to move from a vertically-integrated, cost-of-service business model to competitive markets for the electric generation sector was the key energy policy issue towards the end of the last century. In many ways, the markets have achieved their original objectives. Competition has flourished with overall lower costs to consumers, numerous new generation owners, new generating units, and new technologies entering all of the markets, some successfully, and some not. And when there have been failures by new entrants, the costs have been born by investors rather than customers, exactly as intended.

The RTO/ISO markets in the Northeast are designed to create market signals to incent both new build (market entry), and retirement (market exit) through energy and capacity prices. The PSEG Companies provide instructive examples of response to those signals. Specifically, we are currently investing $2B in construction of three new state-of-the-art combined cycle units in the PJM and New England markets. These units will take advantage of historically low natural gas prices to provide economic energy and a combination of flexible operating characteristics and back up fuel sources, providing enhanced reliability to meet the new Capacity Performance capacity ("CP") market and Pay for Performance constructs. We are also in the process of retiring 1,200 MW of 1960's vintage sub-critical coal plants in New Jersey because they have become uneconomic and too inflexible to reliably meet market needs under CP.

Notwithstanding the success of the current market design in facilitating efficient entry and exit of resources, it is also subject to its inherent limitations. The current design of the energy market only incorporates the direct costs of generating unit operations such as fuel, labor and maintenance costs. "External" costs such as environmental impacts associated with operating units that emit carbon or impacts associated with the loss of fuel diversity exposing consumers to greater losses due to low probability, high impact events, are not addressed.[2] The omission of market structures to internalize these types of externalities is the largest driver of state public policy initiatives that seek to change the energy supply mix away from what the existing competitive markets are delivering in the way of entry and exit on their own.

PJM's wholesale markets are at a crossroads. The initial impetus for the creation of the markets was largely motivated by the desires of states to lower costs and to reduce risks to consumers – an effort that has been successful. Time has revealed, however, that the scope of this mission was too narrow. The PSEG Companies believe that, for markets to survive, they must be re-designed in ways that take into account other policy goals. The need for a broader scope is most dramatically presented with respect to the current risk to the PJM nuclear fleet.

[2] Note: Some "external" costs have been successfully internalized in energy markets over the past decades through cap and trade programs under the CSAPR, Acid Rain Program and RGGI, though these markets are for the most part all long allowances and send weak price signals.

III. Nuclear Generation Is Being Exposed to the Risk of Premature Retirement Due to The Lack of Market Structures That Properly Value Its Attributes

Nuclear units, in particular, are adversely impacted by the failure of market structures to value externalities with significant societal benefits. One valuable externality associated with nuclear generation in the PJM footprint relates to the environment. Numerous states in the Northeast (and elsewhere) have taken or are contemplating measures to ensure that a portion of their state's energy supply comes from "clean" resources. This has resulted in significant support payments to solar, wind, energy efficiency and certain demand response resources. States such as New York and Illinois have recognized that nuclear generation has an indispensable role in meeting these same environmental goals and have recently taken steps to ensure that nuclear generators stay in the market, to generate clean energy.

A second valuable externality associated with nuclear generation in the PJM footprint concerns fuel diversity. The PJM market currently enjoys a diverse, fuel-secure, dispatchable, non-intermittent and well-engineered fleet of generating units. These resources were inherited in large part from the previous vertically integrated system. Nuclear generation is a vital component of this beneficial resource mix. Since the initial formation of the RTO/ISO markets, the primary shift in generation in the Northeast markets has been from coal and oil to natural gas and renewables. Recently, nuclear has also become challenged and is increasingly at risk of exiting as well. While initially these shifts have increased resource diversity, the current trend is moving toward a generation mix dominated almost entirely by gas and renewables. This trend is troubling because it leaves PJM in a situation in which it would be relying disproportionally upon a single fuel source that is susceptible to single contingency failure. In response, some state policy makers have entertained supporting coal and nuclear units out of concern for what they perceive as a need to retain a resilient and fuel-diverse generation portfolio.

IV. State Public Policy Goals Could Be Integrated Into Market Design Structures

Both of these concerns – environmental impacts and system resiliency – are valid and worthy policy goals. As the Supreme Court indicated in the *Hughes* case, it is appropriate for states to take actions that support the public good by promoting clean technologies in a manner that does not displace the wholesale market price. The pursuit of policies in support of grid resiliency associated with fuel and technology diversity would also be appropriate. As noted in the recently drafted PJM whitepaper, "PJM must take account of the possibility of larger-scale disruptions of the natural gas supply system."[3] Because of the efficiencies that can be realized

[3] "PJM's Evolving Resource Mice and System Diversity" PJM Interconnection, dated March 30, 2017 at 35, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx.

through competition, our preferred approach to addressing state public policy goals is through a market-based solution and we are eager to participate in discussions to that end. There is an array of possible choices for how markets could be re-designed to achieve these public policy goals.

First, the value of clean, non-emitting energy can be reflected in energy market pricing by establishing and reflecting the cost of those attributes on resources that emit. If the value is set correctly, it will incent new entry and the retention of non-emitting or low emitting resources in an economically efficient manner. It is also possible to implement "border adjustments" to limit the impact of these policies to states or regions that have those goals and insulate states or regions that do not. Second, the value of fuel or generating technology diversity can be reflected in capacity markets through additional constraints, conceptually similar to the base capacity constraint that PJM used in the CP auctions leading up to the 2020/2021 auction. The costs of these constraints can be allocated to customers in states that agree to them, protecting customers in states that do not share those views or goals.

V. Until the Policy Goals Are Integrated Into Market Structures States Should be Allowed to Take Steps to Recognize These Attributes Without Interference

We recognize the challenges with getting stakeholders to agree on a solution that could be applied regionally and we recognize that this process will take time. In the interim, the Commission must not stand in the way of the ability of the states to take measures that preserve the nuclear fleet. If immediate steps are not taken, these resources may be forced to retire.

It is appropriate for resources which receive state support for valid public policy goals to participate in the capacity auctions without mitigation. They bid at their avoided costs, net of the support payments. The impact of this design would be to lower prices and incent market exit for some number of resources that otherwise would have been economic to stay in the market (but for the support payments received by the selected resources). Because the payment scheme is intended to support the achievement of policy goals not internalized in the markets, this should be viewed as a reasonable and necessary consequence.

PJM is currently exploring with its stakeholders potential structures to appropriately value all resources while the market design still does not internalize the achievement of state public policy goals. PJM's first priority should be to develop market design changes that will fully incorporate valid policy goals (such as environmental and fuel diversity/resiliency) into the energy and capacity markets. However, if as an interim measure PJM does seek to change market rules solely to address units that are receiving state support it is critical that these rules do not thwart the achievement of valid while at the same time ensuring competitive market outcomes.

20170426-5164 FERC PDF (Unofficial) 4/26/2017 11:00:51 AM

VI. Energy Price Formation Reforms Are Also Critical in Establishing the Right Price Signals

The competitive energy markets are currently being shaped by three primary driving forces: (1) the economics of plentiful and low-cost natural gas; (2) state public policy initiatives to shift generation supply to cleaner sources; and (3) the reality of essentially flat demand. The first two have led to a large influx of new supply, while the third suggests that none is really "needed."

This rapid and large decline in overall wholesale energy prices has exposed many inefficiencies in energy price formation. We support the Commission's leadership in recognizing these problems and in continuing to direct key reforms that will ensure the wholesale energy prices more accurately reflect the cost and value of serving load at all times. Getting energy prices right is key to ensuring that the correct price signals are sent to incent efficient investment and market exit decisions. We encourage FERC to press the RTOs/ISOs to implement reforms without delay. While this is not a complete solution to the achievement of the issues facing nuclear generation, improvements in price formation would help.

VII. Where Do We Go From Here?

The PSEG Companies believe that it is incumbent on the Commission to lead the way in seeking the most cost effective means to integrate state public policy goals into the wholesale market design. It is entirely possible, and desirable, to capture the externalities that state policy makers value in the market construct. This can be achieved by reflecting the costs of negative attributes like emissions in unit dispatch (potentially complimented with border adjustments) and allowing policy makers to establish diversity or resiliency goals that can then be implemented through centralized capacity market procurements. However, we caution the Commission to be wary of any potential solution that result in an over procurement of resources.

We understand that it will take a significant amount of time to develop and implement a market-based mechanism that internalizes legitimate state public policy objectives. While this process is underway, we believe that FERC should not interfere with the rights of the states to pursue valid policy objectives such as encouraging clean energy production and the resiliency of the electric grid.

Finally, we appreciate the Commission's efforts in pushing the RTOs/ISOs to implement a number of important energy price formation reforms and respectfully request that FERC continue to encourage the RTOs/ISOs to implement them without delay. We further request that the Commission remain engaged and monitor and evaluate the RTOs/ISOs progress to ensure that the value of these reforms are actually reflected in market pricing.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PJM Interconnection, L.L.C.	)	Docket No. ER18-1314-000 ER18-1314-001

PROTEST AND MOTION TO REJECT OF THE PSEG COMPANIES

Pursuant to Rules 211 and 212 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("FERC" or the "Commission"),[1] PSEG Companies[2] submit this protest and motion to reject PJM Interconnection L.L.C.'s ("PJM") proposed revisions to the Reliability Pricing Model ("RPM") rules in the above-referenced proceeding.[3] The PSEG Companies believe that the PJM Capacity Filing should be rejected because it is fundamentally flawed. Specifically, the PJM Capacity Filing is procedurally defective because it fails to satisfy the requirements of Section 205 of the Federal Power Act ("FPA")[4] and impermissibly blurs the distinction between Sections 205 and 206 of the FPA in contravention of a recent decision by the Court of Appeals for the District of Columbia ("D.C. Circuit").[5] Therefore, the PSEG Companies recommend that the current just and reasonable RPM construct continue in its current

[1] 18 C.F.R. §§ 385.211 and 385.212.

[2] The PSEG Companies include: Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC.

[3] PJM Interconnection, L.L.C., Docket Nos. ER18-1314-000, *et al.,* Capacity Repricing or in the Alternative MOPR-Ex Proposal: PJM Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market ("PJM Capacity Filing").

[4] 16 U.S.C. § 824d.

[5] *NRG Power Marketing, LLC v. FERC*, 862 F.3d 108, 117 (2017) ("*NRG"*).

form.

However, if the Commission does not reject the PJM Capacity Filing on procedural grounds and decides to consider the merits of the two proposals, the PSEG Companies contend that the Commission can only accept the first alternative – the Capacity Repricing Proposal. The second alternative – MOPR-Ex – with its varied application criteria is facially discriminatory and therefore cannot be deemed just and reasonable. In contrast, the Capacity Repricing Proposal represents the only permissible alternative market design that attempts to: (1) accommodate state public policy goals; (2) achieve competitive market outcomes; and (3) acknowledge the existence of units that are part of the established market in a manner that the Commission could deem just and reasonable.

Finally, if the Commission determines that neither approach is just and reasonable under Section 205 and decides to institute a Section 206 proceeding, the PSEG Companies respectfully request that the Commission direct PJM to work with stakeholders to implement an approach that achieves public policy goals within the wholesale markets.

I. INTRODUCTION

PJM explains that, "[a]s the Commission, States, PJM, stakeholders, and other capacity market administrators have grappled with this issue over the past two years, two alternative paths have emerged for protecting wholesale capacity markets from the price suppressive effects of growing state subsidy programs: accommodate or mitigate."[6] PJM's inability to address the intersection between the achievement of state public policy goals and the wholesale market has

[6] PJM Capacity Filing, at 42. It is noted that the Commission identified other potential approaches during the technical conference covering the integration of public policy initiatives into the wholesale markets. *See State Policies and Wholesale Markets Operated by ISO New England, Inc., New York Independent System Operator Inc., and PJM Interconnection, L.L.C.*, Docket No. AD17-11-000, Notice Inviting Post-technical Conference Comments (issued May 23, 2017).

led to the instant filing. Rather than deciding for itself how this issue should be addressed, PJM requests that the Commission make a policy determination, namely, "[s]hould the state-subsidized resources be given a real opportunity to be committed as capacity in the wholesale market notwithstanding its subsidized offer."[7] To effectuate its request to obtain a policy directive from the Commission, PJM asks the Commission to consider and ultimately choose one of two mutually exclusive paths to modify the RPM rules.

One proposed path contemplates a two-settlement auction mechanism ("Capacity Repricing") and is PJM's preferred approach.[8] Under this approach, PJM would clear the capacity auction in two stages. In the first stage, PJM will use the bids from all resources (including units receiving state support payments) and clear the resources that are required to meet the reliability requirement. The resources that clear in this stage will be given a capacity obligation. In the second stage, PJM will substitute reference prices for all resources receiving state support payments (driving some out of the clearing price range) and determine the competitive clearing price. All resources that received a capacity obligation in the first stage would be paid the clearing price from the second stage. Some units can be expected to clear in the second (pricing) auction that did not receive a capacity obligation in the first (commitment) auction (these units are referred to as "in-between units").

According to PJM, this "path makes it more likely that the subsidized resource will clear and receive a capacity commitment," however, it "would not permit the subsidized offer to factor into formation of the clearing price and thereby suppress the clearing price."[9] PJM contends that

[7] PJM Capacity Filing, at 42.

[8] *Id.* at 46.

[9] *Id.* at 42-43.

this path results in "respecting and accommodating state policy choices while ensuring the market signals a competitive price."[10]

The alternative path contained in the PJM Capacity Filing was developed by the PJM Market Monitor and modified throughout the stakeholder process. This path seeks to extend the existing Minimum Offer Price Rule ("MOPR") to certain unit types and to certain existing units that are receiving support payments from states ("MOPR-Ex") in order to achieve public policy goals.[11] MOPR-Ex also readopts the substance of the competitive entry exemption that was in place from 2013 to 2017 and the self-supply exemption that was in place from 2013 through 2017.[12] Moreover, MOPR-Ex adopts a new categorical exemption for public power entities and employs relaxed tests for qualifying for the exemptions. MOPR-Ex further excludes (grandfathers) existing renewable resources and offers defined exclusions for future renewable resources.[13] Finally MOPR-Ex does not apply to Demand Resources.[14] PJM claims that this path "mitigates the harm state policy choices have in suppressing capacity market prices."[15] According to PJM, it accomplished this by "preventing the subsidized offer from being submitted at a price below a competitive offer price in the first place."[16]

PJM emphasizes that there is a critical difference between the two paths: the Capacity Repricing Proposal "honors the state's legitimate policy choice to promote resources with certain

[10] *Id.* at 46.

[13] *Id.*

[14] *Id.* at 53.

[15] *Id.* at 53.

[16] *Id.* at 54.

attributes not otherwise valued in the current wholesale market rules; MOPR-Ex does not."[17] PJM states explicitly that the Capacity Repricing Proposal is its preferred approach and requests that the Commission find that it is just and reasonable under Section 205. PJM further requests that if the Commission cannot accept the Capacity Repricing Proposal, even subject to suspension and further proceedings, that it accept the MOPR-Ex approach as just and reasonable.[18]

II. PROTEST AND MOTION TO REJECT

A. The PJM Capacity Filing Should Be Rejected as Procedurally Defective

As noted above, PJM submitted two alternative, competing and mutually exclusive proposals to modify the current RPM rules under Section 205 of the FPA. As a consequence, in order for the Commission to act on PJM's filing, it is asked to sort through PJM's alternative proposals, accept one and reject the other, and ultimately impose the solution the Commission deems to be just and reasonable. In doing so, PJM has impermissibly blurred the fundamental distinctions and burdens between Sections 205 and 206 of the FPA. Clearly sensitive to this flaw, PJM's filing preemptively attempts to justify its ability to utilize Section 205 rather than Section 206 as the procedural vehicle for asking the Commission to choose and impose a just and reasonable rate in its tariff. While this tactic is understandable given the different burdens that PJM would be required to demonstrate under each provision,[19] it has rendered the PJM Capacity Filing procedurally defective and therefore it must be rejected.

---

[17] *Id.* at 54.

[18] *Id.* at 6.

[19] *See* 16 U.S.C. § 824d(e). Section 205, unlike Section 206, allows the Commission to approve rate increases without a showing that current rates are unjust and unreasonable; it need only find the *proposed* rates to be just and reasonable. *City of Winnfield v. FERC*, 744 F.2d 871 (D.C. Cir. 1984). In contrast, Section 206 requires a public

Section 205 requires that public utilities must file with the Commission "new schedules *stating plainly* the … changes to be made in the schedule … then in force … ."[20] When reviewing Section 205 filings, FERC, in turn, must ensure the rates "are just and reasonable" and do not "make or grant any undue preference or advantage … or subject any person to any undue prejudice or disadvantage."[21] Essentially, "[s]ection 205 puts FERC in a 'passive and reactive role.'"[22]

In submitting two alternative proposals, PJM has failed to meet the threshold requirement to "plainly" state the changes to be made to the rate schedule. Instead, PJM has proposed two possible and mutually exclusive approaches to reforming RPM, included a lengthy discussion of the deficiencies with each approach and asks the Commission to pick one and impose it. Section 205 simply does not contain any provisions that allow a public utility to submit two, three or more possible just and reasonable alternatives and then have the Commission select and impose one as though it were choosing one from a restaurant menu.

Even more problematic is the fact that the PJM Capacity Filing does not appear to be seeking a rate change, but is instead seeking policy direction from FERC to either accommodate or mitigate resources supported by state public policy initiatives. This is demonstrated by PJM's own words in which PJM states that the PJM Capacity Filing seeks "[t]he answer to a single question … [s]hould the state-subsidized resource be given a real opportunity to be committed as

---

utility to demonstrate that the current rate is unjust, unreasonable, unduly discriminatory and preferential. Thus, in reviewing a Section 206 filing, FERC "is required to shoulder the 'dual burden' of finding the existing rate unjust and unreasonable and of 'find[ing] a just and reasonable rate' to replace it." *FirstEnergy*, 758 F.3d at 353 (citing *Md. PSC v. FERC*, 632 F.3d 1283, 1285 n. 1 (D.C. Cir. 2011)).

[20] 16 U.S.C. § 824d(d) (emphasis added).

[21] *FirstEnergy Serv. Co. v. FERC*, 758 F.3d 346, 348 (D.C. Cir. 2014) (citing 16 U.S.C. § 824d(a), (b)).

[22] *NRG* at 11 (citing *Advanced Energy Management Alliance v. FERC*, No. 16-1234 (D.C. Cir. June 20, 2017).

capacity in the wholesale market notwithstanding its subsidized offer?"[23] Clearly PJM's request removes the Commission from an essentially passive and reactive role envisioned by Section 205 into the realm of asking the Commission to take affirmative action and "fix" the tariff under Section 206.

Moreover, the PJM Capacity Filing will place the Commission in an untenable position of violating Section 205 if it accedes to PJM's request. As explained by the D.C. Circuit, "[s]ection 205 does not allow FERC to make modifications to a proposal that transform the proposal into an entirely new rate of FERC's own making."[24] The D.C. Circuit in *NRG* made clear that "FERC has some authority to propose modifications to a utility's proposal if the utility consents to the modifications;" however, "FERC may not unilaterally impose a new rate scheme under Section 205."[25] The Court further explained that, "although 'minor deviations' from a proposal are permissible, 'the imposition by the Commission of only half of a proposed rate' is not permissible."[26] Applying the principles described in *NRG*, the Commission would violate Section 205 if it accepted either of the proposed paths contained in the PJM Capacity Filing because, by definition, it would be imposing only one half of PJM's filing. In light of the substantial legal infirmities in PJM's filing, it should be rejected in its entirety.

B. If the Commission Deems It Necessary to Make Changes to the Current RPM Construct, It Must Accept the Capacity Repricing Proposal as the Only Viable Option

[23] PJM Capacity Filing, at 42.

[24] *NRG* at 3.

[25] *Id.* at 12.

[26] *NRG* at 13 (citing *Western Resources, Inc. v. FERC*, 9 F.3d 1568 (D.C. Cir. 1993).

The PSEG Companies have supported the markets, to date, because of the benefits that competition has brought in lowering prices, increasing innovation and protecting ratepayers. More efficient dispatch of the generating fleet has created billions in savings for customers. In addition, market forces have driven investment in new, more efficient generating resources and the retirement of older less efficient generating plants. In these respects, the current RPM model is functioning as intended.

However, the PSEG Companies agree with PJM that the limited focus of the current market construct is no longer sufficient. The markets must adapt quickly to accommodate state actions designed to advance widely-accepted public policy goals such as reduction of environmental emissions and resiliency. Failure to do so will lead to less efficient solutions, other unintended consequences and an overall weaker electric grid.

If the Commission determines that the PJM Capacity Filing meets the requirements of Section 205, the PSEG Companies request that the Commission accept the Capacity Repricing Proposal and reject MOPR-Ex. While we believe that the Capacity Repricing Proposal may not be an optimal solution, we do believe that an "accommodative" approach would be a better option than a "mitigate" approach. The accommodate path would satisfy the goal of not creating obstacles that would interfere with the efforts of the states to achieve their desired objectives. Moreover, the advantages of the Capacity Repricing Proposal are that: (1) it would allow resources receiving support payments to receive capacity obligations on payments at the same level as other resources thereby ensuring customers do not "overpay" for policy objectives; (2) it ensures that more resources would not be committed than needed to meet demand; and (3) it attempts to achieve a "competitive" capacity price.

We believe that it is imperative that the Commission avoid thwarting the efforts of the states to address carbon abatement and fuel diversity by supporting nuclear generation or other types of generation associated with achieving these goals. Under the Capacity Repricing Proposal, nuclear plants receiving state support payments to achieve their goals would qualify as capacity resources in the first "commitment" auction. Although nuclear units (and any other generators receiving support payments) committed in the first auction would be mitigated in the second "pricing" auction, they would still receive the competitive price realized in that auction regardless of whether they clear. Further, PJM would avoid over-procurement by not assigning a capacity commitment to resources that cleared only in the pricing auction.

PJM's alternative proposal – MOPR-Ex – is significantly flawed and should not be considered a viable option. Under the MOPR-Ex approach, PJM proposes to extend the current MOPR to cover some existing resources that may receive material state subsidies.[27] PJM states that this approach is "mitigative in nature" because it "alters sellers' subsidized offer prices before PJM runs the auction and assigns capacity commitments."[28] However, the application of MOPR-Ex is varied due to numerous exemptions. As a result, certain similarly-situated resources are treated differently even though they are providing the same service and achieving the same state public policy objectives. This flaw renders MOPR-Ex unduly discriminatory and preferential in violation of Section 205(b) of the FPA. Section 205(b) requires that a utility's rules be non-discriminatory and non-preferential as well as just and reasonable.[29] It further

[27] PJM Capacity Filing, at 96.

[28] *Id.* at 96-97.

[29] *See, e.g., Elec. Consumers Res. Council v. FERC,* 747 F.2d 1511, 1515 (D.C. Cir. 1984) (citing 16 U.S.C. § 824d(b)).

prohibits rules that give one group of market participants a preference over another group without an adequate justification.[30]

Here, PJM explains that "whereas MOPR has long applied to new resources regardless of whether any subsidy is received, MOPR-Ex would explicitly target *only* those resources receiving a Material Subsidy and that qualifies as a Capacity Resource with Actionable Subsidy."[31] At the same time, MOPR-Ex contains the self-supply exemption and the competitive entry exemption as well as two categorical exemptions: (1) the Public Entity Exemption for public power entities and electric cooperatives; and (2) the RPS Exemption for resources that receive out-of-market support as part of a state-sponsored renewable portfolio standard. Notably, PJM has flagged the fact that the RPS Exemption in particular may be unduly discriminatory.[32] It is undisputed that MOPR-Ex treats certain clean resources differently depending on whether it receives state support as part of a state-sponsored renewable portfolio standard or if the state support is considered an "Actionable Subsidy." Given that both sets of resources achieve the same public policy goals – carbon abatement – it is facially discriminatory to apply MOPR-Ex to one class while exempting the other class and therefore, MOPR-Ex should be rejected. Moreover, under *NRG*, the Commission cannot "fix" this defect, as PJM requests, by simply eliminating the RPS Exemption provision since such action could not be considered a minor modification.

MOPR-Ex is even unduly discriminatory within the exemptions themselves. MOPR-Ex exempts renewable resources constructed prior to the new MOPR construct becoming effective.

[30] *See id.*

[31] PJM Capacity Filing, at 98.

[32] *Id.* at 114.

Again, however, there is not any valid distinction between the "new" and "old" resources based on their function or their impact on market outcomes. This is a clear example of undue discrimination. Indeed, the Commission rejected a similar attempt to introduce an unduly discriminatory element into a MOPR mechanism when RPM was first adopted. In *PJM Interconnection, L.L.C.*, 117 FERC ¶ 61,331 (2006), the Commission rejected a provision designed to award favorable avoidable cost treatment to coal units constructed prior to an arbitrary cutoff date of 1957.[33] Instead, the Commission required PJM to adopt a non-discriminatory eligibility mechanism related to the purpose of the disparate treatment.[34]

A final flaw with the MOPR-Ex proposal also was highlighted by PJM. The proposal will likely have the effect of mitigating existing resources from the auction clear. To clear the capacity market, another resource(s) will be committed. By ignoring existing resources in the capacity clearing process, the construct will perpetuate an oversupply in the markets – moving the distortion from the capacity market into energy market results through suppressed energy prices. It is imperative that energy markets provide the proper price signal to drive the efficient resource mix, and the MOPR-Ex proposal would increase the reliance on capacity markets, relative to energy, skewing the results in unknown ways.

Finally, while the PSEG Companies prefer the Capacity Repricing Proposal over MOPR-Ex, we do not believe that it fully addresses the failure of the current market designs to value important generator attributes, particularly, the achievement of environmental goals and ensuring energy resilience. We therefore believe that an approach that "achieves" state public policy goals, such as carbon abatement and fuel diversity, within the wholesale electricity market

[33] *PJM Interconnection, L.L.C.,* 117 FERC ¶ 61,331, P 108 (2006).

[34] *Id.*

structure is the correct approach. This could include measures such as carbon pricing in energy markets and enhanced ISO/RTO payments made directly to generating plants needed to meet fuel diversity standards adopted for the region. We respectfully request that, in the event the Commission institutes a Section 206, it directs PJM to develop an approach that achieves the widely-accepted public policy goals within the wholesale market designs.

III. CONCLUSION

WHEREFORE, the PSEG Companies respectfully request that the Commission reject the PJM Capacity Filing on the grounds that it fails to meet the requirements of Section 205. If the Commission finds that PJM has met the Section 205 requirements, we respectfully request that the Commission accept the Capacity Repricing Proposal. Finally, if the Commission institutes a Section 206, the PSEG Companies respectfully request that the Commission direct PJM to work with stakeholders to develop a solution that "achieves" widely-accepted public policy goals within the wholesale market structure.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Resilience in Regional Transmission Organizations and Independent System Operators	))))	Docket No. AD18-7-000

MOTION TO INTERVENE AND REPLY COMMENTS OF THE PSEG COMPANIES

Pursuant to Rules 212 and 214 of the Federal Energy Regulatory Commission's ("Commission" or "FERC") Rules of Practice and Procedure[1] and the "Order Extending Time for Comments"[2] issued on March 20, 2018 in the above-captioned proceeding, the PSEG Companies[3] respectfully submit these reply comments to certain comments filed on March 8, 2018 by Regional Transmission Owners ("RTOs") and Independent System Operators ("ISOs") in response to the Commission's "Order Terminating Rulemaking Proceedings, Initiating New Proceeding, and Establishing Additional Procedures," issued in this docket on January 8, 2018.[4] The PSEG Companies reply comments are focused on PJM Interconnection, L.L.C.'s ("PJM") filing which is the region in which their transmission system and the bulk of their generating fleet is located.

I. Executive Summary

[1] 18 C.F.R. §§ 385.212 and 385.214.
[2] *See* 162 FERC ¶ 61,256 (2018) ("Extension Order").
[3] The PSEG Companies are comprised of Public Service Electric and Gas Company ("PSE&G"), PSEG Power LLC ("PSEG Power") and PSEG Energy Resources & Trade LLC ("PSEG ER&T"). PSE&G, as an owner of transmission in PJM, PSEG Power, as an owner of generation assets in PJM, and PSEG ER&T, as a participant in the PJM electricity markets and a transmission customer within the PJM footprint, have each a substantial interest in this proceeding. No other party can represent these interests. Good cause thus exists for this motion, and the PSEG Companies respectfully request that the Commission grant their motion to intervene and consider their comments.
[4] *Grid Reliability and Resiliency Pricing; Grid Resilience in Regional Transmission Organizations and Independent System Operators*, Docket Nos. RM18-1-000 and AD18-7-000, 162 FERC ¶ 61,012 (2018) ("January 8th Order").

The Commission is faced with a constellation of issues related to the resiliency of the Bulk Electric System ("BES") which require immediate attention. The world is changing rapidly and the BES is no exception. The BES is more efficient than ever but also faces more threats. Additional complexity and interdependence create new risks that are difficult to evaluate. At the same time, the risk of deliberate attacks – both physical and cyber – is higher than ever. Further, due to global warming, the frequency and intensity of extreme weather events is also growing. Cost-benefit analysis of most of these threats will be dubious at best. Moreover, because of the greater complexity of the BES and the likelihood of unpredictable feedback loops, there is the potential for system disruptions on a scale never seen before. It is therefore incumbent upon the Commission to take a leadership role in addressing these issues. The decisions the Commission makes now could have repercussions for many decades into the future.

The PSEG Companies believe that PJM has proposed an overly narrow definition of resiliency which fails to adequately capture the need to address low probability, high impact events that may affect the BES. PJM correctly recognizes that many events affecting BES resiliency "are not amendable to quantitative, probability-based analyses" and that the "impacts of high-impact, low-frequency events . . . are difficult to quantify."[5] Yet, PJM then assumes that it will be possible to determine "the cost efficiency of addressing the vulnerability or threat"[6] or the "incremental value"[7] of a particular measure directed towards achieving resiliency. As a result, PJM's definition of resiliency can be expected to exclude valid resiliency measures, particularly resiliency measures to address the most difficult to predict disruptive events such as cyber attacks. The PSEG Companies thus propose an expanded version of the Commission's

[5] Comments and Responses of PJM Interconnection, L.L.C., Docket No. AD18-7-000, at 4-5 (filed March 9, 2018) ("PJM Comments").
[6] *Id*. at 5, n. 7.
[7] *Id.* at 16.

resiliency definition that better recognizes the unpredictable frequency and impacts of the kind of events the definition should encompass.

The PSEG Companies generally agree with the PJM Comments regarding many of the categories of high-impact, low-probability events that should be considered. However, the PSEG Companies also do not believe that PJM has accorded the proper degree of urgency towards certain of the resiliency threats the PJM system faces. Notably, PJM fails to acknowledge the urgent risk it faces due to loss of fuel diversity associated with the potential for retirement of its nuclear fleet. Excessive reliance on gas-fired generation will expose PJM customers to potential disruptions in "just in time" gas supplies. Extreme weather events that stressed fuel supply availability such as the 2014 Polar Vortex and the 2017/2018 Bomb Cyclone are one category of risks. Accident-related physical disruptions such as the April 2016 Texas Eastern pipeline explosion in western Pennsylvania that significantly reduced pipeline delivery capacity into New Jersey for months are another category of risks. Yet even more sinister is the potential for events *intended* to disrupt the pipeline system such as physical or cyber-attacks by terrorists or unfriendly nation states.

In addition, PJM's Comments fail to acknowledge the full scope of the national security issues that would be attendant upon the loss of the nuclear fleet. The loss of the nuclear fleet would not only expose critical military and civil defense facilities to potential electric supply disruptions but would also expose the our country to less obvious national security risks such as the weakening of our nuclear navy as well as a degradation of the ability of the country to address nuclear proliferation issues. The Commission should make clear that national security issues should be considered as part of a resiliency analysis and should provide guidance to PJM and the other RTOs/ISOs regarding how to address them.

Notwithstanding the immediacy and the seriousness of the risks it faces due to the loss of nuclear generation within its footprint, PJM fails to perceive a need for urgent action. Rather, PJM indicates an intention to "conduct analysis of the anticipated future availability of [generation] attributes"[8] when it should be taking definitive steps right now to preserve the fuel diversity that currently exists. The PJM nuclear fleet is an irreplaceable asset. If the PJM nuclear fleet is lost, it will be gone for good. The Commission should direct PJM to act quickly to address this problem.

Energy market design is also an urgent issue that needs to be addressed to sustain the resiliency of the BES. Fuel diversity is an inherent characteristic of a well-designed energy market because particular generation technologies will be the most efficient means to meet the requirement of particular load segments. The lack of efficient energy market pricing in PJM energy markets, however, disproportionately disadvantages base load generation such as nuclear plants and thus contributes to the economic challenges that they face. PJM has proposed a number of price formation reforms: improvements in operating reserves, better shortage pricing and pricing that reflects the units being dispatched. The PSEG Companies support PJM's efforts in these areas and support PJM's request that the Commission set a deadline for the submittal of filing. Setting a prompt deadline will prevent PJM's efforts from becoming bogged down in an unnecessarily prolonged stakeholder process.

PJM has also requested and should be granted the ability to suspend market operations entirely if necessary to address the impacts of low probability, high impact events. However, PJM should have the ability to take these steps only during true emergencies in order to address imminent loss of load. In addition, affected generators should be paid their full cost of service. Finally, to the extent that the Commission decides not to act or fails to act in a timely manner to

[8] PJM Comments, at 46.

20180509-5233 FERC PDF (Unofficial) 5/9/2018 4:40:40 PM

address resiliency issues, the Commission should not interfere with legitimate efforts of States to address them.

Reforms and improvements with respect to the resiliency of the transmission system are also needed. The current PJM Regional Transmission Expansion Plan ("RTEP") does not include explicit resiliency criteria in many areas and must be modified to do so. Extreme weather events, cyber and physical attacks, electromagnetic pulse events, earthquakes and geomagnetic disturbances as well as other threats place the system at risk and need to be recognized in the planning process. Projects to replace aging infrastructure deserve special mention. Replacement of aging facilities with new or more modern equipment that has more robust characteristics makes the transmission system more resilient to high impact, low probability events as well as providing enhanced predictive failure information.

The Commission should recognize that TOs and RTOs/ISOs have separate but related responsibilities in planning for resiliency which will require a high degree of coordination. RTOs/ISOs need to be forthcoming to TOs with respect to information possessed by RTOs/ISOs regarding threats and vulnerabilities. But because many of the projects to address resiliency can be expected to be on the lower voltage components of transmission, the ascendant role of the transmission owners as asset managers of their own systems needs to be recognized. Also, particular consideration needs to be given to the role of NERC which the PSEG Companies believe should be in the form of identifying and assessing system vulnerabilities but not creating standards.

The PSEG Companies agree with PJM's concern about the increase in frequency and magnitude of extreme weather events and the potential impact on the transmission system.

Further, operating in a coastal state, PSE&G faces especially heightened risks from extreme weather.

Superstorm Sandy in 2012 devastated New Jersey prompting improvements in transmission infrastructure to enhance the resilience of the system. It has become necessary to plan for weather events of greater magnitude than have been previously experienced.

Compliance with NERC CIP-014 and CIP-003 standards pose special challenges. Meeting NERC's requirements will require the identification of highly critical substation information and other critical information whose release could have adverse impacts on national security. Therefore, steps must be taken to assure that compliance with CIP-014 and CIP-003 requirements limits the availably of information appropriately. New processes at PJM and FERC will need to be developed to limit disclosure on a "need to know" basis.

II. Comments

a. PJM Has Proposed an Overly Narrow Definition for Resiliency

The Commission proposed a definition for resiliency and requested comments regarding its proposal. PJM filed comments that suggested certain revisions to the Commission's proposed definitions that the PSEG Companies believe are sound. While the PSEG Companies support the revisions proposed by PJM, additional revisions are still required.

The PSEG Companies submit that two basic concepts are missing from the definition as proposed by the Commission and as amended by PJM. First, the definition should recognize that measures to address resiliency should be directed to those events at the "high end" of potentially disruptive events, i.e., those that could impose significant human costs or cause a high degree of property loss. This will serve as a limit on the kinds of matters that would be addressed through resiliency efforts. While resiliency of the BES is critical, not all potential resiliency threats can

be addressed: accordingly, only the most impactful should be considered. The PSEG Companies thus recommend that "highly" be added to the definition prior to "events."

Second, the PSEG Companies believe that the definition should capture the concept that resiliency could include particular measures that enhance the robustness of the BES generally but are not necessarily directed to particular identified threats and vulnerabilities. Protecting or enhancing certain system attributes, such as robustness towards a common mode failure of a class of widely used technology, could provide justification (in whole or in part) for resiliency measures without reference to a known threat or vulnerability. Recognition of this concept in the definition would also be consistent with FPA section 215 which defines "reliable operation" as including operations that address the "unanticipated failure of system elements."[9]

Combining most of PJM's suggested changes and the changes recommended by the PSEG Companies would result in the following definition for resiliency:

> The ability to withstand or reduce the magnitude and/or duration of potential highly disruptive events, whether anticipated or unanticipated. Resiliency includes the capability to identify vulnerabilities and threats that could be highly disruptive, the capability to identify practices that will increase robustness against unanticipated vulnerabilities and threats that could be highly disruptive, and the capability to prepare for, mitigate, absorb, adapt to, and/or timely recover from a highly disruptive event.

The PSEG Companies submit that this definition would be superior to the original definition or to the definition proposed by PJM in its comments.

b. <u>Generation System Resiliency</u>

i. <u>The Approaches Described by PJM For Identifying Valid Resiliency Measures Are Unclear and Appear to Rely Upon The Unrealistic Expectation that Predictive Modeling Can Be Used to Evaluate Low-Probability, High-Impact Events</u>

The PJM Comments acknowledge sound basic principles regarding the nature of the low probability, high impact events that resiliency measure should protect against but, repeatedly,

[9] FPA, Section 215, 16 U.S.C. § 824(a)(4).

appear to back away from these principles in describing how valid measures should be identified. For example, PJM states:

> The challenge [of deciding on resiliency measures] lies in the nature of high-impact, low-frequency events, because they are not amenable to quantitative, probability based analyses commonly used for risk management due to the difficulty of predicting the timing and impact of their occurrence. Probabilities of high-impact, low frequency events are generally unknown or extremely difficult to quantify, and the consequences or impacts of high-impact, low-frequency events - although assumed to be intolerably high in terms of both human and economic costs - are difficult to quantify.[10]

Elsewhere PJM makes similar comments:

> Generally, the primary challenge to assessing the impact of a high-impact, low-frequency event is that it is impossible to anticipate or account for every situation. Moreover, evaluating high-impact, low-frequency events is uniquely difficult for events for which there is very little data available due to the infrequent occurrence of events of such magnitude. As a result, it is impossible to develop precise quantitative metrics for the measurement of resilience risks.[11]

The PSEG Companies largely agree with these comments. Outside of weather events for which models and history provide *some* predictive value for high impact, low-probability events, we would be deceiving ourselves to contend that it is possible to determine the likelihood that a high impact, low probability event will occur or, even more importantly, the potential impact of such an event with any degree of certitude. This proposition should be a bedrock tenant in guiding decisions regarding resiliency.[12]

But, elsewhere in its comments, PJM seems to retreat from those principles. For example, PJM speaks of balancing "the cost to [make an improvement directed to resiliency

[10] *Id.* at 4 (footnote omitted).
[11] *Id*. at 31.
[12] It is clear as matter of law that under the FPA a cost-benefit is not needed in order for a rate to be valid. The Commission is not required to "engage in painstaking cost benefit analysis" when setting rates. *Process Gas Consumers Group v. FERC,* 866 F.2d 470, 477 (D.C. Cir. 1989). When evaluating the justness and reasonableness of a rate, the Commission must only conduct a "candid, common-sense assessment," *Process Gas,* 866 F.2d at 477, which can include the "consider[ation of] non-cost factors." *Pub. Utils. Comm'n of Cal. v. FERC,* 367 F.3d 925, 929 (D.C. Cir. 2004) (citing *Permian Basin Area Rate Cases,* 390 U.S. 747, 791 (1968)). These include the critically important benefit of reliable power. *See, e.g., NAACP v. FPC,* 425 U.S. 662, 670 (1976) (FERC must "promote the orderly production of plentiful supplies of electric energy ... at just and reasonable rates").

versus] . . . the incremental value that may be achieved in making such improvements for a contingency that will rarely, if ever, occur."[13] Also, after describing how evaluating high impact, low-probability events is "uniquely difficult" and that "it is impossible to develop precise quantitative metrics" to measure such risks, PJM's answer in response to these difficulties is to "use[] information from external events to address the probability and impact of it occurring within PJM's footprint"[14] Moreover, in what may be the most troubling refutation of its own principles, PJM apparently contemplates that a transmission owner could undertake system improvements based on "Commission . . . intelligence and metrics [resulting in] resilience vulnerability and threat analyses that can then guide and anchor subsequent RTO planning, market design, and/or operations directives" and subsequently be subject to prudence challenges for making those improvements "in a rate proceeding or otherwise as to the cost effectiveness of addressing the vulnerability or threat."

The Commission must be mindful of the nature of the threats we are facing. As a result of advances in computer technology and the internet, the BES is far more interdependent and complex than ever before. In addition, the efficiency gains that have been won, while saving money for consumers, have also wrung out much of the inherent redundancy that at one time resided in the system. In addition, even weather events have become more intense than our past experience. In this context, it is critical that the Commission understand that traditional cost benefit analyses of threats to central elements of the BES that could have widespread impacts or impacts on large population centers are not useful and cannot be relied upon in evaluating resiliency measures. To the extent that PJM's comments indicate PJM's intent to do otherwise, the Commission should made clear that such an approach would be improper.

[13] *Id.* at 16.
[14] *Id.* at 31.

ii. PJM's Comments Fail to Recognize the Urgency Associated with Maintaining the Fuel-Security and National Security Attributes of the Nuclear Generation Fleet Within Its Footprint

The PJM Comments acknowledge concerns about the interaction between the operation of the BES and the interstate pipeline system but never address the core concern of the potential premature retirement of fuel-secure resources which it is confronting right now. Thus, the PJM Comments identify the risk associated with the failure of "interdependent systems" related to BES operation, including interstate gas pipelines.[15] In this connection, PJM suggests that improvements could be made in communications between itself and certain interstate pipeline systems regarding conditions on the pipelines and requests the Commission to open a new docket to address is issue.[16] PJM also notes the risk of "specific vulnerabilities [including] common mode outages such as such as the loss of generation fed from common gas infrastructure . . . ."[17] PJM suggests here that "[m]ore work is needed in this area."[18] Finally, PJM asserts that "[g]eneration within PJM is both geographically and fuel diverse" but acknowledges that "[w]ith regard to the extent to which PJM considers whether specific challenges to resilience affect various technologies differently, PJM does not focus on particular fuel types . . . ."[19]

The PJM Comments simply ignore the elephant in the room. PJM is at risk of losing the fuel diversity of its fleet, in particular due to the potential loss of the nuclear generators within its footprint. This would expose the business and residents served by PJM to potentially devastating losses due to a common mode failure of the interstate gas pipeline system. Yet, its comments regarding gas infrastructure barely acknowledge this concern. Moreover, the PJM Comments fail to discuss entirely the particular national security contributions that the nuclear fleet makes

[15] *Id.* at 23.
[16] *Id*. at 26, 27.
[17] *Id.* at 36.
[18] *Id.*
[19] *Id*. at 67.

to the welfare of the nation. Finally, PJM does not acknowledge the resiliency to gas price fluctuations provided by the nuclear fleet within its footprint.

(iii) Fuel Diversity/Fuel Security Issues Associated with the Potential Loss of the PJM Nuclear Generating Fleet

The reality is that there have been announced retirements of 23 nuclear plants in the United States although in some cases the retirements have been averted due to state intervention.[20] A number of these plants are located in PJM including three nuclear plants – Davis-Besse and Perry in Ohio and Beaver Valley in Pennsylvania – whose deactivations were announced by FirstEnergy Solutions only last month. PSEG Power's Salem and Hope Creek plants also face the possibility of retirement. The risks faced by PJM if it becomes overly reliant on gas-fired generation, moreover, are quite clear. Indeed, they are potentially very large and, if they materialize, could place millions of customers at risk for a prolonged loss of electric power or, at least, an extended period of rolling blackouts.

A recent illustration of the importance of a fuel-diverse generation fleet that is not overly-reliant on gas-fired generation was the "Bomb Cyclone" event that occurred at the end of December 2017 into early January 2018. From December 27, 2017, through January 8, 2018, the eastern portion of the United States experienced extremely cold temperatures and high electric demand. During this time, nuclear generation performed extremely well while there were disproportionally high outage levels experienced by gas-fired generators.[21] Moreover, the

[20] *See Keeping the Lights on at America's Nuclear Plants*, Jeremy Carl and David Fedor, Hoover Institution Press, 2017, Appendix B: Recent Nuclear Plant Closures (this accounts for 20 of the plants). As noted in the accompanying text, FirstEnergy Solutions recently announced the retirement of three additional nuclear plants in Pennsylvania and Ohio.

[21] For example, PSEG Nuclear's parent company, Public Service Enterprise Group, stated in its most recent 10-K filing, "[i]f market prices continue to be depressed and legislation is not enacted that adequately compensates nuclear generating stations for their attributes, Power anticipates it will no longer be covering its costs nor be adequately compensated for its market and operational risks at the Salem and Hope Creek nuclear unit and would anticipate retiring these units early." Public Service Enterprise Group, 10-K filing, at 27. (http://www.ezodproxy.com/pseg/2018/ar/images/PSEG_10K2017.pdf).

situation could have been worse had the cold spell lasted much longer. During this period, PSEG Power ran its dual-fuel, combined cycle generating fleet almost entirely on oil. However, despite efforts to replenish the oil tank drawdowns, certain large generators within the PSEG Power fleet were within hours of running out of oil and it is unclear whether gas could have been procured for them. But what is clear is that if the nuclear fleet had not been operating, PJM likely would have experienced serious problems. Indeed, a recent report prepared by IHS Markit analyzed what would have happened if the PJM nuclear generating fleet had been replaced by gas-fired generation that operated with the same outage levels as the gas-fired generation actually experienced during that event. The study concludes that "[u]under these conditions, PJM would have had to exercise the remaining emergency operating procedures and would likely have been pushed beyond its limits and forced to shed load during the bomb cycle."[22]

Another weather event involving extreme winter conditions was the Polar Vortex in January 2014. The abnormal weather conditions during the Polar Vortex drove the power system demand for electricity to an all-time high winter peak demand in PJM and caused a higher-than-normal unavailability from natural gas-fired generating units. As the NOPR proposal put forth by DOE last year explained, "[d]urging the Polar Vortex, PJM . . . struggled to meet demand for electricity because a significant amount of generation was not available to run."[23] According to a DOE Staff Report, the loss of generation capacity could have been catastrophic, but a number of fuel-secure plants that were scheduled for retirement were called upon to meet the need for electricity.[24] The DOE Staff Report also noted that "overall nuclear

[22] "Ensuring resilient and efficient PJM electricity supply," Lawrence Makovich and Benjamin Levitt, IHS Markit, at 14 (April 2018) (attached as Appendix A).
[23] Department of Energy, Grid Resiliency Pricing Rule, Notice of Proposed Rulemaking, 82 *Fed. Reg*. 46940, 46942 (Oct. 10, 2017) ("DOE Proposal").
[24] U.S. Department of Energy, Staff Report to the Secretary on Electricity Markets and Reliability, August 2017 ("DOE Staff Report"), available at:

generators performed extremely well during the Polar Vortex, with an average capacity factor of 95 percent."[25]

The recently completed study undertaken by IHS Markit also provides additional visibility with respect to the financial impact of an event such as the Polar Vortex assuming additional reliance on gas-fired resources.[26] In its study, IHS Markit substituted gas-fired generators, assumed to be operating with the same outage rates as gas-fired generation actually operated during the Power Vortex, for five nuclear plants that have announced their retirement.[27] The result was that the "consumer outage costs" that would have been experienced within the PJM footprint reached $6.7 billion.[28]

Further, the PSEG Companies' recent experience demonstrates that gas pipeline fuel disruptions can last for extended periods. On April 29, 2016, an explosion occurred on a Texas Eastern 30 inch natural gas pipeline operated by Spectra Energy in Salem Township, Westmoreland County Pennsylvania.[29] In addition to the damaged pipeline, Texas Eastern stopped deliveries on two other pipelines in the area.[30] Because corrosion levels were at a rate of about five times the expected "normal" corrosion rate at a weld where the explosion occurred,[31] Texas Eastern evaluated all the welds on the three pipelines and excavated more than 600 sites to

[31] *Id*. at 16:20.

observe suspect welds.[32] Of these, repairs were effectuated at about a third of approximately 400 excavations completed at the time of a town hall meeting in Salem Township on September 13, 2016.[33] In addition, at the time that meeting was held, the pipelines were still not being operated at their full capabilities – more than four months after the incident occurred.[34]

The potential impacts of these events, moreover, may be mild compared with what could occur in the event of a deliberate cyber or physical attack on the interstate pipeline system by terrorists or unfriendly nation states. A simultaneous attack on multiple pipeline systems during severe winter conditions could affect millions of people for a prolonged period. As recently stated by Commissioner Tim Echols of the Georgia Public Service Commission:

> God forbid that we have a terrorist hop the fence and use a shape charge filled with explosives to blow one or all of the national pipelines that deliver this "just-in-time" resource, [i.e. natural gas] to power plants. With more and more plants using natural gas to generate electricity, a lengthy outage would create chaos in many states.[35]

The risk to the electric grid and to the citizens of our country if we have a portfolio of generating resources that is overly reliant on a single fuel source – particularly one that is dependent on "just-in-time" fuel – is very real. PJM faces an urgent situation that must be addressed immediately.

(iv) National Security Issues Associated with the Potential Loss of the PJM Nuclear Generating Fleet

The national security attributes of nuclear generation should also be taken into account in analyzing resiliency. The PSEG Companies included an affidavit from an expert on national security issues – Mr. Jeremy Carl, a fellow at the Hoover Institute -- as part of their reply

[32] *Id.* at 27:27.
[33] *Id.* at 42:05
[34] *Id.* 22:20 – 22:27.
[35] *Public Utilities Fortnightly*, September 2017, "Why Nuclear Energy is a Matter of National Security," at 66.

comments regarding the DOE NOPR. His observations are equally relevant here. As Mr. Carl explained:

> Perhaps the biggest unmeasured value of nuclear is its contribution to our national security. It cannot be stressed enough that unlike any other form of energy, the nuclear enterprise has fundamental non-energy related security attributes that justify additional support in the market.[36]

Moreover, nuclear plants have the ability to maintain more on-site fuel than any other form of energy, which is particularly valuable in the event of a long-term emergency situation or an interruption to fuel supplies to other generators. Nuclear resources have also been designed to withstand many of the new types of threats to power plants such as cyber security attacks or terrorism.

The decline in the United States' nuclear technology capabilities due to a lack of domestic plant manufacturing also impacts the advantages and leverage we have previously enjoyed in the area of non-proliferation. Mr. Carl explained that the

> United States has lost several bids on nuclear power projects in the Middle East to Russia, in no small part because of our degraded capacity in this area. The closure of additional nuclear plants degrades our already fragile capabilities while empowering geopolitical rivals such as Russia and China.[37]

Mr. Carl noted that as the nuclear capability in the United States declines the rest of the world continues to invest in nuclear generation, particularly China, where nuclear power generation has almost tripled in the last decade.[38]

Mr. Carl also explained that even though nuclear power plants' technology is distinct in many ways from nuclear weapons, the two applications cannot be divorced from each other

[36] Reply Comments of the PSEG Companies, Attachment A, Affidavit of Jeremy C. Carl, Grid Reliability and Resilience Pricing at 8, Docket No. RM18-1-000 (submitted November 7, 2017) ("Carl Affidavit") (Attached as Attachment B).
[37] *Id.* at 12.
[38] *Id.*

when it comes to our national security interests. The reactors that power our nuclear navy – almost 100 submarines and aircraft carriers – run on technology virtually identical to that powering our civilian reactors. Therefore, "[l]using the technology and operating experience through the atrophy of our domestic nuclear-power sector would mean a profound loss of capability in our military."[39] The Commission should clarify to PJM (and other RTOs/ISOs) that considerations of this type are within the scope of their responsibilities to analyze and the Commission should provide guidance regarding how to perform this kind of evaluation.

(v) Natural Gas Price Variation Costs Associated with the Potential Loss of the PJM Nuclear Generating Fleet

Another aspect of resiliency associated with fuel diversity not recognized in the PJM Comments or the Commission in the January 8th Order concerns the resiliency that nuclear energy provides to natural gas price variation. The IHS Markit study included an analysis of the costs that would be associated with restoring a base-case level of the current monthly production cost variation experienced in PJM under a scenario in which all the existing PJM nuclear plants were retired and replaced by gas-fired generation. This analysis showed a 53% increase in production cost variability in PJM.[40] Addressing this increase through natural gas call options would result in incurring $714 M annually in order to achieve the same level of production cost variation experienced when existing nuclear generation was present.[41] It should be noted moreover that incurring these amounts would *not* reduce the physical deliverability risks of natural gas.[42]

(vi) PJM Should Have Authority to Suspend Operations, But Only for Well-defined, Specific Situations such as Anticipated Blackouts or Matters of National Security

[39] *Id.* at 15.
[40] IHS Markit Report, at. 33.
[41] *Id.*
[42] *Id.*

PJM contends that in order to address low probability, high-impact event affecting operations that it should have the ability:

> to direct resources to commence non-market operations during emergencies, extended periods of degraded operations, or unanticipated restoration scenarios, including provisions for cost-based compensation when the markets are not operational or when a wholesale supplier is directed to take certain emergency actions by PJM for which there is not an existing compensation mechanism.[43]

PJM currently lacks this right and the PSEG Companies support PJM having the ability to suspend market operations. However, it must be clear that PJM will only exercise this right during true emergencies that pose a high risk of blackouts or national security issues: scarcity conditions alone should not provide a justification. Rather, during scarcity conditions, markets should be allowed to operate and prices should be allowed to reflect the marginal cost of supplying load. Further, as PJM proposes, affected generators must be paid their full cost of service for operating during these conditions.

(vii) Improvements in Energy Market Price Formation Could Help Restore the Resiliency and Fuel Diversity Inherent in a Well-Designed Energy Market

An efficient market will tend to be inherently more resilient because it will result in a diverse mix of generation technologies. As explained in the IHS Markit Report:

> PJM consumers benefit from efficient power supply diversity because it inherently increases the ability of grid-based power supply to withstand and reduce the magnitude and/or duration of disruptive events on both power supply availability and costs. Efficient power supply diversity exists because no single fuel or technology is the lowest-cost source of supply to meet the base-load and variable segments of consumer demand. As a result, cost-effective power supply under expected operating conditions involves employing an efficient mix of fuels and technologies in the power supply portfolio. However, expected operating conditions are subject to disruptions because all fuels and technologies have performance and cost risks. Since many of the key electric generation fuel and technology risk factors are not highly correlated, the cost-effective diversity in a power supply portfolio results in "not having all the eggs

[43] PJM Comments, at 40.

> in one basket" and, thus, ***inherently*** mitigates the impact of disruptions from expected operating conditions.[44]

The inherent generation fuel diversity of the PJM system, however, is being lost.

PJM is losing the resiliency that currently resides in its system to a significant degree due to the "PJM wholesale electric energy markets distortions [that] arise from missing costs because price formation rules reprice security constrained market-clearing prices below power system marginal generating costs."[45] The effect of these "distortions disproportionately [is to] reduce cash flows for higher-utilization power supply resources."[46] Accordingly, technologies such as nuclear plants with high operating factors do not receive the proper level of energy market payments which contributes to the economic challenges they face.

The PJM comments do not explicitly recognize the disproportionate impact of its current energy market design on different resource types as explained in the HIS Markit Report but they do acknowledge that "clearing prices are artificially lower than they should be."[47] PJM thus discusses certain reforms that it contends "would go a long way to properly compensating *all* generation needed to serve the demand for electricity."[48] These reforms are in the areas of improvements to reserve markets, shortage pricing and enhancements that would allow all needed units to set price. PJM requests that the Commission set a deadline for the submittal of market reforms and that these market reforms be considered in conjunction with the instant docket concerning resiliency issues. PJM notes that "[t]hose market reforms are an important and inter-related component of ensuring grid resilience . . . ."[49]

---

[44] *Id.* at 4, 5 (emphasis in original).
[45] IHS Markit Report, at 7.
[46] *Id*
[47] PJM Comments, at 75.
[48] *Id*. (emphasis in original).
[49] *Id.*

The PSEG Companies fully support PJM's price formation initiatives. If properly implemented, these reforms could provide substantial support to base load generating units such as nuclear plants. However, as PJM notes, these reforms are still under review in the PJM stakeholder process. A deadline to prevent these processes from becoming bogged-down is essential. Given the urgency of the need faced by base load resources, any further stakeholder processes should be truncated and PJM should be directed to make its submittals to the Commission in as timely a fashion as possible.

(viii) The Commission Should Not Interfere With Legitimate Efforts By States to Address Resiliency Issues

For the reasons discussed above, the Commission can and should address the resiliency issues with which it is faced as quickly as possible. Not only do these issues require immediate attention but they are best addressed on a regional or national level which the Commission has the power to accomplish. However, to the extent that the Commission declines to act or cannot act quickly enough to address problems, it is critical that the Commission not thwart the activities of States intended to address resiliency matters. Resiliency of the generation fleet is a legitimate State goal and within the jurisdiction of States to address. Unless it is demonstrated that the achievement of those goals is actually intended to interfere with the operation of markets, the Commission should not thwart State efforts.

(b) Transmissions System Resiliency[50]

(i) PJM Should Be Expressly Authorized to Include Consideration of Resilience Issues in its Existing Regional Transmission Planning Role

The current PJM Regional Transmission Expansion Plan does not include explicit resiliency criteria. It should be modified to do so. As discussed above, high impact, low

[50] PSE&G is a member of Transmission Owners Agreement-Administrative Committee ("TOA-AC") which is contemporaneously filing Reply Comments in this matter and participated in their preparation. The PSEG Companies support those comments as expanded and amended here.

probability events are a threat to the PJM system. Certain of these threats could be extremely impactful to the transmission system and put customers out of service for extended time frames. These include extreme weather events, cyber and physical attacks, electromagnetic pulse events, earthquakes and geomagnetic disturbances.

One category of resiliency improvements that deserves special mention is the replacement of aging infrastructure. Replacement of aging facilities with new or more modern equipment with more robust characteristics makes the transmission system more resilient to high impact, low probability events. However, this type of improvement also enhances system visibility and analytics that ensure insight into the condition of the assets as well as provide predictive failure information. For example, PSE&G is in the process of converting its aging 26 kV system to a more robust 69 kV system. The 26 kV system was built in the 1920s and met the needs of the time period in which it was built but is not adequately suited to address long-term grid modernization needs. For our new 69 kV facilities, we are using modernized equipment and stronger poles with a higher capacity for moving power through our system. Because this new system is more robust and has more capability, it will be more resilient to disruptions from many types of threats.

(ii) Transmission Owners and RTOs/ISOs Need to Coordinate Closely in Addressing Resiliency Issues

The Commission should recognize that TOs and RTOs/ISOs have separate but related responsibilities in planning for resiliency which will require a high degree of coordination. TOs are in a unique position to understand and evaluate their systems. In addition, they have an independent responsibility to safeguard their own assets. RTOs/ISOs thus need to interact with TOs more closely than with other stakeholders and at an early stage in the planning process.

Further, RTOs/ISOs need to be forthcoming to TOs with respect to information possessed by RTOs/ISOs regarding threats and vulnerabilities.

The determination of responsibilities for resiliency planning must also respect the unique role of the TOs as the asset managers of their system. This is particularly so because many transmission resiliency upgrades will occur on the lower voltage portions of the system. Under the PJM planning procedures, these projects will often be considered "Supplemental Projects" under the PJM OATT for which the TOs, not PJM, have the primary planning responsibility.

(iii) Transmission Owners Must Be Given The Same Level of Access to Threat Assessment and Threat Awareness Data As Provided to The RTOs/ISOs

Because of the active role played by the TOs in resiliency planning, construction and operations, it is important that they have access to the same threat assessment and threat awareness data as provided to the RTOs/ISOs. The PJM Comments stress the need for data from the Commission and other governmental agencies in order to address resiliency concerns:

> Simply put, in coordination with other federal agencies such as the United States Department of Defense ("DOD"), DOE, United States Department of Homeland Security ("DHS"), as well as NERC, the Commission needs to provide intelligence and metrics to apply to resilience vulnerability and threat analyses that can then guide and anchor subsequent RTO planning, market design, and/or operations directives.[51]

The TOs need this data for the same reasons that PJM does in dealing with governmental agencies. Because the TOs need to closely coordinate with PJM and, as well, have their own independent role to play in undertaking resiliency projects, it is essential that they also have the same data regarding threat assessment as made available to PJM. Similarly, having knowledge of threats awareness will allow TOs to take necessary steps to safeguard their assets as situations arise that pose specific risks.

[51] PJM Comments, at 5.

The role of NERC merits special mention. Because of its expertise regarding the BES, NERC is uniquely positioned to be a resource in identifying and assessing system vulnerabilities. The PSEG Companies submit that proper role for NERC is in the form of assessments and information gathering to be shared with the RTOs and TOs. We believe that NERC should not attempt to develop new standards. Achieving resiliency is very situation focused and does not lend itself well to a standard of general applicability.

(iv) Planning for Severe Weather Events Is Critical For All TOs but In Particular For Companies Such As PSE&G Located On Coastal Waters

As noted by PJM, "[f]rom a resiliency perspective, the frequency and magnitude of [severe terrestrial weather] events is decidedly on the rise and the resilience threat is the extreme storms that destroy infrastructure such that service cannot be restored."[52] But, as noted in legislation recently passed by the New Jersey legislature, because of its location in a coastal state, PSE&G faces special challenges:

> As a coastal state, New Jersey is particularly exposed to many of the effects of global climate change, such as rising sea levels and more extreme storms. Many of New Jersey's most important commercial and tourism assets are located in coastal areas, and events like Superstorm Sandy have demonstrated the imminent and tangible threats that intense storms pose to New Jersey's economy and environment.[53]

PSE&G's experience in New Jersey certainly bears these observations out. Superstorm Sandy in 2012 devastated New Jersey and presented extraordinary challenges to the transmission and distribution systems in our area, prompting us to replace, harden, smarten, and even *move* electric infrastructure to improve the resilience of the system. The lesson to be derived this experience is that we need to plan for weather events that we have not yet experienced and that the criteria adopted for addressing weather events should recognize this reality. Further, it must

[52] *Id*. at 29.
[53] Assembly Bill 3724 (legislative finding no. 11).

be recognized that transmission zones that border on the oceanic coast line may need to have special rules.

(v) Confidentiality Issues in Meeting NERC CIP Standards

TOs are registered NERC entities and, accordingly, have responsibility for complying with CIP-014 physical security protection standards relating to critical facilities. Compliance with this requirement will require the identification of highly critical substations essential to serve large load centers and/or particularly critical facilities and then efforts to reduce their criticality by creating system redundancies and back-up facilities. However, the information surrounding this analysis – even the knowledge of which substations are critical – is very sensitive and could reveal system vulnerabilities that pose national security concerns if disclosed. Compliance with CIP-003, regarding cyber security standards poses similar concerns.

In this context, steps must be taken to assure that compliance with CIP-014 and CIP-003 requirements limits the availably of information appropriately. While the PSEG Companies acknowledge that stakeholders have an interest in participating in the transmission planning process, that interest has to be balanced against the need to retain the confidentiality of sensitive information regarding national security concerns. New processes need to be developed for this purpose. Current Critical Electric Infrastructure Information ("CEII") rules lack sufficient stringency. Stakeholders should be provided with data only on a "need to know" basis and only to the extent necessary to verify that the project is being undertaken consistent with the standard.

III. CONCLUSION

WHEREFORE, the PSEG Companies respectfully request that the Commission recognize the importance of the resiliency issues with which it is faced and take decisive steps to them. At a minimum, to the extent that the Commission declines not to act or fails to act in a

timely manner to address resiliency issues, the Commission should not interfere with legitimate efforts of States to address them.

Ensuring resilient and efficient PJM electricity supply

The value of cost-effective nuclear resources in the PJM power supply portfolio

Lawrence Makovich, Vice President and Chief Power Strategist

Benjamin Levitt, Associate Director

About the report

The *Ensuring resilient and efficient PJM electricity supply: The value of cost-effective nuclear resources in the PJM power supply portfolio* report from IHS Markit utilizes the company's extensive knowledge and proprietary models of the interaction between regional power system demand and supply to assess the impact on consumers of current PJM wholesale market distortions that increase the probability of uneconomic closure and replacement of PJM nuclear generating resources. This report is made up of two volumes. Volume 1 contains the main report, and Volume 2 contains the appendixes. This research was supported by Nuclear Matters.

The authors are exclusively responsible for all analysis and content.

Executive summary

PJM faces the potential loss of cost-effective nuclear resources that provide valuable resilience to the disruptive events that can affect normal power system operating conditions. This problem exists because ongoing wholesale market distortions are increasing the likelihood of uneconomic closures of existing PJM nuclear resources and the subsequent replacement by the fuel and technology mix in the current PJM new power supply pipeline (15% renewables and 85% natural gas–fired technologies). This analysis indicates that if nothing is done to prevent uneconomic nuclear closures and replacements, then the 65 million consumers relying on PJM grid-based power supply face

- **Less resilient PJM capacity availability.** This follows from the loss of the inherent resilience created by the weak correlation between nuclear and nonnuclear capacity availability risk factors, most recently observed during the polar vortex and bomb cyclone disruptive winter events. Since inherent resilience is costless to consumers, the associated increase in the cost to achieve PJM reliability levels to compensate for uneconomic nuclear closures means that an efficient trade-off between reliability benefits with costs results in a lower level of power system reliability.

- **Less consumer net benefits from electricity consumption.** The uneconomic retirement and replacement of PJM nuclear power plants reduces the consumer annual net benefit from PJM grid-based electricity. Since consumers value electricity more than what they pay for it, the net benefit of electricity purchases declines by $5–12 billion per year owing to higher retail prices and lower consumption levels. The loss in consumer net benefits is about 3 cents per kWh produced by existing PJM nuclear resources.

- **Less affordable electricity.** Annual PJM electricity supply costs increase the average retail price for electricity to consumers by 9–18% because nuclear resources are lower cost to continue to operate than they are to replace.

- **Less resilient PJM electric production costs.** Month-to-month variation (as measured in terms of standard deviation) in consumer monthly production costs increases by roughly 53% owing to the loss of the inherent electric production cost resiliency provided by the nuclear contribution to the current fuel

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0532

diversity in the PJM electricity supply portfolio. Since monthly production costs represent about one-third of consumer monthly power bills, the variation in monthly consumer electricity bills is about 18% greater. Replacing the production cost resilience from nuclear resources with financial hedging instruments would involve an annual cost of about $714 million.

- **Less environmentally responsible PJM power supply.** PJM nuclear resources provide 88% of the PJM non–carbon dioxide (CO_2)–emitting electric production. If these nuclear resources close prematurely, then the net effect on PJM electric greenhouse gas (GHG) emissions is an annual increase of about 100 million metric tons of CO_2. PJM nuclear closures would remove 12 times more CO_2-free power supply than currently produced by all the wind and solar resources in PJM. To put this into perspective, the potential annual increase in PJM CO_2 emissions equals the CO_2 emissions produced each year by two-thirds of the vehicles on the road in PJM. The potential annual increase in CO_2 emissions imposes an annual environmental cost of about $4.3 billion based on the $43 per metric ton midrange estimate of the social cost of incremental CO_2 emissions.

The bottom line is that efficient power supply is diverse because no single fuel or technology is the lowest-cost source of supply to meet the base-load and variable segments of consumer demand and the uneconomic loss of the nuclear contribution to the PJM power supply portfolio caused by market distortions is a lose-lose proposition. The outcome involves both higher power production costs as well as higher CO_2 emissions. Since environmental responsibility requires making efficient environmental cost and benefit trade-offs, uneconomic PJM nuclear closures and replacements are not environmentally responsible.

© 2018 IHS Markit

Electricity consumers reveal a preference for resilience to disruptive events affecting both power supply availability and electric production costs. The 19 PJM nuclear power plants are a cost-effective source of electric energy and capacity in the current diverse PJM power supply portfolio (see Figure 1).

PJM nuclear resources supply net dependable capacity to meet power system real-time demand levels, and PJM dispatches nuclear resources to cost-effectively align energy output with the steady 24/7 base-load segment of consumer demand that accounts for 60% of annual PJM electric load. The uneconomic retirement and replacement of PJM nuclear power plants would have reduced the consumer annual net benefit from PJM grid-based electricity by about $8 billion per year over 2013–16. This translates into a consumer net benefit per kilowatt-hour of PJM nuclear generation of about 3 cents per kWh.

PJM consumers benefit from efficient power supply diversity because it inherently increases the ability of grid-based power supply to withstand and reduce the magnitude and/or duration of disruptive events on both power supply availability and costs. Efficient power supply diversity exists because no single fuel or technology is the lowest-cost source of supply to meet the base-load and variable segments of consumer demand. As a

SI-SSA-0010-0533

result, cost-effective power supply under expected operating conditions involves employing an efficient mix of fuels and technologies in the power supply portfolio. However, expected operating conditions are subject to disruptions because all fuels and technologies have performance and cost risks. Since many of the key electric generation fuel and technology risk factors are not highly correlated, the cost-effective diversity in a power supply portfolio results in "not having all the eggs in one basket" and, thus, ***inherently*** mitigates the impact of disruptions from expected operating conditions.

In particular, the nuclear power plants in the PJM power supply portfolio provide consumers with inherent resilience in both power supply availability and affordability because the PJM nuclear capacity availability and production cost risk factors are not highly correlated with the risk factors of the other resources in the PJM power supply portfolio.

The value of the inherent capacity diversity provided by nuclear resources in the PJM power supply portfolio became apparent during recent deviations from expected winter operating conditions. During the deviation from normal winter conditions known as the polar vortex in January 2014, PJM hit a record wintertime peak demand of 141.8 GW. This severe cold snap did not reduce available nuclear capacity below its expected net dependable level. However, the severe cold snap did reduce available natural gas–fired capacity by 27% from the expected net dependable level.

The polar vortex episode revealed the inherent resilience arising from the lack of correlation between natural gas–fired capacity availability risk factors and the risk factors associated with nuclear, oil-fired, and coal-fired power plants. This lack of correlation allowed these resources that did not depend on natural gas to back up and fill in for the disproportionate limitations on natural gas–fired capacity availability during the polar vortex. Looking back, if the PJM net dependable nuclear had been replaced by an equivalent amount of net dependable natural gas–fired capacity along with an expanded natural gas supply infrastructure capable of providing the same natural gas–fired capacity availability (ratio of available capacity to net dependable rating) experienced during the polar vortex, then the available capacity on 7 January 2014 would have been 9.3 GW lower. Under these conditions, PJM would have had to fully exercise the remaining emergency operating procedures that provided an estimated equivalent of 2.7–3.7 GW of firm capacity and, therefore, would likely have been pushed beyond its limits and forced to shed some load during the polar vortex.

PJM responded to the lessons of the polar vortex by changing capacity performance rules. However, these changes did not eliminate the exposure of PJM power supply to natural gas–fired generation risk factors. The continued vulnerability of PJM to the availability of natural gas–fired capacity became apparent when PJM faced another significant deviation from normal winter operating conditions during the "bomb cyclone" event during the winter of 2017/18. The bomb cyclone cold snap was not as severe as the polar vortex episode. Yet the bomb cyclone was severe enough to reduce natural gas–fired capacity and constrain natural gas supply to PJM generators. As a result, the 35% of installed PJM capacity consisting of natural gas–fired resources accounted for 59% of the PJM capacity outages that drove the 7 January 2018 PJM installed capacity forced outage rate to 12.1%.

The inherent diversity of the PJM power supply portfolio reduced the magnitude and duration of the disruptions to expected PJM operating conditions during the cold snap known as the bomb cyclone. But the implication was clear—if the PJM net dependable nuclear capacity had been replaced by an equivalent amount of net dependable natural gas–fired capacity and the gas supply infrastructure had also been proportionately expanded to provide the same natural gas–fired capacity availability factor as experienced during the bomb cyclone, then the available PJM capacity on 7 January 2018 would have been 5.2 GW lower. Under these conditions, PJM would have had to exercise all emergency operating procedures and would likely have been pushed beyond its limits and forced to shed load during the bomb cyclone.

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0534

PJM natural gas–fired capacity availability appeared better during the bomb cyclone than during the polar vortex owing in part to the significant costs that natural gas–fired generators incurred to improve capacity availability in response to the PJM capacity performance rule changes. This cost to increase capacity resilience stands in stark contrast to the costless resilience inherently provided by the efficient fuel and technology diversity of a cost-effective PJM power supply portfolio. The cost implication is clear—if uneconomic closure and replacement of PJM nuclear resources results in the loss of inherent PJM power supply portfolio resilience, then restoring that lost resilience will impose additional costs on consumers.

The costly loss of inherent capacity availability and production cost resilience is one of the predictable negative impacts resulting from the uneconomic closure and replacement of PJM nuclear resources. This analysis quantified the potential impacts from the closure and replacement of nuclear capacity and energy in the PJM generating portfolio with an analysis of the closure and replacement of PJM nuclear resources under the operating conditions experienced from 2013 through 2016.

The findings of negative impacts from PJM nuclear power plant closure and replacement indicate that premature closure and replacement of existing PJM nuclear resources is not the result of efficient market dynamics generating cost-effective resource turnover. In an undistorted marketplace, effective cost-based competition sorts out the most efficient suppliers. Under these conditions, the exit of an unprofitable supplier benefits consumers. But to make this happen, existing suppliers would not exit the marketplace and be replaced by costlier alternatives.

The results of this study indicate that retiring existing PJM nuclear resources would trigger replacement by costlier alternatives. Such an outcome is inconsistent with an efficient market outcome and consistent with the results in a distorted marketplace that does not count all costs in the cost-based competition. Under competitive conditions with missing costs, market forces do not sort out the most efficient suppliers. Instead, market price signals support the operation of less cost-effective suppliers while more cost-effective suppliers are driven out of business.

PJM wholesale electric energy markets distortions arise from missing costs because price formation rules reprice security constrained market-clearing prices below power system marginal generating costs. In addition, current subsidies and mandates for some but not all non–CO_2-emitting competitive generators shift costs to taxpayers and alter PJM market demand and supply interactions resulting in lower market-clearing prices, at some times, enough to produce negative price levels. These energy market distortions disproportionately reduce cash flows for higher-utilization power supply resources. In addition, current uneven internalization of the full cost of CO_2 emissions among rival generators disproportionately impacts higher-utilization power resources with lower CO_2 emissions per megawatt-hour compared with the CO_2 emission intensity of the generating units whose short-run marginal cost (SRMC) bids are setting the market-clearing price.

PJM wholesale electricity capacity market distortions arise from federal and state environmental policies that subsidize and mandate capacity development and, thus, override market price–driven capacity entry, thereby delaying the point in time when electricity market demand and supply achieve long-run balance and suppressing capacity market-clearing prices.

PJM market distortions have a significant impact on competitive generator cash flows. The track record of persistent cost recovery shortfalls and bankruptcies of competitive generators, including natural gas–fired generators, indicate the magnitude of the problem. Other power systems provide examples of unresolved discord between public policies and market operations leading to market distortions that eliminated nuclear generation shares like current PJM nuclear generation shares within a dozen years. Consequently, the uneconomic closure of PJM nuclear resources is a plausible result from current market distortions. The

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0535

recent FirstEnergy Solutions announcements to prematurely deactivate more than 4,000 MW of PJM nuclear resources are the leading edge of the potential loss of cost-effective PJM nuclear resources.

The most straightforward solution to the problem of uneconomic nuclear retirements involves reforming price formation rules to close gaps between marginal costs and market-clearing prices, along with putting an appropriate price on CO_2 emissions for all rival generators in PJM rather than subsidizing and mandating generation shares for some but not all non–CO_2-emitting generating technologies. However, since policy and market discord is entrenched, the probability is low that policy formulation will reverse course and quickly eliminate the underlying root causes of market distortions. Therefore, PJM market distortions are likely to persist. Under these conditions, other feasible policy options are under consideration to augment cash flows for cost-effective generating resources and produce outcomes closer to the results expected in an efficient market end state. These options involve providing compensation for attributes—such as cost-effective contributions to resilient capacity availability, contributions to resilient electric production costs, contributions to flexible operating capabilities, or contributions to lowering power system CO_2 emission levels.

Looking ahead, unresolved market distortions create inefficiencies that make PJM grid-based electricity supply less affordable, less reliable, less resilient, and less environmentally responsible. The implication is that the FERC Resilience Docket AD18-7-000 provides the opportunity to do something to address PJM market distortions and to avoid the consequences of uneconomic PJM nuclear power plant closures and the resulting significant declines in the consumer net benefit from PJM grid-based power supply.

Since PJM is the largest electricity market on earth and widely regarded as a model for electricity policy formulation and market design, actions to preserve the inherent resilience to electric availability and production cost levels provided by current cost-effective nuclear resources in the power supply portfolio have the potential to not only benefit electric consumers in PJM but also produce a highly influential example for other power systems to follow in addressing the consequences of market distortions arising from the lack of harmony between public policies and market operations.

Overview

This study focuses on the resilience impacts from the uneconomic closure and replacement of PJM nuclear resources for two reasons. First, current PJM market distortions disproportionately reduce cash flows for high-utilization and low–CO_2-emitting resources and make the premature loss of PJM nuclear resources a plausible scenario. Second, the inherent resilience provided from cost-effective nuclear in the PJM power supply portfolio is significant and expensive to replace.

Power system operating conditions are subject to disruptive events that can decrease the availability and increase the cost of grid-based power supply to consumers. As a result, consumers reveal preferences for cost-effective resilience in both power supply availability and electricity production costs.

Wholesale electric market operations can produce outcomes that meet consumer demands for electric supply resilience when public policies and wholesale operations are harmonized. However, resilience in power supply has become a strategic concern in the US power sector because the current lack of harmony between public policies and market operations is causing wholesale electricity market distortions and reducing power supply resilience. At the individual power plant level, market distortions are lowering cash flows and causing underinvestment in the resilience of power plant operations. At the power system level, market distortions are producing price signals that shape less efficient fuel and technology diversity in the power supply portfolio that decreases the inherent ability of an efficient power supply portfolio to withstand and reduce the magnitude and/or duration of disruptive events to expected operating conditions. The combination of plant and power

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0536

system impacts creates an electricity system with less resilience compared with the level of resilience expected from an undistorted, efficient wholesale electricity market outcome.

The link between policy and market discord, market distortions, and resilience losses is not appreciated by some industry observers who believe that wholesale electricity markets are currently working well with subsidies that favor some rival generators and not others, with policies that count some costs but not others in the marginal cost–based competition to generate electric energy, and with rules that generate persistent gaps between power system marginal generating costs and market-clearing energy prices.

The blind spot to market distortions supports assessments that insufficient nuclear power plant cash flows are the result of existing nuclear plants being uncompetitive with natural gas–fired competitors that gained a competitive advantage from downward pressure on natural gas prices due to development of shale natural gas resources. Such assessments reflect the perception that nuclear closures are simply the result of the "creative destruction" in an efficient marketplace.[1] From this perspective, there is no distinction between economic and uneconomic nuclear power plant retirements. Further, the blind spot to market distortions fails to reconcile with the financial track record of the competitive natural gas–fired generators across the past 15 years, where the rule rather than the exception was inferior risk-adjusted returns to broader capital market benchmarks, significant asset write-downs, and periodic bankruptcy reorganization. The implication is that these natural gas–fired competitive power generators are not "winning" in the marketplace but instead are also being impacted by market distortions suppressing cash flows below levels expected in an undistorted market outcome.

Resilience in power supply is a strategic concern for the PJM wholesale electricity market because PJM operates the world's largest competitive wholesale electricity market and coordinates the power system security-constrained movement of wholesale electricity in all or part of 13 states (Delaware, Illinois, Indiana, Kentucky, Maryland, Michigan, New Jersey, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia) and the District of Columbia. PJM centrally dispatches generation through a bid-based competitive process that determines power system security-constrained locational market prices in day-ahead and real-time electric energy markets as well as determines prices in capacity and ancillary service markets.

This study analyzes the resilience impacts from the perspective of the 65 million consumers who rely on PJM for affordable, reliable, resilient, and environmentally responsible grid-based power supply. From this perspective, the power system objective is to cost-effectively meet the multiple dimensions of consumer demand by efficiently integrating a reliable and resilient mix of fuels and technologies to supply consumers with the electricity that they want, whenever they want it, at prices that reflect all the costs of the grid-based security-constrained economic dispatch of the power supply portfolio.

Consumers reveal preferences for resilient electric supply availability

Electric system operating conditions are uncertain because the availability of all generating fuels and technologies are vulnerable to disruptions from mechanical or software failures, accidents, political interventions, overloading network pathways, regulatory changes, extreme weather events, and physical or cyber attacks.

1. Joseph Schumpeter, *Capitalism, Socialism and Democracy,* Harper, New York, 1975 (original publication 1942), p. 83.

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0537

Resilience in grid-based power supply provides the ability to withstand and reduce the magnitude and/or duration of disruptive events, which includes the capability to anticipate, absorb, adapt to, and/or rapidly recover from such events.[2]

Consumers benefit from resilient electric supply availability that reduces the magnitude and duration of electric service outages. Estimates of total annual power outage costs for US consumers exceed hundreds of billions of dollars per year.[3] Of course, consumer outage impacts vary depending on the size, timing, and duration of an outage, but available estimates of actual annual outage costs and durations indicate that electric service disruptions in the United States result in about $75 billion per hour of electric service interruption costs.[4] This cost translates into a $170/kWh incremental outage cost.

Estimates of the value of lost load are more than 100 times greater than the price consumers pay for electricity. These value of lost load estimates align with the high valuations consumers reveal when they choose to purchase backup generation resources to provide uninterrupted power supply to critical electrical applications. US grid-based power supply is typically available 99.97% of the time, and the typical backup generation cost per kilowatt-hour to provide electric service during the 2.33 hours per year of expected grid-based supply disruptions is roughly 100 times the US average price of 12.6 cents per kWh that households pay for grid-based power supply.

Consumer choices to invest in backup generation reveal high valuations for avoiding incremental grid-based outages. Many commercial and industrial customers—especially customers with critical electric applications in hospitals and data centers—choose to install backup generation. On the residential side, more than 1 million US residential consumers have chosen to invest in emergency backup generation systems. Within PJM, a surge of residential consumer investments in backup generation followed the Hurricane Sandy outages in 2012, even though the PJM electricity supply is available over 99% of the time.[5]

Consumers chose to back up supply for some, but not all, electric loads. These choices reveal that consumers weigh the costs and benefits of improving electric reliability across all electric end uses and determine that making a power system 100% reliable for all applications is not cost effective. These consumer choices reveal that consumers recognize reducing the probability of grid-based electric supply outages to zero will cost far more than the high, but not unlimited, value that they place on unserved electric load. Therefore, from a consumer perspective, cost-effective grid-based power supply meets their preferences for resilience in power supply availability by achieving a level of reliability that balances the marginal costs and benefits of reliability investments.

Current value of lost load estimates put the benefit of avoiding an additional hour of electricity outages in PJM at about $12.5 billion. PJM is responsible for maintaining mandatory reliability standards in grid operations and network planning established by the North American Electric Reliability Corporation and approved by the Federal Energy Regulatory Commission (FERC). To meet reliability obligations, PJM establishes a forward demand curve for capacity designed to produce capacity price signals that pace investment in power supply to achieve a target loss of load probability for the power system.

SI-SSA-0010-0538

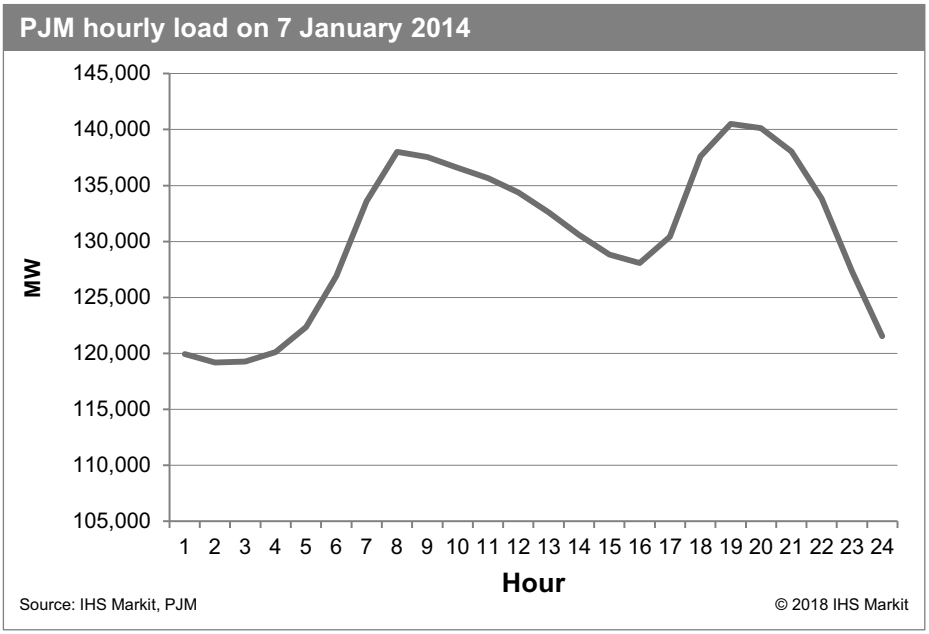
PJM consumers benefit from efficient power supply diversity because it inherently increases the ability of grid-based power supply to withstand and reduce the magnitude and/or duration of disruptive events on power supply availability. Efficient power supply diversity exists because no single fuel or technology is the lowest-cost source of supply to meet the base-load and variable segments of consumer demand. As a result, cost-effective power supply under expected operating conditions involves employing an efficient mix of fuels and technologies in the power supply portfolio. However, expected operating conditions are subject to disruptions because all fuels and technologies have performance risks. Since many of the key electric generation technology risk factors are not highly correlated, the cost-effective diversity in a power supply portfolio results in "not having all the eggs in one basket" and, thus, ***inherently*** mitigates the impact of disruptions from expected operating conditions.

The uneconomic closure of PJM nuclear capacity results in the loss of inherent resilience in PJM capacity availability. Since cost-effective nuclear generation in the PJM supply portfolio provides consumers with inherent resilience in capacity availability, this resilience comes at zero cost to consumers. Consequently, achieving the same level of power system reliability following uneconomic PJM nuclear closure and replacement requires incurring additional costs. As a result, if PJM meets consumer preferences to balance the costs and benefits of reliability investments, then the result of uneconomic nuclear closures and replacements will be a lower cost-effective level of power system reliability and higher expected outage costs for consumers.

Recent disruptive events to expected winter operating conditions in PJM illustrate the benefits of the resilience provided by the diverse technology and fuels in the electric supply portfolio, and the responses to these winter episodes indicate the cost associated with increasing the resilience of electric capacity availability.

The polar vortex was a recent disruptive event involving a significant deviation from normal winter conditions during January 2014. Figure 2 shows the aggregate consumer hourly load on 7 January 2014, when the polar vortex caused PJM to hit a record wintertime peak demand of 141.8 GW.

Figure 2



On the supply side, polar vortex conditions in the PJM power system caused significantly higher-than-expected unavailability from natural gas–fired generating units linked, in many cases, to abnormally high natural gas pipeline supply constraints. Although the polar vortex did not reduce electric supply just from natural gas–fired resources, the natural gas–fired resources were nevertheless the hardest-hit supply resource. Table 1 reports the actual PJM installed capacity in January 2014 and the associated net dependable ratings by technology and fuel type.[6] Net dependable capacity measures the

expected capacity available from a resource under expected peak demand power system conditions. In PJM, the net dependable capacity of renewable solar and wind resources is typically 13% and 38%, respectively, of the capacity rating associated with operation under favorable conditions. Natural gas–fired generating units have a net dependable rating of 85–90% of the nameplate capacity, and existing PJM nuclear capacity has a net dependable rating of 92% of nameplate capacity. The table also shows the actual outage rates experienced during the polar vortex on 7 January 2014 and the associated actual firm capacity available by technology and fuel type.[7] Resilient capacity availability is a concern because disruptions to expected conditions during peak demand conditions can cause correlated outages for power plants relying on the same fuels or technologies and thus cause the actual overall capability of a class of generating resources to fall short of the expected aggregate net dependable capacity.

The polar vortex experience revealed that a severe cold snap disproportionately constrained the actual available capacity relative to the net dependable capacity of natural gas–fired generating resources. The polar vortex experience also revealed that the lack of correlation between the risk factors associated with natural gas–fired generating resources and the risk factors associated with other resources allowed nuclear, oil-fired, and coal-fired power plants to offset some of the disproportionate limitations on natural gas–fired resources.

A retrospective analysis of the polar vortex provides important resilience lessons because, as a July 2017 National Academies of Sciences, Engineering, and Medicine report notes, a process of continual learning from past events is essential for enhancing the resilience of the grid.[8]

PJM was in a fortunate position that a surplus of installed capacity was present in 2014 when the reported systemwide reserve margin was 22.5% rather than the long-run reserve margin target of about 16%. Analysis of PJM operating under polar vortex conditions shows that as capacity reserves decline, PJM approaches the point at which further reductions in available supply would likely produce increasingly large outage costs. Table 2 shows that as additional net dependable nuclear capacity is removed from the PJM supply portfolio and replaced by equal amounts of net dependable natural gas–fired capacity, the expected consumer outage costs

7. In the May 2014 report *Analysis of Operational Events and Market Impacts During the January 2014 Cold Weather Events,* PJM quantified power supply reserves available to its system during the peak period on 7 January 2014, including 500 MW of 10-minute synchronized reserves, 1,167 MW of 10-minute nonsynchronized reserves, and 1.1–2.0 GW of temporary voltage reduction. Although other actions may have been available, such as purchasing additional emergency energy or recalling shared reserve obligations from neighbors, this analysis does not include the potential for PJM to purchase additional energy or recall additional obligations that PJM provided to neighbors.

The polar vortex episode indicates that if the PJM nuclear net dependable capacity had been replaced by an equal amount of net dependable natural gas–fired generating capacity and the gas supply infrastructure had also expanded in proportion to provide the same forced outage rate of natural gas–fired generation during the polar vortex, then the firm capacity available on 7 January 2014 would have been 9.3 GW lower. The results indicate that replacing PJM nuclear capacity with natural gas–fired capacity reduces the risk diversification in the PJM power supply portfolio. Since nuclear net dependable capacity risk factors are not highly correlated with natural gas–fired net dependable risk factors, the expected overall available capacity is higher with a combination of nuclear and natural gas–fired capacity compared with the same amount of capacity consisting entirely of natural gas–fired resources. Therefore, the increase in correlation to risk factors within a generation portfolio results in an increase in the overall power system loss of load probability. Under the conditions of closure and replacement of PJM nuclear net dependable capacity with an equivalent amount of net dependable natural gas–fired capacity, PJM would likely have been pushed beyond the power system supply limits and thus forced to shed load during the polar vortex operations even if PJM employed the remaining emergency operating procedures that provided an estimated equivalent of 2.7–3.7 GW of firm capacity.

The polar vortex experience led PJM to examine the poor generator capacity availability. The examination exposed the lack of clarity in the PJM capacity market regarding the definition of the capacity commodity. PJM responded by developing capacity performance rules for its capacity marketplace designed to provide larger capacity payments for the most available resources, including performance bonus payments for overperforming participants as well as higher penalties for nonperformers. FERC approved PJM's rule changes in June 2015.

Since the polar vortex, 8,922 MW of coal-fired capacity and the 608 MW Oyster Creek, 837 MW Three Mile Island, 908 MW Davis-Besse, 1,268 MW Perry, and 1,872 MW Beaver Valley nuclear plants announced plans for closure. In addition, PJM added 11,715 MW of natural gas–fired generating capacity by the end of 2016. As a result, the exposure of PJM electric supply to the risks in the natural gas supply chain increased because the PJM electric supply portfolio became more natural gas dependent.

Implementing the PJM capacity performance rules showed that increasing PJM power supply resilience from natural gas–fired resources came at a cost. PJM surveyed 100 units (62 GW of the 93 GW) of the generators that committed to the capacity performance auction for the 2016/17 delivery year to understand the costs being incurred to comply with the new capacity performance requirements.[9] Table 3 summarizes the types

9. "Capacity Driven Performance Investments," PJM, October 2016, http://www.pjm.com/-/media/committees-groups/committees/mc/20161024-webinar/20161024-item-03-resource-investments-in-response-to-capacity-performance-requirements.ashx, retrieved 27 March 2018.

of investments the PJM generators reported along with the range of costs for each type of investment and the associated capacity involved in each response.

PJM capacity performance rule changes and the increased reliance on natural gas–fired resources altered the exposure of PJM power supply to natural gas–fired generation risk factors. The current vulnerability of PJM to the availability of natural gas–fired capacity became apparent when PJM faced another significant deviation from normal winter operating conditions during the bomb cyclone event during the winter 2017/18. The bomb cyclone cold snap was not as severe as the polar vortex episode, yet natural gas–fired capacity availability was again disproportionately reduced. The bomb cyclone conditions drove the 7 January 2018 PJM installed capacity forced outage rate to 12.1%, and the 35% of installed PJM capacity that consists of natural gas–fired resources accounted for 59% of the PJM capacity outages.

The bomb cyclone episode indicates that if the PJM net dependable nuclear capacity had been replaced by an equivalent amount of net dependable natural gas–fired capacity and the gas supply infrastructure had also been proportionately expanded to provide the same natural gas–fired capacity availability factor as experienced during the bomb cyclone, then the available capacity on 7 January 2018 would have been 5.2 GW lower. Under these conditions, PJM would have had to exercise the remaining emergency operating procedures and would likely have been pushed beyond its limits and forced to shed load during the bomb cyclone.

The 2014 polar vortex and the 2017/18 bomb cyclone events show that replacing the net dependable PJM nuclear capacity with an equivalent amount of net dependable natural gas–fired capacity results in a higher loss of load probability and a lower level of reliability. The costs incurred to increase resiliency in response to the PJM capacity performance rules indicate that if unresolved PJM market distortions lead to uneconomic nuclear power plant closures, then replacing the lost resiliency provided by these resources in the generation portfolio will involve significant costs. Since cost-effective nuclear resources in the PJM supply portfolio provide inherent capacity resilience, replacing this source of zero-cost capacity resilience results in higher power bills for consumers.

Since the uneconomic closure of PJM nuclear capacity increases the cost of achieving the equivalent level of capacity resilience, adjustments to the PJM capacity demand curve are likely to replace only some of the lost resilience because a rebalancing of the costs and benefits of capacity resilience results in a lower level of cost-effective resilience.

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0542

The bottom line is that uneconomic PJM nuclear retirements will result in higher costs of capacity resilience, lower levels of cost-effective reliability, and higher expected annual consumer outage costs.

Consumers reveal preferences for affordable electric supply with production cost resilience

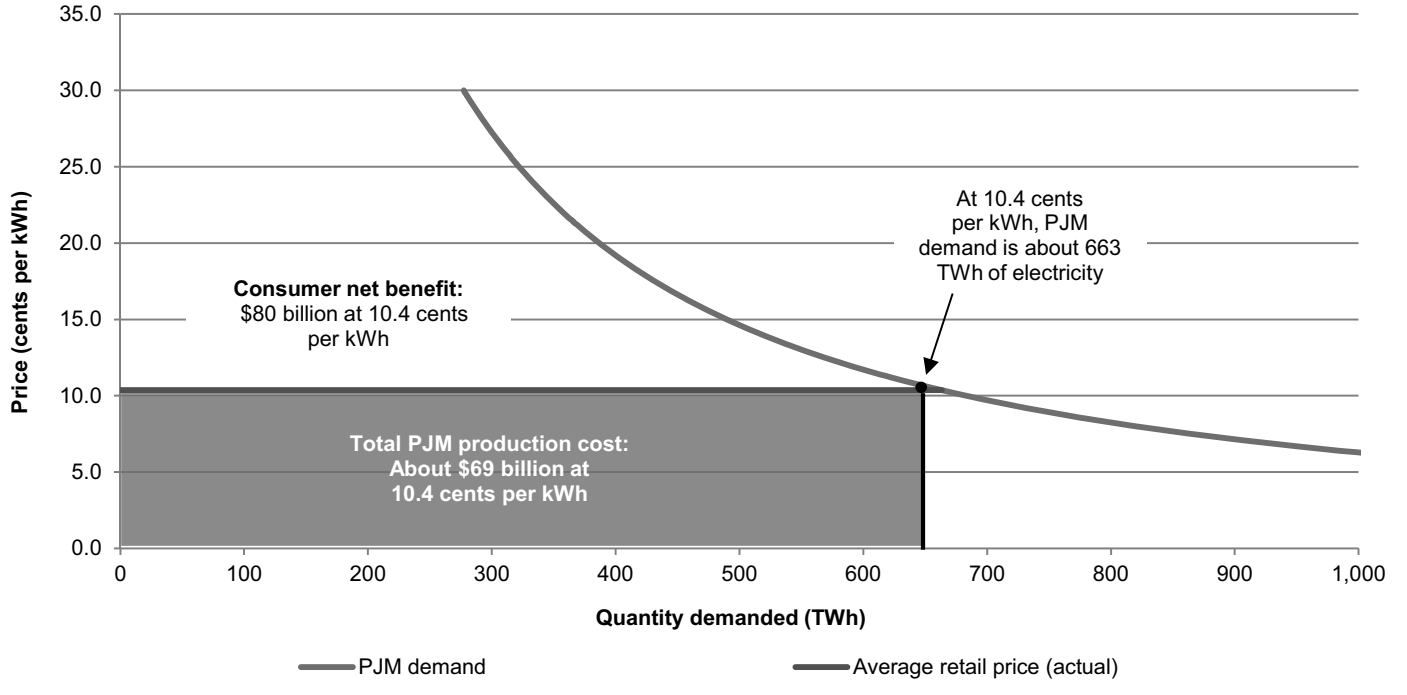
Consumers reveal a preference for affordable electric service. In 2016, electricity consumers within PJM purchased 663 billion kWh of grid-based power and paid an average retail price of 10.4 cents per kWh. These consumers had a choice to purchase electricity from the grid or to generate their own electricity off the grid. Self-generation is typically far more expensive than grid-based electricity supply because regional power grids can integrate a cost-effective mix of fuels and technologies that exploit available economies of scale that are well beyond the scale of self-generation. Therefore, the choices of most households and businesses to purchase grid-based electricity reveals a preference not to pay more than is necessary for electricity service.

Consumers also reveal that they value grid-based electricity more than what they pay for it. Consumers reveal the value that they place on different amounts of grid-based electricity purchases through the choices that they make when the price of electricity changes. For example, when the electricity price goes up, consumers choose to forgo buying some, but not all, of the electricity that they purchased at the lower price. This change in consumption indicates that the value of the forgone electricity consumption was not worth the higher price and, conversely, that the value of the new level of electric consumption is greater than or equal to the new higher price.

Analyses of consumer behavior allows for the estimation of the relationship between the amount of electricity consumers purchase at different price levels—a relationship illustrated by the 2016 aggregate PJM grid-based electricity demand curve shown in Figure 3. Appendix A explains the statistical analyses of the long-standing differences in electricity retail price and consumption levels across states and consumer segments.

Figure 3

PJM grid-based electricity demand (long run), 2016



Source: IHS Markit

© 2018 IHS Markit

SI-SSA-0010-0543

The area under the PJM demand curve from the origin to the actual consumption level in 2016 provides an estimate of the total value consumers in PJM put on electricity consumption. In 2016, a conservative estimate of the total value consumers in PJM put on electricity consumption was $149 billion. The estimate is conservative because it measures only the area under the PJM demand curve below the 30 cents per kWh level. The 30 cents per kWh price is the highest observed retail price in the United States, and limiting the price range in this assessment aligns with the statistically reliable demand curve estimated across the range of observed retail price levels in the United States.

Figure 3 also shows the observed 2016 average retail price (10.4 cents per kWh) and the corresponding observed level of aggregate consumer electricity consumption on the demand curve (663 billion kWh). The shaded area of the rectangle defined by the average retail price times the level of electricity consumption shown in Figure 3 indicates the $69 billion direct cost of grid-based electricity to PJM consumers in 2016.

Electricity consumption produces a net benefit for consumers equal to the value they place on their electricity consumption minus the direct cost of the electricity. Economic textbooks describe this value of consumption over what consumers pay as the "consumer surplus."

Table 4 shows that the 2016 PJM consumer net benefit from grid-based electricity consumption was about $80 billion along with estimates of the consumer net benefit from consumption of PJM grid-based power supply in 2013 through 2015. The implication is clear—consumers in PJM valued the electricity that they consumed over the recent past more than twice the amount that they paid for it.

Table 4

PJM consumer net benefits, 2013–16
(billion dollars, nominal)

Year	Revealed consumer electricity valuation	Consumer direct retail electricity supply cost	Consumer net benefit	Ratio of electricity value versus cost
2016	$149	$69	$80	2.2
2015	$148	$69	$78	2.1
2014	$148	$68	$80	2.2
2013	$145	$66	$80	2.2

Source: IHS Markit, Energy Information Administration (EIA) © 2018 IHS Markit

With this consumer benefits to cost ratio, it is not surprising that consumers complain when electric service restoration from an outage is slower than expected, even though a continuing outage lowers the consumer's power bill.

Analysis of consumer net benefits from grid-based electricity consumption indicates that maximizing consumer net benefits requires efficient electricity production. Since consumers demand different amounts of grid-based electricity at different points in time, an efficient electric supply portfolio involves a diverse mix of fuels and technologies that reflect a cost-effective alignment of available alternative electric generating resource performance characteristics to the pattern of aggregate consumer demand through time.

Nuclear resources are part of the cost-effective PJM fuel and technology power supply mix because nuclear output cost-effectively aligns with the steady 24/7 base-load segment of consumer demand that accounts for 60% of annual PJM electric load. As a result, replacing existing PJM nuclear resources with costlier power supply alternatives is uneconomic. The implication is that if uneconomic nuclear power plant closures and replacements make PJM grid-based electricity more expensive than it needs to be, then consumers lose quantifiable net benefits from electricity consumption.

Consumer net benefits from electricity consumption are uncertain because electricity production costs are uncertain. Power supply cost risk factors include the uncertainty in relative fuel prices for power generation

SI-SSA-0010-0544

caused by multiyear fuel price cycles, strong seasonal price movements, and periodic episodes of extreme price spikes reflecting the impact of disruptions in normal operating conditions in the fuel supply chain.

The shale natural gas revolution continues to benefit the US economy and to make natural gas–fired generating resources a major component of cost-effective power supply portfolios. Natural gas–fired resources are part of the cost-effective PJM power supply mix, particularly as a flexible resource to meet the variable segment of PJM aggregate consumer demand. This role for natural gas–fired resources results in the delivered cost of natural gas disproportionately affecting the cost of PJM electricity to consumers. Rival natural gas–fired generators' SRMC supply bids set the market-clearing wholesale electric energy price in response to changing demand levels in the PJM marketplace most of the time. As a result, the natural gas–fired share of marginal generation is greater than the natural gas–fired share of overall generation. Thus, the marginal costs of natural gas–fired resources exert a disproportionate influence on overall PJM wholesale price setting.

PJM natural gas–fired generators face long-run natural gas price cycles. The expected operating lifetime of a natural gas–fired power plant spans several decades. This links the input fuel price and fuel availability at these power plants to the long-run dynamics of the natural gas business landscape. A brief review of the dramatic changes in the natural gas industry landscape across the past several decades illustrates how several factors—disharmony between market forces and regulatory processes, consumer and producer recognition and adjustment lags, and changes in technology—combine to create dynamic natural gas price cycles in the long run.

- In the 1970s, the oil embargoes generated historically high oil prices and competitive forces drove the substitution of natural gas for oil in many energy end-use applications in the US economy, including in the generation fuel input mix for electric generation. However, at that time, disharmony between the regulatory process and competitive forces created disconnects between demand and supply trends and caused a failure to provide a sufficient price signal to incentivize development of the needed additional natural gas supply. The resulting shortages not only produced historically high price levels but also forced natural gas curtailments to consumers and ultimately generated legislated restrictions for the use of natural gas. These conditions led to contractual commitments between consumers and producers focused on security of supply, which later proved expensive as the natural gas industry moved into an era of deregulation and lower prices.

- In the 1980s, the tension between regulatory processes and market forces drove the deregulation of the natural gas industry, which resulted in a greater reliance on competitive markets to determine investment, resource development, and price levels.

- In the second half of the 1980s and in the 1990s, the transition to rely more on market forces and less on regulatory processes proved disruptive to the existing contractual commitments made during the prior era's regulatory regime. Market forces, combined with actions to unwind regulatory arrangements, produced an era of supply increases outpacing demand increases. These conditions produced historically low natural gas prices. Eventually, this "gas bubble" discouraged drilling for additional natural gas supply development while, at the same time, encouraging the growth of a natural gas–fired power plant development pipeline.

- In the early 2000s, the failure to recognize and adjust to the increasing gap between rising natural gas demand and the gradual depletion of conventional natural gas resources led to a multiyear upswing in natural gas prices and triggered investments to enable imports of LNG to satisfy expected increases in demand at these higher price levels. However, the upswing in natural gas prices drove the development of hydraulic fracturing techniques along horizontal drilling capabilities that unleashed shale and tight sands natural gas production, which led to aggregate supply outpacing demand by 2007 and subsequently causing a dramatic price decline from 2008 to 2009.

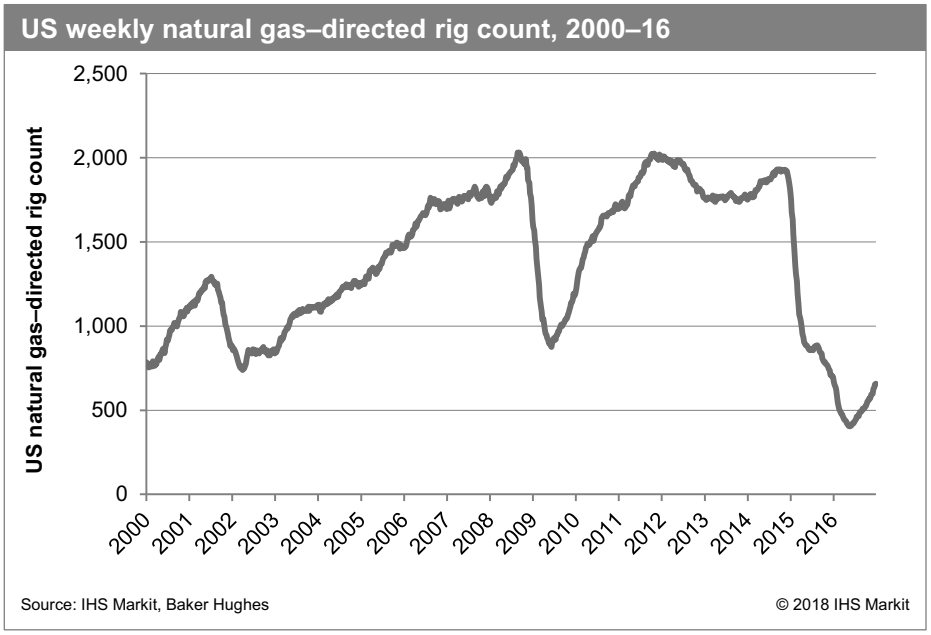
Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0545

- In the 2010s, the evolving state of technology and associated declining marginal cost of shale gas resource production drove the need to reconfigure the natural gas supply chain to accommodate the changing flow patterns arising from the shift in the geographic center of gravity of natural gas production toward Appalachia and the concentration of demand growth in the south and southwest—a shift that is currently proving to be a challenge to the timely delivery of incremental supply to meet the needs of areas with growing demand. Low-probability but high-impact events such as the polar vortex in 2014 and the bomb cyclone in 2017/18 are exposing the current vulnerabilities in the shifting natural gas supply chain.

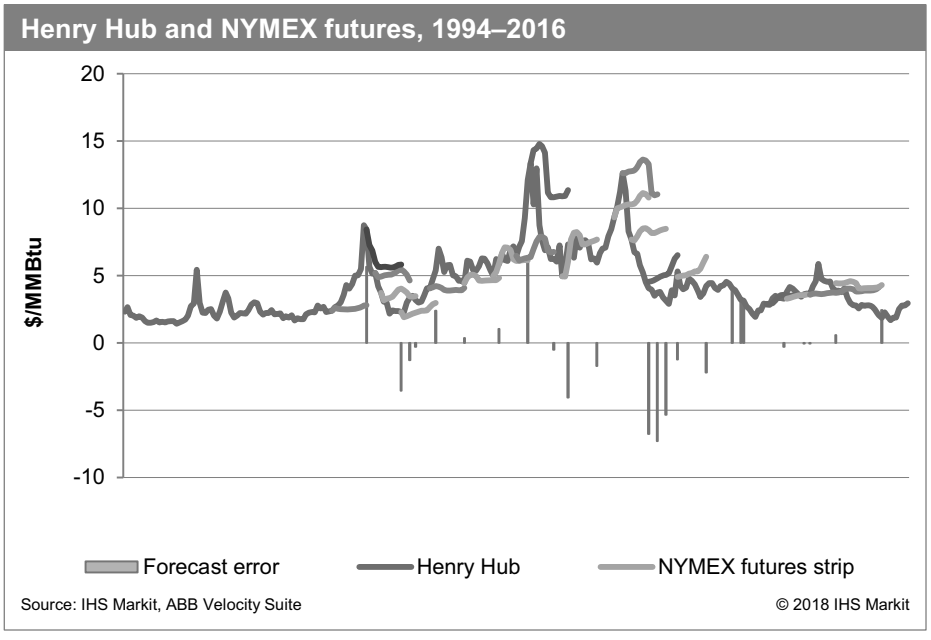
The current natural gas business landscape remains dynamic. Although innovations in the extraction of shale natural gas continue to significantly expand the economically recoverable natural gas resource base, the typical shale gas well has a more rapid production decline rate through time compared with a conventional natural gas well. As a result, shale gas production must be continually replenished by additional in-fill drilling or new exploratory drilling and field development. However, the natural gas supply chain—including wellhead and transportation capacity—is capital intensive, and investment requires a sufficient price signal to incentivize the development of new supply. Multiyear lags exist between the recognition of the price signal, the capital investment decision, the eventual production increase, and the expansion of pipelines and storage facilities. These natural gas industry recognition and adjustment lags cause the high degree of variation in the US natural gas–directed rig count (see Figure 4).

Figure 4



x

Figure 5



The swings in drilling activity are a driver of the long-run natural gas price cycles shown in Figure 5. Anticipating the timing of these multiyear price cycles has proven difficult as the Henry Hub futures price strips that are regarded as the marketplace consensus forecast of prices have proven to be a poor and biased indicator of the future Henry Hub spot price.

The drivers of multiyear natural gas price cycles are not going away, and neither is the difficulty in anticipating the timing of

SI-SSA-0010-0546

20180509-5233-FERC-PDF (Unofficial) 5/9/2018 4:10:10 PM

these price cycles. Prudent risk management involves recognizing the risk profile associated with multiyear delivered natural gas price cycles with hard-to-predict timing across the operating lifetime of a natural gas generating plant.

Natural gas deliverability constraints also involve multiyear cycles. Competitive natural gas–fired generators require pipeline capacity to move natural gas from the well to the burner tip. However, since a natural gas–fired generator's future fuel requirements are uncertain, competitive generators are unlikely to contract for long-term pipeline capacity that fully covers fuel delivery requirements. In addition, competitive natural gas–fired generator cash flow shortfalls due to market distortions reduce the financial capacity of these generators to pay for the desired partial contracting of the firm fuel supply. Consequently, the construction of power plants without firm transportation capacity sets up the possibility that natural gas fuel deliverability may not keep pace as power generation requirements change through time.

Significant natural gas pipeline investment is currently needed because the shale gas revolution shifted the location of natural gas supply and altered natural gas flow patterns away from the flow patterns dictated by delivering peak winter natural gas demand for home heating demand that shaped much of the existing gas pipeline infrastructure topography. The rise of the Marcellus Shale, in which there was no production as recently as 2008, currently accounts for 40% of US production and significantly altered the center of gravity of production in North America, with the associated attendant stress on the pipeline grid.

Physical pipeline flow constraints exist and increase the probability that all the natural gas needed for power generation will not always be available. Construction of pipeline infrastructure is triggering increasing political opposition, particularly in the eastern United States, and this political opposition to new pipelines limits the possibility of eliminating natural gas deliverability constraints.

Hydraulic fracturing has become controversial, and since it is the primary technological innovation that drove the growth of US shale gas production, natural gas supply hinges on the future of hydraulic fracturing. A permanent ban on hydraulic fracturing exists in some states, and if the political forces behind these bans can produce temporary or wider constraints or bans on hydraulic fracturing in the future, the impacts will quickly diminish production owing to the high initial decline rates that characterize shale production.

The current PJM natural gas supply chain operates at a relatively high utilization factor, with wellhead productive capacity routinely operating at a utilization rate of about 98%. At such a high utilization rate, shifts away from expected normal levels of demand, either up or down, typically results in large short-term price movements to bring demand back into balance with supply. Natural gas–fired power generators face the risk of seasonal or shorter-duration natural gas price run-ups as well as brief episodes of days or weeks when natural gas prices spike at multiples of the normal price level.

Natural gas storage infrastructure provides some short-run capacity to manage unanticipated ups or downs in natural gas demand. However, natural gas storage involves a seasonal injection and withdrawal pattern that manages the inverse strong seasonality in aggregate consumer natural gas demand. As a result, using the flexibility of natural gas storage to manage short-run shocks to demand and supply alters the expected seasonal injection or withdrawal pattern. For example, US lower-48 storage inventories were nearly 1 Tcf below the five-year average inventory at the end of March 2014 following the polar vortex. As a result, the accumulation of short-run storage adjustments across a season can produce inventory surplus or deficit conditions that cause a ripple effect on natural gas prices until inventory levels return to normal, an adjustment process that can take a year or more.

SI-SSA-0010-0547

The bottom line is that as PJM becomes more dependent on natural gas–fired generation, a risk exists in the short run that the expansion of natural gas supply—production, storage, and delivery—will not expand in sync with overall demand changes and short-run price variability will likely wax and wane in the years ahead.

The current risks in the power generation natural gas fuel supply chain led the US Department of Energy (DOE) to conclude, "Capacity challenges on existing pipelines combined with the difficulty in some areas of siting and constructing new natural gas pipelines, along with competing uses for natural gas such as for home heating, have created supply constraints in the past. Supply constraints can create increased price risk and, in extreme cases, could impact reliability."[10]

Fuel price and deliverability risks are not unique to natural gas. However, the current size of the PJM natural gas–fired generation share, and the dominance of natural gas–fired capacity in the PJM new electricity supply pipeline, focuses attention on increasing exposure to natural gas risk factors. Assessments of overall fuel supply risk factors indicate that price movements and deliverability constraints are not highly correlated across all fuels used to generate electricity.

Efficient diversity in a power supply portfolio provides more stable and more predictable consumer monthly power bills because a diverse power supply portfolio mutes the impact of any single fuel price change on overall power system production costs. In addition, the cost-effective diversity of an efficient power supply portfolio also provides the capability to lower overall production costs by enabling the substitution away from more expensive generation and toward less expensive generating resources as relative generating costs change in the dispatch of supply to demand in real time. Consequently, efficient diversity in a power supply portfolio provides an inherent ability of grid-based power supply to withstand and reduce the magnitude and/or duration of disruptive events on grid-based power supply costs. As the National Academies of Sciences, Engineering, and Medicine notes, "Resilience is broader than reliability."[11] From this broader perspective, resilient grid-based power supply provides the capacity to reduce the magnitude of variations in the expected costs of electricity production.

Recent events illustrate how the uncertainty of fuel costs and the periodic changes in fuel deliverability constraints create hard-to-anticipate, real-time power production cost variability. During the 28 December 2017 to 7 January 2018 winter cold snap designated the "bomb cyclone" event, weather conditions caused a hard-to-predict and significant deviation from expected natural gas prices and delivery conditions.

The bomb cyclone event caused a spike in the delivered fuel costs of rival natural gas–fired PJM generators. Figure 6 shows that on

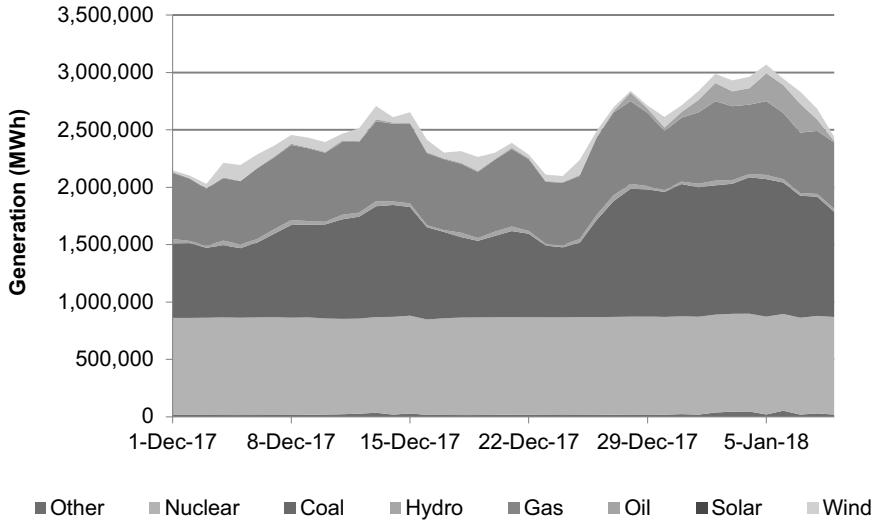
SI-SSA-0010-0548

5 January 2018, the Transco Zone 6 non-NY spot price reached $124.7/MMBtu, representing a 40-fold increase from the average daily price in 2017 and a 35-fold increase from the average daily price in January 2017.

Natural gas–fired generation accounts for a minority of PJM generation output, but since natural gas–fired SRMCs disproportionately influence PJM market-clearing energy price levels, the delivered cost of natural gas price spikes caused the market-clearing hourly wholesale price of electricity in PJM to increase 20-fold, from an average of $29.4/MWh in 2017 to a peak of $586.40/MWh on 7 January 2018.

Figure 7

PJM generation by fuel type during 2017/18 bomb cyclone



Source: IHS Markit, PJM

© 2018 IHS Markit

As Figure 7 shows, as the bomb cyclone unfolded, the natural gas–fired share of PJM electricity declined while generation shares increased from nuclear and other fossil resources, especially oil-fired capacity. This resilience in power supply and production costs was a direct result of the lack of correlation of risk factors among the diverse fuel and technologies employed in the current PJM generating portfolio.

During the bomb cyclone, oil-fired generation shares increased significantly, particularly in New England and other natural gas–constrained regions. The share of generation from oil-fired units exceeded 30% for six consecutive days in ISO New England (ISO-NE). This increase in generation shares from oil-fired units accelerated the depletion of on-site inventories of fuel oil. Over the course of one week, the total usable fuel oil for power generation in New England was depleted by about 50%. As shown in Figure 8, if burn rates had continued at a similar pace, without resupply, the region would have nearly fully depleted available fuel oil inventories in one week.[12]

Figure 8

SI-SSA-0010-0549

In scenarios where nuclear capacity was unavailable, the region would have been even more fuel constrained. For example, if New England's nuclear power generating capacity had been retired and replaced by a combination of natural gas– and/or oil-fired generation, the region would have burned even more oil during the storm and left inventories completely or close to fully depleted.

Consumers reveal a preference for stable and predictable electricity costs. The deployment of advanced metering, communication, and control technologies across the past decade enabled a wide range of consumers the option to choose retail electricity prices that reflected real-time wholesale electricity marginal costs. These "time-of-use" retail pricing schemes involved less stable and less predictable electricity costs than traditional average cost–based retail pricing schemes. A minority of electric consumers, consisting primarily of large commercial and industrial users with flexibility regarding when they consume electricity, revealed a preference for real-time pricing schemes. By contrast, when most consumers were given the choice, they revealed a preference for the retail electricity prices with less variability and more predictability than the "time-of-use" prices.[13] The choices suggest that most electricity consumers are residential and small commercial consumers who typically do not have the flexibility to benefit from shifting electricity use through time in response to real-time price changes and, therefore, find little upside to choosing more variable real-time electricity pricing options. The bottom line is that most consumers reveal a preference for resilience in power supply costs.

Cost-effective nuclear generation shares in an efficient, diverse PJM power supply portfolio provide inherent electric production cost resilience. Since the production cost risks of nuclear plants are not highly correlated to risks associated with nonnuclear fuels and generating technologies, the nuclear generation in the PJM power supply portfolio makes power production costs more stable and less variable compared with the production costs of the current PJM replacement power resource mix. Since cost-effective nuclear generation in the PJM supply portfolio provides consumers with inherent electric production cost resilience, this resilience comes at zero cost to consumers.

The bottom line is that if the uneconomic PJM nuclear capacity closure and replacement results in less production cost resilience, then consumers face more varied and less predictable monthly electricity bills unless other mechanisms, such as financial hedging instruments, are employed to restore the production cost resilience lost due to premature nuclear power plant closures. Since these other production cost risk mitigation options are more expensive, a balancing of the costs and benefits of production cost risk management results in higher costs and a lower expected level of production cost resilience.

Public policies harmonized with wholesale market operations can meet consumer preferences for cost-effective resilience in electric availability and production costs

Alignment of government policies with a well-structured electricity market design is necessary for efficient market outcomes. Addressing resilience challenges does not involve choosing between markets and regulation to organize and coordinate electric system operations. Instead, the resilience issue shows that efficient electricity market outcomes are not possible without enabling government involvement and policy and market harmonization. The importance of public policy and market harmonization is often underappreciated because many fundamental government market interventions for efficient market operations are taken for granted. For example, court systems enable electricity market interactions by providing the mechanisms to make electricity market transactions enforceable, and government regulations setting the financial disclosure requirements and accounting standards for companies enable efficient market allocation of capital to electric

Regulatory market interventions*

The market model benchmark:

The main body of microeconomic theory can be interpreted as describing how, under proper conditions, an unregulated economy will produce optimum economic results.

The economic rationale for regulation:

That for one or another of many possible reasons, competition simply does not work well.

The principle of regulation:

The single most widely accepted rule for the governance of the regulated industries is regulate them in such a way as to produce the same results as would be produced by effective competition, if it were feasible.

*Alfred E. Kahn, *The Economics of Regulation: Principles and Institutions,* vol. 1, MIT Press, Cambridge, Massachusetts, 1998 (original publication 1970), pp. 11 and 17.

infrastructure investments. The bottom line is that federal oversight and ongoing adjustments of regional reliability standards and wholesale electricity market rules and institutions are necessary to enable efficient electricity market operations.

Alfred Kahn wrote the textbook on government regulation and established the principle that government involvement in the marketplace needs to enable effective competition (see the box "Regulatory market interventions").

From this perspective, effective wholesale electricity market competition involves a coordinated mix of competitive forces and regulatory processes that produce the timely price signals to govern the engineering and economic trade-offs that shape a diverse mix of fuels and technologies that cost-effectively align with the recurring annual hourly pattern of aggregate consumer demand, and allow for the efficient utilization of available resources, subject to the security of supply constraints in an AC power system. These conditions produce a well-functioning electricity market capable of reliably balancing power system demand and supply—in both the short and long run—to provide the electric services that consumers want, whenever they want them, at a price that internalizes all costs. Appendix B outlines the characteristics of an efficient wholesale electric market outcome.

Consumer demands for affordable electricity require achieving the lowest overall cost of the security-constrained economic dispatch of electric supply by harmonizing public policies and market operations to meet consumer demands. Enabling public policies can produce effective competition only by insuring that similarly situated rival generators are treated equally and that all costs are counted in the marginal cost–based competition.

Consumer demands for reliable electricity require harmonizing public policies and market operations to ensure effective competition yields a capacity price that complements the market-clearing electric energy price to provide a timely investment signal that maintains a capacity reserve that delivers a loss of load probability that balances the costs and benefits of incremental losses of load.

Consumer demands for resilient production costs require harmonizing public policies and market operations to ensure effective competition generates capacity and energy prices that drive each supply resource to balance the costs and benefits of investments providing cost and operating resilience to the specific fuel and

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0551

technology risk factors. Since the risk factors associated with each fuel and technology pairing have weakly correlated risk factors, harmonized public policies and market operations also shape an efficient mix of fuels and technologies whose cost-effective diversity provides inherent resilience in overall power production costs to mitigate the potential impact of significant deviations from normal operating conditions.

Environmental responsibility requires harmonization of public policies and market operations to enable efficient trade-offs of environmental costs and benefits. Such trade-offs ensure that investments to reduce CO_2 emissions deliver the greatest bang for the buck.

The bottom line is that an efficient market outcome provides a benchmark to access market outcomes distorted by the unequal treatment of similarly situated rival generators. Appendix C describes the predictable market distortions that arise under these conditions.

A loss of resilience due to uneconomic PJM nuclear closures is a plausible scenario

Costly premature PJM nuclear power plant closures present a plausible scenario. Such a scenario is already unfolding in other US power systems where the discord between public policy initiatives and wholesale market operations has already contributed to the premature closure of six nuclear plants in the past eight years and announced plans for eight more in the next eight years (see Figure 9). The recent FirstEnergy Solutions announcement of the premature deactivation of more than 4,000 MW of PJM nuclear resources is the leading edge of the potential rapid loss of PJM nuclear resources. The potential consequences of rapid, premature PJM nuclear closures on power system reliability, resilience, costs, and CO_2 emissions are apparent from experiences in other power systems.

Figure 9

This map is not to be reproduced or disseminated and is not to be used nor cited as evidence in connection with any territorial claim. IHS Markit is impartial and not an authority on international boundaries which might be subject to unresolved claims by multiple jurisdictions.

The consequences of unresolved discord between public policies and California Independent System Operator (CAISO) market operations is a harbinger for other power systems, including PJM. Market distortions contributed to the decisions within a span of three years to close and replace all four nuclear units and drive the in-state generation share of nuclear resources from 18% to zero within a dozen years. The lack of harmony has already caused the in-state nuclear generation share to decline from 18% to 10% in the five years from 2012 to 2016, and announced premature nuclear closures will eliminate nuclear generation in California by 2025. The consequences of the closure and replacement of nuclear capacity and energy in California already include

- **Costly capacity and energy replacement.** The replacement of nuclear capacity and generation outputs with more expensive wind, solar, and natural gas–fired resources caused California power price increases to outpace US average retail electricity price changes and pushed the California average retail electricity price in 2016 to a 50% premium to the US average.

- **CO_2 emission boomerang.** The replacement of California nuclear generation with renewable resources integrated by natural gas–fired resources to back up and fill in for the intermittent output patterns shifted most of the in-state generation to fossil fueled resources. The associated rebound in CO_2 emissions resulted in California electric generation CO_2 emission levels remaining the same in 2016 as the levels observed 15 years ago when California legislation mandated the first renewable power generation shares. As a result, California did not make an environmentally responsible trade-off of higher costs in exchange for lower CO_2 emissions.

- **Ad hoc market interventions to address unresolved market distortions.** The interventions arose to create compensation for selected generation attributes. In 2013, CAISO recognized that the suppression of CAISO wholesale market-clearing prices caused a cash flow shortfall for the continued operation of generation resources required for reliable electric supply. As a result, CAISO implemented market interventions in 2014 to augment energy market cash flows for flexible generation resources needed to back up and fill in for mandated intermittent resources by implementing ramping products to provide out-of-market payments for these selected attributes.

- **Reduction in power supply resilience.** This reduction is due to the increased exposure to natural gas supply risk factors associated with the greater reliance on natural gas in the generation portfolio. The Aliso Canyon natural gas storage outage discovered in 2015 constrained fuel deliveries and forced the in-state generation share for natural gas to decline from 61% to 50% from 2014 to 2016.

- **Inefficient market operations.** The inefficiencies involve larger cost burdens associated with managing overgeneration market conditions reflecting the mismatch between intermittent generation and aggregate consumer demands. The inefficiency results in higher costs from increasing renewable power curtailments and growing Energy Imbalance Market sales at prices well below what California consumers had to pay for the renewables.

- **Lower consumer net benefits.** Higher electricity prices and the associated consumer demand reductions lowered the annual California consumer net benefit from electricity consumption.

The bottom line is that decisions to prematurely close nuclear power plants and reduce the PJM nuclear generation share of firm capacity from 20% to zero within a dozen years is a plausible scenario because PJM could follow the example of California. In California, persistent, unresolved discord between public policies and market operations is eroding the consumer net benefits from electricity consumption, as well as the resiliency and environmental responsibility of power supply coming from nuclear resources.

The analytical framework to assess the potential impact of uneconomic nuclear closures in the PJM power supply portfolio

Assessing the current value of nuclear generation in the PJM power supply portfolio involves the comparison of the performance of the PJM power supply portfolio with and without nuclear resources.

This assessment of the value of current nuclear resources evaluates alternative PJM power supply portfolio performance using a backcasting analysis across the most recent four years (2013 to 2016) to analyze the impacts of uneconomic PJM nuclear power plant closures. A backcasting approach uses the range and severity of deviations from expected normal operating conditions in the recent past to provide a realistic "wind tunnel" to test how the loss of PJM nuclear capacity affects overall power system production costs, as well as assess how nuclear power in the supply portfolio affects the resilience of PJM outcomes to a realistic profile of instability and deviations from normal operating conditions.

A forecasting approach can also incorporate a realistic risk profile through sensitivity analyses of forecast simulations. However, forward-looking sensitivity analyses need to foresee the risk profile of the power system operating environment. As the National Academies of Sciences, Engineering, and Medicine study notes, resiliency involves assessing how robust power systems operations are to disruptions, including those that may not be foreseen.[14]

Besides the possibility of unforeseen risks, behavioral economists observe that most people view themselves, the world, and the future in a considerably more positive light than is objectively justified or than reality can sustain.[15] Therefore, employing a forecasting approach creates the risk of bias toward underestimating the risk profile of future electric system operating conditions. To see this, imagine a PJM forecast sensitivity analysis developed four years ago that included the 2014 polar vortex episode, no PJM load growth, Hurricane Sandy (second-most destructive storm in US history), the demise of the Clean Power Plan, and daily delivered natural gas prices ranging from $0.5/MMBtu to $121.2/MMBtu. Building a consensus that this scenario represented a realistic risk profile would have been difficult because of the perception that these events occurring over a four-year interval was unrealistic. Yet experience shows that this is exactly what happened as the years unfolded.

Experience shows that deviations from expected normal electric system operating conditions are inevitable. The implication is evident in a recent PJM market assessment concluding that, "Relying too heavily on any one fuel type may create a fuel security or resilience issue …. But, a moderate level of diversity helps to ensure the system's ability to withstand unforeseen system shocks—either operational disturbances caused by contingencies beyond those studied and planned for today or both man-made and natural disasters".[16]

Looking ahead for several decades, the low-probability but high-impact events that caused past deviations from normal operating conditions will no doubt differ from the risk factors that trigger future deviations from expected operating conditions. The probability of another polar vortex episode like 2014 or the bomb cyclone event in 2017/18 may be 1 in 10 years or less. Such a low probability of recurrence can lead to complacency regarding power supply resilience. Similarly, the probability of another hurricane like Sandy in 2012 hitting New Jersey may also be 1 in 10 years or less. Likewise, the probability of another pipeline disruption such as the 2016 Texas Eastern pipeline disruption in Pennsylvania may also be 1 in 10 years. Other potential low-

SI-SSA-0010-0554

probability but high-impact deviations from normal operating conditions include a natural gas storage failure like what recently happened at the Aliso Canyon natural gas storage facility in 2014, as well as wildfires, heat waves, droughts, and physical or cyber attacks.

Political risks also define a dimension of the electric operating risk profile. For example, the growing anti–fossil fuel movement is delaying the development of the natural gas supply infrastructure to keep pace with the increased supply requirements of the electricity sector. Such political risks can shift the power production operating environment suddenly.

The consequences of these risk factors can increase when two or more high-impact events occur simultaneously. For example, the risk of a severe seismic event associated with hydraulic fracturing wastewater injections somewhere in United States could interact with the risk of a political overaction. Such an interaction could produce a ban on hydraulic fracturing for natural gas production everywhere, including the Marcellus natural gas fields that supply a significant portion of natural gas for electric generation in PJM. Even if such a ban were temporary, the price and deliverability of natural gas in PJM would likely be dramatically affected for months.

Although the probability of any one of the risk factors happening in any given year is low, the probability of some type of high-impact event that challenges electric system resilience is much higher because the probability of at least one of these events happening is the sum of the probabilities of each of these independent risk factors.

The bottom line is that prudent planning ought to account for a better-than-even chance that a major disruptive event affecting the availability of one type of electric generating resource in the PJM supply portfolio will occur within the next decade.

The backcasting approach helps to address the problem of risk blind spots and risk underestimation by providing a realistic set of significant deviations from expected conditions.

Assessing the potential impacts of uneconomic nuclear closures in the PJM power supply portfolio

Quantifying the impact of uneconomic retirement and replacement of PJM nuclear power plants involves four steps:

- Estimating PJM nuclear resource going-forward costs
- Estimating the cost of generating technologies in the current PJM new supply pipeline capable of providing equivalent capacity and energy outputs as provided by PJM nuclear resources
- Identifying the market inefficiency—retiring power plants that are lower cost to continue to operate than to replace
- Quantifying market inefficiency by estimating counterfactual outcomes from 2013 to 2016 for the PJM nuclear retirement and replacement scenario

PJM nuclear going-forward costs

PJM nuclear power plants account for 34% of the US installed nuclear fleet. Table 5 shows US nuclear power plant going-forward cost assessments from the Nuclear Energy Institute (NEI) differentiated by single-plant

SI-SSA-0010-0555

and multiplant sites.[17] The nuclear going-forward cost represents the average going-forward cost for existing nuclear power plants. The going-forward costs for a particular existing nuclear power plant will differ from the average owing to a variety of factors including different operating and market risk factors.

Table 5

Levelized going-forward costs of existing US power supply portfolio resources, 2016
($/MWh)

Plant type	Levelized cost

PJM new supply pipeline technology cost and performance profiles

The current PJM new capacity supply pipeline is composed of 85% natural gas–fired generating technologies and 15% renewable resources. Consequently, the replacement of the capacity and energy of uneconomic PJM nuclear power plant closures would likely involve a similar mix of technologies.

The cost and performance characteristics of the mix of grid-connected electric generating technologies in the PJM new supply pipeline reflect the EIA cost and performance profiles reported in the Annual Energy Outlook 2016, shown in Table 6 with adjustments to heat rates based on observed heat rates of new generating resources operating in PJM. The size of each generating technology option reflects expected current minimum efficient scale.

The operating lifetime technology parameter is the basis for the calculation of straight line depreciation to account for the consumption of capital in the production process over the life of the asset. The MACRS is the recovery period for accelerated depreciation used when calculating taxes.

Overnight costs are the total of all cost components for the project based on prices in a single year. The wind overnight costs include a transmission investment adder to reflect the incremental grid investment associated with the project interconnection to the network.[18] Renewable transmission cost adders are higher than thermal power plant transmission cost adders for two reasons. First, wind and solar resources are typically farther away from consumer loads than thermal generation technologies and therefore require longer radial spur transmission connection to the grid. Second, renewable resources are smaller and more geographically dispersed and, thus, require more granular linkages to more sites. For example, in Texas, the expansion of wind energy required about $6 billion of transmission investment to link the Competitive Renewable Energy Zones to load centers. The transmission cost adder in the Electric Reliability Council of Texas was $600/kW of

Table 6

Electric generating technology cost and performance characteristics in PJM

Technology	Size (MW)	Lifetime/ MACRS (years)	Overnight costs (2017$/kW)	Lead time (years/ CFUDC)	Contingency factor	Variable nonfuel O&M (2017$/MWh)	Fixed O&M (2017$/kW-year)	Heat rate (Btu/kWh)

17. NEI, *Nuclear Energy 2016: Status and Outlook, Annual Briefing for the Financial Community,* 11 February 2016.

18. Estimates of typical incremental transmission investments are based on Andrew D. Mills, Ryan H. Wiser, and Kevin Porter, *The Cost of Transmission for Wind Energy: A Review of Transmission Planning Studies,* Lawrence Berkeley National Laboratory, 2009, https://emp.lbl.gov/publications/cost-transmission-wind-energy-review, retrieved 27 March 2018; and National Academies of Sciences, Engineering, and Medicine, *The Power of Change: Innovation for Development and Deployment of Increasingly Clean Electric Power Technologies,* The National Academies Press, Washington, DC, 2016.

SI-SSA-0010-0556

installed wind capacity. An estimate of the incremental transmission investment needed to upgrade the current system capabilities as well as build new transmission to implement the estimated 15,200 MW of new renewable resources required to meet California's 50% renewables goal is $5.8 billion—implying a $382/kW incremental transmission cost adder.[19]

The lead time is the number of years required for project construction. The CFUDC factor reflects the capitalization of the cost of debt and equity funds tied up during construction.

The contingency factor reflects the specific provisions for unforeseen elements of costs within a defined project scope as defined by the American Association of Cost Engineers based on previous experience indicating that unforeseeable cost elements are likely to add to the total costs.

Variable O&M costs exclude fuel costs. Fixed O&M costs are annual costs that are expensed rather than capitalized and more a function of time than of plant annual utilization rates.

The heat rate (British thermal units of fuel input per kilowatt-hour of generation output) measures the efficiency of transforming fuel into electricity. This cost analysis employs a higher heat rate than reported in the EIA Annual Energy Outlook 2016. The EIA heat rate reflects thermal efficiency levels of equipment manufacturer performance specifications that typically express heat rates based on fuel inputs that count only the British thermal units that were converted into electric energy. In the thermal electric generation process, some of the British thermal unit content of the fuel input vaporizes the moisture present in the combustion process, and, as a result, this heat content is not converted into electricity. By contrast, a fuel input that accounts for all British thermal units involved in the electric generation process has a heating value that is higher by about 11%.

This analysis uses a heat rate reflecting all British thermal units consumed in the generation process. Since the prices of fuel inputs for power generation reflect the cost of the total British thermal unit content of the fuel expressed in a dollars per million British thermal units basis, the higher heat rate provides the appropriate transformation of fuel input cost to cents per kilowatt-hour fuel generating cost. The difference between higher and lower heating values explains the 11% difference between the actual average heat rates of new natural gas–fired combined-cycle generating technologies shown in Table 7 and the heat rate specification appearing in cost and performance characteristics of new central station natural gas–fired generating technology specifications of the EIA Annual Energy Outlook 2016.

The variation of heat rates around the capacity-weighted average shown in Table 7 reflect differences in operating conditions affecting the new natural gas–fired combined-cycle power plant heat rates that include altitude, humidity, and ambient air temperature. As a result, the actual operating experience of a new natural gas–fired generator is not as favorable as the equipment manufacturer's generating technology specifications that typically reflect more stable and favorable operating conditions of sea level altitude, 59 degrees Fahrenheit ambient air temperature, and 60% relative humidity.

EIA reports the average realized natural gas–fired power plant heat rate in 2016 was 7,878 Btu/kWh. This indicates that new natural gas–fired combined-cycle power plants operating under actual conditions have a thermal efficiency that is about 11% lower than the average thermal efficiency of installed natural gas–fired generation.

Identifying market inefficiency

Capacity and energy price signals from an unfettered, efficient market would not cause generating resources to close if their cost of continued operation was lower than the cost of their replacement. Cost-effective power plant retirements occur in a well-functioning marketplace because market-clearing prices reflect the long-run marginal costs (LRMCs) of new power resources and thus provide a signal regarding the cost-effective timing for replacing existing generation. As a result, in an efficient market outcome, an existing resource is economic to operate until the existing resource going-forward costs are not covered by market cash flows reflecting the cost of replacement supply.

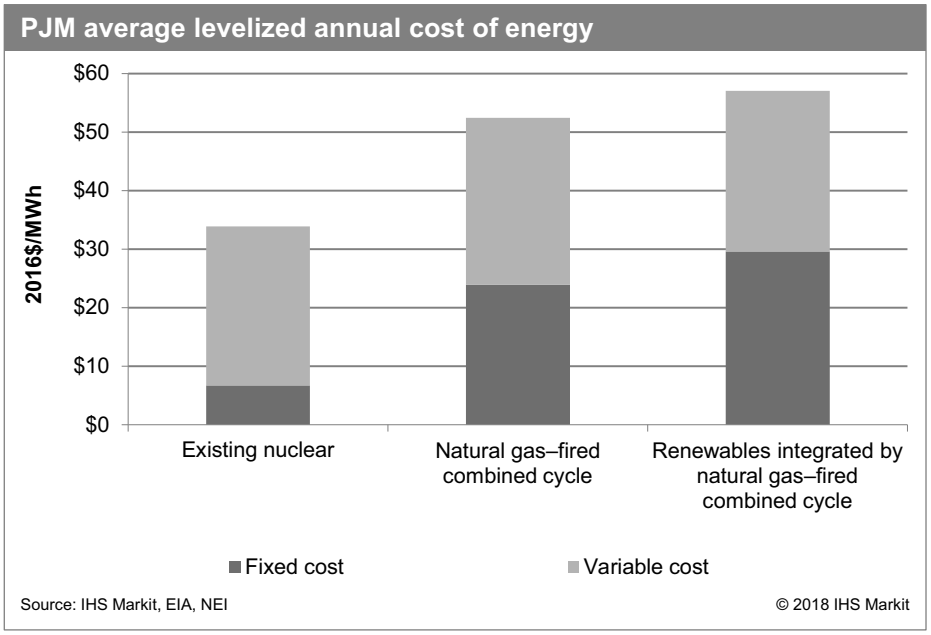
PJM nuclear generating plants' going-forward costs are significantly below replacement costs. Figure 10 shows the differences between average going-forward costs for PJM nuclear resources to supply the stable 24/7 base-

SI-SSA-0010-0558

load segment of PJM consumer demand and the cost of replacement capacity and energy from natural gas–fired combined cycles integrated with a mix of intermittent wind and solar resources in the proportions found in the current PJM new power supply development pipeline.

Analyses show that the going-forward costs of nuclear plants increase by less than 1% per year over the observed age distribution of existing plants.[20] Therefore, the existing gaps between the going-forward costs of existing nuclear resources and replacement costs appear persistent.

Figure 10



The bottom line is that premature PJM nuclear power plant retirements are uneconomic because continued operation is less costly than closure and replacement. As a result, an efficient PJM wholesale market outcome would not likely involve premature nuclear power plant closures. The result is not unique to PJM. Analyses of the US electrical interconnection absent the distortions of wind and solar subsidies and mandates, and incorporating an appropriate CO_2 emission charge, indicate that the premature retirement of nuclear power plants—with typical going-forward costs—would be highly unlikely on economic grounds.[21]

Counterfactual outcomes in 2013–16 for the PJM nuclear retirement and replacement scenario

Backcasting PJM demand and supply interactions at a monthly frequency for 2013–16 with the removal of the Oyster Creek nuclear power plant provides a backcasting base case for the PJM nuclear closure and replacement scenario. The base case removes Oyster Creek because its closure is not in doubt. The PJM nuclear power plant closure and replacement scenario involves the closure and replacement of all remaining 18 PJM nuclear units. Table 10 shows differences between the PJM backcasting base case and the PJM nuclear closure and replacement scenario.

The PJM nuclear closure and replacement scenario results in higher power production costs and thus higher retail power price levels compared with the PJM base case. The retail price increases are greatest in 2013–14, when the delivered price of natural gas to electric generators averaged $4.6/MMBtu, compared with 2015–16, when the delivered price of natural gas averaged $2.4/MMBtu.

Consumer cost impacts from uneconomic PJM nuclear retirements

Higher production costs and higher retail power prices have a negative impact on electricity consumers who rely on PJM grid-based electricity supply.

A useful metric to assess consumer impacts from the electricity price increases expected from uneconomic PJM nuclear power plant closures is the change in consumer net benefits from electricity consumption. This metric provides a better indication of consumer impacts from higher retail prices than assessments based on the change in the consumer monthly power bill. For example, if the price of electricity increased by 50% and consumers responded by reducing their consumption by 50%, then their monthly power bill remains unchanged. However, although the power bill did not change, the consumer is worse off. Employing an assessment of the change in net benefit from electricity consumption can measure economic impact on the consumer while accounting for price-induced consumer reductions in consumption.

Figure 11 show the changes in retail electricity prices estimated by the difference between the base and alternative cases of the PJM nuclear closure and replacement scenario in 2016. The figure also shows the expected PJM consumer reduction in demand due to the higher prices and the associated change in the net benefit from electricity consumption.

Table 11 shows the estimates of the loss in PJM consumer net benefits of electricity consumption in the PJM nuclear closure and replacement scenario for the power system from the baskcasting analyses with power system conditions reflecting actual conditions in 2013–16.

The bottom line is that the uneconomic retirement and replacement of PJM nuclear power plants reduces the consumer annual net benefit from PJM grid-based electricity by about $8 billion per year over 2013–16. This translates into a consumer net benefit per kilowatt-hour of PJM nuclear generation of about 3 cents per kWh.

Production cost resilience impacts from uneconomic PJM nuclear retirements

The PJM nuclear closure and replacement scenario results in an increased reliance on natural gas–fired generation resources and the associated increased exposure to natural gas price variation. Backcasting the PJM nuclear closure and replacement scenario across 2013–16 results in a more than doubling of the monthly variation in PJM overall production costs (as measured by the standard deviation of PJM production costs).

PJM market distortions that cause uneconomic base-load power plant retirements accelerate the move toward a natural gas–fired generation share beyond the cost-effective share expected in an unfettered, efficient market outcome. Therefore, natural gas–fired generation risks—short-run price variability, long-run

Figure 11

multiyear price cycles, physical limits to deliverability, and political uncertainties—become an increasing long-run concern in PJM.

Table 11

PJM consumer net benefits—Actual versus higher prices, 2013–16

The cost of replacing PJM nuclear production cost resilience

The diversity provided by cost-effective nuclear energy reduces the exposure of electric production costs to natural gas price variation. An estimate of the value of this production cost risk management provided by current PJM nuclear resources is available from another backcasting assessment in which the PJM nuclear closure and replacement scenario is altered to allow for the purchase of financial instruments—natural gas futures and options—to restore the base-case level of monthly production cost variation.

Hedging natural gas prices provides an alternative approach to limiting the impact of natural gas price variation on overall PJM electric production cost variation. A simple hedging strategy could employ natural gas call options. Purchasing a natural gas call option provides the holder with the right, but not the obligation, to purchase a specified amount of natural gas at a specified price and at a specified future point in time. Appendix D provides an example of applying this approach to create a rolling month-ahead call option on the delivered price of natural gas in PJM across 2013–16, employing a strike price set to limit the price paid for natural gas to the current delivered price of natural gas. The option cost assessment employs a variant of the Black-Scholes

option pricing formula to estimate the cost of reducing the variability of the delivered price of natural gas in PJM with this hedging strategy.

In the nuclear closure and replacement scenario, hedging PJM natural gas prices across 2013–16 with natural gas call options involves an average annual cost of $14 million to reduce the monthly variability of PJM cost of production by 1%. Because the production cost variability in PJM is 53% higher in the nuclear closure and replacement scenario, the annual cost to use natural gas call options to achieve the same level of production cost variability found in the PJM base case is $714 million. Note that this cost reduces the price risk of natural gas inputs for electric generation in PJM but does not reduce the physical deliverability risks of natural gas.

The bottom line is that the uneconomic retirement and replacement of PJM nuclear power plants increases the variation of PJM production costs, and restoring this cost resilience for consumers requires employing natural gas hedging mechanisms with an annual cost of $714 million. This translates into a consumer production cost resilience benefit per kilowatt-hour of PJM nuclear generation of about 0.3 cents per kWh.

PJM environmental impacts from uneconomic nuclear closures and replacement

The uneconomic closure of nuclear power plants in PJM due to market distortions would likely produce a power sector CO_2 emission increase. Uneconomic closures of power plants serving the base-load segment of aggregate consumer demand can increase CO_2 emissions when the replacement power resources are intermittent renewables integrated by natural gas–fired power plants. Table 12 shows the CO_2 intensity of the PJM replacement energy in the PJM nuclear closure and replacement scenario.

Table 12

Electric generation CO_2 emission intensity

	Capacity (MW)	Capacity factor	Generation (MWh)	Emissions factor (lbs/MWh)	Emissions (metric tons)
Typical nuclear power plant	1,600	93.0%	13,034,880	0	0
Total	**1,600**	**93%**	**13,034,880**	**0**	**0**
Wind—15%	797	28%	1,955,232	0	0
Natural gas combined cycle—85%	2,040	62%	11,079,648	1,003	5,040,727
Total	**2,837**	**52%**	**13,034,880**	**853**	**5,040,727**

Source: IHS Markit

Closure and replacement of the non–CO_2-emitting PJM nuclear resources would remove 12 times the current output of PJM wind and solar resources.[22] To put this into perspective, there is approximately one vehicle for every two people in the United States, and therefore the 65 million people who rely on PJM grid-based power supply drive about 32.5 million vehicles.[23] The typical US vehicle emits 4.6 metric tons of CO_2 per year.[24] Therefore, the annual CO_2 emission increase expected from the uneconomic closure and replacement of PJM nuclear resources would equal the annual CO_2 emissions from two-thirds of the vehicles on the road in PJM.

Uneconomic closures of PJM nuclear power plants would likely create a CO_2 emission boomerang like the one observed in the New England power system. A lack of harmonization between electric sector policy implementation and ISO-NE market operations involves renewable mandates suppressing cash flows and causing the uneconomic closure of nuclear capacity. The closure of the Vermont Yankee Nuclear Power Corp.

SI-SSA-0010-0562

nuclear power plant occurred at the end of 2014 even though the going-forward costs of operation were less than the cost of replacement based on the cost profiles of the electric supply pipeline of mandated subsidized renewable generation and natural gas–fired combined-cycle plants making up the replacement power sources. This premature nuclear power plant closure caused ISO-NE electricity market CO_2 emissions to increase by 7% from 2014 to 2015. In another few years, the premature closure of the Pilgrim Nuclear Power Station will have a similar upward impact on the regional electricity sector CO_2 emission level.

A PJM CO_2 boomerang is not environmentally responsible because it does not involve an efficient trade-off of higher costs in exchange for lower CO_2 emission levels. By contrast, an efficient CO_2 abatement initiative would achieve any CO_2 emission target by exploiting the lowest-cost options. Since the cost of continued PJM nuclear operation is lower than the cost of closure and replacement, continued nuclear operation provides a zero-cost option to reduce CO_2 emissions compared with offsetting the emissions associated with largely natural gas–fired replacement generation. Making such an offset by ratcheting up renewable mandates would be inefficient because the implicit cost of CO_2 reduction in PJM associated with policy-driven renewable resource development is about $220 per metric ton of CO_2 abatement.

Electric consumers reveal a preference for environmentally responsible power supply. Green power programs respond to this preference by offering more expensive renewable power options to satisfy the revealed preferences of consumers to do something about climate by limiting the CO_2 emissions associated with electricity production.

In 2016, consumers voluntarily chose to purchase 95 TWh of green power, representing 1.7% of total US retail electric energy sales. The highest customer participation rate in a utility voluntary green power program in 2016 was 17% in Portland General Electric's "Green Source" program, where consumers paid a 6.8% retail price premium.[25]

Since electricity consumers choose to purchase some, but not all, of their electricity at a green premium price, they reveal an underlying consumer preference to balance the costs and benefits of renewable power. At first blush, US consumers do not appear to be willing to pay much of a premium for renewable power, nor do they appear to be willing to purchase a large percentage of their supply from the higher-cost renewable resources.

Consumer choices for renewable power are likely suppressed by existing public policies that do not rely on voluntary individual consumer choice and instead mandate renewable generation shares and stimulate renewable development by socializing green power costs through subsidies and rate structures. Opinions vary regarding whether the politically determined level of renewable resources approximates the level expected from the aggregation of individual voluntary choices in an unfettered, efficient marketplace. However, politically determined renewable generation share mandates are like voluntary consumer choices because both typically limit renewable generation shares below 100% of supply. The implication is that politically determined collective decisions regarding renewable generation reveal an underlying trade-off between the political costs and benefits of increasing renewable generation shares.

The bottom line is that both individual consumer or collective political decisions regarding renewable generation shares reveal an underlying preference to balance the costs and benefits of increasing renewable generation in the power supply portfolio. Since environmental responsibility involves balancing environmental costs and benefits, the implication is that if premature PJM nuclear closures increase electricity costs while also increasing CO_2 emissions associated with PJM electricity production, then no trade-off is being made between environmental costs and benefits and, therefore, the outcome is less environmentally responsible.

25. Eric O'Shaughnessy, Jenny Heeter, Jeff Cook, and Christina Volpi, *Status and Trends in the U.S. Voluntary Green Power Market (2016 Data),* National Renewable Energy Laboratory, https://www.nrel.gov/docs/fy18osti/70174.pdf, retrieved 20 February 2018.

SI-SSA-0010-0563

An assessment of the higher costs associated with developing mandated wind and solar development rather than the least-cost natural gas–fired combined-cycle alternative provides the basis to calculate the implicit cost of CO_2 reduction from policies that mandate wind and solar development rather than allow the market-driven development of natural gas–fired resources.

The cost of replacing PJM nuclear generation with natural gas–fired resources alone is about $52/MWh. Replacement with 15% of the generation coming from unsubsidized wind along with 85% of the generation coming from natural gas–fired generation has a higher combined cost of about $56/MWh. The natural gas–fired generation produces 1,003 pounds of CO_2 per MWh while the wind and natural gas–fired integrated alternative is 15% lower. Therefore, if the purpose of a wind generation share mandate is to lower CO_2 emissions from the market outcome, then the difference in cost divided by the difference in CO_2 emissions yields an implicit cost of CO_2 abatement of about $59 per metric ton.

The cost of offsetting the CO_2 impact of PJM nuclear closure and replacement involves the option of purchasing CO_2 emission allowances. Within 2013–16, the market-clearing price of CO_2 emission allowances in the Regional Greenhouse Gas Initiative (RGGI), which sets a price for CO_2 emissions in some PJM states, ranged from $3.5 to $8.5 per metric ton. These prices are below the midrange estimates of the social cost of carbon if about $43 per metric ton.[26]

PJM CO_2 emission abatement through emission allowance payments provides more than five times the CO_2 emission abatement per dollar compared with mandates of renewable resources. Since continued nuclear operation is an even less costly CO_2 emission abatement compared with RGGI allowance purchases, the environmental bang for the buck is even greater from continued nuclear operation. Employing the midpoint estimate ($43 per metric ton) as an estimate of an appropriate CO_2 emission cost indicates that PJM nuclear generation provides an annual $2 billion worth of PJM CO_2 emission abatement.

The bottom line is that uneconomic PJM nuclear retirements and replacements caused by market distortions are a lose/lose proposition because the outcome involves both higher power production costs as well as higher CO_2 emissions. Since environmental responsibility requires making efficient environmental cost and benefit trade-offs, uneconomic PJM nuclear closures and replacements are not environmentally responsible.

Conclusions

The primary finding of this analysis is that the 65 million consumers who rely on PJM grid-based power supply are better off if something is done to prevent the uneconomic closures of PJM nuclear resources because the PJM power supply portfolio is more efficient, more resilient, and environmentally responsible with the continued contribution of cost-effective nuclear resources.

The impact of uneconomic PJM nuclear closures and replacement on consumer electricity bills is significant, ranging from 9% to 18% depending on the price of natural gas for the replacement generation. This conclusion is at odds with the assertion that consumers are insensitive to electricity costs. Therefore, the approach employed in this study to translate consumer behaviors and choices into preferences for resilient availability and resilient cost levels for affordable and environmentally responsible grid-based electricity provided a framework grounded in consumer behavior data. The approach defined metrics to evaluate the impact of uneconomic nuclear power plant closures and replacements in the PJM power system. Further, the fully documented statistical analyses of consumer demand used to quantify the consumer net benefits

SI-SSA-0010-0564

from electricity consumption provides a transparent metric to quantify the impact of losing cost-effective power supply.

Resilience in power supply is a controversial issue, and the results of this study may be different from other studies. The conclusion is that transparency in approach and the reliance on a minimum of assumptions will assist in comparing this study to others. Therefore, this analysis specifies assumptions and quantifies efficiency and resilience impacts with a backcasting approach across 2013–16 to incorporate a realistic set of PJM operating conditions and disruptive events. Comparing actual PJM outcomes with the outcomes from the backcasting analysis of the closure and replacement of PJM nuclear resources scenario provided a transparent analysis that can be replicated in a straightforward way because the analysis minimizes the influence of assumptions by holding all other analytical conditions equal to the actual recent historical conditions.

Quantifying the value of cost-effective nuclear generating resources in the efficient diversity of a PJM power supply portfolio does not infer a preference for one fuel or technology over another. Instead, the assessment focuses on efficient diversity in a power supply portfolio and confirms that consumers benefit from a cost-effective mix of fuels and technologies in their grid-based power supply.

The quantifiable benefits of continued PJM nuclear resource operations despite insufficient market cash flows leads to the conclusion that current market viability does not provide a test of economic cost effectiveness. Instead, the analysis indicates PJM market outcomes involve distortions.

The linkage between market distortions and current discord between public policies and market operations is a fuel and technology neutral assessment. Pointing out that mandates and subsidies of renewable resources distort market operations does not mean that intermittent wind and solar resources are not part of the cost-effective mix of fuels and technologies. Instead, the analysis indicates that the market distortions arise from command and control policy approaches to support renewable development rather than encouraging efficient market-based renewable development by putting an appropriate price on CO_2 emissions for all rival generators in the marketplace.

Noting that counting all costs, including CO_2 emissions costs, is a requirement for an efficient market outcome does not mean that addressing the resilience challenge in the US power system requires eliminating all subsidies and mandates and imposing a uniform CO_2 emission charge. Assuming that eliminating the cause of a problem is the only available solution does not recognize the political infeasibility of rapidly undoing entrenched public policies. Instead, the analysis supports consideration of other options to offset the predictable consequences of current market distortions.

The conclusion that market interventions can offset the impacts of market distortions is consistent with actions being taken in some states. Current feasible policy options to augment cash flows for cost-effective generating resources and to produce outcomes closer to an efficient market end state involve providing compensation for attributes—such as cost-effective contributions to capacity resilience, contributions to production cost resilience, contributions of flexible operating capabilities, or contributions to lower power system CO_2 emission levels. For example, California has implemented ramping products to compensate for flexible generation attributes, while Illinois, New York, and Connecticut have implemented zero-emission credits. However, an apparent challenge to implementing offsetting market interventions is emerging from market stakeholder conflicts. Since wholesale electricity market distortions affect rival producers in different ways, competition spills over from the marketplace to the policy arena where rival electricity producers reveal the preference to support interventions that offset the negative impacts of market distortions to their own fuel source or technology while opposing interventions that offset negative impacts on their competitors.

Confidential. © 2018 IHS Markit™. All rights reserved

SI-SSA-0010-0565

Suppressing capacity and energy prices below the price levels expected in an undistorted and efficient marketplace is not a sustainable long-run outcome. Consequently, generating plant retirement and investment decisions will respond to distorted wholesale energy and capacity price signals. As market distortions cause uneconomic power plant retirements, market forces will move capacity and energy prices levels to reflect the marginal costs of the less efficient fuel and technology mix in the supply portfolio. Preventing uneconomic nuclear closures and replacements will result in lower long-run electricity costs. These actions to offset the impacts of current market distortions do not increase distortions because nuclear resources are cost-effective resources in an undistorted market outcome.

PJM faces the challenge to take actions to address the predictable consequences arising from the unresolved lack of harmony between public policies and market operations. Such actions are imperative to meet the consumer preferences for affordable, reliable, resilient, and environmentally responsible electricity services. Since PJM is the largest electricity market on earth and widely regarded as a model for electricity policy formulation and market design, actions to offset the consequences of market distortions have the potential to not only benefit electric consumers in PJM but also produce a highly influential example for other power systems to follow in addressing similar challenges.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

AFFIDAVIT OF
JEREMY C. CARL

My name is Jeremy C. Carl and I am a research fellow at the Hoover Institution ("Hoover") at Stanford University.

In my role at Hoover, I am the Executive Director of the Shultz-Stephenson Task Force on Energy Policy at Stanford University, and Co-Executive Director of the Hacking for Defense Program's new energy initiative at Stanford. As such, I have direct experience with both energy policy and how it relates to our security and the environment. I have a B.A. from Yale University, a Master in Public Administration from the Kennedy School of Government at Harvard University, focusing on energy policy, and did further graduate work in energy policy at Stanford University.

I have written extensively about grid reliability and resiliency, and have published a number of papers advocating for reform of state and national electricity policy.

I provide this affidavit in support of the PSEG Companies' reply comments in this proceeding on the Secretary of the Department of Energy's Notice of Proposed Rulemaking ("NOPR") for final action by the Federal Energy Regulatory Commission ("FERC" or "Commission").

The purpose of this affidavit is to address issues raised in this proceeding concerning resiliency and the need for federal policymakers to take affirmative action on

this NOPR. Specifically, I will describe how nuclear units affect grid reliability and resilience, U.S. security and economic growth, and non-proliferation interests.

I. THE CURRENT ENVIRONMENT FOR NUCLEAR

There are currently four primary factors driving the decline of the existing nuclear fleet, which I have at times referred to as the "four horsemen of the apocalypse." These four factors facing America's nuclear power sector in the current regulatory environment are:

1. Naturally and artificially depressed wholesale electricity prices in deregulated states.
2. A failure in our markets to recognize and value the unique attributes nuclear resources provide.
3. A trend of higher nuclear generation costs in older, smaller nuclear power plants and in nuclear plants requiring major refurbishment or upgrades. This trend is exacerbated by a period of general operational and regulatory cost increases that have affected all plants.
4. Increasingly effective antinuclear advocacy efforts by both those who dislike nuclear power and those who see nuclear power as competition for their own favored forms of power generation.

It is important to note that the current pressure on our nuclear fleet is largely a result of being squeezed like a vice on one side by fossil fuel plants whose emissions are not factored into their pricing, and subsidized renewables, which reflect the subsidies in their market offers. This has led to negative prices in a significant number of hours (and very low prices in others), distorting the economics for baseload resources such as nuclear units.

II. THE VALUE OF NUCLEAR IN TODAY'S GRID AND WHY THE CURRENT MARKET UNDERVALUES IT

In the remainder of this affidavit, I will explain the critical aspects of maintaining nuclear power as a vital part of our electric grid. The security and resilience aspects include:

1) The new evolving threats facing the system today, particularly terrorism and cyber-security.
2) The ways in which current nuclear unit retirements (America has lost 5 nuclear plants since 2013 and have just 61 plants remaining representing 99 reactors) are negatively impacting overall system resilience and increasing our risk exposure to extreme events.

A. RECENT NUCLEAR POWER PLANT CLOSURES[1]

- Crystal River 3 (Florida), decommissioning began in 2013 *Reactor had been licensed to 2016.*
- Fort Calhoun (Nebraska), 2016 - *Reactor had been licensed to 2033.*
- Kewaunee (Wisconsin), 2013 - *Reactor had been licensed to 2033.*
- San Onofre 2 & 3 (California), 2013 - *Reactors had been licensed to 2022.*
- Vermont Yankee (Vermont), 2014 - *Reactor had been licensed to 2032.*

B. RECENT POWER UPRATES CANCELED[2]

- Cooper (Nebraska), anticipated uprate investment called off in 2013
- LaSalle Generating Stations 1 & 2 (Illinois), 2013
- Limerick 1 & 2 (Pennsylvania), 2013
- Prairie Island 1 (Minnesota), 2012

C. CURRENTLY-OPERATING PLANTS ANNOUNCED FOR CLOSURE[3]

- Diablo Canyon 1 (California), 2024: Proposed by utility owner through decision not to pursue license extension. Licensed to 2024.

---

[3] *Id.*

- Diablo Canyon 2 (California), 2025: Proposed by utility owner through decision not to pursue license extension. Licensed to 2025.
- Indian Point 2 (New York), 2020: Anticipated closure as a result of negotiated state settlement, not averted by state subsidy to other plants. Licensed to 2013 (operating under temporary license).
- Indian Point 3 (New York), 2021: Anticipated closure as a result of negotiated state settlement, not averted by state subsidy to other plants. Licensed to 2015 (operating under temporary license).
- Oyster Creek 1 (New Jersey), 2019: Anticipated closure as a result of negotiated state settlement. Licensed to 2029.
- Palisades (Michigan), 2018: Proposed by utility owner. Licensed to 2031.
- Pilgrim Nuclear Power Station (Massachusetts), 2019 Proposed by utility owner. Licensed to 2032.

D. **CURRENTLY-OPERATING PLANTS CLOSURES AVERTED BY STATES**[4]

- Clinton Power Station (Illinois), decommissioning announced for 2017: Originally proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. The reactor is licensed to 2026.
- James A Fitzpatrick (New York), 2017: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2034.
- Nine Mile Point Nuclear Station 1 (New York), 2017: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2029.
- Nine Mile Point Nuclear Station 2 (New York), 2017: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2046.
- Quad Cities Generating Station 1 (Illinois), 2018: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2032.
- Quad Cities Generating Station 2 (Illinois), 2018: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2032.
- R. E. Ginna Nuclear Power Plant (New York), 2017: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2029.

3) The reliability, on site fuel-storage and the fact that nuclear facilities are already significantly hardened against both physical and cyber threats.

4) The critical role the U.S. leadership and nuclear fleet plays in non-proliferation.

[4] *Id.*

5) The importance of civilian nuclear for America's military leadership.

Economic factors will also be discussed, including:

1) The importance of nuclear power in workforce development.
2) The importance of the civilian nuclear supply chain for both civilian and military matters.
3) The importance of maintaining strong diverse electric generation assets with different sources of power. America needs an actual portfolio strategy for its electricity system, not simply a myopic focus on short-term cost-minimization.

III. THE CRITICAL ROLE OF NUCLEAR POWER TODAY

Nuclear energy provides critical capabilities associated with a resilient and secure electric grid. First, it provides the necessary baseload power that is reliable and available when needed.

As we continue to add more and more renewables and other intermittent sources of energy to the grid, the importance of having a supply that is always on is more important than ever.[5] These intermittent forms of power generation make up increasingly large parts of the grid and cannot always be relied upon to reliably meet system demand. The aggressive deployment of these intermittent resources leads to increased costs for the electricity system as a whole, both in terms of requiring greater transmission capacity to transmit from the generation asset to the load source and more complicated computerization and forecasting to keep up with non-dispatchable assets. In addition, as more of these intermittent sources come on to the grid, it will require the deployment of

[5] Jeffery St. John, *The California Duck Curve Is Real, and Bigger Than Expected*, Greentech Media, November 3, 2016, available at: https://www.greentechmedia.com/articles/read/the-california-duck-curve-is-real-and-bigger-than-expected#gs.VpC0WFE.

more expensive long-term storage solutions, such as batteries. As a result of all of these factors, California, which has arguably been the most aggressive state on renewable energy, has electricity costs that are more than 60% higher than the national average despite record low natural gas prices. (Natural gas makes up almost half of California's power generation.).[6]

In contrast, nuclear power has been a model of predictability. The capacity factor of nuclear power plants in 2016 was a record 92.5%,[7] light years above other low-emission alternatives such as Hydro (38.0%), Solar PV (27%) and wind (34.7%) or even fossil generation such as combined cycle gas (56%) and coal (52.7%) [8] Nuclear Power is indeed "used and useful" in America's electricity generation mix.

IV. NUCLEAR PORTFOLIO ECONOMICS

The recent nuclear unit retirements are negatively impacting overall system resilience and increasing our exposure (unnecessarily) to extreme events.[9] When the California San Onofre plant shutdown, the resulting need to contract with other generation resources led to a $350 million increase in direct customer costs as well as an increase in emissions and a need to build out extensive infrastructure at a multi-billion-

dollar cost to maintain reliability.[10] In the wake of the shutdown of San Onofre, the California Independent System Operator, Inc. ("California ISO") acknowledged that "reliability has become a more pronounced concern."[11]

With low natural gas prices, the U.S. generation mix is migrating toward gas resources as the primary source of generation capability, and we cannot lose sight of the fact that there can be disruptions that could halt the natural gas revolution in its tracks. The growth in gas production is almost entirely dependent on hydraulic fracturing ("fracking"); yet fracking is under unprecedented attack in numerous states. If these attacks[12] succeed or an issue such as unexpected environmental impacts arises with the technology, we could see tremendous price spikes (akin to what we observed in 2007 thru 2009) and decreases in gas production. Declining yields could also unexpectedly thwart the fracking revolution, stressing the importance of not making all of our energy bets on one source.[13] Even if those price spikes are mitigated in short order, the damage to consumers will have been done.

In less than a decade, the Northeast markets have seen coal production decline from over 30% of our output to 11%. Nuclear, has seen small declines with the retirement of Vermont Yankee, but those declines could increase dramatically if more at risk units are lost. Natural gas has filled the gap, increasing from 23% of the generation

[11] California ISO, *Grid Resiliency*, available at: http://publications.caiso.com/StateOfTheGrid2014/GridResiliency.htm.

[12] Current concerns raised by fracking opponents focus on surrounding seismicity or groundwater pollution.

[13] Mason Inman, *Natural Gas: The Fracking Fallacy*, Nature, December 3, 2014, available at: https://www.nature.com/news/natural-gas-the-fracking-fallacy-1.16430.

mix to 43%. As these trends continue, overall diversity declines, and as PJM has noted in its own reports this leads to potential resiliency risks.[14]

Many argue this is so-called free-market principles at work. As an aggressive free-market proponent who has been aligned with some of the strongest pro-market forces and Congressmen in American politics, this argument garners natural sympathy. But, and this is a critical point all-too-little understood by the public, the U.S. electricity system is not a free market – it has never been a free market, and frankly it has no reasonably foreseeable prospects of becoming a free market.

It is, for better or for worse, a highly regulated market that has been manipulated for many years in ways that have been profoundly damaging to nuclear energy's competitiveness. Yet despite these challenges, nuclear still provides one-fifth of all electricity in the U.S. and creates far more emission-free energy than any other technology, including the solar and wind that capture environmentalist plaudits and journalists headlines.

V. NUCLEAR ENERGY AND NATIONAL SECURITY

Perhaps the biggest unmeasured value of nuclear power is its contribution to our national security. It cannot be stressed enough that unlike any other form of energy, the nuclear enterprise has fundamental non-energy related security attributes that justify additional support in the market. Furthermore this national security assessment is not a partisan issue. As a report by the Energy Futures Initiative (a non-partisan energy think tank founded by former Secretary of Energy Ernest Moniz), notes: "The national security

[14] PJM Interconnection, L.L.C., *PJM's Evolving Resource Mix and System Reliability*, March 30, 2017, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx.

imperatives of nuclear energy, however, are not addressed in state rate-making. This is understandable: national security policy is inherently Federal in nature. As such, the fundamental role of a robust nuclear energy sector in meeting national security imperatives must, in reality, be addressed by the Federal government."[15] Given FERC's rulemaking power, it is ideally situated to do just that.

Nuclear plants are able to keep more fuel on site than any other form of energy, due to nuclear fuel's high energy density.[16] Nuclear energy generation is incredibly space efficient with a fuel pellet the size of a pencil eraser providing as much electricity as 17,000 cubic feet of natural gas, 1,780 pounds of coal or 149 gallons of oil.[17] This could be particularly useful in the event of an interruption to fuel supplies to other generators. In a long-term emergency situation, transporting the necessary amount of nuclear fuel to power a reactor for years could be achieved with relative ease, even in a situation where roads and other transportation networks might be badly degraded. Overall fuel also averages just 31% of total plant costs for operation as opposed to 80-90% of coal and natural gas, making nuclear power much less prone to vacillations in fuel prices.

There are several new threats that potentially menace our power plants and the grid today – from terrorism to cyber threats. In San Jose, CA in 2013 a single non-hardened substation sustained millions of dollars of damage from a sniper attack in 2013

[17] *Id.*

when multiple gunmen opened fire on the transformers using high-powered rifles. As was noted by the ranking member of the House Energy and Commerce Subcommittee at the time who called the attack "... an unprecedented and sophisticated attack ... Communications were disrupted. The attack inflicted substantial damage. It took weeks to replace the damaged parts. Under slightly different conditions, there could have been serious power outages or worse."[18] Nuclear power plants, with their already high-levels of surveillance and security, are much less vulnerable to these types of attacks.

Nuclear has an advantage in this world because nuclear power plants are already hardened against risks and have been designed with safety and security (physical and cyber) in mind from the ground up.

One need only scan the government documents to find a wealth of information on steps nuclear plants have taken to reduce the risk from electromagnetic pulse ("EMP") attacks or the numerous recent publications and books specifically devoted to emergency planning for nuclear power plants and/or hardening their components for cyber or EMP attacks.[19] U.S. nuclear units are similarly resistant to extreme climatic events. When Hurricane Andrew had a direct hit of Florida's Turkey Point Nuclear Plant as a category 5 hurricane with wind gusts up to 175 MPH in 1992, there was no damage to the plant's critical systems.[20] Other forms of electricity generation are simply not hardened and

secured to nearly the same degree. With increasing concerns arising every day about foreign powers hacking into the U.S. electric grid, the hardened security around America's nuclear power plants is critical. In the U.S. nuclear industry, safety and security are a core part of the design and building process in a far more direct and substantive way than they are for any other type of resource.

VI. THE COUNTRY'S NUCLEAR TECHNOLOGY CAPABILITY IMPACTS NON-PROLFERATION EFFORTS

One of the primary areas in which America gains major strategic advantages from the civilian nuclear enterprise—advantages that are not currently accounted for in market prices - occurs in the area of non-proliferation. The U.S. has long been a leader in enforcing non-proliferation norms, as first enunciated by President Dwight Eisenhower in his Atoms for Peace initiative. We have used our leadership in nuclear technology non-proliferation to sign so-called "123" agreements with countries wishing to use civilian nuclear technology which had very strong proliferation safeguards.

These initiatives can have great value to the countries that sign them. For example, when India signed its 123 agreement with President George W. Bush in 2008, it represented the most serious lobbying the Indian government had done on any issue in the US and was described as the cornerstone of the new relationship between the U.S. and India. India was willing to expend these efforts and commit to a much stricter regime under IAEA supervision, in no small part because India's government highly valued the U.S. nuclear technologies we could bring to the table. Without a serious ongoing effort in civilian nuclear technology, these anti-proliferation efforts on the military side would not have been possible. The deal was described by the Council on Foreign Relations as a "watershed in U.S.-India relations and introduces a new aspect

to international nonproliferation efforts."[21] A similar gold-standard 123 Agreement was signed with the United Arab Emirates in December of 2009. Again, U.S. technological leadership in the nuclear arena was used to leverage a strong nonproliferation agreement in a sensitive part of the word.[22]

As our nuclear technology capability has weakened due to a lack of domestic plant manufacture (we have not completed a greenfield nuclear power plant in three decades) so has our leverage in this area, with challenges coming from countries that may have very different views on non-proliferation than we do. Recently the United States has lost several bids on nuclear power projects in the Middle East to Russia, in no small part because of our degraded capacity in this area. The closure of additional nuclear plants degrades our already fragile capabilities while empowering geopolitical rivals such as Russia and China.

Whether or not the U.S. is in the nuclear game, the rest of the world continues to play it, particularly in China where nuclear power generation has almost tripled in the last decade. There are over 400 GW of installed nuclear capacity in more than 31 countries, with more being added every year. There were 58 reactors in 15 countries with a capacity of almost 57 GW under construction as of 2016.[23]

VII. PRESERVING NUCLEAR IS AN IMPORTANT TO THE COUNTRY'S NATIONAL SECURITY INTERESTS

In addition to our work in non-proliferation, the civilian nuclear enterprise dramatically strengthens our military capability as well, another nuclear attribute that is not priced into the market. This is most visibly seen in our Nuclear Navy, which is indubitably the world's most capable. America has almost 100 nuclear-powered vessels, consisting of aircraft carriers and submarines. We have accumulated almost 6200 reactor years of service without a single nuclear accident.[24]

For decades, the United States has gained a strategic advantage from its use of nuclear-powered ships that can deploy longer and more effectively than conventionally powered craft. The importance of fuel choice on capability has a rich history, most notably when Winston Churchill turned the British Navy from coal to oil for many of the same reasons the United States would move its key assets to nuclear. If America does not maintain a nuclear power capability domestically it is difficult to imagine that we will be able to maintain a nuclear navy at the same level of capability we have had historically. This would be a substantial degradation of our ability to project U.S. power.

One example of this degraded capability has been seen in our procurement processes for highly-enriched uranium to fuel both domestic and military reactors. Historically, the entire supply chain for highly enriched uranium has been legally mandated to be of U.S. origin. However, due to the decline of our nuclear capability, the

[24] "Nuclear Powered-Ships," *World Nuclear Association*, Updated October 2017, available at: http://www.world-nuclear.org/information-library/non-power-nuclear-applications/transport/nuclear-powered-ships.aspx.

20180509-5233 FERC PDF (Unofficial) 5/9/2018 4:40:40 PM

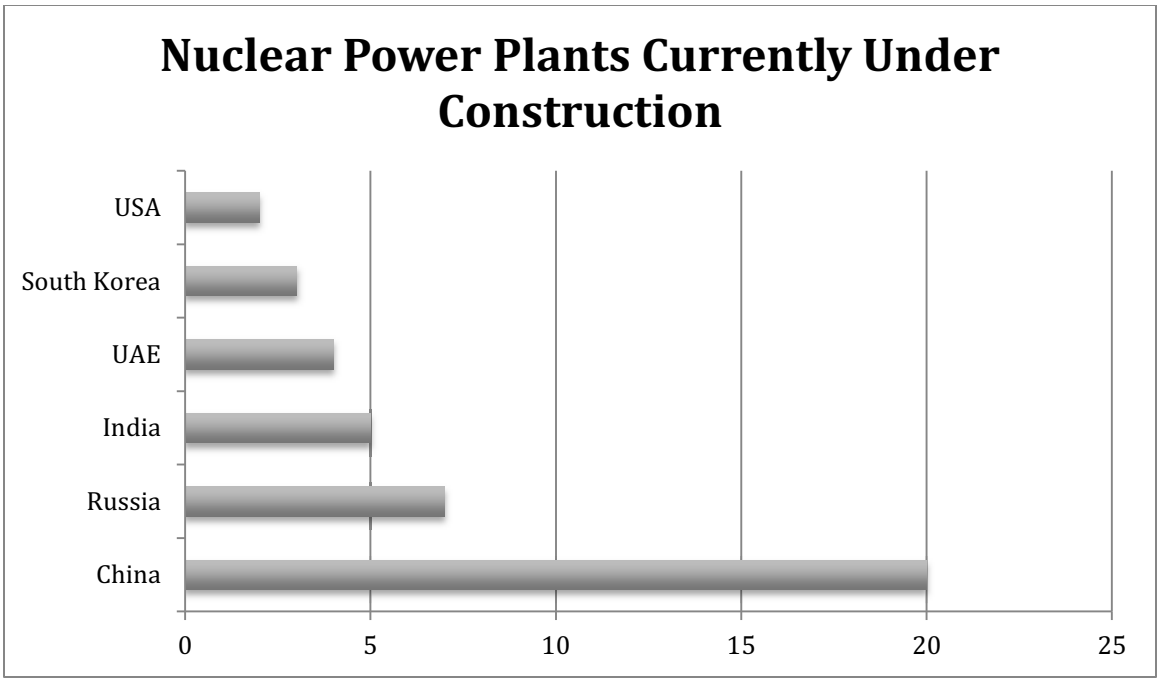
country no longer maintains all aspects of this process domestically, and other nations have gained production advantages over us."[25]

Our nuclear weapons stockpile, and its critical nature for deterring threats such as we are seeing in North Korea, is also hostage to the degradation of America's civilian nuclear capability. The stockpile requires a constant source of Tritium that must also be from U.S. origin reactors using domestically produced LEU reactor fuel. Our lack of an enrichment facility using solely U.S. origin technology represents a substantial impediment to our security in this area. As a result we find ourselves relying on Europe for the supply of this fuel at a time in which Europe's commitment to the nuclear enterprise has become questionable.

Our nuclear technology capability has profound impacts on America's national security. The failure of a new nuclear build in South Carolina and cost overrun issues in Georgia are further indications that the U.S. has lost control of its own nuclear destiny. Without a course correction we will see the future of nuclear power determined by China and Russia, who continue to move aggressively in this arena. China will complete five new nuclear power plants in this year alone.[26]

[25] Energy Futures Initiative, Inc., *The U.S. Nuclear Enterprise: A Key National Security Enabler*, August 2017, available at: https://static1.squarespace.com/static/58ec123cb3db2bd94e057628/t/5992f7e0bf629ad8f9d575ec/1502803938248/EFI+Nuclear+Report+FINAL+08.2017.pdf.

[26] Source: *World Nuclear Association*



The dangers of this situation should be obvious: While nuclear power plants are in many ways a quite distinct technology from nuclear weapons, the capabilities used in domestic enrichment for civilian nuclear power plants can also be used to create nuclear weapons. This fact has been at the core of much of our conflict with Iran and North Korea over their "civilian" nuclear programs. The U.S. has traditionally used its leadership in the supply of nuclear technologies to make it very difficult for nuclear-power-plant operators to proliferate the technology. Are the Chinese and Russians likely to share our interests in this? We need only look to Pyongyang and Pakistan to find out.

In addition to the critical role of nuclear energy in U.S. national security, the reactors that power our nuclear navy – almost 100 submarines and aircraft carriers – run on technology that is virtually identical to the technology powering our civilian reactors. In fact, domestic nuclear power originally grew from these naval programs. Losing the technology and operating experience through the atrophy of our domestic nuclear-power sector would mean a profound loss of capability in our military.

Although these aspects of nuclear retention are tangential to the energy markets, the importance of these resources both to the resilience of the electric system and our overall national interest must be considered in any decision. Putting these units at risk because of short-run market signals and the failure of our markets to adequately value all of the units' attributes is a deficiency that requires immediate attention and action.

VIII. SUPPLY CHAIN AND WORKFORCE DEVELOPMENT

More than 700 companies in 44 states contribute to the U.S. nuclear supply chain and this supply chain is increasingly missing links because of the lack of support for a robust domestic nuclear industry. While nuclear weapons and nuclear power are two quite distinct technologies, there are many suppliers who create specialized solutions for both markets. Without the support of the civilian nuclear fleet our weapons supply chain may also suffer badly, with consequent damage to our nuclear deterrent.

As a result of the uncertainties about our nuclear future, America's number of nuclear engineers being trained sank to less than 25% of what it was at its peak. Although rebounding impressively during the short lived nuclear renaissance created by the Energy Policy Act of 2005, the numbers remain well below peak levels reached in the 1970s.[27]

The closure of a nuclear power plant can often have a dramatic effect on local workforces. When Vermont Yankee closed more than 500 people lost their well-paying jobs that were 2.5 times the average for a worker in the region. The total economic impact within seven years of the plants closing was projected to be 1,100 jobs lost with

[27] Oak Ridge Institute for Science and Education, 2016 Nuclear Engineering Enrollments and Degrees Survey, 2016, available at: https://orise.orau.gov/stem/workforce-studies/nuclear-engineering-enrollments.html.

almost a half billion in economic activity. Nuclear plants also tend to be in more rural areas and the loss of economic activity in these areas from a shutdown is therefore more profound.

There is also the additional important issue of outlet jobs for the U.S. Navy's nuclear technicians. Without a civilian nuclear workforce for these trained nuclear engineers to "graduate" into upon leaving naval service, the U.S. Navy's ability to attract top candidates to work in the nuclear navy may badly lag.

IX. CONCLUSION

The Nuclear enterprise is a vital part of America's electricity infrastructure, that, unique among major forms of generation, provide substantial national security, resilience and reliability and environmental attributes, all of which are either poorly valued by the marketplace or not valued at all. In many cases, local power companies and public utility commissions are poorly positioned to be able to properly value these attributes, which bring benefits far beyond those that accrue to local ratepayers. Furthermore, nuclear energy's lack of price correlation with other forms of electricity generation and its lack of dependence on spot fuel prices make it an ideal component of a broad electricity-generation portfolio.

Given the varied attributes that nuclear energy brings, FERC is absolutely justified in pursuing policies to ensure that the nuclear fleet and our broader civilian nuclear enterprise, will not be irreparably damaged by a myopic focus on short-term cost-minimization.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PJM Interconnection, L.L.C.	)	**Docket Nos. ER18-1314-000**
	)	**ER18-1314-001**
	)	
	)	

MOTION FOR LEAVE TO ANSWER AND ANSWER OF EXELON CORP. AND THE PSEG COMPANIES

Pursuant to Rules 212 and 213 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission"),[1] Exelon Corp. ("Exelon") and the PSEG Companies[2] move for leave to answer, and submit their answer, to the comments and protests filed in the above-captioned dockets.

MOTION FOR LEAVE TO ANSWER

Exelon and the PSEG Companies respectfully request that the Commission permit this Answer, and the attached Declaration of Michael M. Schnitzer ("Schnitzer Decl."), to protests and comments filed in the above-captioned dockets on May 7, 2018. The protests and comments include new evidence, including many new expert affidavits. Moreover, the protests and comments stake out novel positions—not just advocating for and against Capacity Repricing and MOPR-Ex, but suggesting modified versions of both, as well as entirely new approaches. Several protests and comments also respond to PJM's Section 205 filing by urging the Commission to act under Section 206. The Commission has allowed answers to protests where the answer provides

[1] 18 C.F.R. §§ 385.212, 385.213 (2017).
[2] The PSEG Companies include: Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC.

20180522-5305 FERC PDF (Unofficial) 5/22/2018 3:34:39 PM

information that assists the Commission in its decision.[3] Exelon and the PSEG Companies respectfully suggest that this Answer will do so. In particular, the Schnitzer Declaration provides important new evidence concerning the Capacity Repricing proposal, in response to comments submitted by other parties.

ANSWER

The commenters clamoring for an expanded MOPR seek to exploit the Commission's commitment to markets and competition for ends that are profoundly anti-market and anti-competitive. While they purport to be purifying the Commission's markets from state intrusions, in reality they are seeking to entrench an unfair advantage they have enjoyed for decades: continuing to exploit the market's failure to value certain environmental attributes, and thereby imposing harm on society without paying for the costs. It is not a "level playing field" to treat resources that pollute as though they did not. When a coal or gas plant can underbid a wind farm, or a nuclear generator, by polluting the air we breathe, this is not a triumph of markets' power to drive efficient results. It is a market failure. When state policies attempt to internalize the pollution externality—through subsidies, taxes, or otherwise—they make markets more competitive and market outcomes more efficient.[4] This is, literally, textbook economics.[5] That is why there is broad agreement—even among advocates of MOPR-Ex—that markets should and must evolve, one way or another, to take into account environmental externalities like carbon.[6]

[6] Exelon Protest at 44 & n.152; *see* PJM Filing at 54-55; *infra* at 20-21.

The Commission, of course, has decided so far that its market mechanism should be fuel-neutral. But the Commission can afford to ignore the different environmental profiles of different generation types only because *states'* policies are *not* fuel neutral. Resources thus bring with them to the Commission's fuel-neutral markets a cost structure that reflects whatever fuel-related benefits or penalties states have chosen to impose in light of state environmental priorities. The Commission's market mechanism selects the least-cost set of resources against the backdrop of those state policies. As Exelon's Protest showed, the Commission thus far has always crafted market rules to respect and accommodate state programs addressing environmental externalities.[7] Doing so adheres to the principle that the Commission must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role,"[8] consistent with the Federal Power Act's purpose to "complement," not "usurp[] … State regulatory authority."[9] For two decades, this is how the Commission's markets have operated. Thus, there is no truth to the allegation that this proceeding is a referendum on the Commission's commitment to markets.[10]

Advocates of MOPR-Ex ask the Commission to sweep away this market-based model of cooperative federalism in favor of one that countermands state environmental policies, so that the Commission's market yields the outcome that would result if the state policies did not exist. The Commission should not be fooled by these parties' rhetoric: while they cloak themselves in the language of market integrity and fairness, what these generators really want is to protect the market advantage they gain by polluting without paying. They urge PJM market rules that would neuter state policies compensating for the real benefits of cleaner fuels, and thus would strangle

competition from cleaner generators that, when pollution costs are taken into account, would outcompete the polluters.

As Exelon and the PSEG Companies showed in their Protests, such action is not only inconsistent with sound economics and principles of cooperative federalism, but also is unjustified in light of current PJM market conditions. The Commission's markets are achieving what the Supreme Court has identified as "the principal purpose of" the Federal Power Act: "the orderly development of plentiful supplies of electricity … at reasonable prices."[11] Supply is plentiful, prices are low, and new entry remains significant. The commenters declaring that the markets are on the verge of collapse never address this reality, nor offer any evidence at all to support their panicked assertions that PJM is in the midst of a crisis.

For these reasons, the Commission should reject both PJM proposals. But if the Commission nevertheless determines to take some action to bring capacity prices closer to the levels that would exist without state environmental policies, the Commission should approve Capacity Repricing. Advocates of MOPR-Ex, of course, prefer MOPR-Ex, because it shields them from competition and furthers their goal of ridding the capacity markets of their non-emitting competitors. But if the Commission is compelled to act and finds Capacity Repricing, "PJM's preferred approach,"[12] to be just and reasonable (or that it can be rendered just and reasonable with an appropriate conditional acceptance), the Commission must approve it without reaching MOPR-Ex. Capacity Repricing satisfies the Commission's standard for market design—that it be "workably competitive."[13] And even if the comparison to MOPR-Ex were relevant, from a policy standpoint, Capacity Repricing is clearly superior to MOPR-Ex.

[11] *NAACP v. Fed. Power Comm'n*, 425 U.S. 662, 669-70 (1976).
[12] PJM Filing at 53.
[13] *See, e.g.*, *PJM Interconnection, L.L.C.*, 110 FERC ¶ 61,053, at P 84 (2005).

Under MOPR-Ex: (1) The wrong resources clear (because clean resources should have the chance to out-compete polluters, after environmental harm is accounted for); (2) Too many resources clear (given the likelihood that the clean resources excluded by MOPR-Ex will continue to supply capacity without compensation from the market); and (3) Energy market price signals are corrupted (suppressed by forced overprocurement). The MOPR's proponents claim this harm is good because it "disincentiv[izes]" states.[14] But the Commission has no business trying to deter states from protecting citizens' health and welfare, and it is doubtful that the Commission could do so in any event.

Capacity Repricing avoids all these problems. The correct resources clear, after accounting for environmental harm; the right quantity of resources clears; and energy market prices are not distorted. Advocates of MOPR-Ex nevertheless argue that Capacity Repricing must be rejected because it yields a price-quantity pairing that is not on the demand curve, and because it may create opportunities for strategic bidding. But these critiques, even if true, are not fatal to Capacity Repricing, and they certainly are no reason to select MOPR-Ex in its stead. As to the price-quantity issue, this theoretical criticism has only modest practical effects. And MOPR-Ex *also* yields a price-quantity pairing that is not on the demand curve, once one accounts for the reality that states will continue support environmentally friendly resources that will effectively provide capacity to the system. Likewise, as to alleged incentives for strategic bidding, any effects "are likely to be modest and would reduce the cost of repricing to customers."[15] To the extent there is any effect, strategic bidding will tend to result in a clearing price that is still significantly higher than the status quo, but lower than the MOPR-Ex clearing price would be. In effect, Capacity Repricing strikes a middle ground. If the Commission remains concerned about bidding incentives, they can be

[14] IMM Comments at 14-15; EPSA Protest at 28-29.
[15] Schnitzer Decl. ¶ 15.

fixed. One example of a potential fix would be including an "opportunity cost" payment in the Capacity Repricing model. Such payments, by making resources indifferent between clearing and not, could virtually eliminate these bidding incentives. In a variety of contexts, the Commission has approved similar payments to align incentives with efficient behavior.

Thus, while there are good reasons to reject any mitigation of environmental payments, including Capacity Repricing, the broad criticisms of Capacity Repricing are overblown. Capacity Repricing is flawed because clean resources should be allowed to account for environmental attribute revenues and other state compensation in making capacity bids. These revenues reflect payments for separate services, and thus those resources, to cover their going forward costs, do not need to receive those amounts from the capacity market. But if the Commission disagrees, Capacity Repricing is the only proposed workable—and "workably competitive"—alternative.

I. The Comments Confirm That PJM's "Two Alternative[]" Approach Violates Section 205.

The comments underscore why Section 205 prohibits alternative filings like PJM's. Arrayed before the Commission are dozens of comments advocating for or against an unbounded universe of potential tariffs: Capacity Repricing,[16] MOPR-Ex,[17] and assorted permutations of MOPR-Ex without certain exemptions (with various commentators seeking to sever versions of the RPS Exemption, Self-Supply Exemption, Public Entity Exemption, Competitive Entry Exemption, and the carve out for federal subsidies, among others).[18] By placing this free-for-all

[16] A number of commentators show that no change is warranted, but that Capacity Repricing is vastly superior to MOPR-Ex. *See* Comments of American Electric Power Service Corp. at 1 ("American Electric Comments"); Protest of Dominion Energy Services, Inc. at 9-11 ("Dominion Comments"); Exelon Protest at 8; Comments of Nuclear Energy Institute at 1 ("NEI Comments"); Protest and Motion to Reject of the PSEG Companies at 2 ("PSEG Protest").

[18] *See, e.g.*, Comments of LS Power Associates, L.P. at 18 ("LS Power Comments"); Comments of Natural Gas Supply Association at 8 ("NGSA Comments"); Protest of the NRG Companies at 25 ("NRG Protest"); P3 Protest at 20; Comments and Protest of Rockland Capital, LLC at 5 ("Rockland Comments"); Comments of Vistra Energy Corp. and Dynegy Marketing & Trade, LLC at 13 ("Vistra Comments").

before the Commission, instead of proposing a single tariff "stating plainly the change or changes to be made,"[19] PJM's filing is inconsistent with the "passive and reactive role" that Section 205 requires the Commission to play.[20] If PJM wishes to give the Commission broad discretion to set policy, it must attempt to carry Section 206's heavy burden, or else seek a declaratory judgment. Because Section 205 does not sanction PJM's approach, the Commission must reject its filing.

II. The Comments Confirm That The Commission Should Not Hesitate To Reject Both Of PJM's Proposals And Preserve The Status Quo.

Stakeholders of every stripe have identified significant problems with both of PJM's proposals. Yet proponents of mitigation urge the Commission to press ahead anyway based on claims that the sky is falling—that state programs are "wreak[ing] havoc with PJM's markets,"[21] which are supposedly facing a "serious threat"[22] and "will collapse."[23] These are serious charges that, if true, would yield evidence for all to see. But what the comments of mitigation proponents reveal, more than anything, is that no *evidence* backs up this rhetoric. And the *actual* evidence confirms that the crisis is manufactured. As shown by Exelon, the PSEG Companies, and others, reserve margins are historically high (23.3% for the 2020-21 BRA) at prices that are historically low ($86/MW-day)—yet still, new entry continues at a significant pace (including almost 40 GW of recently entered or potential near-term entrants across PJM).[24] These high reserve margins, moreover, have been sustained despite years of claims that the capacity markets face "imminent

[19] 16 U.S.C. § 824d(d).

and substantial," and even "existential," "threat[s]."[25] The efficacy of PJM's capacity markets, and investors' faith in them, speaks for itself.

While PJM does not need to point to a crisis to justify tariff revisions under Section 205, the absence of any on-the-ground problem means that the Commission should not hesitate to reject both of PJM's proposals. Instead, until PJM formulates a new tariff that is genuinely just and reasonable, the Commission should leave PJM's capacity market rules where they are—with the MOPR limited, as it has been, to counteracting buyer-side market power by new resources.[26] That cautious approach avoids all the problems that come from expanding mitigation. And it respects stakeholders' wishes: Of the comments filed that take a position on the merits, a substantial majority urge the Commission to reject both proposals.[27] That preference has been consistent since November 2017, when 64% of stakeholders stated that they preferred the status quo.[28]

III. Although The Capacity Repricing Proposal Is Unwarranted And Flawed, Claims That The Proposal Is Unworkable Are Incorrect.

Exelon and the PSEG Companies agree with the commenters who criticize Capacity Repricing as unwarranted and unnecessary because it needlessly raises prices for customers at a

time of oversupply with no corresponding benefit, and because it incorrectly mitigates payments recognizing the environmental value of clean generation. But to the extent the Commission disagrees and deems some departure from the status quo necessary, it is not "free to accept the better of the two approaches filed under Section 205," as the IMM incorrectly asserts.[29] PJM has identified Capacity Repricing as its "prefer[red]" approach, and thus the Commission must "assess first whether it can accept Option A, even if subject to suspension and further proceedings."[30] If the Commission determines Capacity Repricing is just and reasonable (or, with an appropriate conditional acceptance, can be *made* just and reasonable), it cannot reach MOPR-Ex. And while Capacity Repricing is unnecessary, the broader attacks on it are meritless. Capacity Repricing's auction mechanism can meet the Commission's "workably competitive" standard,[31] and can accommodate state programs while insulating capacity prices from those programs' effects.

A. The Criticisms Of Capacity Repricing's Auction Design Are Overstated And Can Be Remedied.

Several commentators note strategic bidding incentives that exist under Capacity Repricing's two-stage design—three such incentives, in particular. First, if a portfolio owner has high-cost resources that cannot hope to receive a capacity commitment at Stage 1, it might inflate the bids for those resources in the hope of contributing to higher Stage 2 clearing prices for other resources (what the Wilson Affidavit calls "clear-out-the-top").[32] Second, some "in between" resources—which might be economic at the Stage 2 clearing price, but cannot clear at Stage 1—may drop out.[33] Third, if resources would be economic at the anticipated Stage 2 clearing prices, they may have incentives to make offers below their forward costs in order to increase their

[29] IMM Comments at 3.
[30] PJM Filing at 46.
[31] *See, e.g.*, *PJM Interconnection, L.L.C.*, 110 FERC ¶ 61,053, at P 84 (2005).

[33] EPSA Protest at 11 n.46 and Affidavit of David W. DeRamus and Collin Cain ¶¶ 49-53.

chances of receiving a capacity commitment at Stage 1 (what the Wilson Affidavit calls "race-to-the-bottom").[34] The first two incentives tend to increase prices; the third, to decrease prices.

Even if these incentives exist, they are not *per se* fatal. Indeed, as the Schnitzer Declaration explains, "[w]hile commenters' witnesses point out these strategic bidding behaviors, they do not provide any well-supported analysis of their combined net impact."[35] And careful analysis shows that the concerns about Capacity Repricing are overblown. Any incentives to "clear-out-the-top" reflect issues that are already addressed by existing market rules, such as seller offer caps and the risk of Commission enforcement penalties for manipulative bidding.[36] Likewise, the effect of "in between" resources dropping out of the market will be limited given PJM's deep well of potential new entrants.[37] Finally, as between the three incentives, the effect termed "race-to-the-bottom" likely will affect a broader range of resources, and this price-reducing effect will likely swamp the other two price-increasing effects.[38] This effect, however, is also self-limiting: If a resource were the *only* one pursuing this strategy, perhaps it might steeply reduce its bid, predicting that Stage 2 would increase the clearing price.[39] But bidders take into account others' expected behavior.[40] And here, a resource will know that other bidders are also likely to reduce their bids—and thus if the resource reduces its bid too steeply, it risks losing money even at the higher Stage 2 price.[41] This will limit incentives to reduce bids.

The upshot of these incentives will be to mitigate the price increases that would otherwise result from Capacity Repricing. For example, one witness estimates that Capacity Repricing (and

[34] DC/MD/NJ Ratepayers Protest at 9.
[35] Schnitzer Decl. ¶ 51.
[36] *Id.* ¶ 54.
[37] *Id.* ¶ 57.

[39] *Id.* ¶¶ 59, 61.
[40] *Id.* ¶ 59.
[41] *Id.*

MOPR-Ex) would increase capacity prices by about 50% absent strategic bidding.[42] The bidding incentives, on plausible assumptions, lower this amount slightly to 39%.[43] Exelon and the PSEG Companies have shown that Capacity Repricing and MOPR-Ex both "will raise capacity market prices and costs for consumers"; the bidding incentives produced by Capacity Repricing thus somewhat limit that effect, yielding prices that are "elevated relative to the status quo, but below MOPR-Ex."[44] That is a reason to prefer it to MOPR-Ex.[45] Whatever the theoretical criticisms of Capacity Repricing's design, it cashes out as a compromise. It respects state policies by allowing state-supported clean generation to clear while still raising prices to offset this support—albeit not as much as certain fossil-fuel generators hope to achieve via MOPR-Ex.[46]

If the Commission remains concerned about Capacity Repricing's effects on bidding incentives, there are potential solutions. For example, the Schnitzer Declaration explains that resources whose offers are above the Stage 1 clearing price but below the Stage 2 clearing price could receive a "lost opportunity cost" payment equal to the difference between their offers and the Stage 2 clearing price.[47] The lower the offer, the higher the payment.

A "lost opportunity cost" payment largely could eliminate all three incentives detailed above: It could eliminate "clear-out-the-top" (artificially inflated offers would be costly, as they would reduce lost opportunity cost payments); the drop out of "in between" resources (who would receive an incentive, via the lost opportunity cost payment, to submit a bid); and the "race to the

[42] *Id.* ¶ 61.
[43] *Id.*
[44] *Id.* ¶¶ 18, 61.
[45] *Id.* ¶ 64.
[46] EPSA also contends that the effect termed "race-to-the-bottom" will cause the auction to procure too much capacity—because when the demand curve slopes down, lower offer prices will yield a larger quantity. EPSA Protest at 11. Because the demand curve is so steep, however, any such effect will be very small—on the order of 0.1% of the market, or 167 MW. Schnitzer Decl. ¶ 63.
[47] Schnitzer Decl. ¶ 67.

bottom" (as failing to clear at Stage 1 would no longer harm resources that can beat the Stage 2 price).[48] This modification could also address the concern that Stage 2 clearing prices will be set by resources with no capacity commitment at stake: A lost opportunity cost payment means that *all* resources that can beat the Stage 2 price have something at stake.[49] The size of these payments would likely be small—0.75% of total capacity payments.[50]

Nor would such payments amount to money for nothing: preparing bids is costly,[51] and PJM would be compensating generators for their expense in preparing cost-based bids that help the PJM market operate efficiently. Opportunity cost payments are already used by PJM to align bidder incentives with efficient behavior—for example, to address out-of-market dispatch for reliability reasons in energy markets, and in operating reserves markets.[52]

If the Commission concludes that a modification to Capacity Repricing is warranted, Exelon and the PSEG Companies respectfully suggest that the appropriate next step would be to reject the current filing as unjust and unreasonable, but indicate that the Commission would accept a Section 205 filing including such a modification.

B. The Broader Attacks On Capacity Repricing Are Meritless.

The broader attacks on Capacity Repricing—many pressed by fossil-fuel generators hoping to drive the Commission toward an unwarranted expansion of the MOPR—are baseless.

Clearance by state-supported resources. One supposed flaw is that clean generators receiving payments for their environmental value clear at the expense of other generators.[53] But this is Capacity Repricing's key *virtue*. As Dr. Willig's Declaration explains, this is the efficient

[48] *Id.* ¶¶ 68-72.
[49] *Id.* ¶ 68.
[50] *Id.* ¶ 73.
[51] *See* Affidavit of David W. DeRamus & Collin Cain, ¶ 50, attached to EPSA Protest.
[52] Schnitzer Decl. ¶ 74.
[53] *See, e.g.*, EPSA Protest at 9; P3 Protest at 12-13.

result when environmental externalities are taken into account,[54] and by permitting this result, Capacity Repricing avoids the costly overprocurement and distorting energy market effects that plague MOPR-Ex (as discussed further below). In this respect, Capacity Repricing follows the CASPR Order's lead—which also permitted, through a different mechanism, state-supported clean resources to replace existing polluting resources.

Effects on other states. Next, the proponents of a broader MOPR claim Capacity Repricing "would create a significant externality" by allowing "states … to shift th[e] costs of th[eir] polices … onto other" states.[55] Not so. State policies themselves do not impose any costs on other states—for example, the funds for Illinois' ZEC Program come entirely from Illinois customers—and the whole *point* of Capacity Repricing is to set prices where they would have been without state payments that qualify as Actionable Subsidies. That does not export any costs onto other states, or alter prices received by other generators. To the contrary, states *benefit* other states when they support clean generation, because the benefits of pollution abatement are experienced by citizens of all states, not only the state paying for the pollution abatement.

EPSA also repackages similar arguments as constitutional objections, claiming that Capacity Repricing unconstitutionally "[a]llow[s] [s]tates [t]o [r]egulate [b]eyond [t]heir [b]orders" by permitting "the actions of one state to affect[] … other states."[56] The Commerce Clause prohibits states from enacting extraterritorial legislation that "directly regulates transactions which take place across state lines."[57] Never could the Commission's *federal* approval of market rules violate that restriction on state authority. And regardless, EPSA does not

[54] Willig Decl. ¶ 52; *see* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms* at 10-12 (April 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf.
[55] EPSA Protest at 29.
[56] *Id.* at 21 (internal quotation marks omitted).
[57] *Edgar v. MITE Corp.*, 457 U.S. 624, 641 (1982).

point to any "direct[] regulat[ion]" of interstate commerce;[58] at most, it alleges that one state's actions may have effects elsewhere.[59] But mere extraterritorial effects do not violate the Commerce Clause: "it is inevitable that a state's law … will have extraterritorial effects," and the "Supreme Court has never suggested that the … Commerce Clause" precludes such effects.[60] Indeed, EPSA's argument proves vastly too much. Whenever states have subsidized fossil-fuel plants, they have required citizens "in other states to shoulder much of the burden"—in less efficient wholesale electricity markets, and in more polluted air.[61] On EPSA's theory, all such subsidies would be unconstitutional. The Commerce Clause has never stretched so far.

Violation of constitutional limits on ratemaking. EPSA's other constitutional objection fares no better. EPSA argues that, as to resources that offer below the Stage 2 clearing price but do not receive a capacity commitment at Stage 1, Capacity Repricing violates the Constitution (and FPA) because it does not provide these resources the "*opportunity* to recover [their] costs,"[62] invoking *FPC v. Hope Natural Gas Co.*[63] and *Bridgeport Energy, LLC*.[64] That standard, however, does not apply here. When a utility is compelled to provide service to the public, as with a traditionally regulated utility, this standard forbids "confiscatory" rates for compelled service.[65] Likewise, when a generator is compelled to remain operational for reliability, the same standard governs.[66] In PJM, however, generators are not compelled to provide capacity. To be sure, generators that have sold capacity generally have a must offer obligation into the Reliability

[63] 320 U.S. 591, 603 (1944)
[64] *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005).
[65] *Duquesne Light Co. v. Barasch*, 488 U.S. 299, 310 (1989) (citing *Hope Natural Gas*, 320 U.S. at 502).
[66] *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005).

Pricing Model. But if these resources choose to retire, they can do so upon 90 days' notice (and, presumably, upon covering any outstanding capacity obligations)—regardless of reliability implications.[67] In such circumstances, the Commission has held that "there can be no question of confiscation of a resource's property."[68]

Seller-side market power. The American Petroleum Institute ("API") claims, uniquely, that state support generally, and Capacity Repricing in particular, "facilitate the exercise of *supplier*"—not buyer—"market power"[69] via three anticompetitive tactics: (1) "predatory pricing"; (2) "entry deterrence"; and (3) "economic withholding" of a portion of an owner's portfolio.[70] As best Exelon and the PSEG Companies can discern, API's argument appears to be that these tactics require that the owner have the financial wherewithal to withstand temporary losses or losses in part of its portfolio, and that subsidies and Capacity Repricing "facilitate" these tactics by giving generators more money overall. But that money could just as well come from *anywhere*—utility operations, capital markets, or tax reductions. API's argument has nothing to do with Capacity Repricing.

Price/quantity pair not on the demand curve. EPSA criticizes Capacity Repricing because it yields a result that does not fall on "RPM's sloped demand curve": Because Stage 1 determines the quantity procured, and Stage 2 determines the price, Capacity Repricing yields a "price/quantity relationship" that does not appear on the demand curve.[71] But that theoretical flaw

[67] PJM Open Access Transmission Tariff, § 113.
[68] *Id.*; *see also N.Y. Indep. Sys. Operator, Inc.*, 124 FERC ¶ 61301, at P 58 (2008) (similar). To the extent EPSA's argument is that Capacity Repricing is unreasonable under the FPA because it does not "represent[] an appropriate balancing of consumer and investor interests," EPSA Protest at 19, Exelon and the PSEG Companies agree—but EPSA gets the imbalance backwards. For consumers, Capacity Repricing strikes the wrong balance because it raises prices with no sound justification. But for investors, it is not unfair that some polluting resources fail to clear due to states' efforts to address environmental externalities—which remains true even if these resources could have beaten the Stage 2 clearing price.
[69] Affidavit of Paul M. Sotkiewicz ¶ 6, attached to Comments of API.
[70] *Id.*
[71] EPSA Protest at 14; *see* Affidavit of David W. DeRamus and Collin Cain ¶ 38.

is no reason to reject Capacity Repricing absent some evidence that it is *actually* unworkable. And certainly, it is no reason to select MOPR-Ex over Capacity Repricing: As the Schnitzer Declaration explains, "the same is true of MOPR-Ex," which *also* yields a "price and quantity pair [that] does not fall on the demand curve," once one accounts for the resources that will continue to receive state support and effectively provide capacity to the system, even though they are not selected in the capacity auction.[72] "Indeed, because MOPR-Ex results in *significant over-procurement*, the effective price-quantity pair that results is even further away from the demand curve than Capacity Repricing."[73]

IV. The Proposals To Expand The MOPR Are Fundamentally Flawed.

Even if the Commission determined that a change must be made and that it could not approve Capacity Repricing (or a variant), it could not approve MOPR-Ex or any of the expansions of the MOPR proposed here. Both in theory and in execution, they are fundamentally flawed.

A. The Proposals To Expand The MOPR Are Flawed In Theory.

The commentators pushing for an expanded MOPR depict competitive markets as, by definition, insulated from the effects of state policies—which, when those policies involve payments for environmental benefits, they derisively call "subsidies."[74] Thus, they proclaim that "*all* subsidies" "are bad," "evil[]," and a "problem[]."[75] But the Commission will not find a citation to any economic authority that supports that broad proposition. That is because this proposition is false—for reasons Exelon has explained. Markets are not efficient when fossil-fuel generators inflict pollution on society without paying.[76] And state policies that attempt to

[72] Schnitzer Decl. ¶ 22.
[73] *Id.* ¶ 15 (emphasis added).
[74] *See, e.g.*, API Comments at 5; EPSA Protest at 12; NGSA Comments at 1-2; P3 Protest at 3.

[76] Willig Decl. ¶¶ 13(c)-(d), 31.

internalize this externality, whether by taxing or penalizing pollution, or by supporting clean generation that abates pollution, make markets more efficient and competitive.[77] This is Economics 101.[78]

In reality, the MOPR's proponents do not really believe that *all* state interventions must be mitigated; instead, their pious rhetoric is only meant to encourage the Commission to adopt changes that harm cleaner competitors, while leaving untouched the massive subsidies they have long reaped. Thus, P3 proposes a supposedly "Clean MOPR" that removes MOPR-Ex's enumerated exemptions and also the carve-out from the definition of "Actionable Subsidy" for "federal production and investment tax credits."[79] But tellingly, P3 does not seek to remove the exclusion for various siting- or development-based subsidies—subsidies that happen to go to gas-fired generators. Likewise, there is not a peep about the untold billions in subsidies that coal-fired generators have and continued to receive, including both direct subsidies—$4.7 billion, just on the federal side, every year[80]—and indirect support, such as Pennsylvania's sales-tax exclusion for coal.[81] And all of this is in addition to the *implicit* subsidy that fossil-fuel generators receive from the ability to pollute without paying, which Exelon showed comes to $12.1 to $17.7 billion annually.[82] There is no justification for targeting government policies for mitigation *only* when they promote clean generation and make the Commission's markets more efficient.

[81] Clean Energy Advocates Protest at 90.
[82] Exelon Protest at 12.

The MOPR's proponents have no adequate answer for how their approach undermines not just sound economics, but federalism principles the Commission has long respected. As explained by Exelon and others, states have long exercised their FPA-protected authority as regulators of "facilities used for the generation of electric energy,"[83] and the Commission has reaffirmed that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[84] That means that when states regulate generators to protect the air citizens breathe, the Commission should not attempt to thwart or disincentivize those policies, no matter how much rhetorical noise the policies' opponents employ.

The MOPR's proponents insist that an expanded MOPR does not seek to thwart state environmental policies. But in more candid moments, they admit the opposite—that an expanded MOPR aims to create "a disincentive" for state policymaking favoring clean generation.[85] That is consistent with PJM's statement that applying the MOPR to federal payments to wind and solar resources would, in effect, "countermand … acts of Congress."[86] But under the FPA, the Commission has no authority to establish market rules that seek to deter states from legislating to protect their citizens' health and welfare, or to countermand state actions that do so.[87]

Again and again, the MOPR's proponents labor to narrowly limit the state authority over generation that the Commission must respect. First, they put states to an all-or-nothing choice—claiming that states forfeited any ability to influence the generation mix when they joined "an organized capacity market," and that states wishing to make any "policy decision[s]" concerning generation must "pursue Fixed Resource Requirement ('FRR') treatment."[88] But as many

[88] P3 Protest at 21.

commentators note, that claim mocks history: In myriad states, restructuring went hand-in-hand with RPS programs.[89] That is why the D.C. Circuit has held that restructured states "retain the right to forbid new entrants from providing new capacity, to require retirement of existing generators, to limit new construction to more expensive, environmentally-friendly units, or to take any other action in their role as regulators of generation facilities."[90] Likewise, states' ability to fulfill their obligations under *other* cooperative-federalism statutes, like the Clean Air Act, often *depends* on influencing the generation mix that serves them.[91] Indeed, the Commission's organized markets have earned sustainable support precisely *because* the Commission has not required, as a condition of entry, that states give up their authority to influence the generation mix. To the contrary, in myriad ways, the Commission has actively "accommodate[d]" such policies.[92]

Second, the MOPR's proponents insist that states must make the perfect the enemy of the good. The IMM, for example, avers that states can address the harm caused by carbon dioxide only if they can agree on "a carbon price."[93] But unlike the IMM, states cannot wait for "[t]he theoretical ideal market approach."[94] They want to protect citizens *today*. Thus, acting under their police powers, states can—and often must—"take reform 'one step at a time, addressing [themselves] to the phase of the problem which seems most acute."[95] States, like the Commission, are permitted to adopt market-based approaches, entirely non-market mechanisms, or something

in-between. As Dr. Willig explains, well-designed environmental initiatives like Illinois' ZEC Program, which tie compensation to the value of the externality being abated and procure resources based on their environmental contribution, result in more efficient markets. There is no justification for thwarting those efforts simply because a carbon price would be superior.

Third, the MOPR's proponents imply that the Commission need not respect state policy choices because states may have different views about what externalities are most important to address—noting that FirstEnergy has identified, as "externalities," "fuel diversity" and "fuel security," and that resources possessing these attributes may be different from the clean generators targeted by MOPR-Ex.[96] But this concern is purely hypothetical. The *real* programs that states have enacted, and that MOPR-Ex targets, address environmental externalities like air pollution. Such environmental externalities are the easiest and clearest case. They are "the classic example found in almost every economics textbook."[97] So while the IMM disingenuously says that action may be warranted "[*i*]*f* society determines that carbon is a pollutant with a negative value"[98]—implying that carbon *might not* be a harmful pollutant—nobody *really* doubts that air pollution is a harmful externality, and that addressing it makes markets more efficient. At the May 2017 technical conference, even representatives of Calpine and NRG agreed that "carbon [is] an externality" that should be "price[d]."[99] Indeed, the federal government has *already found* that carbon is a harmful pollutant (in, for example, the EPA's "endangerment finding," which was affirmed on judicial review)[100]—and in any event, states need not wait for the federal government

to address threats to citizens' health and welfare. Whatever the scope of the externalities that states can permissibly address, environmental externalities are in the heartland of what states have historically addressed, and should be encouraged to address.

B. The Proposals To Expand The MOPR Are Flawed In Execution.

Apart from its conceptual flaws, MOPR-Ex is indefensible purely as a matter of auction design. The same is true of the broader variants, like "MOPR Clean." All should be rejected.

Proponents suggest that an expanded MOPR *must be* just and reasonable because PJM has a MOPR rule, which "already reflects stakeholder compromises."[101] Not so. The present MOPR is narrow in its purpose (combatting buyer-side market power), in the fuel sources it covers (gas only), and in the vintage it targets (only new generators).[102] The broader MOPRs proposed in this proceeding would twist this rule for a sweeping new purpose, and to a new universe of resources—counteracting the effects of disfavored state policies on wholesale markets, for both new and existing resources of any fuel type. PJM's MOPR was not designed for this new role, and has never been applied in this far-reaching manner. Stakeholders' agreement to, or the Commission's approval of, the narrow existing MOPR provides no support for the sea change sought here.[103]

Moreover, the comments confirm that the expanded MOPR's Swiss-cheese exceptions are incurably arbitrary. Stakeholders from all walks—generators, environmental groups, customer advocates—agree that the RPS Exemption is discriminatory: It exempts favored RPS programs for renewables, while mitigating environmental programs based on disfavored technologies (like nuclear or offshore wind), disfavored procurement processes, and even RPS programs with

[101] IMM Comments at 10; *see* API Protest at 10.
[102] Exelon Protest at 38-40.
[103] *Id.*

technology-specific tiers.[104] It does so even though the favored and disfavored programs pursue the same purposes and have the same effects on capacity markets, and even though disfavored programs like Illinois' ZEC Program may be more economically efficient than the exempted programs, by capping payments at the value of the environmental externality being abated.[105]

Likewise, myriad commentators explain why the Self-Supply and Public Entity exemptions are indefensible under MOPR-Ex's proposed new purpose of counteracting effects of state policies on wholesale markets. Because of the implicit subsidy provided by captive ratepayers, the vertically integrated utilities that qualify for these exemptions can build or maintain generation that "may be uneconomic" and that "would not have been built" or maintained, "but for being backed by ratepayer funds."[106] The state policies favoring the vertically integrated business model may be *older* than the pro-environmental policies that have spread over the last two decades. But that does not justify differential treatment.

Contra the suggestion of some fossil-fuel generators, these problems cannot be solved by blue-penciling MOPR-Ex's enumerated exemptions. One reason—again, acknowledged by several commentators—is that *NRG Power Marketing, LLC v. FERC*[107] precludes doing so.[108] But the more important reason is that once the Commission starts down the path of applying the MOPR to some disfavored policies—even state environmental policies that promote market efficiency—there is no non-arbitrary stopping point. The comments illustrate the point. Many commenters, as noted above, explain that MOPR's enumerated RPS Exemption, Self-Supply Exemption, and Public Entity Exemption are discriminatory. But even if the Commission severed these

[107] 862 F.3d 108 (D.C. Cir. 2017).
[108] Clean Energy Advocates Protest at 65; Joint Consumer Advocates Protest at 8-9; PSEG Protest at 10.

exemptions, that would still leave the sundry additional subsidies that PJM excludes from the definition of "Actionable Subsidy"—subsidies that "promote … general industrial development in an area," subsidies that "incent … siting facilities in [a particular] locality," and federal tax credits.[109] As many commentators show, those subsidies also affect wholesale capacity markets by supporting resources that might not otherwise be economic, and they may be less efficient than well-designed state environmental programs.[110] There is no justification for applying the MOPR to state environmental policies, but not to these distorting subsidies. P3 trumpets its support for a "Clean MOPR."[111] But as explained above, P3 only proposes eliminating the exclusion for federal subsidies to renewables, not the state and local subsidies that generally benefit gas and coal generators. Even if those exclusions were eliminated, that would still leave the various upstream subsidies fossil-fuel generators receive—for example, Pennsylvania's sales tax exemption for coal.[112] The solution to this problem is not to embark along the path proposed by MOPR-Ex.

If, however, PJM's market rules exempt *some* state policies from an expanded MOPR, then the market rules must, at the least, exempt Illinois' ZEC Program. As Exelon has established, that program is more efficient than state RPS programs—not to mention state policies favoring vertically integrated utilities—because it links the externality payment to a conservative estimate of the participating plants' environmental value.[113] Failing to exempt the ZEC Program thus would be arbitrary. The ratepayer advocates for the District of Columbia, Maryland, and New Jersey defend an RPS-specific exemption on the theory that RPS programs are "long-standing" and

[109] *See* proposed PJM Tariff § 1, Definitions L-M-N (Option B).
[110] Exelon Protest at 24-25; *see* Clean Energy Advocates Protest at 8, 54-55; Duquesne Comments at 5; FirstEnergy Protest at 19-20; NEI Protest at 10-11; PSEG Protest at 10; Solar RTO Protest at 19, 25-26.
[111] P3 Protest at 20.
[112] Clean Energy Advocate Protest at 90.
[113] Exelon Protest at 24-25.

widespread across PJM.[114] Exelon and the PSEG Companies agree that RPS programs should not be subject to the MOPR, but once the Commission begins applying the MOPR to environmental programs, neither the vintage nor the political popularity of RPS programs is a reasoned ground for exempting them.[115]

The proponents of an expanded MOPR also have no adequate answer for the gross overprocurement of capacity that it will yield. They predict—without evidence—that an expanded MOPR will deter states from supporting clean resources. There is no reason to think that is so, and every reason to think the opposite. Despite ISO-New England's limited MOPR exemption for 200 MW of renewables, for example, states issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, and Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[116] And in PJM, if the unsupported predictions of the MOPR's proponents prove wrong, the result will be a massive overprocurement of capacity estimated to cost customers $14-24.6 billion annually.[117] The Commission should not adopt a policy premised on speculation that states will abandon *en masse* policies in which they have invested for a decade and to which they have shown increasing commitment in recent years. In the CASPR Order, the Commission found that clean energy "will be developed by the operation of state environmental and clean

[114] DC/MD/NJ Ratepayers Protest at 22.

[115] The ratepayer advocates also aver that RPS programs are different because they are "designed to bring new resources … online," rather than to "prevent[] the retirement of … older facilities." DC/MD/NJ Ratepayers Protest at 22. This is backwards: PJM's MOPR has only ever applied to *new* resources, precisely because those resources are better vehicles for buyer-side market power. *See* Exelon Protest at 39-40. The ratepayer advocates assert that the "long lead time for new entry" provides time for the market to "anticipate[] and absorb[]" these resources. DC/MD/NJ Ratepayers Protest at 22. But to the extent this argument is meant to distinguish RPS programs from the ZEC Program, it does not. Nuclear generators have been in operation for decades, and have been part of the markets from their origin. Market prices have always accounted for their operation.

[116] CASPR Order, at P 4.

[117] Clean Energy Advocates Protest at 105 & Grogging Aff. at PP 3-4, 15; *see* Exelon Protest at 46-48.

energy mandates, whether that capacity clears the [market] or not."[118] There is no reason to think that PJM states will act any differently.[119]

MOPR proponents say that if states do not acquiesce to the "disincentive" provided by an expanded MOPR, the overprocurement is states' fault.[120] But this ignores the FPA's jurisdictional lines. States regulate generation, while capacity requirements—how much must be procured, and what resources count toward satisfying the administratively determined obligations—rest with the Commission.[121] So if capacity is procured inefficiently—or if more capacity is procured than is needed to ensure resource adequacy, because the Commission is ignoring capacity provided by state-supported resources—that error is squarely within the Commission's domain. Moreover, proponents of the MOPR-Ex badly disrespect state authority in claiming that states can avoid overprocurement by relinquishing the ability to legislate to protect their citizens' health and welfare. Never has the Commission sought to deter states from implementing legitimate environmental policies in their domain by punishing their citizens—and those elsewhere in PJM, too—with unnecessary capacity costs. Instead, the Commission has made sure to accommodate those policies.[122]

MOPR's proponents also have no answer to the price suppression in energy markets this overprocurement will yield. PJM identified this problem in its filing.[123] Yet the MOPR's proponents barely attempt to respond. The Commission cannot approve an expanded MOPR when the problems it creates may be larger than the problems it purports to solve.[124]

---

[118] CASPR Order, at P 45.
[119] *See* Willig Decl. ¶ 73.

[124] Exelon Protest at 46-48; *see* Willig Decl. ¶ 74.

Finally, the MOPR's proponents cannot account for the CASPR Order, which made clear that the Commission's policy is to accommodate rather than countermand state initiatives. This policy is not new: more than a decade ago, the Commission likewise emphasized that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[125] MOPR proponents make much of the CASPR Order's statement that the Commission would use "the MOPR as our standard solution" "[a]bsent a showing that a different method would" be effective.[126] But that statement referred to ISO-New England's narrower MOPR applying to only new resources, and even then, only two Commissioners endorsed it. The CASPR Order's actual *holding* was that ISO-New England's proposed reforms were just and reasonable precisely because the Commission concluded that they would succeed in ISO-England's goal of reasonably "accommodat[ing] state sponsored resources … over time."[127] Moreover, Exelon and the PSEG Companies respectfully suggest that it would be unwise for the Commission to establish a rule that it will apply the MOPR unless a different "market design proposal[]" is "developed by [an RTO] and [its] stakeholders,"[128] and is "the result of extensive compromise."[129] Under that rule, stakeholders that will financially benefit from an expanded MOPR—like EPSA's fossil-fuel generators—will never compromise, knowing that a default Commission action will award them what they cannot achieve through negotiation.

C. If The Commission Finds That It Cannot Approve Either Of PJM's Proposals, It Should Not Proceed Under Section 206.

A few stakeholders urge that, if the Commission rejects both Capacity Repricing and MOPR-Ex, it should proceed under Section 206 and craft new rules itself.[130] Exelon respectfully suggests that this would be a mistake. It would require the Commission to carry the dual burdens of showing that "existing rates are 'entirely outside the zone of reasonableness,'" and that the solution crafted by the Commission is just and reasonable.[131] In turn, that would require the Commission to show, based on substantial evidence, that it is necessary for just and reasonable rates to raise prices at a time of vast oversupply, and to apply PJM's MOPR for the first time to existing resources receiving payments for their clean-energy benefits under state environmental programs. The Commission would also have to craft new rules that avoid all of the fatal flaws that parties have correctly identified in PJM's proposals, and amass a majority of Commissioners to support them. The Commission should not embark on this venture. No imminent—or even foreseeable—threat to reliability or investment has been shown, and the Commission should instead simply reject PJM's filing.

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

A. QUALIFICATIONS

1. My name is Michael M. Schnitzer. I am a director of The NorthBridge Group, Inc ("NorthBridge"). NorthBridge is a consulting firm that provides economic and strategic advice to the electric and natural gas industries. My business address is 30 Monument Square, Concord MA 01742.

2. In 1992, I co-founded NorthBridge. Before that, I was a Managing Director of Putnam, Hayes & Bartlett, which I joined in 1979. I have experience working with private sector clients in the electric utility, natural gas, and private power industries, as well as with public and nonprofit agencies. My electric industry work has focused on regulatory policy, finance, and market structure issues. I received an A.B. in chemistry, with honors, from Harvard University, and an M.S. in management from the Sloan School, Massachusetts Institute of Technology.

3. I have testified before the Commission on many matters and have participated in Commission technical conferences and workshops on capacity market and energy market design issues. I have also testified before the public utility commissions of Arkansas, California, Delaware, Illinois, Indiana, Louisiana, Maine, Maryland, Massachusetts, Mississippi, New Hampshire, New Mexico, New Orleans, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, and Wisconsin.

B. BACKGROUND AND PURPOSE OF TESTIMONY

4. On April 9, 2018, PJM Interconnection, LLC ("PJM") filed at the Federal Energy Regulatory Commission ("FERC" or "Commission") two proposals to modify its capacity market design.[1] In its filing, PJM requested that the Commission approve its preferred capacity market repricing proposal (referred to as "Capacity Repricing" or "Option A"), or if the Commission cannot approve PJM's preferred proposal, that it approve in the alternative PJM's MOPR-Ex proposal (referred to as "Option B").

[1] PJM Interconnection, L.L.C., Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, FERC Docket No. ER18-1314-000, April; 9, 2018 ("PJM Filing").

5. Both proposals seek to prevent capacity prices from declining, all other things equal, due to the alleged impact of state actions to support various types of generation not already covered by PJM's existing Minimum Offer Price Rule ("MOPR"), with particular focus on the increase in state sponsored zero-emission capacity resources. Under the Capacity Repricing proposal, state sponsored resources are allowed to clear in PJM's capacity auctions, while under the MOPR-Ex proposal (Option B), some state sponsored resources are allowed to clear in capacity auctions while others are not.[2]

6. Reply comments were filed by a wide range of industry stakeholders, including Exelon Corporation with an attached declaration by Robert E. Willig, on May 7th, 2018.[3]

7. I have been asked by Exelon Corporation to respond to certain issues raised by two commenters, The Electric Power Supply Association[4] and the Office of the People's Counsel for the District of Columbia, Maryland Office of People's Counsel, and New Jersey Division of the Rate Counsel[5] (collectively, "Commenters"), and their respective expert witnesses, David W. DeRamus and Collin Cain,[6] and James F. Wilson[7] (collectively, "Commenters' Witnesses"). Commenters, relying on the analysis of their respective expert witnesses, describe several issues with both of PJM's proposals, and several issues which particularly affect PJM's Capacity Repricing proposal. These issues include increased consumer costs, the fact that PJM's proposals do not produce results which fall on the capacity demand curve, and strategic bidding incentives created by Capacity Repricing. Commenters argue that these issues collectively are cause for the Commission to choose the MOPR-Ex proposal over the Capacity Repricing proposal.

8. The purpose of my testimony is to evaluate the issues raised by commenters' witnesses and place these issues in the broader context of the capacity market design choice before the Commission in these proceeding, namely whether the Commission should decline to adopt either Capacity Repricing or MOPR-Ex and preserve the status quo or, in the alternative, to choose one of the two alternatives.

C. SUMMARY OF CONCLUSIONS

9. My conclusions are as follows:

10. Commenters' witnesses raise several valid issues with respect to the two mitigation alternatives presented by PJM, Capacity Repricing and MOPR-Ex. Specifically, they show that neither alternative produces a solution that falls on the capacity demand curve and that both raise costs for consumers relative to the status quo. The issues they raise highlight the need for the Commission to confront two central economic questions. First, do the out-of-market payments at issue in this proceeding internalize externalities and contribute to retention and entry of the least-cost set of resources once social costs as well as production costs are accounted for, or are they subsidies that support uneconomic retention and entry? And second, even if the state actions driving these payments do represent inefficient subsidies, would MOPR-Ex deter this conduct or not?

11. Because the out of market payments at issue, in the main, do internalize externalities and promote economic retention and entry, the issues raised by Commenters' witnesses highlight the inefficiency of adopting either of the mitigation options proposed, and the Commission should instead choose the status quo approach. The status quo approach results in the most efficient price and resource selection, does not unnecessarily raise costs for consumers, and does not increase incentives to engage in strategic bidding. For the Zero Emission Credit ("ZEC") programs in particular, commenters provide no evidence that these payments are not an efficient mechanism for internalizing carbon emission externalities. Nor do they – or could they, given the current PJM energy market design – suggest a feasible alternative mechanism for internalizing these externalities. Under these circumstances, the Capacity Repricing alternative would be a distant "second choice" to the status quo from an efficiency standpoint, but, somewhat ironically, the strategic bidding issues identified by commenters' witnesses make Capacity Repricing less

inefficient in this case because their net effect is to push the market clearing price down closer to the price under the most efficient status quo approach.

12. If the Commission is not persuaded that the status quo is adequate, then as between the two alternatives before it, the Capacity Repricing proposal is a much better choice than MOPR-Ex. The advocates of MOPR-Ex implicitly assume that states will abandon their support of environmentally-friendly resources in response. The witnesses do not provide any theoretical or empirical support for this assumption. Yet if states do continue to make out-of-market payments to support environmentally-friendly resources, notwithstanding MOPR-Ex, then MOPR-Ex will result in the over-procurement of capacity, saddling customers with significant unnecessary costs.

13. If, on the other hand, mitigation does deter some states from enacting legitimate environmental programs, then MOPR-Ex will select the wrong set of resources to provide capacity. Resources that are more efficient once externalities are taken into account will be led to retire or will not enter. That outcome likewise leads to an inefficient mix of resources that makes society worse off than the status quo. Notably, MOPR-Ex includes a number of proposed exemptions, but these exemptions are not based on whether the out-of-market state payments promote or impair the efficient selection of resources. The ZEC program provides an illustrative example: the ZEC payments that MOPR-Ex targets are demonstrably the most economic form of carbon abatement available to the states and are the only form of support that the states can effectively utilize given PJM's energy market design. It would be unjust and unreasonable for the Commission to eliminate the only effective unilateral option that states have to support the economic retention of zero carbon resources.

14. Capacity Repricing, by contrast, avoids both of these problems. Capacity Repricing avoids over-procurement by allowing state-supported resources to clear. And Capacity Repricing selects a more efficient set of resources, by allowing the resource mix to be influenced by state programs accounting for environmental externalities.

15. Commenters argue that MOPR-Ex is preferable to Capacity Repricing, focusing on several points they allege make Capacity Repricing unworkable. First, they contend that Capacity Repricing leads to a price-quantity pair that is not on the demand curve. But the same is true of MOPR-Ex. Indeed, because MOPR-Ex results in significant over-procurement, the effective price-quantity pair that results is even farther away from the demand curve than Capacity

Repricing. Second, commenters identify potential strategic bidding issues associated with Capacity Repricing. These issues are real but are not disqualifying. The effects of such strategic bidding are likely to be modest and would reduce the cost of repricing to customers—even as Capacity Repricing significantly increases capacity prices relative to the status quo. To the extent these effects are nevertheless of concern to the Commission, the incentive to bid strategically can be largely remedied by a lost opportunity cost payment directed towards the small slice of resources that set the second stage price of Capacity Repricing without being cleared in the initial stage. Thus, strategic bidding concerns are not a valid basis to reject the PJM Capacity Repricing proposal.

16. In sum, the best course is for the Commission to maintain the status quo. If the Commission does believe some action is required, the Capacity Repricing alternative is workable and certainly preferable to MOPR-Ex.

II. COMMENTERS' WITNESSES RAISE VALID ISSUES WITH BOTH MOPR-EX AND CAPACITY REPRICING, WHICH REINFORCES THE CONCLUSION THAT CONTINUATION OF THE STATUS QUO IS THE PREFERRED APPROACH

17. Both Wilson and DeRamus & Cain correctly point out several issues with both MOPR-Ex and Capacity Repricing. These issues highlight the inefficiency of either proposal relative to the status quo.

A. BOTH CAPACITY REPRICING AND MOPR-EX RAISE COSTS

18. First, at the simplest level, commenters' witnesses show that both solutions proposed by PJM will raise capacity market prices and costs for consumers. Wilson provides an example, calibrated to the current PJM capacity demand curve and recent real-world supply curves, that shows that, relative to the status quo, Capacity Repricing with an assumed 9,000 MW of resources targeted for re-pricing (that is, with "actionable subsidies" per the terminology used by PJM) causes both the market clearing price and the capacity payments by consumers to rise by about 50%.[8] DeRamus & Cain provide a more stylized example that is directionally similar.[9]

[8] Wilson Affidavit at ¶ 48-49.

[9] DeRamus/Cain Affidavit at ¶ 29-30.

19. Specifically, Wilson's example begins with a status quo where 161,474 MW of UCAP is procured at a price of $102.8/MW-day, resulting in total customer costs of $6.1 billion. Under Capacity Repricing, the price rises to $154.53/MW-day while the quantity procured remains the same as under the status quo, increasing customer costs to $9.1 billion.

20. Wilson's example does not directly address MOPR-Ex, but if MOPR-Ex is analyzed using the same assumptions, it produces a very similar result. Under MOPR-Ex, the capacity clearing price would also rise to $154.53/MW-day but the quantity procured through the capacity market would fall to 159,800 MW. This results in capacity payments of $9.0 billion, a similar increase, 48%, as Capacity Repricing relative to the status quo. Unlike Capacity Repricing, MOPR-Ex does not clear or compensate the 9,000 MW of resources with actionable subsidies. If we assume that states continue to compensate these resources at the original status quo price to induce them to remain in the market, consumers in those states pay an additional $340 million for the capacity these resources provide outside the RPM mechanism. This additional cost raises the total cost of MOPR-Ex in Wilson's example to $9.4 billion, a 56% increase from the status quo.

B. Neither Capacity Repricing nor MOPR-Ex produce a price and quantity result which falls on demand curve

21. Commenters' witnesses correctly criticize Capacity Repricing for producing an ultimate price and cleared quantity outcome that is not located on the RPM demand curve.[10] Returning to Wilson's example, the clearing price of $154.53/MW-day corresponds to a cleared quantity of 159,800 MW on the RPM demand curve. But because Capacity Repricing clears resources using a lower supply curve in its first stage, the cleared quantity is 161,474 MW. The resulting price and quantity combination is off the demand curve. Because of this, Capacity Repricing is not consistent with the underlying reliability versus cost tradeoff embedded in the demand curve and it is costlier for customers because the elevated stage two price is paid to the resources cleared in stage one.

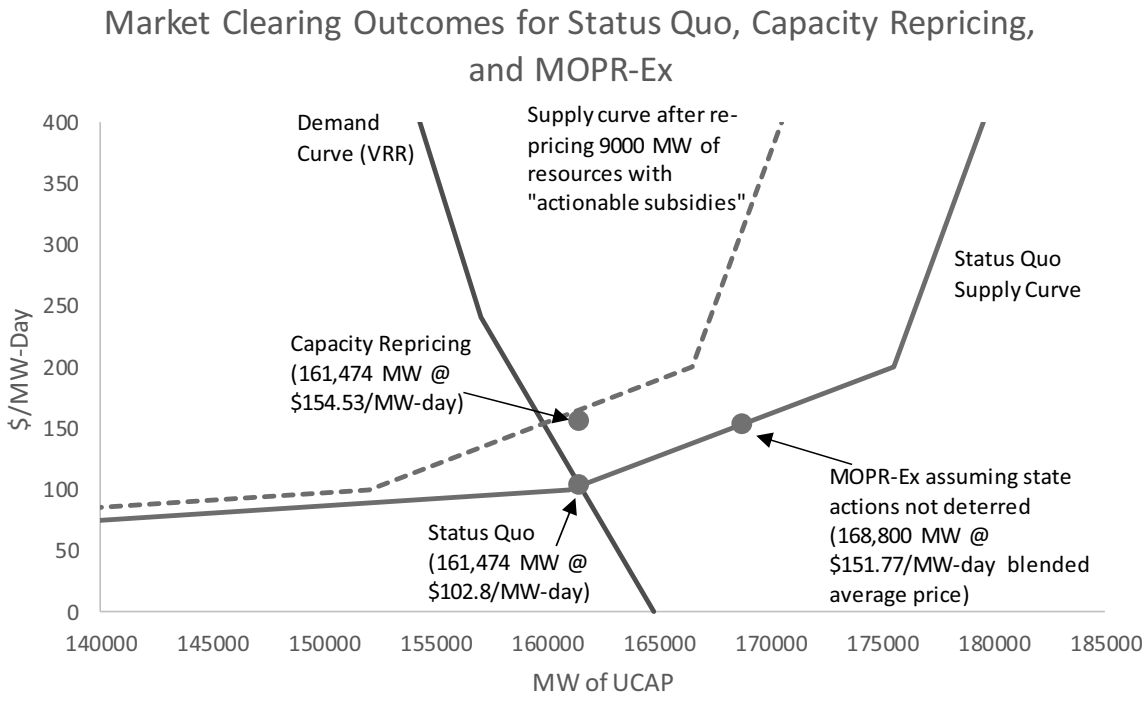
22. DeRamus & Cain claim that PJM's MOPR-Ex proposal, in contrast to Capacity Repricing, does produce a result that falls on the RPM demand curve.[11] That claim is only correct

[10] DeRamus/Cain Affidavit at ¶ 37 and Wilson Affidavit at ¶ 48-51.

[11] DeRamus/Cain Affidavit at ¶ 72.

if one assumes that states will be deterred from supporting environmentally friendly resources—and there is no evidence to support that assumption. It is true that the price and quantity capacity pair procured solely through the RPM under MOPR-Ex does fall on the demand curve. However, if MOPR-Ex does not deter states from continuing to provide compensation sufficient to retain these resources, then these resources would still effectively be committing their capacity to the market, and the total amount "procured" would not be on the demand curve. Further, it is likely that state compensation provided to these resources would need to be raised to offset the loss of capacity revenues, effectively forcing consumers in these states to pay more to retain environmental resources while simultaneously procuring more capacity than needed via RPM. Returning to Wilson's example, if all 9,000 MW of resources with actionable subsidies remain in the market and are paid the original status quo clearing price of $102.8/MW-day via increased state out-of-market payments (the actual amount of increased payments is uncertain, but an increase equal to the status quo price offsets the loss of capacity revenues under MOPR-Ex, making it a reasonable illustrative value for this example), the total capacity procured is 168,800 MW (159,800 MW directly through the market and 9,000 MW via state action) and the blended average price paid is $151.77/MW-day. This price and quantity pair also does not fall on the demand curve. The only instance where MOPR-Ex would result in a price and quantity pair that falls on the demand curve is an instance where all 9,000 MW of targeted resources were deterred from either entering or remaining in the market. Figure 1 below shows where the various options (status quo, MOPR-Ex, and Capacity Repricing) fall relative to the demand curve.

Figure 1



23. Of the three alternatives, the only approach that will always fall on the demand curve is the status quo.

C. THE STATUS QUO IS THE MOST EFFICIENT APPROACH

24. Most types of state out-of-market payments under consideration in this proceeding are intended to explicitly or implicitly account for positive environmental attributes that are not priced by RTO markets. These state actions contribute to economic retention and entry and increase overall market efficiency.

25. The subsidies that appear to primarily concern some commenters are ZECs and similar subsidies that are paid to the Quad Cities nuclear plant in Illinois and may be paid to certain nuclear plants under recently-passed legislation in New Jersey. As is discussed at length in the declaration of Robert E. Willig filed in this proceeding,[12] these subsidies, and similar subsidies for other types of zero-emission generation, are designed to correct, for the resources in question, the fact that carbon pollution externalities are not priced in PJM's markets, and thus the zero-emission attribute

[12] Willig Declaration ¶ 25-54.

of these resources is not appropriately compensated. By appropriately accounting for the positive externality they produce by displacing the pollution caused by carbon-emitting resources, ZECs and similar subsidies make the market more efficient, rather than less.

26. Thus, consideration of ZEC (or similar) revenue is appropriately part of the formation of a competitive capacity bid for these resources. That is, when developing competitive capacity bids, it is appropriate that these resources consider ZEC revenue as a deduction from production costs, similar to energy or ancillary services, which serves to reduce their capacity bid relative to where it would have been absent the ZEC. The resulting capacity bid is not artificially suppressed by the subsidy, but rather is the proper price for the resource considering the state-provided compensation for its environmental attributes.[13] ZECs in particular are designed to promote economic entry and retention because the environmental attribute payment is based on, and cannot exceed, the social cost of avoided carbon emissions, and the resource will only clear the capacity market and be economically retained if its total cost of retention, including the benefit of the positive externality it produces, is lower than the cost of alternatives.[14]

27. The status quo allows those resources to appropriately reflect the impact of the subsidies in their capacity market bids and does not re-price or adjust those bids to a higher level that purports to eliminate the impact of the subsidies, as is contemplated by Capacity Repricing and MOPR-Ex.[15] The status quo selects the most efficient mix of resources at the most efficient price. Compared to either Capacity Repricing or MOPR-Ex, the status quo does not result in unnecessarily high customer costs, it produces a result that falls on the demand curve, and it does not create any incremental strategic bidding incentives.

28. For the ZEC programs in particular, commenters provide no evidence that the state payments are not an efficient mechanism for carbon reduction. Nor do they suggest a feasible alternative under the current PJM energy market design. Several commenters (notably the PJM IMM)[16] suggest a market-wide carbon price as an efficient alternative. That alternative is not

[13] Willig Declaration at ¶ 39-44.

[14] Willig Declaration at ¶ 51-54.

[15] Willig Declaration at ¶ 13(i).

[16] Comments of the Independent Market Monitor for PJM, Docket Nos. ER18-1314-000 and ER18-1314-001 (filed May 7th, 2018), at 10-11.

available to individual states, and it is disingenuous to suggest it is a viable near-term option. If an individual state attempted to impose a carbon tax on generation within its borders, as Dr. Willig demonstrates under the present market design, a carbon price high enough to value carbon at the social cost set by the states and drive the desired emission outcome would suffer considerably from leakage issues that would render it unworkable.[17] Thus, under the present market design, ZEC programs remain the only feasible approach to efficiently accomplishing state environmental goals. The status quo approach correctly recognizes the positive externalities targeted by these programs in both the prices and resource selection that result in the capacity market.

III. IF MODIFICATION TO THE CURRENT MOPR IS PURSUED, CAPACITY REPRICING IS A BETTER CHOICE THAN MOPR-EX

29. If the Commission is not persuaded that the status quo is adequate, two central economic questions can help guide the choice between the primary proposal presented by PJM, Capacity Repricing, and its alternative, MOPR-Ex. The first question is whether the out-of-market payments at issue in this proceeding internalize externalities and contribute to the retention and entry of the least-cost set of resources, once social costs as well as production costs are accounted for. As discussed previously, most state actions under consideration in this proceeding do contribute to economic retention and entry. The second question is whether states will be deterred by a mitigation mechanism, like MOPR-Ex, that would prevent state-supported resources from clearing. Absent any reason to think that states uniformly would be deterred, MOPR-Ex risks substantial over-procurement of capacity, and thus significant unnecessary costs imposed on customers. On the other hand, if MOPR-Ex does actually deter certain state actions related to legitimate environmental programs, then it would prevent economic resources from clearing the capacity market, which will result in a less efficient mix of capacity resources.

30. Capacity Repricing avoids both problems that plague MOPR-Ex. Capacity Repricing does not depend upon how states react, and by allowing state-supported resources to clear, avoids any over-procurement. And by allowing state-supported resources to clear, Capacity Repricing also allows legitimate state environmental programs to influence the resource mix, which promotes efficiency once environmental externalities are taken into account.

[17] Willig Affidavit at ¶ 35.

A. MOPR-EX RESULTS IN OVER-PROCUREMENT IF STATES ARE NOT DETERRED

31. If states are not deterred in pursuing programs seeking to preserve certain types of generation, MOPR-Ex results in over-procurement. MOPR-Ex operates by adjusting the bids of targeted resources to a higher level that seeks to "undo" the effect of payments resulting from state actions. MOPR-Ex then clears the market in a single step incorporating these higher, modified bids. As a result, the resources targeted by MOPR-Ex will not likely clear the capacity market and will instead be replaced by other resources that would not have cleared had the targeted resources bids not been adjusted upwards. However, the targeted resources will nonetheless remain in the market if state action is not deterred. And the additional resources procured in their place under MOPR-Ex will also remain in the market.

32. As discussed in the example summarized in Figure 1, this over-procurement effect will effectively cause the market to retain a much larger portfolio of capacity resources than is needed and would be procured under either the status quo or Capacity Repricing. As Figure 1 shows, with 9,000 MW of resources targeted by Capacity Repricing, MOPR-Ex results in the effective procurement of 7,326 MW (68,800 MW vs. 61,474 MW) more resources than either the status quo or Capacity Repricing.

B. IF STATES ARE DETERRED, MOPR-EX CHOOSES THE WRONG RESOURCES

33. To the extent that MOPR-Ex does deter states from making out-of-market payments even when those payments internalize externalities, MOPR-Ex will select the wrong set of resources to provide capacity and will result in the inefficient exit of economic resources. Under this scenario, states either cease state actions when the resources in question are targeted by MOPR-Ex, or never engage in state programs they would otherwise have engaged in due to the threat of MOPR-Ex.

34. As discussed previously, in the case of state actions which compensate resources for positive externalities, the most efficient treatment is to allow those resources to reflect those payments in their capacity bids, which will generally lead to a reduction in their bid price. If the resource clears the capacity market when bidding in this fashion, its retention is economic and least cost and appropriately takes into account the value of the positive externality that it produces.

Thus, retention or entry of the resource is socially-efficient and the state action adds to the social surplus enjoyed by all market participants.

35. MOPR-Ex explicitly targets resources receiving such payments and makes it much less likely that they will clear the market and receive a capacity obligation. To the extent that these resources leave the market due to this treatment, either because the state action is discontinued, never occurs, or is not sufficient to cover the lost capacity revenue, the market as a whole is deprived of the social surplus added by the presence of these resources in the market. In place of these resources, higher cost resources (after taking account of externalities) will be cleared in their place and will displace them in the capacity portfolio. This outcome results in an inefficient mix of resources that makes society worse off than the status quo.

36. Notably, MOPR-Ex includes a number of proposed exemptions, but these exemptions do not reflect whether the out-of-market state payments promote or impair the efficient selection of resources. This is discussed at length in the Willig Declaration, and the ZEC program provides an illustrative example: the ZEC payments that MOPR-Ex targets are demonstrably the most economic form of carbon abatement available to the states and are the only form of support that the states can effectively utilize given PJM's energy market design. It would be unjust and unreasonable for the Commission to eliminate the only unilateral option that states have to support the economic retention of zero carbon resources.

37. MOPR-Ex thus implicitly assumes that all state programs other than the enumerated exceptions are inefficient. It also implicitly assumes that MOPR-Ex mitigation will deter states from pursuing these programs. Both of these implicit assumptions are incorrect. With respect to the first assumption, the state ZEC programs at which MOPR-Ex is aimed are a prime example of efficient state programs that promote economic entry and retention. MOPR-Ex proponents offer no evidence to support their conclusion that these programs are inefficient. And their arguments that states have better alternatives ring hollow in the face of PJM energy market design. With respect to the second assumption, there is no evidence that MOPR mitigation will deter state environmental action. One has only to consider the progression of state renewable energy programs and targets to reach this conclusion, including in states/regions where MOPR provisions currently apply or might be implemented. A recent example of this is the New England states, where ISO-New England put in place a modest exemption (200 MW per year) to its MOPR for

capacity entering to support state renewable portfolio standards, and several states issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, while Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[18] Another example is those states in PJM that are contemplating programs such as offshore wind that are not exempted under the MOPR-Ex proposal.

38. Thus, MOPR-Ex presents considerable risk on two fronts. If there is a significant likelihood that states will not be deterred in pursuing programs to support generation (and there is), it risks over procurement and additional costs to consumers. And if there is a significant likelihood that the state programs MOPR-Ex would mitigate enhance efficiency (and there is), there is risk that cost-effective, efficiency-enhancing resources will be excluded from the market.

C. CAPACITY REPRICING AVOIDS OVER-PROCUREMENT AND CHOOSES THE MOST EFFICIENT PORTFOLIO OF RESOURCES

39. Capacity Repricing, by contrast, avoids these risks. The most basic difference between Capacity Repricing (or the status quo) and MOPR-Ex is that resources receiving out-of-market payments are cleared based on their un-modified bids and are thus likely to receive a capacity obligation (and payment) under Capacity Repricing (or the status quo) whereas they are unlikely to be cleared and be paid for capacity under MOPR-Ex. In the event that states are not deterred by either option in continuing to pursue state actions to support generation, Capacity Repricing avoids the over-procurement problem suffered under MOPR-Ex because it recognizes the reality that these resources will remain in the market and provides them with a capacity obligation to the extent their un-modified bid is economic. Capacity Repricing thus avoids the inefficient excess procurement of capacity and results in a more efficient and cost-effective outcome for consumers, regardless of one's view on whether externality payments under state programs improve efficiency.

40. Capacity Repricing also chooses the most efficient portfolio of resources because resources are cleared based on their original, un-modified bid. As discussed previously, when these un-modified bids appropriately reflect the value of payments intended to internalize

[18] *See* ISO-NE Transmittal at 3-4, Docket No. ER18-619-000 (January 8, 2018).

externalities, these bids reflect the true total social cost of these resources. Because Capacity Repricing selects resources based on these costs, rather than modified bids that omit the social cost or value of externalities, it selects the most efficient, least-cost portfolio of resources.

IV. ISSUES RAISED BY COMMENTERS' WITNESSES WITH RESPECT TO CAPACITY REPRICING ARE NOT DISQUALIFYING AND DO NOT RENDER IT UNWORKABLE

41. Commenters argue that MOPR-Ex is preferable to Capacity Repricing, focusing on several points they allege make capacity repricing unworkable. First, they contend that Capacity Repricing leads to a price-quantity paid that is not on the demand curve. Second, they identify potential strategic bidding issues associated with Capacity Repricing that they contend are "fatal flaws." Both arguments are incorrect. I address each in turn below.

A. MOPR-EX DOES NOT PRODUCE A RESULT ON DEMAND CURVE EITHER, AND PRODUCING A RESULT NOT FALLING ON THE DEMAND CURVE DOES NOT RENDER CAPACITY REPRICING UNWORKABLE

42. As discussed previously, it is true that Capacity Repricing produces a result that does not fall on the demand curve. Indeed, this is one reason to prefer the status quo to either alternative offered by PJM. However, MOPR-Ex does not produce a result that falls on the demand curve either. As shown on Figure 1, unless states are deterred from pursuing the programs targeted by MOPR-Ex in all cases, MOPR-Ex will result in the procurement of significant excess capacity. The cost of this capacity will be paid for by consumers in the states in question. When this excess procurement is included, the effective price-quantity paid that results is even farther away from the demand curve than Capacity Repricing.

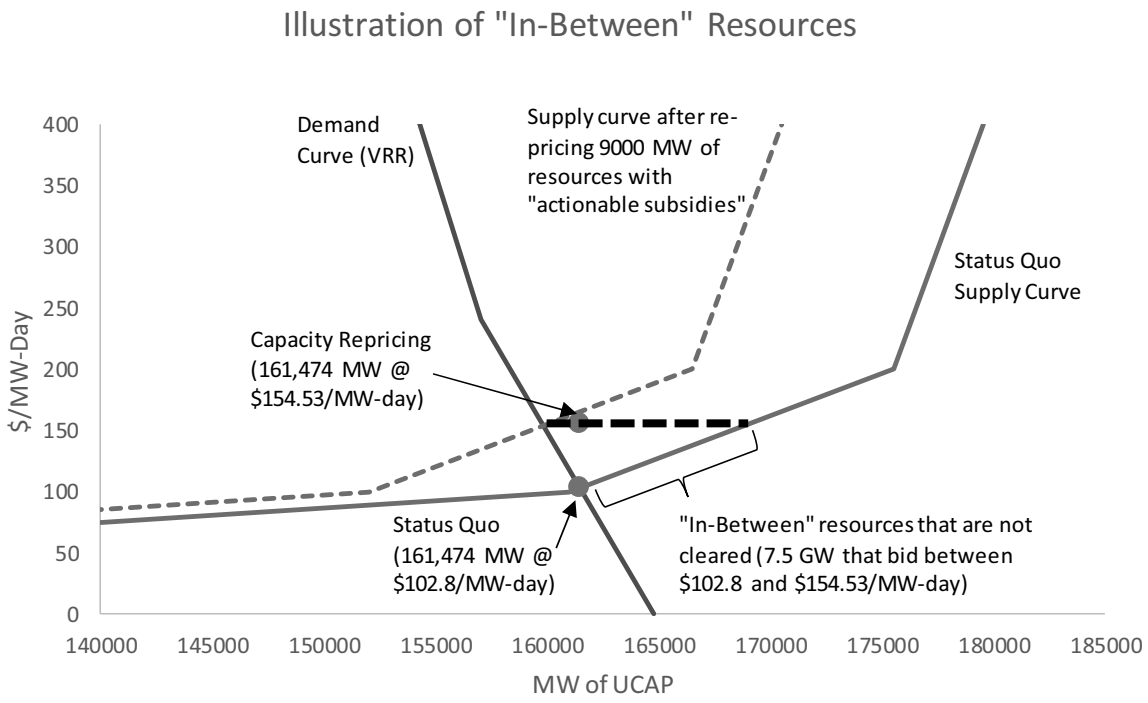
43. Second, even though the price-quantity pair resulting from Capacity Repricing does not fall on the demand curve, that does not render Capacity Repricing unworkable or impossible to execute. That is, the market clearing mechanisms identified by PJM are functional and should clear and produce stable and workable results.

B. STRATEGIC BIDDING BEHAVIORS WILL REDUCE MARKET CLEARING PRICES UNDER CAPACITY REPRICING

44. Commenters' witnesses also identify two issues associated with the two-stage market clearing mechanics of Capacity Repricing. Both issues stem from the fact that Capacity Repricing

does not jointly set the price and quantity of cleared resources. Rather, because resources with "actionable subsidies" are bid as-is in stage one but are re-priced at a higher price in stage two, the stage two price will be set by a class of resources whose bids fall at or below the stage two clearing price but who are not cleared in stage one and do not receive a capacity obligation. These resources are termed the "in-between" resources by Wilson. Figure 2 below shows the mechanics of this in graphical form:

Figure 2



45. The problems that commenters' witnesses identify with bidding under Capacity Repricing stem from the fact that the in-between resources are relied upon to set the stage two price but do not receive a capacity obligation or payment. First, commenters' witnesses claim that the resulting stage two price is arbitrary and not the result of a workably competitive process because it may be set by a resource offer that has nothing at stake in setting its offer price.[19] Second, they claim that the separation of price and quantity creates incentives for market participants to engage in a variety of strategic bidding behaviors that may cause bids to deviate either above or below their true costs, which may inappropriately increase or decrease the stage

[19] Wilson Affidavit at ¶ 75 and DeRamus/Cain Affidavit at ¶ 35-39.

two clearing price and will generally result in increased capacity price volatility. The first of these two problems is actually more of a theoretical complaint about this type of re-pricing mechanism. But the question before the Commission is not one of theory but rather of whether the specific PJM proposal is workable and will produce reasonable results. And the answer to that question turns on the specific complaints related to strategic bidding behaviors and their market implications, which I address below.

46. Commenters' witnesses collectively identify three specific strategic bidding behaviors that result from the two-stage clearing mechanics of Capacity Repricing that they collectively contend makes Capacity Repricing "unworkable." These are a "race to the bottom" or bid suppression effect, identified by both Wilson and DeRamus & Cain,[20] an enhanced incentive to engage in above-cost bidding for certain resources, termed the "clear out the top" behavior,[21] identified by Wilson, and a tendency for resources that repeatedly fall within the "in between" resource zone to cease participation in the market over the longer term, identified by DeRamus & Cain.[22]

47. The "race to the bottom" behavior arises from the fact that to receive a capacity obligation and be paid the higher stage two price, resources must clear at or below the lower stage one price. If they do not clear in stage one, even if they offer at or below the stage two price, they will not receive a capacity obligation and will realize no capacity revenue, becoming an "in-between" resource. As a result, resources generally have an incentive to reduce their bids below their cost of providing capacity to increase the likelihood of clearing in stage one. Because the stage two price will be higher than the stage one price and be set by resources higher up the supply curve that did not clear in stage one, this is a rational strategy for most resources that suspect they may be marginal or near-marginal in stage one. Its overall effect is to reduce capacity offer prices.

48. The "clear out the top" behavior identified by Wilson (but not DeRamus & Cain) describes an increased incentive for certain resources that are part of a larger portfolio to offer at a higher level than otherwise to the extent they believe they are unlikely to clear in stage one but may be marginal or near marginal in stage two. This stems from the fact that the opportunity cost

[20] Wilson Affidavit at ¶ 54-57 and DeRamus/Cain Affidavit at ¶ 40-49.

[21] Wilson Affidavit at ¶ 58.

[22] DeRamus/Cain Affidavit at ¶ 49-53.

of bidding at a higher level and not clearing is largely eliminated for those resources because as likely "in-between" resources they will not clear anyway. Because this opportunity cost is reduced or eliminated, the value to the overall portfolio of engaging in this strategy is incrementally increased, which may cause certain resources to bid higher than otherwise.

49. Finally, DeRamus & Cain suggest that over the longer-term resources that repeatedly fall in the "in-between" resource group, and particularly new entrant resources falling in this zone, will eventually cease participation in the market despite being ostensibly competitive at the stage two price because of the ongoing cost of preparing and standing behind their capacity offers. This effect will tend to steepen the supply curve in the in-between resource zone to the extent that these participants are not replaced with other new entrants at a similar offer level.

50. Of the three strategic bidding effects, one ("race to the bottom") will tend to reduce offer prices and lower the supply curve, while two ("clear out the top" and long-term exit of in-between resources) will tend to increase offer prices and/or raise the supply curve. The overall impact on market clearing prices and amount of cleared capacity under Capacity Repricing is thus ambiguous at first glance and depends on the relative strength and prevalence of the three effects.

51. While commenters' witnesses point out these strategic bidding behaviors, they do not provide any well-supported analysis of their combined net impact. Wilson provides an example, based on an approximation of the 2020/21 RPM RTO supply and demand curves, that purports to show that the "clear out the top" effect will tend to predominate, at least for purposes of determining the market clearing price, and will result in higher than otherwise prices, while the "race to the bottom" effect will drive a slightly higher cleared quantity in stage one.[23] This example, however, is completely driven by an arbitrary and unsupported assumption about which resources will choose a particular bidding strategy and the degree to which a given bidding strategy will cause them to change their offer prices. As I discuss below, a careful examination of each strategy indicates that the assumptions underlying this analysis are not representative of the likely outcome. DeRamus & Cain, on the other hand present an example that suggests that the effect is to decrease the stage two clearing price, while increasing the quantity cleared in stage one.[24]

[23] Wilson Affidavit at ¶ 60-62.

[24] DeRamus/Cain Affidavit at ¶ 45-46.

52. An analysis of the each of the strategic bidding behaviors identified by commenters' witnesses indicates that the impact of the "race to the bottom" behavior is likely to dominate the effect of the other two behaviors, leading to a net incremental reduction in offer prices and a decrease in the stage two clearing price.

53. The principal reason for this is that the "clear out the top" behavior is likely to be quite rare because it would only apply to certain resources that are part of unusually-constituted portfolios. This is because Capacity Repricing does not actually create a new incentive to engage in "clear out the top" bidding, but instead may slightly reduce the opportunity cost of engaging in this bidding strategy where there is already an incentive present. Thus, the incremental increase in the frequency of "clear out the top" bidding due specifically to Capacity Repricing is likely to be minimal. As a result, the "clear out the top" behavior will have little impact on the capacity supply curve.

54. Furthermore, it is important to note that the "clear out the top" bidding behavior, whether in the status quo or incrementally under Capacity Repricing, is bounded by existing market power mitigation rules. Existing generation resources under either the status quo, Capacity Repricing, or MOPR-Ex remain subject to the must-offer requirement, the safe harbor offer cap of Net CONE times the balancing ratio ("B"), and the requirement to justify offers above the safe harbor cap with a unit specific Avoidable Cost Rate showing. Thus, to the extent that any resource engages in the behaviors described previously, and to the extent that its offer is above "cost," it still must remain at or below Net CONE times B, which the PJM IMM and the Commission have stated is representative of the opportunity cost that resources face when choosing whether to take on a Capacity Performance obligation. The "clear out the top" behavior then is limited at most to replacing an offer for which the resource owner judges the private costs of providing capacity to be some lesser value than Net CONE times B with a different offer at some higher level that is nonetheless equal to or less than Net CONE times B. That is, the resource owner is replacing one competitive offer with a different, higher, but still competitive offer. Any argument that the prices resulting from such behaviors are somehow not competitive or otherwise inappropriate is an argument that the existing market power mitigation rules are somehow inadequate, rather than an argument against a particular market design; such an argument seems beyond the scope of this proceeding.

55. In addition, the resources that may have incentives to engage in "clear out the top" behavior will also have incentives to engage in the "race to the bottom" behavior as well. Wilson contends that resources can easily predict where they will fall within the relative range of "in-between" resources and can thus precisely determine what strategy is appropriate for them. In the real world, where bidders have highly imperfect information, this is unlikely to be the case. Resources' ability to predict where they will fall on the supply curve when formulating their offers is highly limited and imprecise.

56. Finally, as both Wilson and numerous other commenters amply document, recent experience with the PJM capacity market indicates that there is a very large pool of potential new entrants, particularly new build natural gas combined cycles, that are willing to enter the market at relatively low prices.[25] The ability of any market participant to influence prices through a particular bidding strategy will be sharply constrained by the competitive discipline provided by these potential new entrants. Any strategic bidding behavior that tends to raise prices, such as the "clear out the top" behavior, will likely be met by a new entrant response which will tend to offset its impact.

57. Like the "clear out at top" behavior, the potential impact of "in-between" resources dropping out of the market over the longer-term, identified by DeRamus & Cain, is likely to be offset by this deep pool of new entrant capacity. Evidence from recent auctions suggests that new entrants tend to bid as price takers, rather than as marginal resources, and will thus be likely to respond to any price increase caused by "in-between" resource exit simply by increasing the amount of new entrant capacity offered.

58. Unlike the other two behaviors, the "race to the bottom" behavior identified by both Wilson and DeRamus & Cain is broadly applicable to all resources and does not depend on a set of particular circumstances such as being part of a specifically-constituted portfolio. Indeed, as discussed above, even when resources potentially face countervailing incentives to engage in other behaviors such as "clear out the top," the "race to the bottom" incentive will still be present and in many cases will tend to dominate the other incentive. For this reason, of the three behaviors

[25] Wilson Affidavit at ¶ 19-22 and Exelon Protest at 32-37.

identified, "race to the bottom" is likely to be far more prevalent and will tend to dominate the other two effects.

59. While it is likely to dominate, the "race to the bottom" behavior is likely to be self-limiting to the extent that it is not likely to drive the stage two price below the stage one price. This is because rational bidders will build into their decision on how to offer their resource the expectation that most other bidders will also be engaging in the "race to the bottom" behavior. If only one bidder is reducing its bid below cost to clear in stage one, its expectation of the stage two price will remain relatively high, and thus an aggressively below-cost bid is very likely to clear stage one and will be rewarded with a relatively high stage two price. If, however, all other bidders are engaging in the same behavior, the risk of not clearing stage one is increased, and the stage two price is likely to be much lower, increasing the risk that if the resource does clear, it may not be paid a price that covers its costs. Thus, under the expectation that all resources are engaging in "race to the bottom," resources are likely to be less aggressive in reducing their bids below cost to clear in stage one.

60. To provide a sense of the likely overall aggregate magnitude of the bidding behaviors, given the likely dominance of the "race to the bottom" behavior over the others, I have modified the example provided by Wilson to show the outcome that results when resources only engage in the "race to the bottom" behavior.[26] Following Wilson's assumptions, I have assumed that 50% of resources with offers more than $80/MW-day and less than $170/MW-day reduce their offers by 20% relative to the status quo. Unlike Wilson, however, I do not assume that any offer modification due to "clear out the top" occurs. I otherwise adopt Wilson's underlying assumptions with regards to supply curve shape and other parameters. This modified example is shown in graphical form in Figure 3 and Figure 4 below:

[26] Wilson Affidavit at ¶ 60-62.

Figure 3

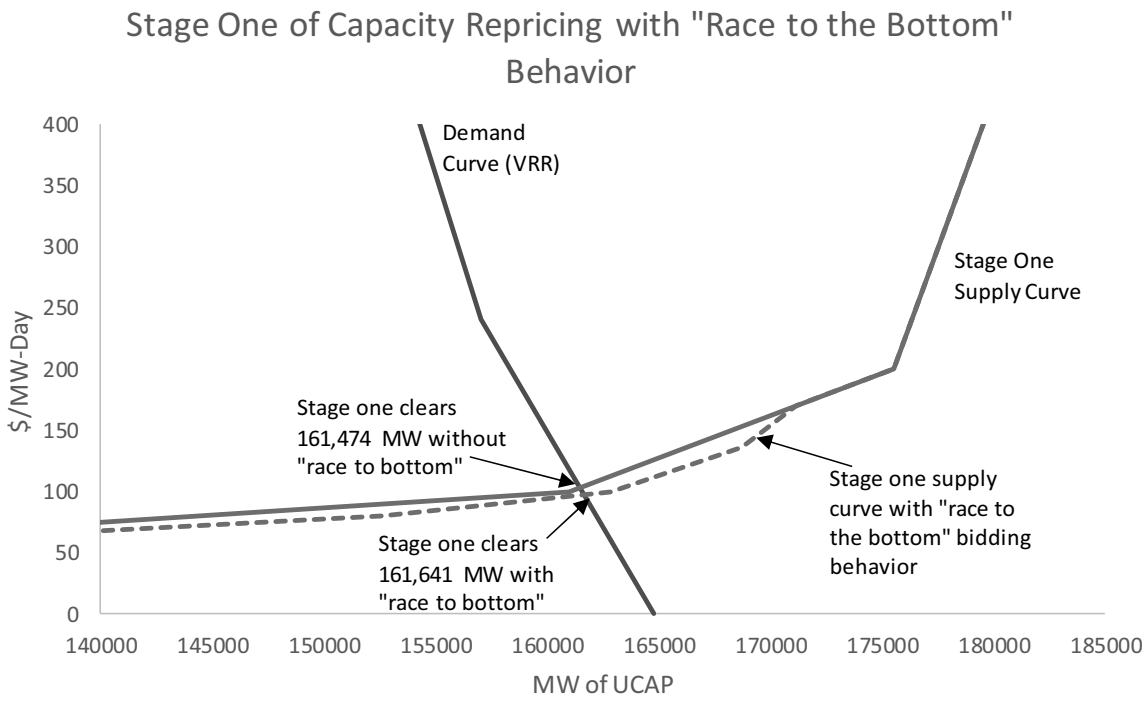


Figure 4

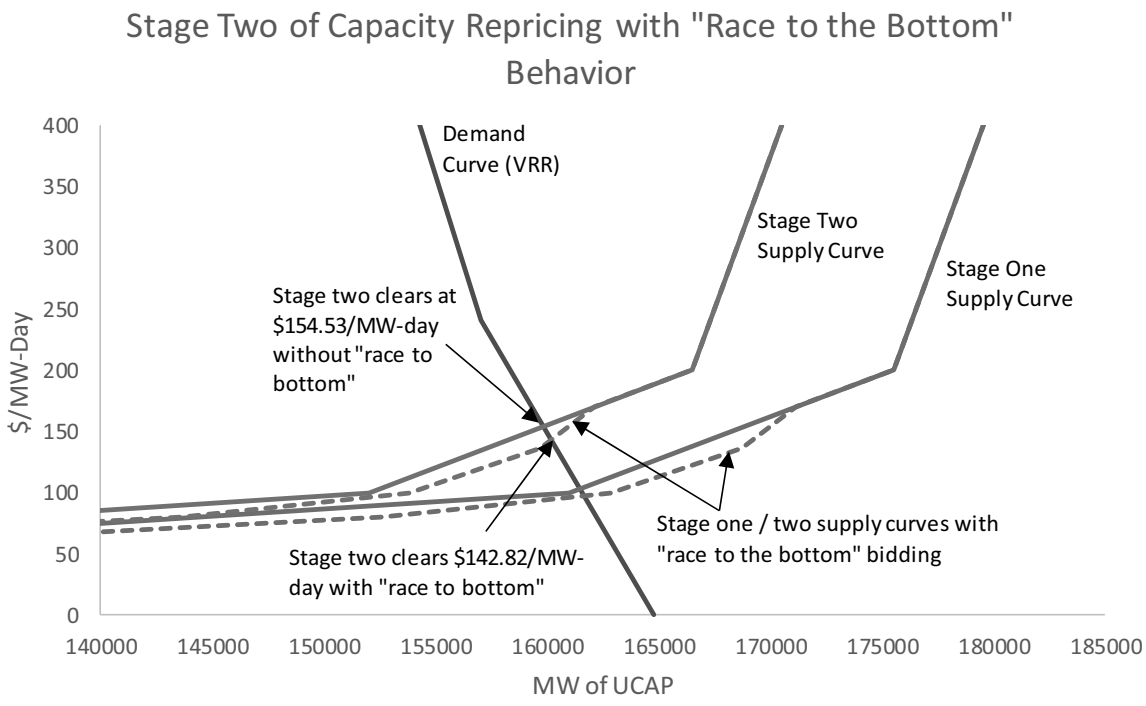


61. Without any strategic bidding behaviors, Capacity Repricing causes the capacity clearing price to increase from $102.8/MW-day in the status quo case to $154.53/MW-day in the Capacity Repricing case, with total unforced capacity cleared of 161,474 MW in both cases. Load payments thus rise from $6.06 billion in the status quo to $9.1 billion under Capacity Repricing, or a 50% increase. If we assume that the "race to the bottom" behavior dominates as per the assumptions discussed above, the total UCAP procured under Capacity Repricing rises slightly, by 167 MW to 161,641 MW, but the clearing price is $142.82/MW-day, or about 7.5% lower than it would have been without strategic bidding behaviors. Customer load payments with strategic bidding behaviors are $8.425 billion, or about a 39% increase relative to the status quo, rather than 50%. As discussed earlier, MOPR-Ex results in a customer cost increase of about 50% versus the status quo, so the effect of strategic bidding on Capacity Repricing in this example results in customer costs that are still considerably elevated relative to the status quo, but below MOPR-Ex.

62. The overall effect, then, of strategic bidding would be to drive the stage two clearing price under Capacity Repricing closer to the status quo price that would prevail absent Capacity Repricing. Generally, the resulting price should fall somewhere between the price absent strategic bidding (which is also the price that would result from MOPR-Ex) but above the status quo price that would result from no mitigation. Exactly where on this continuum the price would fall in this range is difficult to predict with precision, but the predominance of the "race to the bottom" behavior should ensure that it falls below the MOPR-Ex price while bidder rational expectations should ensure that it falls above the status quo price.

63. Strategic bidding would result in a total quantity procured slightly in excess of what it would be in the most efficient status quo case. Given the steepness of the demand, the incremental capacity procured because of this is minimal. In the example above, strategic bidding causes 167 MW of additional capacity to clear, or a 0.1% increase versus the status quo.

64. To the extent that the resources subject to mitigation are receiving payments addressing environmental externalities, the status quo price is more efficient than the Capacity Repricing price without these strategic bidding behaviors (which is also the same as the MOPR-Ex price). Thus, ironically, the effect of strategic bidding behaviors in the aggregate is to make Capacity Repricing less inefficient, not more inefficient, because collectively they drive a lower market clearing price that is closer to the efficient status quo price. As a result, the strategic bidding

behaviors incrementally increase the efficiency of Capacity Repricing and lower its cost to consumers. But whatever one's view of the state programs at issue, these behaviors are likely to have only modest effects that will yield a price somewhere between the status quo price and the MOPR-Ex price.

C. STRATEGIC BIDDING BEHAVIORS CAN BE REMEDIED WITH A LOST OPPORTUNITY COST PAYMENT TO "IN-BETWEEN" RESOURCES

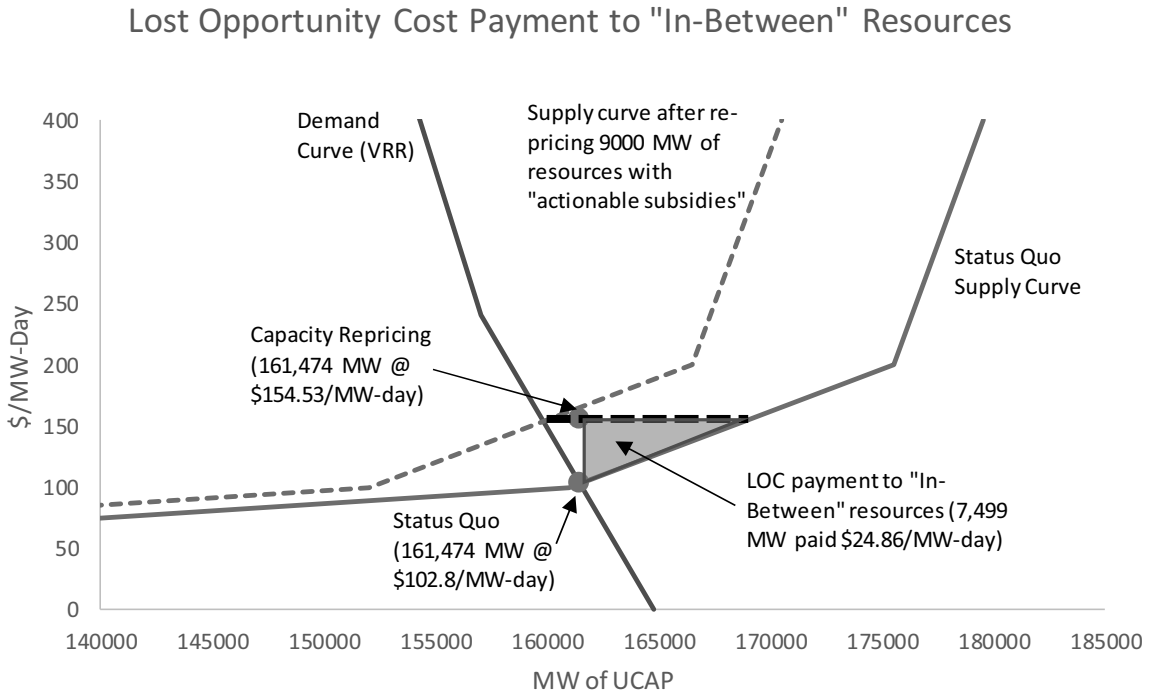
65. If the Commission does decide to proceed with Capacity Repricing but also determines that the strategic bidding behaviors identified by commenters' witnesses are undesirable, the behaviors could be largely eliminated by implementing a simple market design fix analogous to other market design fixes that the Commission has approved to address similar strategic bidding issues in RTO energy, ancillary service, and capacity markets. That is, rather than representing an insoluble "fatal flaw," these strategic bidding behaviors can easily be addressed within the broader market design. The market design fix in this case would be to implement a lost opportunity cost ("LOC") payment for "in-between" resources.

66. As discussed above, the root cause of all the potential strategic bidding behaviors identified by commenters' witnesses is the fact that "in-between" resources do not clear and thus do not bear any direct financial consequences for their bid. A LOC payment adds financial consequences for "in-between" resources in a manner that simulates the consequences that would occur if they did clear in stage two of Capacity Repricing, and in so doing largely eliminates the incremental incentives to engage in strategic bidding behaviors.

67. A LOC payment would be implemented by paying resources that do not clear in stage one the difference between the stage two clearing price and their individual bid price, if greater than zero. Despite receiving this payment, they would still not clear in stage one and would not receive a capacity obligation. The LOC payment would thus not carry an obligation that the resource receiving it remain in the market (for an existing resource) or subsequently enter the market (for a new resource); an existing resource could subsequently retire following the auction and still receive the payment. The LOC payment replicates the margin that the "in-between" resources would have earned by providing capacity if they were cleared and received a capacity obligation. That is, the stage two price represents the capacity revenue they would have received, while their offer price represents their private cost of providing capacity. The LOC payment pays

them as if they had cleared the market but recognizes that because they do not receive a capacity obligation they are able to avoid the cost of providing capacity, and thus deducts their offer price from the capacity clearing price. Figure 5 below shows how a LOC payment for "in-between" resources would work in graphic form:

Figure 5



68. The LOC payment restores financial consequences to the bidding decisions made by in-between resources. Because lack of financial consequences for their bidding decision is the root cause of the strategic bidding behaviors incentivized by Capacity Repricing, a LOC payment reduces the incentive to engage in these behaviors.

69. First, the incentive to engage in "race to the bottom" below-cost bidding is reduced because the LOC payment makes resources indifferent between clearing or not clearing in stage one. Working off the "race to the bottom" example provided by Wilson,[27] assume that a resource with costs of $115/MW-day is determining its offer price under the knowledge that an offer of $100/MW-day or less is needed to clear stage one, but the stage two price is likely to clear at around $150/MW-day. Without a LOC payment, this resource has an incentive to reduce its offer

[27] Wilson Affidavit at ¶ 55.

below its costs, to $100/MW-day or less, to avoid becoming an "in-between" resource. If it bids below costs and clears stage one, it earns a margin on its capacity sale of $35/MW-day, the difference between the stage two price of $150/MW-day and its costs of $115/MW-day. But if it bids its costs, it will not clear and will receive nothing. With a LOC payment, however, if it bids its costs of $115/MW-day, it receives a payment of $35/MW-day – the difference between the stage two price and its offer price. Thus, the resource owner's incentive to reduce its offer price to a level needed to clear stage one is eliminated – the resource's margin is equalized between the two outcomes.

70. It is true that a LOC payment likely does not fully eliminate the incentive to bid below cost in all situations. Resources that expect to fall within the "in-between" zone would have a modest incentive to reduce their offer prices slightly below cost in order to maximize the size of the LOC payment while still remaining a "in-between" resource. This incentive is much weaker, however, because it only produces gains if the resource still does not clear stage one despite reducing its offer below cost, and higher cost resources that engage in this strategy would run the risk of clearing in stage one and taking on a capacity obligation at a loss.

71. Second, the "clear out the top" behavior would be eliminated, to the extent it exists, because the LOC payment restores the opportunity cost of bidding a high cost "in-between" resource at above its costs. As discussed previously, this behavior arises because such resources are unlikely to clear in stage one and thus do not forgo any capacity margin by bidding above cost. With a LOC payment, however, bidding in this fashion would cause the resource to either forgo the payment (because it bids above the stage two price) or reduce its magnitude. Thus, the payoff to a "clear out the top" strategy of bidding such a resource above its costs is re-set back to the same level that exists under the status quo.

72. Finally, resources that consistently fall in the "in-between" region, particularly new entrant offers, will not face an incentive to stop bidding over time due to failure to cover their offer costs. LOC payments should provide sufficient compensation for such resources to continue preparing offers and participating in the market.

73. The cost of LOC payments is likely to be quite small relative to overall capacity cost. Returning to the example originally provided by Wilson, with an assumed 9,000 MW of re-priced resources, Capacity Repricing results in a clearing quantity of 161,474 MW and a clearing price

of $154.53/MW-day for stage two and $102.8/MW-day for stage one. Under these assumptions, and with the capacity supply curve assumed by Wilson, there are 7,499 MW of resources that do not clear stage one but bid below $154.53/MW-day (*i.e.*, "in-between" resources). These resources have an average bid price of $128.66/MW-day. A LOC payment system would pay this 7.5 GW of resources an average payment of $24.86/MW-day (the stage two price less their average bid). The total cost of these payments would be about $68 million, or about 0.75% of the total capacity payments under the example.

74. While LOC payments have not to date been utilized in capacity markets, they are widely used (and FERC-approved) in RTO energy and ancillary services markets to align bidder incentives and increase market efficiency. Examples include LOC payments to generators in the energy market to keep them whole when responding to out-of-market dispatch signals for reliability reasons, and co-optimization of energy and operating reserves markets, where lost opportunity cost forms the basis for the reserve price.

75. By comparison, there is no relatively simple adjustment, like a lost opportunity cost payment, that would fix the flaws in the MOPR-Ex proposal. MOPR-Ex by its nature pushes targeted resources out of the capacity market. As discussed previously, the flaws in MOPR-Ex arise from this fundamental feature of MOPR-Ex – either the resources remain and excess capacity is effectively procured, or economic resources may exit the market. There is no way to avoid these problems without changing this fundamental aspect of MOPR-Ex.

76. This completes my declaration.

June 10, 2015

The Honorable Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Re: PSEG Energy Resources & Trade, LLC
Revised Rate Schedule FERC No. 3
Docket No. ER15-1882-000
Errata to Pending Filing

Dear Secretary Bose:

On June 5, 2015, PSEG Energy Resources & Trade LLC ("PSEG ER&T") filed with the Federal Energy Regulatory Commission (Commission") in the above docket a revised Rate Schedule FERC No. 3 ("Rate Schedule"), which sets forth the cost-based revenue requirements for the provision of Reactive Supply and Voltage Control from Generation Sources Service ("Reactive Power") owned by PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear"). This filing ("Reactive Power Filing") is currently pending before the Commission. PSEG ER&T submits this errata filing to correct an error in the proposed effective date and to include certain referenced workpapers.

Specifically, PSEG ER&T requested a proposed effective date of June 5, 2015. The requested proposed effective date appears on pages 2, 7, 8 and 9 of the Reactive Power Filing. The proposed effective date should be June 6, 2015 consistent with the one-day suspension effective date requested in the filing. Also, this errata amends the Reactive Power Filing to include the attached workpapers referenced in the testimony submitted with the filing. Further, an unmarked copy of the proposed tariff submitted with the Reactive Power Filing is attached and all relevant tariff records are being resubmitted with the corrected proposed effective date in the metadata.

PSEG ER&T respectfully requests that the Commission accept this within errata.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

Respectfully submitted,

PSEG Energy Resources & Trade LLC

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule which consists of seventeen separate tariff rate sections for each of PSEG ER&T's generating facilities sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement; the Heating Losses Component, and the Total Revenue Requirement for each generating facility is set forth in the Rate Schedule sections below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

BERGEN 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,925,105.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $28,652.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,925,105 + $28,652 = $2,953,757.

Total Monthly Revenue Requirement is $2,953,757 / 12 = $246,146.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

BERGEN 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,330,193.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $31,021.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,330,193 + $31,021= $ 2,361,214.

Total Monthly Revenue Requirement is $2,361,214 / 12 = $ 196,768.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

LINDEN 1 & 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $8,589,078.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $68,593.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $8,589,078 + $68,593 = $8,657,672.

Total Monthly Revenue Requirement is $8,657,672 / 12 = $721,473.

HUDSON 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $1,386,352.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $7,266.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $1,386,352 + $7,266 = $1,393,617.

Total Monthly Revenue Requirement is $1,393,617 / 12 = $116,135.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

MERCER 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $318,855.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $2,290.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $318,855 + $2,290 = $321,145.

Total Monthly Revenue Requirement is $321,145 / 12 = $26,762.

20150610-5280 FERC PDF (Unofficial) 6/10/2015 3:34:23 PM

MERCER 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $969,405.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $3,168.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $969,405 + $3,168 = $972,573.

Total Monthly Revenue Requirement is 972,573 / 12 = $81,048.

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule which consists of seventeen separate tariff rate sections for each of PSEG ER&T's generating facilities sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement; the Heating Losses Component, and the Total Revenue Requirement for each generating facility is set forth in the Rate Schedule sections below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

BERGEN 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,925,105.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $28,652.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,925,105 + $28,652 = $2,953,757.

Total Monthly Revenue Requirement is $2,953,757 / 12 = $246,146.

VIA ETARIFF FILING

June 5, 2015

The Honorable Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Re: PSEG Energy Resources & Trade, LLC
Docket No. ER15-___-000

Dear Secretary Bose:

Pursuant to Section 205 of the Federal Power Act ("FPA"), 16 U.S.C. § 824d, and Part 35 of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations, PSEG Energy Resources & Trade LLC ("PSEG ER&T" or "Applicant"), hereby submits for filing a revised Rate Schedule FERC No. 3 ("Rate Schedule"), which sets forth the cost-based revenue requirements for the provision of Reactive Supply and Voltage Control from Generation Sources Service ("Reactive Power") owned by PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear"). This filing covers all of the generating facilities currently owned by subsidiaries of PSEG Power LLC ("PSEG Power") within the PJM Interconnection, L.L.C. ("PJM") region ("the Facilities").[1] While the filing includes all of generation facilities within the PJM region owned by subsidiaries of PSEG Power, this filing sets forth a separate and distinct revenue requirement reflected in a separate tariff record for each "generating facility."[2]

PSEG ER&T provides Reactive Power Service pursuant to Schedule 2 of PJM's Open Access Transmission Tariff ("Tariff") and a Commission-approved revenue requirement rate schedule for the provision of Reactive Power Service. As explained herein, PSEG ER&T is updating its revenue requirement for Reactive Power to reflect generating facility unit retirements and to reflect significant capital expenditures relating to the provision of Reactive

[1] PSEG ER&T, PSEG Nuclear and PSEG Fossil are each direct subsidiaries of PSEG Power. PSEG ER&T is responsible for the administration within PJM of the assets covered by this filing and is currently recognized by PJM as the entity responsible for providing Reactive Power provided by the assets and is paid by PJM for providing such service. PSEG ER&T accordingly is the proper entity to provide this service.

[2] The term "generating facility" refers to a specific location where a generation unit or generation units are located. In some instances, one generating unit is located at a generating facility and in others more than one generating unit is located at a generating facility.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Power that have occurred since the establishment of the current revenue requirement in May 2008.

In addition to updating PSEG ER&T's Reactive Power revenue requirement to reflect significant additions to generating facilities, this filing is being made, in part, to address certain concerns of the Commission's expressed in its November 20, 2014, Order to Show Cause directed to PJM.[3] In the Order to Show Cause, the Commission directed PJM to revise its Tariff to provide that a generation owner should no longer receive reactive power payments after it has retired a generating unit or if a generating unit is transferred out of a fleet. While PJM's responsive Tariff amendment, which remains pending, properly leaves it to the discretion of the filing utility to determine whether it will make a Section 205 filing to alter its revenue requirement in the event of a retirement, PSEG ER&T has concluded that disaggregation of the revenue requirement will allow it to better comply with the Commission's policy that there should be greater transparency as to the possible rate impacts of a retirement where a single company sells Reactive Power from multiple units that constitute a generating fleet.

Under the current rate structure, PSEG ER&T operates under a "fleet rate" schedule that sets forth an aggregate revenue requirement for all of the generating facilities from which it sells Reactive Power. As discussed hereafter, by way of this filing, PSEG ER&T seeks to change its rate schedule structure by establishing a separate revenue requirement and tariff record for each generating facility. This revised rate schedule structure will enable PSEG ER&T to more efficiently withdraw a revenue requirement for a generating unit should the unit be retired. Similarly, if PSEG ER&T procures new generation or modifies an existing generator, adding to or changing the relevant revenue requirement will be simplified.

PSEG ER&T respectfully requests waiver of the Commission's 60-day prior notice requirement to allow the attached revised rate schedule to become effective June 5, 2015.

II. DOCUMENTS SUBMITTED

This filing consists of the following:

1. This Letter of Transmittal;

2. "Attachment A" consisting of PSEG ER&T's proposed amended Reactive Power Rate Schedule FERC No. 3 (including a red-lined version of the changes to the existing tariff record and a clean version of the changed and new tariff records);

3. Exhibit No. PSEG – 1: Pre-filed Direct Testimony of Stephen M. Merchant;

4. Exhibit No. PSEG – 2: List of Proceedings in which Stephen M. Merchant has filed testimony;

5. Exhibit No. PSEG – 3: Development of Reactive Power Revenue Requirements:

   (a) Revenue Requirements' Schedules

      i. Schedule No. 1 - Revenue Requirement Summary;

      ii. Schedule No. 2 - Capital Structure, Rate of Return and Income Tax Rates; and

      iii. Schedule No. 3 - Revenue Requirement for Individual Units/Facilities.

   (b) Supporting Work-papers

III. BACKGROUND AND DESCRIPTION OF REQUIREMENT FOR SERVICE

PJM administers the PJM control area and provides transmission service to customers pursuant to the Schedule 2 of its Tariff.[4] PSEG ER&T provides Reactive Power pursuant to Schedule 2 of PJM's Tariff and a Commission-approved rate schedule. The Tariff provides that each month PJM will pay "each Generation Owner an amount equal to the Generation Owner's monthly revenue requirement as accepted or approved by the Commission." (*See* PJM Tariff, OATT VI, Schedule 2).

[4] *See PJM Interconnection, L.L.C.,* 106 FERC ¶ 61,253 at P 6 (2004) (accepting for filing tariff revisions to permit the integration of ComEd's Transmissions system into PJM).

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Within the PJM region, PSEG Fossil and PSEG Nuclear own and operate twenty-two (22) generating units and own undivided interests in nine (9) generating units which in some cases they operate and which in other cases are operated by others. These consist of base-load, intermediate and peaking facilities and have a total operating capacity of about 9,869 MWs. PSEG Fossil and PSEG Nuclear acquired a large portion of their assets from Public Service Electric and Gas Company ("PSE&G") as part of the restructuring of New Jersey electric utilities as required by the New Jersey Board of Public Utilities pursuant to the New Jersey Energy Discount and Energy Competition Act. The transfer of these facilities occurred in August 2000 following the receipt of all necessary regulatory approvals. Substantial write-downs of many of the transferred assets were taken on the books of PSE&G prior to the transfer. In particular, most of the book value of interests in nuclear units at Salem, Hope Creek and Peach Bottom were written down.

PSEG ER&T's current Reactive Power rate was accepted by the Commission's Letter Order dated November 13, 2008 in Docket No. ER08-951-002.[5] The Letter Order was issued in response to PSEG ER&T's May 13, 2008 filing ("May 2008 Filing"). On July 7, 2008, PSEG ER&T supplemented its May 2008 Filing in response to Commission Staff's inquiries regarding certain cost allocation percentages. Thereafter, on September 12, 2008, PSEG ER&T further supplemented its May 2008 filing. The revenue requirement established for the PSE&G ER&T fleet based on the May 2008 Filing, as supplemented, is $26,626,787.

The 2008 revenue requirement was established based upon the Commission approved methodology set forth in *American Elec. Power Serv. Corp.,* 88 FERC ¶ 61,141 (1999), *order on reh'g,* 92 FERC ¶ 61,001 (2000) (the "*AEP methodology*"). The within filing is likewise based upon the *AEP methodology* and is consistent with the methodology used in the May 2008 Filing.

Since the establishment of the current Reactive Power revenue requirement, PSEG Fossil and PSEG Nuclear have constructed new generating units and have made significant capital expenditures to the existing generating fleet within PJM including, in particular, significant investments in rebuilding or replacing facilities associated with providing reactive power such as turbo-generators, generators, accessories and generator step-up transformers. The new generating units constructed since the establishment of the current revenue requirement are Kearny #13 and #14 owned by PSEG Fossil. Since 2008, the most significant investments, major upgrades, and replacement of equipment related to reactive power have taken place at: Linden Units #1 and #2 (approximately $1B), Hudson #2 (approximately $100M), and three nuclear facilities, Hope Creek, Peach Bottom and Salem (approximately $1B). PSEG Fossil has retired certain generating units that that were in service in 2008 and, as a result those units are not included in this filing.

PSEG Fossil's and PSEG Nuclear's investment in generating units capable of providing Reactive Power has increased since 2008 from $4,341.7M to $7,318.1M. This amount, which is an increase in investment of approximately 69%, includes the removal of the costs associated with the retired units. As a result, the currently authorized Reactive Power annual revenue requirement of $26,626,787 significantly understates PSE&G ER&T's actual annual revenue

[5] *PSEG Energy Resources and Trade, LLC*, Docket Nos. ER08-951-000, ER08-951-001, ER08-951-002, Letter Order, November 13, 2008.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

requirement for all of its generation facilities based upon updated levels of investment and operating costs.

Original investment cost and other financial and operating data were taken from the books and records of PSEG Fossil and PSEG Nuclear, as those companies do not submit a FERC Form No. 1. Information from manufacturers was used in some cases to allocate original investment or as a source for generator efficiency data.[6]

This filing is supported by the attached testimony of Stephen M. Merchant ("Merchant Testimony").

IV. DESCRIPTION OF REVENUE REQUIREMENT FOR REACTIVE POWER

The proposed rate schedules sets forth rates that represents PSEG ER&T's revenue requirement for Reactive Power on a "generating facility" specific basis for seventeen (17) generating facilities.[7] The revenue requirement for each generating facility is the sum of two components: (1) fixed costs attributable to reactive power production capability ("Fixed Capability Component") and (2) increased generator and step-up transformer heating losses that result from the production of reactive power ("Heating Losses Component").

As required by the Commission in *FPL Energy Marcus Hook, L.P.,* 110 FERC ¶ 61,087, P 16 (2005) (*"Marcus Hook I"*), the proposed revenue requirement is developed consistent with the *AEP methodology*.

The total annual revenue requirement that PSEG ER&T is seeking to recover for all of its generating facilities included in this filing is $38,671,025. This aggregate annual revenue requirement is based upon actual investment and operating costs for the 2014 test year excluding the investments and expenses of retired units. The individual components of the proposed rate schedule are briefly discussed here and are supported by the Merchant Testimony.

A. Fixed Capability Component

The Fixed Capability Component of the Reactive Power revenue requirement represents the portion of the plant investment in the Facilities that can be attributed to the production of Reactive Power. Mr. Merchant analyzes the costs associated with the reactive portion of PSEG Fossil's and PSEG Nuclear's investment in the generator/exciter system and the generator step-

---

[6] In one case – the Yards Creek pumped storage facility – actual cost data from the manufacturer was not available because the GE company division that constructed the unit was sold to a consortium of European companies. In lieu of a manufacturer's letter of actual cost data, a proxy allocator equal to 15% (the same value as used in *AEP*) was used. The use of this allocator for Yards Creek is a conservative estimate that is supported by information supplied by a consulting firm (Axford Consulting) who conferred with personnel in the gas and steam turbine divisions of GE and with Hitachi America LDT, a company currently in the business of building generators/motors for pumped hydo storage. Axford Consulting concluded that an allocation between 25% and 45% would be reasonable.

[7] See Merchant Testimony, Exhibit No. PSEG – 3, Schedule 1. For the purposes of this filing, although "Bergen 1" and "Bergen 2" are at the same location, they are not being treated as a single "generating facility." Rather, each is designated as separate generating facility. Similarly, "Linden 1 & 2" and "Linden 3-4" are each designated as a separate "generating facility."

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

up transformer, accessory electric equipment, and the balance of plant costs. His analysis determines the original investment cost of the (i) generator/exciter, (ii) step-up transformer, and (iii) the accessory electric equipment to determine the reactive portion of this investment.

As explained by Mr. Merchant, for some facilities, the original investment cost of the generator/exciter is specified on PSEG Power's books. In other cases, the generator/exciter investment is calculated as a share of the per books original investment cost associated with turbo-generator investment, based on data provided by the turbo-generator manufacturer.[8]

Consistent with the May 2008 Filing, for each named facility or group of units, Mr. Merchant allocates dual use plant related to the function of reactive power production. The reactive allocator is unity less the square of the facility's power factor. The balance of plant is also allocated to the provision of reactive power pursuant to the *AEP methodology*. To determine the annual revenue requirement, a fixed charge rate ("FCR") specific to each generating facility has been developed to apply to the Reactive Power production cost. The FCR includes the following components: Fixed O&M, Real Estate Tax and Property Insurance, Sinking Fund Depreciation, Levelized Tax Factor, Prepayments, Cash Working Capital ("CWC"), Return, and Accumulated Deferred Income Taxes ("ADIT").

B. Heating Losses Component

The production of Reactive Power produces higher currents and, as a result, losses occur from resistive heating associated with armature winding and field winding of the generators. Additionally, losses occur as a result of increased eddy currents in the generator and associated step-up transformer. These losses can be calculated as the real power consumed to produce Reactive Power, and therefore, constitute a cost that is directly attributable to the production of Reactive Power. Such costs associated with losses also occur in the generator step-up transformer units. Efficiency data used for the heating losses calculations was obtained from the best available sources. These sources include printed curves and specification sheets, calculations from data components on printed curves, specification sheets and instruction manuals. When possible, original plant specification data was used. For some units, however, this data was not originally included in the generator data sets. In these cases, efficiency data was obtained from the manufacturers for comparable units.

Mr. Merchant explains in his testimony how heating losses are calculated and why it is proper to include the cost of such losses in the revenue requirement for the Facilities.[9] In this filing, heating losses comprise only small portion of the total Reactive Power total annual revenue requirement for all of the generating facilities – $331,641 out of $38.67 million.

---

[8] As noted *supra*, – because manufacturer data is not available for Yards Creek pumped storage facility, an allocation factor was recommended by a consulting firm (Axford Consulting).

[9] See *Dynegy Midwest Generation, Inc*., 121 FERC ¶ 61,025 (2007) (Opinion Number 498), order on reh'g, 125 FERC ¶ 61,280 (2008) ("Dynegy"), (The Commission has found that heating loss costs are recoverable).

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

V. DESCRIPTION OF AMENDED RATE SCHEUDLE STRUCTURE

Under PSEG ER&T's current Rate Schedule FERC No. 3, the annual revenue requirement for Reactive Power is stated as a monthly and annual number that is based upon the sum of the revenue requirement for each of the generating facilities included in PSEG ER&T's generating fleet. By way of this filing, PSEG ER&T seeks to amend Rate Schedule No. 3 so that each "generating facility" has its own, separate FERC-accepted annual and monthly revenue requirement reflected in its own tariff record. More specifically, PSEG ER&T is requesting that the Commission accept the revenue requirement for each generating facility as set forth on Exhibit PSEG-3, Schedule 1, resulting in a separate rate for each generating facility included in Rate Schedule FERC No. 3 as amended. (Attachment A identifies proposed revisions to Rate Schedule FERC No. 3 and includes the addition of generating facility-specific tariff records.)

VI. OTHER FILING REQUIREMENTS

- 18 C.F.R. § 35.13(b)(1) – A list of documents submitted with this filing is included at Section II.
- 18 C.F.R. § 35.13(b)(2) – The date on which PSEG ER&T proposes to make the rate change effective is June 5, 2015.
- 18 C.F.R. § 35.13(b)(3) – A copy of this filing has been sent to PJM and the New Jersey Board of Public Utilities.
- 18 C.F.R. § 35.13(b)(4) – A description of the rate change is explained herein at Section IV.
- 18 C.F.R. § 35.13(b)(5) – A statement of the reasons for the rate change is explained herein at Section III.
- 18 C.F.R. § 35.13(b)(6) – PSEG ER&T hereby represents that no additional agreement, by contract or otherwise, is required for the filing of this rate.
- 18 C.F.R. § 35.13(b)(7) – PSEG ER&T hereby represents that there are no expenses or costs included in this filing that have been alleged or judged in any administrative or judicial proceeding to be illegal, duplicative, or unnecessary costs that are demonstrably the product of discriminatory employment practices.
- 18 C.F.R. § 35.13(c)(3) – No specifically assignable facilities have been or will be installed in connection with the proposed rate schedule.

The instant filing contains an explanation as to the method used in arriving at the cost of service for the rate proposed herein for Reactive Power. PSEG ER&T respectfully requests waiver of the requirements of Section 35.13 of the Commission's regulations to the extent necessary to permit acceptance of the Reactive Power proposed Rate Schedules.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

VII. EFFECTIVE DATE AND REQUEST FOR WAIVERS

PSEG ER&T respectfully requests waiver of the Commission's notice requirements so that its revised Rate Schedule FERC No. 3 may become effective on June 5, 2015. As discussed above, since the last time a reactive power revenue requirement for PSEG ER&T was obtained seven years ago, significant capital expenditures to units in the existing fleet have been made, new generating units have been constructed and operational expenses have increased. These additional costs associated with the provision of reactive power services more than offset the decrease in costs stemming from retirements that occurred during the same time period. The costs of these additional investments and new facilities are not reflected in the currently effective revenue requirement and, as a result, PSEG ER&T is significantly under-recovering its costs of supplying reactive power to PJM.

The Commission has regularly granted waiver establishing effective dates less than sixty (60) days after filing for Reactive Power rate schedules. *See, e.g., Tenaska Virginia Partners, L.P.,* 107 FERC ¶ 61,207 (2004) (requested suspension rejected, not set for hearing, and effective date of less than sixty (60) days after date of filing granted); *FPL Energy Marcus Hook. L.P.,* 110 FERC ¶ 61,087 (2005) (granting effective date of less than sixty (60) days after date of filing); *Cottonwood Energy Company LP,* 110 FERC ¶ 61,303 (2005) (effective date of filing eight (8) days after filing made); *Union Power Partners, L.P.,* 112 FERC ¶ 61,065 (2005) (effective date of filing one day after filing made). For the reasons set forth above, PSEG ER&T respectfully submits that good cause for waiver of the 60 day notice period exists in this case.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

VIII. CONCLUSION

WHEREFORE, for the foregoing reasons, PSEG ER&T respectfully requests that the Commission accept the proposed Rate Schedules to become effective on June 5, 2015 and grant the waivers requested herein.

Respectfully submitted,

PSEG Energy Resources & Trade LLC

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PSEG Energy Resources & Trade, LLC) **Docket No. ER15-____-000**

PREFILED DIRECT TESTIMONY OF STEPHEN M. MERCHANT

ON BEHALF OF PSEG ENERGY RESOURCES & TRADE, LLC

Introduction and Qualifications

Q. Please state your name, business address and occupation.

A. My name is Stephen M. Merchant. My business address is 1155 15th Street, NW, Suite 400, Washington, D.C. 20005. I am employed by the energy consulting firm of Brown, Williams, Moorhead & Quinn, Inc. My position is Vice President.

Q. Please describe your education and professional experience.

A. Over the last 41 years I have served an officer or associate of several public utility and energy consulting firms. In that capacity I have provided professional services to numerous clients, including gas and electric distribution, transmission and production companies. I have testified as an expert witness in many proceedings, on such matters as transmission cost of service, rates and terms and conditions of service; ancillary services pricing; rate of return, and the existence of competitive alternatives. I have performed load studies and forecasts and have prepared

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

economic analyses of electric and gas supply options. I have prepared and testified in support of market power studies filed for market-based rates.

I have a Bachelor's degree in Economics from the University of Delaware and a Master's Degree in Economics from the University of Maryland.

Q. Please identify the cases for which you have offered testimony in hearings before regulatory agencies.

A. I have testified and/or prepared written testimony in many rate proceedings, including before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state regulatory commissions, and federal and state courts. The cases are listed in Exhibit No. PSEG – 2.

Q. On whose behalf are you testifying?

A. I am testifying on behalf of PSEG Energy Resources & Trade, LLC ("PSEG ER&T" or "Company"), a direct subsidiary of PSEG Power, LLC ("PSEG Power").

Q. Please list the Exhibits you are sponsoring.

A. I am sponsoring the following exhibits:

1) Exhibit No. PSEG – 1: Prefiled Direct Testimony of Stephen M. Merchant

2) Exhibit No. PSEG – 2: List of Proceedings in which Stephen M. Merchant has filed testimony

3) Exhibit No. PSEG – 3: Development of Reactive Revenue Requirement by Generating Facility – 2015

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Q. In addition to Exhibit No. PSEG – 3, which shows the details of the revenue requirement calculations for each generating facility, have you included workpapers supporting these calculations?

A. Yes. Workpapers are included showing the development of the capital structure and debt cost rate; the calculations of heating losses for each facility; test year investment and expense data; test year real estate taxes; insurance expense and common expenses and their allocation; prepayments and two workpapers showing physical characteristics of units/facilities. In addition, the filing includes thirty-eight (38) pages of generator specific data in *pdf* format, including generator reactive capability curves.

Purpose of Testimony

Q. What is the purpose of your testimony?

A. PSEG Power, through its subsidiaries PSEG Fossil LLC and PSEG Nuclear LLC, is owner or part-owner of numerous generating facilities in or near the control area of Public Service Electric & Gas Company ("PSE&G"). The various PSEG Power generating facilities that are the subject of this filing ("PSEG Power fleet") are located within the geographic area of the PJM Interconnection, LLC ("PJM"). PJM is the control area operator, and each of the generating units in the PSEG Power fleet is eligible to recover its costs of providing Reactive Power (also, "VArs") to PJM. In order to recover its costs it is necessary to establish a FERC-approved

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

monthly Reactive Power revenue requirement which PJM includes in Schedule 2 of its OATT. PJM assesses transmission customers and distributes the revenues it collects to generators with FERC-approved revenue requirements.

My testimony explains and supports the calculations and methodology that PSEG ER&T has employed to derive the reactive revenue requirement for each generating facility or grouping of units in the PSEG Power fleet.

Q. Does PSEG ER&T currently have a FERC-approved revenue requirement for Reactive Power included in PJM's Schedule 2?

A. Yes. In Docket No. ER08-951-000, et al., FERC accepted by letter order PSEG ER&T's proposed total annual Reactive Power revenue requirement for the PSEG Power Fleet of $26,626,787 (hereafter "2008 Filing").

Q. To prepare the currently proposed Reactive Revenue requirement, has PSEG ER&T utilized the same methodology as in the last filing?

A. Yes. In its November 13, 2008 letter order accepting PSEG ER&T's 2008 Filing, FERC found: "Consistent with the Commission's prior directives, you have utilized the methodology set forth in *American Electric Power Services Corp.*, 88 FERC ¶ 61,141 (1999) (AEP methodology), for determining the plant cost to be reflected in a revenue requirement for Reactive Power."

Like the 2008 Filing, this filing utilizes the FERC approved AEP

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

methodology. In order to maintain consistency with the 2008 Filing accepted by FERC, PSEG ER&T has updated the same exhibits used to support the revenue requirement employed in the 2008 Filing: (a) bringing investment and operating costs to current levels; (b) removing generating units that have been retired, and (c) adding units placed in service since 2008. PSEG ER&T's proposed annual Reactive Power revenue requirement for all of the generating units in this filing is $38,671,025.

The total new revenue requirement reflects $16.0 million in revenues to support generation investment since the 2008 Filing, less $4.0 million in revenue requirement associated with the generation facilities that have been retired since the 2008 Filing.

Q. What is the primary reason for the increase in the revenue requirement?

A. While some plants included in the 2008 Filing analysis (using the 2007 test year) have since been retired, PSEG Power has made significant new investments in generation both by upgrading existing plants and adding new units. Since the last filing, PSEG Power's total investment in generating units capable of providing Reactive Power has grown from $4,341.7 million to $7,318.1 million, an increase of almost 69%. Clearly, this change in investment is the main driver of the proposed increase in the revenue requirement.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Q. Of the generating units in the current analysis, which have had significant new investment by PSEG?

A. Two new units were installed at Kearny (#13 & #14) for $280 million. In addition, nearly one billion dollars of investment was made at Linden #1 & #2, and another $103 million at Hudson 2. Finally, upgrades and replacements of generating equipment since 2008 at three nuclear facilities (Hope Creek, Peach Bottom and Salem) have totaled slightly more than one billion dollars.

Q. Please state the major components of your testimony.

A. The major components of this testimony are:

1. Identification of all equipment employed in Reactive Power production and its installed cost. This equipment consists of generators and exciters, generator step-up transformers ("GSUs"), accessory electrical equipment and the balance of plant.
2. Explanations of the calculations of the allocation factors to be applied to the generators/exciters, GSUs, accessory electrical equipment, balance of plant and the application of these factors to derive total Reactive Power investment.
3. Support for the development and application of the fixed charge rate ("FCR") used to determine the fixed component of the Reactive Power revenue requirement for each generating facility.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

4. Explanation of the development of the heating loss component of the Reactive Power revenue requirement.

Q. Please explain the Commission's methodology for calculating the cost of Reactive Power.

A. In Order No. 888, the Commission found that Reactive Power from generators is an Ancillary Service of which the costs should be separately assessed to transmission customers. In *American Electric Power Service Corp.*, 80 FERC ¶ 63,006 (1997), *aff'd in part and rev'd in part*, 88 FERC ¶ 61,141 (1999) ("AEP") and *Dynegy Midwest Generation, Inc.*, 121 FERC ¶ 61,025 (2007) (Opinion No. 498) ("*Dynegy*"), *order on r'hg*, 125 FERC ¶ 61,280 (2009), the Commission discussed the methodology for determining the cost of Reactive Power. As I noted above, the Reactive Power revenue requirement proposed by PSEG Power was developed consistent with the methods described in *AEP* and *Dynegy*.

The *AEP* methodology identifies the Reactive Power fixed cost component with respect to four groups of investments, as noted above: (1) generator/exciter, (2) GSU transformers, (3) accessory electrical equipment, and (4) balance of plant investment. The methodology then develops an allocation factor to separate the foregoing investment into Real and Reactive components. Consistent with *Dynegy*, the Reactive Power revenue requirement also includes the cost of incremental heating losses which are incurred in the production of Reactive Power.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Q. What is the test period?

A. The test period is calendar year 2014, the most recent calendar year data is available.

Q. Please explain how PSEG determined the plant investment associated with the generator and exciter, GSUs, accessory electrical equipment and balance of plant.

A. To determine plant investment associated with the generator and exciter, PSEG Power used one of two methods: (a) direct examination of generator/exciter costs from company's books and records, or (b) allocation of a portion of turbogenerator costs to generator/exciter, where the allocator is based on information directly from the manufacturer (e.g., a letter). For each generating unit or facility in the analysis, Exhibit No. PSEG – 3 Schedule 1 shows the source of the generator/exciter investment.

Exhibit No. PSEG – 3 Schedule 1 also shows the allocation of accessories to dual use. PSEG has sufficient data to provide an accessories allocation for only two facilities, so the accessories allocations for the other facilities are zero. With respect to GSUs, booked data provides the investment amounts, for the 12 out of 17 facilities for which such data exists. The allocator for the share of remaining plant allocable to dual use is based upon an allocation factor derived from an

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

analysis conducted by PSEG Power utilizing the following formula:

$$\frac{\text{Exciter MW}}{\text{Generator MW}} * \frac{\text{Maximum MVAR}}{\text{Nameplate MVAR.}}$$

The factor is 0.14%, which in my experience is conservative.

Q. Please explain how the Reactive Power portion of each of the four components is determined.

A. First, a "Reactive Allocator" is calculated that is specific to each generating station or group of generating units. The Reactive Allocator is the value unity less pf^2, where pf is the weighted power factor of all generating units in the facility. This value is shown on line 14 of the revenue requirement calculation for each unit or group of units. See, for example, the specification of the Reactive Allocator for Bergen 1, Exhibit No. PSEG - 3, Schedule 3, page 1 of 34. The workpaper for Bergen 1 shows the development of the weighted power factor.

The dual use investment for the generator/exciter is developed at lines 5, 6 and 7 of Exhibit No. PSEG - 3, either by direct assignment of the cost or by multiplying the turbogenerator costs by the percent of generator/exciter costs specified by the manufacturer.[1] The dual use investment for accessories is

[1] In one case - the Yards Creek pumped storage facility – actual cost data from the manufacturer was not available because the GE company division that constructed the unit was sold to a consortium of European companies. In lieu of a manufacturer's letter of actual cost data, a proxy allocator equal to 15% (the same value as used in *AEP*) was used. The use of this allocator for Yards Creek is a conservative estimate that is supported by information supplied by a consulting firm (Axford Consulting) who conferred with personnel in the gas and steam turbine divisions of GE and with Hitachi America LDT, a company currently in the business of building generators/motors for pumped hydo storage. Axford Consulting concluded that an allocation between 25% and 45% would be reasonable.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

developed at lines 8, 9 and 10 by multiplying accessories investment by the percent developed by analysis. The dual use investment for GSUs is specified at line 12 as a per books amount.

The sum of these three dual-use investments is shown at line 13 and is multiplied by the Reactive Allocator at line 14 to derive the total of dual-use investment allocated to Reactive Power.

Finally, the balance of plant allocable to Reactive Power (line 16) is total plant investment (line 1) less the total allocated to Reactive Power (line 15). This balance is multiplied by the balance of plant allocator shown on line 17 to derive line 18. Total plant allocated to Reactive Power production (line 19) is the sum of lines 15 and 18.

Q. Once you have determined the Reactive Power portion of total plant investment, how do you calculate the revenue requirement for the fixed capability component?

A. Consistent with the *AEP* methodology, the method employed is a levelized gross plant method. For each named generating facility or unit, a fixed charge rate ("FCR") applicable to each facility is calculated. The FCR includes the following components: Fixed O&M, Real Estate Tax and Property Insurance, Sinking Fund Depreciation, Levelized Tax Factor, Return, Prepayments, Cash Working Capital ("CWC"), and Accumulated Deferred Income Taxes ("ADIT").

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

See, for example, the specification of the components of the FCR for Bergen 1, Exhibit No. PSEG - 3, Schedule 3, page 1, lines 24 through 32.

Q. Please describe how the depreciation, income tax, and rate of return components of the FCR are calculated.

A. The depreciation component is calculated using the Commission's standard sinking fund method as employed in *AEP.* The component equals Return / (1+Return^n - 1), where "n" is the depreciable life of the plant. This calculation is shown on line 22 of the above-cited schedule for Bergen 1 (and on each of the other schedules showing the FCR calculations by plant).

The income taxes component ("LTF" = levelized tax factor) is calculated based on the composite income tax rate ("CIT" from Schedule 2, "Capital Structure and Taxes") as follows: (CIT / (1- CIT) x (Return + SFD – SLD) x (1 – LTD / Return), where SFD is the sinking fund depreciation rate, SLD is the straight line depreciation rate and LTD is the weighted interest rate component of the capital structure.

The after-tax rate of return of 8.86% is calculated on Schedule 2, page 1**.** The rate of return calculation is consistent with the weighted average cost of capital methodology used in the 2008 Filing and includes the same rate of return on equity ("ROE"). The capital structure and its associated debt cost are based upon PSEG Power's actual capital structure and debt costs as set forth in the 2014 SEC Form

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

10-K filed by PSEG Power, LLC. Consistent with the 2008 Filing, and to be conservative, the current filing includes the same ROE as that in the 2008 Filing which is at the low end of the range of ROEs of transmission owners in PJM.

Q. Please explain why a heating losses component is included in the proposed rates.

A. The production of Reactive Power results in the increase of current in addition to the current flowing as a result of the production of Real Power. Due to the electrical resistance inside of the generator and GSU windings, this incremental current causes Real Power to be consumed or lost in the form of heat. This loss of Real Power is a cost of providing Reactive Power that is properly recovered through the Reactive Power rate. The Commission has accepted the inclusion of a rate component to recover the cost of heating losses in numerous proceedings. See, for example, *Dynegy,* cited earlier.

Q. Do you have schedules showing the detailed calculations of generator and transformer heating losses for each of the generating facilities?

A. Yes. Exhibit No. PSEG – 3 includes workpapers that calculate the incremental heating loses for each generating facility.

Q. When the losses for each generating facility have been calculated, how are

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

they valued?

A. They are appropriately valued at the average annual locational marginal price ("LMP") of energy associated with the location of each generating facility. These values are shown on the "Plant LMP" workpaper included with Exhibit No. PSEG –3.

Q. Have you calculated the specific revenue requirement for each generation facility? And, if so, how do those calculations affect your filing?

A. Yes. The calculation of the total annual Reactive Power revenue requirement for all of the generation facilities is based on the sum of the separate revenue requirements for each facility. Thus, Exhibit No. PSEG - 3, Schedule 1, sets forth the specific revenue requirement (i.e., rate) for each generation facility. (See Exhibit No. PSEG - 3, Schedule 1, Column (A) for "generating facilities" – which may consist of one or more generation units). In this filing, PSEG Power is requesting that the Commission accept the revenue requirement for each generating facility resulting in a separate rate for each generating facility. In my opinion, each of these individual generation reactive power revenue requirements is properly calculated on a consistent basis, utilizing facility-specific data where necessary.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

Exhibit No. PSEG - 2

STEPHEN M. MERCHANT – SUMMARY OF TESTIMONY EXPERIENCE

JURISDICTION	CASE OR DOCKET NO.	UTILITY/ORGANIZATION INITIATING PROCEEDING	CLIENT	APPROXIMATE DATE	SUBJECT MATTER
FERC	ER78-409, 410	Philadelphia Electric Company	Borough of Lansdale, Pennsylvania.	September 1979	Competition between Electric Utilities; Price Squeeze (settled before hearing)
U.S. District Court, CT	Civil Action No. 15609	City of Groton, et al., vs. CL&P, et al.	City of Groton, Connecticut	February 1980	Competition between Electric Utilities; Market Power Study (cross-examined)
U.S. District Court, PA	Civil Action No. 78-2533	Borough of Lansdale vs. Philadelphia Electric Company	Borough of Lansdale, Pennsylvania	June 1980	Competition between Electric Utilities; Market Power Study (cross-examined)
FERC	RM81-38	Construction Work in Progress for Public Utilities	American Public Power Association	December 1981	FERC Rulemaking on Inclusion of CWIP in Rate Base
AR PSC	81-144-U	Arkansas Power & Light Company	Arkansas Public Service Commission Staff	January 1982	Cost of Service and Rate Design Issues; Time of Day Rates (cross-examined)
FERC	RM80-38	Generic Rate of Return for Electric Utilities	Arkansas Municipal Power Association	January 1983	FERC Rulemaking on Rate of Return
ICC	82-0892	Iowa-Illinois Gas & Electric Company	U.S. Department of the Army and Other Federal Agencies	June 1983	Rate Stabilization/Cost Deferral Plan; Rate of Return (cross-examined)
DC PSC	FC 813	Potomac Electric Power Company	District of Columbia Public Service Commission Staff	October 1983	Company's Proposed Attrition Adjustment (cross-examined)
NM State Corp Commission	1032	Mountain States Telephone & Telegraph Company	New Mexico State Corporation Commission Staff	November 1983	Local Exchange Cost of Service; Toll Rates (cross-examined)
NM State Corp Commission	1052	Mountain States Telephone & Telegraph Company	New Mexico State Corporation Commission Staff	December 1983	Access Charges for Toll Service Providers (cross-examined)

BERGEN-2 COMBINED CYCLE
2014 TEST PERIOD

1	Gross Book Investment (incl. allocated common)	$	367,228,644	
2	O&M	$	17,795,500	
3	Depreciation (incl. common depreciation)	$	9,363,273	
4	Real Estate Taxes & Property Insurance	$	666,138	
5	Turbogenerator Investment	$	267,702,291	(Acct 344)
6	Generator/Exciter share of Turbogenerator		14.47%	(Manufacturer letter)
7	Generator/Exciter Investment	$	38,724,612	(line 5 * line 6)
8	Accesssories Investment	$	41,024,167	(Acct 345-adjusted per detailed analysis)
9	Allocation of Accessories to Dual Use		13.98%	(Internal analysis)
10	Accessories Allocated	$	5,735,179	(line 8 * line 9)
11	Step-up share of total investment		N/A	
12	Step-up Investment	$	2,855,268	(per books)
13	Total Dual-Use Investment	$	47,315,058	(line 7 + line 10 + line 12)
14	Reactive Allocator [@ weighted pf of all unit(s)]		27.75%	= 1 - pf^2, where pf = power factor = 0.85
15	Dual-Use Investment Allocated to Reactive	$	13,129,929	(line 13 * line 14)
16	Balance of Plant Allocable	$	354,098,715	(line 1 - line 15)
17	Share of Remaining Plant Allocable		0.14%	Per PSEG Analysis
18	Balance of Plant Allocated	$	495,738	(line 16 * line 17)
19	Total Allocated Reactive Investment	$	13,625,667	(line 15 + line 18)

Depreciation Rates & Levelized Tax Factor

20	Calculated SL Depr. Rate (SLD)	2.55%	(line 3 / line 1)
21	n = life of plant	39.2	(1 / (line 3 / line 1)
22	Sinking Fund Depr. Rate (SFD)	0.33%	= ROR/ ((1+ ROR)^n - 1)
23	Levelized Tax Factor	3.72%	= CIT / GTF * (ROR + SFD - SLD) * (1 - weighted LTD / ROR)

	FCR Components		
24	Production Cost	4.85%	(line 2 / line 1)
25	RE Tax & Property Ins. Component	0.18%	(line 4 / line 1)
26	Sinking Fund Depreciation Rate	0.33%	(line 22)
27	Levelized Tax Factor	3.72%	(line 23)
28	Return	8.86%	(Cap. Struct & Taxes Sch)
29	Prepayments * Pre-tax ROR / Plant =	0.00%	(WP-Prepayments & Schedule 2)/line 1
30	CWC=1/8 O&M*Pre-tax ROR / Plant =	0.08%	(line 2/8 & Schedule 2)/line 1
31	ADIT Adjustment	-0.92%	- (line 44 (k) / 36 (c)) Page 2
32	FCR Total	17.10%	(sum 24 through 31)

33	Annual Reactive Revenue Requirement	$	2,330,193	(line 19 * line 32)
34	kW capacity		560,000	Rated Capacity
35	Annual Vars Rate ($/mW)	$	4,161	(line 33 / line 34 * 1000)

LINDEN 1 & 2 (IDENTICAL, EACH CONSISTING OF TWO GE 7FA CTs AND ONE GE D11 STEAM TURBINE

2014 TEST PERIOD

1	Gross Book Investment (incl. allocated common)	$ 1,100,431,647		
2	O&M	$ 98,678,000		
3	Depreciation (incl. common depreciation)	$ 27,640,742		
4	Real Estate Taxes & Property Insurance	$ 2,465,929		
5	Turbogenerator Investment	$ 852,549,147	(Acct 344)	
6	Generator/Exciter share of Turbogenerator	14.46%	(Manufacturer letter)	
7	Generator/Exciter Investment	$ 123,260,590	(line 5 * line 6)	
8	Accesssories Investment	$ 49,369,888	(Acct 345-adjusted per detailed analysis)	
9	Allocation of Accessories to Dual Use	19.03%	(Internal analysis)	
10	Accessories Allocated	$ 9,395,090	(line 8 * line 9)	
11	Step-up share of total investment	N/A		
12	Step-up Investment	$ 7,184,622	(per books)	
13	Total Dual-Use Investment	$ 139,840,301	(line 7 + line 10 + line 12)	
14	Reactive Allocator [@ weighted pf of all unit(s)]	27.75%	= 1 - pf^2, where pf = power factor = 0.85	
15	Dual-Use Investment Allocated to Reactive	$ 38,805,684	(line 13 * line 14)	
16	Balance of Plant Allocable	1,061,625,963	(line 1 - line 15)	
17	Share of Remaining Plant Allocable	0.14%	Per PSEG Analysis	
18	Balance of Plant Allocated	$ 1,486,276	(line 16 * line 17)	
19	Total Allocated Reactive Investment	$ 40,291,960	(line 15 + line 18)	

Depreciation Rates & Levelized Tax Factor

20	Calculated SL Depr. Rate (SLD)	2.51%	(line 3 / line 1)
21	n = life of plant	39.8	(1 / (line 3 / line 1)
22	Sinking Fund Depr. Rate (SFD)	0.31%	= ROR/ ((1+ ROR)^n - 1)
23	Levelized Tax Factor	3.74%	= CIT / GTF * (ROR + SFD - SLD) * (1 - weighted LTD / ROR)

	FCR Components			
24	Production Cost		8.97%	(line 2 / line 1)
25	RE Tax & Property Ins. Component		0.22%	(line 4 / line 1)
26	Sinking Fund Depreciation Rate		0.31%	(line 22)
27	Levelized Tax Factor		3.74%	(line 23)
28	Return		8.86%	(Cap. Struct & Taxes Sch)
29	Prepayments * Pre-tax ROR / Plant =		0.00%	(WP-Prepayments & Schedule 2)/line 1
30	CWC=1/8 O&M*Pre-tax ROR / Plant =		0.15%	(line 2/8 & Schedule 2)/line 1
31	ADIT Adjustment		-0.94%	- (line 44 (k) / 36 (c)) Page 2
32		FCR Total	21.32%	(sum 24 through 31)
33	Annual Reactive Revenue Requirement	$ 8,589,078		(line 19 * line 32)
34	kW capacity	1,300,000		Rated Capacity
35	Annual Vars Rate ($/mW)	$ 6,607		(line 33 / line 34 * 1000)

	From GE Letter - April 17, 2008 to PSEG Power, LLC		Unit Price	Gen. %

SALEM NUCLEAR UNITS 1 & 2
2014 TEST PERIOD

1	Gross Book Investment (incl. allocated common)	$	722,542,909	
2	O&M	$	244,759,952	
3	Depreciation (incl. common depreciation)	$	26,598,638	
4	Real Estate Taxes & Property Insurance	$	3,086,649	
5	Turbogenerator Investment		N/A	
6	Generator/Exciter share of Turbogenerator		DA	
7	Generator/Exciter Investment	$	15,165,340	(per books)
8	Accesssories Investment	$	9,330,643	(Acct 324)
9	Allocation of Accessories to Dual Use		0.00%	(none)
10	Accessories Allocated	$	-	(line 8 * line 9)
11	Step-up share of total investment		N/A	
12	Step-up Investment	$	3,815,073	(per Book)
13	Total Dual-Use Investment	$	18,980,413	(line 7 + line 10 + line 12)
14	Reactive Allocator [@ weighted pf of all unit(s)]		19.00%	= 1 - pf^2, where pf = power factor = 0.9
15	Dual-Use Investment Allocated to Reactive	$	3,606,278	(line 13 * line 14)
16	Balance of Plant Allocable	$	718,936,630	(line 1 - line 15)
17	Share of Remaining Plant Allocable		0.14%	Per PSEG Analysis
18	Balance of Plant Allocated	$	1,006,511	(line 16 * line 17)
19	Total Allocated Reactive Investment	$	4,612,790	(line 15 + line 18)

Depreciation Rates & Levelized Tax Factor

20	Calculated SL Depr. Rate (SLD)	3.68%	(line 3 / line 1)
21	n = life of plant	27.2	(1 / (line 3 / line 1)
22	Sinking Fund Depr. Rate (SFD)	0.98%	= ROR/ ((1+ ROR)^n - 1)
23	Levelized Tax Factor	3.45%	= CIT / GTF * (ROR + SFD - SLD) * (1 - weighted LTD / ROR)

	FCR Components		
24	Production Cost	33.87%	(line 2 / line 1)
25	RE Tax & Property Ins. Component	0.43%	(line 4 / line 1)
26	Sinking Fund Depreciation Rate	0.98%	(line 22)
27	Levelized Tax Factor	3.45%	(line 23)
28	Return	8.86%	(Cap. Struct & Taxes Sch)
29	Prepayments * Pre-tax ROR / Plant =	0.03%	(WP-Prepayments & Schedule 2)/line 1
30	CWC=1/8 O&M*Pre-tax ROR / Plant =	0.59%	(line 2/8 & Schedule 2)/line 1
31	ADIT Adjustment	-0.50%	- (line 44 (k) / 36 (c)) Page 2
32	FCR Total	47.71%	(sum 24 through 31)

33	Annual Reactive Revenue Requirement	$	2,200,674	(line 19 * line 32)
34	kW capacity		1,336,505	Rated Capacity
35	Annual Vars Rate ($/mW)	$	1,647	(line 33 / line 34 * 1000)

Notes: (1) Common plant and depreciation at facilities is allocated among units by relative investment: for example, Bergen common shown at line 1, column (E) is allocated by Bergen 1, 2, & 3 based on investment (excluding common) shown at lines 2, 3, 4, col (F).

(2) Common plant and depreciation relating to peaking facilities at various locations is allocated to them by relative intestment. Total peaking common is shown at the top of column (G) and allocated to peaking facilities by the investment in column (H).

(3) Salem & Hope Creek RE Taxes each include an allocated portion of Francis Corp and Training Center RE taxes.

Reactive Supply and ~~voltage~~Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, ~~LLC~~L.L.C. ("PJM") system. This Rate Schedule which consists of seventeen separate tariff rate sections for each of PSEG ER&T's generating facilities sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component~~. Total charges~~ for ~~any 12-month period will not be less than~~each of its generating facilities. The Fixed Capability Revenue Requirements; the ~~sum of~~ Heating Losses Component, and the ~~annual charges specified~~Total Revenue Requirement for each generating facility is set forth in the Rate Schedule sections below. This Rate Schedule shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

~~**MONTHLY REVENUE REQUIREMENT:**~~

~~**1. FIXED CAPABILITY COMPONENT**~~

~~The annual revenue requirement for the Fixed Capability Component is $25,750,450.~~

~~The monthly charge to PJM is $25,750,450 / 12 = $2,145,871~~

~~**2. HEATING LOSSES COMPONENT**~~

~~The annual revenue requirement for the Heating Losses Component is $876,337.~~

~~The monthly charge to PJM is $$876,337 / 12 = $73,028.~~

~~**3. TOTAL REVENUE REQUIREMENT**~~

~~Total Annual Revenue Requirement is $25,750,450 + $876,337 = $26,626,787~~

~~Total Monthly Revenue Requirement is $26,626,787 / 12 = $2,218,899.~~

BERGEN 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,925,105.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $28,652.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,925,105 + $28,652 = $2,953,757.

Total Monthly Revenue Requirement is $2,953,757 / 12 = $246,146.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

BERGEN 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,330,193.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $31,021.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,330,193 + $31,021= $ 2,361,214.

Total Monthly Revenue Requirement is $2,361,214 / 12 = $ 196,768.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

LINDEN 1 & 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $8,589,078.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $68,593.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $8,589,078 + $68,593 = $8,657,672.

Total Monthly Revenue Requirement is $8,657,672 / 12 = $721,473.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

HUDSON 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $1,386,352.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $7,266.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $1,386,352 + $7,266 = $1,393,617.

Total Monthly Revenue Requirement is $1,393,617 / 12 = $116,135.

20150605-5178 FERC PDF (Unofficial) 6/5/2015 4:24:09 PM

MERCER 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $318,855.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $2,290.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $318,855 + $2,290 = $321,145.

Total Monthly Revenue Requirement is $321,145 / 12 = $26,762.

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule which consists of seventeen separate tariff rate sections for each of PSEG ER&T's generating facilities sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement; the Heating Losses Component, and the Total Revenue Requirement for each generating facility is set forth in the Rate Schedule sections below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

CPV Power Holdings, L.P., Calpine Corporation and Eastern Generation, LLC,	)	
Complainants,	)	**Docket No. EL18-169-000**
v.	)	
PJM Interconnection, L.L.C.,	)	
Respondent.	)	

PROTEST OF EXELON CORPORATION AND THE PSEG COMPANIES

Pursuant to Rules 212 and 213 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("the Commission"), Exelon Corporation ("Exelon")[1] and the PSEG Companies ("PSEG")[2] protest the Complaint filed on May 31, 2018 by CPV Power Holdings, L.P., Calpine Corp. ("Calpine"), and Eastern Generation, LLC ("Complainants") in the above-captioned proceeding. Complainants ask the Commission to find that PJM's Minimum Offer Pricing Rule ("MOPR") is "unjust and unreasonable" under Section 206, and ask the Commission to impose as a remedy what they dub, ironically, a "Clean MOPR." The "Clean MOPR" is purpose-built to harm clean, non-emitting generators and to benefit emitting fossil-fuel generators while continuing to make arbitrary and discriminatory distinctions in its application. The Commission should reject the Complaint.

[1] Exelon timely filed a document-less intervention on June 4, 2018.
[2] The PSEG Companies include: Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC.

INTRODUCTION

For two years, Complainants have prophesied an imminent crisis in wholesale capacity markets due to state environmental programs. But they have never provided *evidence* of a crisis. The capacity markets have continued to fulfill the Federal Power Act's mandate of "encourag[ing] the orderly development of plentiful supplies of electricity … at reasonable prices."[3] Energy prices are at historic lows, and capacity prices are well below the estimated cost of new entry. That basic pattern continued in the most recent auction, where reserve margins barely dipped even as prices rose. With each passing year, Complainants' unsupported claims of a reliability catastrophe are thus farther from reality. No reliability problem exists in PJM—and even if it did, the Commission could not accept the Complainants' version of the MOPR.

First, Complainants purport to purify the Commission's markets of state intrusions, but in reality they are seeking to preserve a supply portfolio that ignores the harm that pollution imposes on society. That is not a triumph of efficient markets; it is a market failure. State policies addressing the costs that pollution imposes on society make markets more competitive and market outcomes more efficient.[4] This is, literally, textbook economics.[5] That is why there is broad agreement, even among Complainants, that markets should and must evolve, one way or another, to take into account environmental externalities like carbon. The Commission should seek to accommodate, not frustrate, state policies aimed at reducing pollution.

Second, Complainants dramatically depart from the principles the Commission has always followed and the cooperative federalism scheme the Federal Power Act ("FPA") enacts. The

[4] Decl. of Robert D. Willig ¶¶ 13(a)-(b), 27-49, attached hereto ("Willig Decl.").
[5] *See id.* ¶¶ 32 & n.28-29, 33-49 (citing P.A. Samuelson & W.D. Nordhaus, *Economics* at 346-355 (1995); R.S. Pindyck & D.L. Rubinfeld, *Microeconomics*, 639-657 (2d ed. 1992); A.C. Pigou, *The Economics of Welfare* (4th ed. 1932); W.J. Baumol & W.E. Oates, The theory of environmental policy, Ch. 3 (2d ed. 1995)).

Commission has decided so far that its market mechanisms should be fuel-neutral, but it has always accepted that state policies are *not* fuel neutral. Resources confront a cost structure that reflects whatever fuel-related benefits or penalties states have chosen to impose in light of state environmental priorities. The Commission's market mechanism selects the least-cost set of resources against the backdrop of those policies. And thus far, the Commission has always crafted market rules to respect and accommodate state programs addressing environmental externalities. Doing so adheres to the principle that the Commission must "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role,"[6] consistent with the Federal Power Act's purpose to "complement[]," not "usurp[] … State regulatory authority."[7] For two decades, that is how the Commission's markets have operated, and they should continue to do so.

Third, Complainants depart from settled precedent concerning PJM's MOPR. The Commission has always limited the MOPR to addressing buyer-side market power, and to new gas-fired resources—precisely because those resources are the most effective tools for buyer-side market power. Yet Complainants do not claim that their proposed expansion of the MOPR is necessary to address buyer-side market power, and they have not remotely justified their request to transform PJM's MOPR to reach existing resources and to become a roving tool to offset the effects of disfavored state policies on PJM's auction.

Fourth, while Complainants cloak themselves in the garb of free marketeers, they ask the Commission to massively expand government control over capacity market bidding. At a time of oversupply, the "Clean" MOPR will artificially raise clearing prices to Net CONE times B by mitigating more than 20% of the market. Over time, mitigating vertically integrated utilities and state programs may drive many into Fixed Resource Requirement plans, making PJM's market

[6] *Cal. Indep. Sys. Operator Corp.*, 116 FERC ¶ 61,274, at P 1117 (2006).
[7] *Conn. Light & Power Co. v. FPC*, 324 U.S. 515, 526 (1945) (quotation marks omitted).

less liquid and more fragmented. The only way to avoid that outcome is the unlikely possibility that enough mitigated resources seek and obtain unit-specific exemptions so that they set the clearing price. The end result, again, will be to drive PJM's capacity market toward an almost entirely administrative design.

Fifth, the "Clean" MOPR would massively over-procure capacity to customers' detriment. It would require PJM to ignore capacity provided by resources whose mitigated capacity offer is too high to clear, and instead procure redundant capacity. Moreover, by unnecessarily procuring capacity, the "Clean" MOPR uneconomically suppresses energy prices. PJM has admitted that such suppression will result from an expanded MOPR. Complainants do not even acknowledge this problem, much less address it.

Sixth, the "Clean" MOPR is also discriminatory. It exempts certain favored subsidies granted by state and local governments, as well as every existing federal subsidy (though not new federal subsidies), despite Complainants' admission that it should not matter whether "a federal, rather than a state" subsidy is at issue.[8] And all of this is in addition to continuing to exempt the *implicit* subsidy that fossil-fuel generators receive from the ability to pollute without paying.

Instead of pursuing Complainants' "Clean" MOPR, the Commission should move forward in two steps. *First*, if the Commission nonetheless perceives a reliability problem requiring an immediate fix—which, as Exelon and PSEG explain, does not exist—the Commission should and must pursue an option that is vastly superior: It can approve PJM's Capacity Repricing proposal. Indeed, because PJM has proposed Capacity Repricing under Section 205, the Commission *cannot* even consider the "Clean" MOPR without first rejecting Capacity Repricing. While Exelon and PSEG believe Capacity Repricing is unnecessary and would raise prices without justification,

[8] Compl. at 19.

Capacity Repricing responds to the same basic problem that Complainants allege—that "subsidized resources" are affecting "clearing prices"[9]—but imposes vastly less damage than the "Clean" MOPR. Because Capacity Repricing (like CASPR) allows resources supported by state environmental programs to obtain capacity commitments, it selects the most efficient set of resources and respects the cooperative-federalism principles on which the FPA is based. And because Capacity Repricing acknowledges capacity that will be developed under state environmental programs, it avoids over-procurement. In all respects, it is a more appropriate policy than Complainants' proposal.

Second, whether or not the Commission orders an immediate tariff change, Exelon and PSEG respectfully suggest that the Commission should direct PJM to stop treating the symptoms and work with even greater urgency on a cure for the disease. Because PJM's markets do not presently account for the environmental harms of fossil fuels, states have stepped into the gap, as they are authorized to do under the FPA. Thus the Commission's current dilemma: State environmental programs make the markets more efficient, but such state-level actions will always spur claims that they are distortionary. The answer, as many parties (including Complainants) urged at the 2017 technical conference, is that the Commission's markets should be designed to *achieve* states' legitimate goals—so that the markets themselves incorporate these goals. This could be accomplished, for example, with a price on carbon. Crafting this solution will require work, and it could take many forms. That is all the more reason for the Commission to direct PJM to commence work now on a regional carbon pricing solution and formulate a proposed tariff within a year.

[9] Compl. at 10.

PROTEST

I. Complainants Have Not Demonstrated A "Serious And Imminent Threat" Justifying Action Under Section 206.

Complainants seek radical change based on two assertions—first, that payments under state environmental programs (which they call "subsidies") in "any . . . contexts are bad," "distort prices, and interfere with the efficient entry and exit of generation," and second, that these payments have created an "imminent threat" to PJM's capacity market.[10] Both assertions are false. Because Complainants fail to show the existing market rules are not just and reasonable, the Commission should reject the Complaint.

A. Payments For Environmental Benefits Make Capacity Markets More Efficient.

These fossil-fuel generators aim at state environmental programs paying for the environmental benefits of clean generation—renewable portfolio standards and zero emissions programs that provide payments to "nuclear," "wind," and "solar … resources."[11] Such payments, Complainants say, "distort prices," and failing to mitigate them would render PJM's market rules no longer just and reasonable under Section 206.[12]

This assertion is wrong.[13] Complainants ignore the economics of externalities, and how they are addressed by the state programs that Complainants target.[14] When fossil-fuel generators owned by Complainants produce electricity, they create pollutants—notably, carbon dioxide.[15]

ER18-1314-000, -001 (May 22, 2018) ("Exelon & PSEG Answer"); Protest of Exelon Corp. at 19-25, *Calpine Corp. v. PJM Interconnection*, EL16-49-000 (Jan. 30, 2017).
[14] *See generally* Willig Decl. ¶¶ 32-49.
[15] *Id.* ¶¶ 13(a), 27; *see, e.g.*, *Coal. for Responsible Regulation, Inc. v. EPA*, 684 F.3d 102, 121 (D.C. Cir. 2012), *aff'd in part, rev'd in part on other grounds sub nom. Util. Air Regulatory Grp. v. EPA*, 134 S. Ct. 2427 (2014).

These pollutants harm human health and the environment, but their costs generally fall on society, not generators that produce them—hence, they are "negative externalities."[16] Conversely, clean generators produce electricity without this harmful pollution but do not receive compensation for this benefit from the Commission-regulated markets. Instead, the benefit is externalized—a positive externality.[17] Externalities distort incentives, and so result in inefficiencies. When the fossil-fuel generator decides how much to produce, it considers only its private costs, not the full costs to society.[18] When the clean generator weighs the same decision, the same mismatch occurs in the opposite direction. The fossil-fuel generator will produce too much, and the clean generator, too little. As Dr. Willig explains, when incentives are misaligned, the outcome will not be efficient.[19] The fossil-fuel generator may continue operating when it should retire, and the clean generator may retire when it should continue operating—or the clean generator may never be constructed at all.

The ability of fossil-fuel generators to produce electricity without paying for the social harm caused by pollution amounts to a subsidy—and can be a massively distorting one. Society is bearing part of the cost of that generation, rather than the plant owners. For carbon dioxide alone, estimates put this subsidy's value for fossil-fuel generators across PJM at $12.1 billion to $17.7 billion dollars *annually*.[20] That means that when fossil-fuel generators offer into wholesale markets, their offers are artificially low: they do not reflect the true costs of producing electricity

[16] Willig Decl. ¶¶ 27, 32.

[19] *Id.* ¶ 33; *see* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms*, at 7 (Apr. 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf.
[20] These figures reflect 291.9 million tons of CO_2 emitted in PJM in 2017 and 426.6 million tons emitted in 2016, at a cost of $41.40 per ton. *See* Monitoring Analytics, LLC, *2017 State of the Market Report for PJM, Volume 2: Detailed Analysis*, at 361 (Mar. 2018).

using fossil fuels. As a result, these generators may clear at the expense of cleaner generators that would outcompete the polluters if environmental harm were taken into account.

This misalignment, however, is fixable through regulatory or market mechanisms.[21] Indeed, so compelling is the economic logic of addressing environmental externalities that even *Calpine* had to admit that "carbon [is] an externality" that should be "price[d]."[22] Likewise, at the Commission's 2017 technical conference, a broad cross-section of stakeholders agreed with that basic view.[23] Exelon and PSEG respectfully suggest that the Commission would be on firm ground in taking Calpine at its word and proceeding under Section 206 to require PJM to impose a carbon price, as explained below.[24] Thus far, though, the Commission has not attempted to address these issues itself and has relied on the fact that *states* are addressing these externalities, in the programs that Complainants target, based on states' FPA-protected authority over "facilities used for the generation of electric energy."[25] The Commission has thus "fulfill[ed its] statutory mandate under the FPA to ensure that … rates … are just, reasonable and not unduly discriminatory or preferential" by "respect[ing] the traditional role of states."[26] RPS standards are examples of such programs, and so too are the ZEC programs Complainants target. As

explained in detail in the Willig Declaration, ZEC programs are especially efficient because compensation under them cannot exceed the social cost of carbon—a conservative estimate of the plants' environmental benefits—and thus the plants will remain operational only if doing so is socially efficient.[27]

The "first principles of capacity markets" set forth in the CASPR Order support allowing the actions that states have taken on environmental externalities to affect capacity markets.[28] When private and social costs are better aligned, "competition" is more "robust," and the markets' "price signals" more accurately "guide the orderly entry and exit of capacity resources" to select the "set of resources" that is truly "least cost."[29] By contrast, if the Commission designed rules to countermand state environmental initiatives without setting a carbon price of its own, the Commission would recreate the same type of "regulatory void" the Commission was created to address[30] and doom the Commission's markets to inefficiency. Wholesale rates designed to *prevent* consideration of environmental externalities could never be just and reasonable. Complainants get matters backwards when they suggest that environmental programs make the Commission's markets *un*just and *un*reasonable.

The Commission, of course, has not given *all* state policies a free pass: When state policies reflect exercises of buyer-side market power and "artificially depress[] capacity prices" by supporting new entry that is truly "uneconomic," the Commission has acted.[31] But when policies address environmental externalities, the Commission has explained that these "policy objectives" are "legitimate,"[32] and it has always made sure that those policies would be accommodated. Never

[27] Willig Decl. ¶¶ 55-58.
[28] *ISO New England Inc.*, 162 FERC ¶ 61,205, at P 21 (2018) ("CASPR Order").
[29] *Id.*; *see* Willig Decl. ¶ 34-49, 79.
[30] *FERC v. Elec. Power Supply Ass'n*, 136 S. Ct. 760, 767 (2016).

[32] *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 68 (2017).

has it sought to *thwart* their effects. Hence, the Commission has long recognized that state command-and-control "environmental regulation … driv[es] significant changes in the mix of resources" by increasing costs of fossil-fuel generators, and "resulting in the early retirement of some coal-fired generation."[33] The Commission has not attempted to *counteract* those pro-efficiency results by rejiggering auction rules to offset the costs of regulation even though such costs impact wholesale market prices.[34] Likewise, when states have exercised their authority to incentivize clean generators, the Commission has affirmed that states may "encourage renewable or other types of resources" even when doing so "allow[s] states to affect the [wholesale] price" or makes clean generation "more competitive in a cost comparison with fossil-fueled generation."[35] States are "free" to incentivize clean generation, the Commission has explained, "even if the price signals in the regional wholesale capacity market indicate that [those] resources are [not] needed."[36]

Especially off base is Complainants' claim that when one state acts alone, it is "exporting the impact of its subsidy onto other states."[37] When one state funds resources that address environmental externalities, what it exports are environmental benefits—cleaner air that other states enjoy, even when they do not pay. The harmful "exporting" occurs when fossil-fuel generators foist their harm onto the public in other states, who then must pay the costs that result.[38]

---

[33] *Transmission Planning & Cost Allocation*, 139 FERC ¶ 61,132, at P 5 (2012).

[34] Consider, for example, the cost of scrubber equipment that a fossil-fuel generator installs to satisfy state emissions requirements. Those requirements are imposed for same reason that states implement REC or ZEC programs—to promote cleaner air. The scrubber costs would increase capacity market offers and so impact the clearing price. Under Complainants' theory, such costs should somehow be expunged from the market. No one believes such mitigation would be warranted. Yet Complainants' theory demands it.

[35] *S. Cal. Edison Co.*, 71 FERC ¶ 61,269, at 62,080 (1995).

[36] Amicus Br. of United States at 33, *Hughes v. Talen Energy Mktg., LLC*, 136 S. Ct. 1288 (2016) (No. 14-614), 2016 WL 344494.

[38] *See generally, e.g.*, *Maryland v. Pruitt*, No. 1:15-cv-02873 (D. Md. filed Sept. 27, 2017) (suit by Maryland against EPA to address pollution from upwind states that causes harm in Maryland).

Indeed, the Commission has *ensured* that state environmental programs can affect wholesale markets, even in restructured states. For example, the Commission approved the proposal of the California Independent System Operator Corporation ("CAISO") to lower its "bid floor" in energy markets "from negative $30/MWh to negative $150/MWh."[39] It permitted "variable energy resources" to bid at such extremely low prices because they "generally receive, in addition to market revenues, production tax credits, renewable energy credits, and contractual energy payments."[40] As a result, such variable resources are allowed to submit large negative energy offers, and presumably reduce energy market revenues for other participants—because the Commission understood that the negative $150/MWh offer reflects the "opportunity cost" of not receiving significant revenues tied to clean energy production.[41] In New England, the Commission approved the deduction of revenues from REC payments in the calculation of the offer review trigger price applicable to new renewable resources,[42] and exempted 200 MW of new renewable generation from ISO-NE's MOPR[43]—until expansion of renewables mandates made clear that *yet more* accommodation of renewable resources was necessary, which the CASPR Order supplied.

The Commission's acceptance of state environmental programs as complementary to its markets is consistent with a more general principle: When generators receive compensation for services not captured by the Commission's markets, they properly take account of that compensation in their bids. That is why the Commission has held that resources operating pursuant to reliability services support agreements ("RSSAs") should be permitted to clear in the capacity market: Because the units "are needed for reliability and would clear a capacity market that also

[39] *Cal. Indep. Sys. Operator Corp.*, 145 FERC ¶ 61,254, at P 34 (2013).

[42] *ISO New England Inc.*, 146 FERC ¶ 61,084, at P 32 (2014) (rejecting argument that REC revenues are out-of-market revenues, and approving reduction of ORTP for new renewable resources to account for REC revenues).
[43] *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 4.

reflected local reliability needs, RSSA revenues received by these resources reflect the value of the services provided by these resources to customers."[44] Similarly, revenues from state environmental programs represent the "value of the [environmental] services provided by these resources."[45] The Commission should follow its precedent and reject the proposition that just and reasonable rates require insulating market prices from the effects of state environmental programs.

The recent CASPR Order underscores that the Commission does not share Complainants' view of "just and reasonable" market rules. In CASPR, the Commission acted in the spirit of cooperative federalism and in recognition of states' legitimate role by ensuring that state-supported resources could clear and receive a capacity commitment. ISO-NE explained that "New England states recently have significantly increased both their targets and their efforts to promote the development of renewable resources," and the Commission observed that ISO-NE's existing exemption from its MOPR for renewable resources "would not be able to accommodate" the new clean energy initiatives.[46] So ISO-NE created CASPR "to better accommodate [these] actions."[47] And the Commission approved CASPR as just and reasonable because it succeeded by "accommodat[ing] the entry of new Sponsored Policy Resources into the FCM over time" and so providing a "'better way to integrate these state policies into the competitive wholesale markets.'"[48] Indeed, the CASPR Order blessed *exactly* what Complainants contend is unjust and unreasonable—CASPR "result[s] in [capacity market] participation by resources that would not

[44] *Indep. Power Producers of N.Y., Inc. v. N.Y. Indep. Sys. Operator, Inc.*, 150 FERC ¶ 61,214, at P 66 (2015), *reh'g pending*.

be in the market but for the subsidies."[49] Accepting Complainants' theory would thus require the Commission to abandon the approach it just approved in CASPR.[50]

B. There Is No Imminent Reliability Threat Warranting Action.

The Complaint's unsupported claims of an "imminent" reliability threat are not the first time the Commission has heard that the sky is falling. The Commission has heard such claims since Illinois and New York passed ZEC programs in 2016. The Commission was told that Illinois' legislation posed an "existential threat,"[51] and was "poised to drop onto the RPM market like an anvil onto a woeful coyote beginning with the Base Residual Auction for … 2020/2021."[52] It heard the same thing about New York's ZEC Program and the markets of the New York Independent System Operator, Inc. ("NYISO").[53] But *years* of evidence has proven these claims to be false.[54] As the empirical outcomes demonstrate, PJM's markets have been—and continue to

[49] Compl. at 12.

[50] There is nothing to Complainants' assertion that they are "deprived of their … constitutional rights to an '*opportunity* to recover [their] costs.'" Compl. at 11 (quoting *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005) (alteration in original); and citing *FPC v. Hope Nat. Gas Co.*, 320 U.S. 591, 603 (1944)). Exelon and PSEG have already explained why in Docket No. ER18-1314-000. *See* Exelon & PSEG Answer at 14-15. The standard of *Hope Natural Gas* and *Bridgeport Energy* simply does not apply here. When a utility is compelled to provide service to the public, as with a traditionally regulated utility, this standard forbids "confiscatory" rates for compelled service. *Duquesne Light Co. v. Barasch*, 488 U.S. 299, 310 (1989) (citing *Hope Nat. Gas*, 320 U.S. at 602). Likewise, when a generator is compelled to remain operational for reliability, the same standard governs. *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005). In PJM, however, generators are not compelled to provide capacity. To be sure, existing generation capacity resources generally have a must offer obligation into the Reliability Pricing Model. But if these resources choose to retire, they can do so upon 90 days' notice (and, presumably, upon covering any outstanding capacity obligations)—regardless of reliability implications. PJM Open Access Transmission Tariff, § 113. In such circumstances, the Commission has held that "there can be no question of confiscation of a resource's property." *ISO New England, Inc.*, 135 FERC 61,029, at P 255 (2011).

[54] Exelon Protest at 32-37.

be—robust, despite myriad forms of government intervention, and there is no evidence of market jeopardy going forward, either.[55]

The recent results of the 2021/2022 BRA confirm that PJM has "plentiful supplies."[56] The most recent auction cleared 163.6 GW of unforced capacity and a reserve margin of 21.5% (including commitments under Fixed Resource Requirement plans), or 5.7% higher than the target margin of 15.8%.[57] That pattern is stable: The last seven auctions have cleared reserve margins above 19%.[58]

The markets have achieved these reserve margins at prices that refute any suggestion of a crisis. The 2020/2021 BRA achieved historically high reserve margins (23.3%) at historically low prices ($76.53 per MW-day for rest-of-RTO).[59] In 2021/2022, rest-of-RTO prices rose to $140.00 per MW-day even as reserve margins remained high.[60] There is no reason to artificially raise prices yet higher at a time of continuing oversupply. To the extent these auction results disclose a problem, it is the need to more comprehensively address environmental externalities: Even as 10,643 MW of nuclear generation failed to clear, much of which might have been economic if its environmental benefits were taken into account, the auction "cleared 500 MW more coal

[55] Complainants thus have failed to demonstrate a problem with *reliability*: They have not shown any risk that, today or in the foreseeable future, PJM will lack adequate resources to serve load under the full range of normal operating conditions. But as Exelon has noted elsewhere, the *resilience* of the power grid is a different issue. In other words, while PJM has enough megawatts, it lacks the right kind and mixture of resources to be able to effectively serve load under all circumstances, particularly when extreme weather events are coupled with unexpected outage events. *See* Comments of Exelon Corp. at 13, Docket No. AD18-7-000 (May 9, 2018); Reply Comments of Exelon Corporation at 2, Docket No. AD18-7-000 (June 8, 2018). While the Commission should reject the Complaint, it should take appropriate action in other dockets to ensure that it understands the resilience risks in PJM and to remedy any risks that it finds.

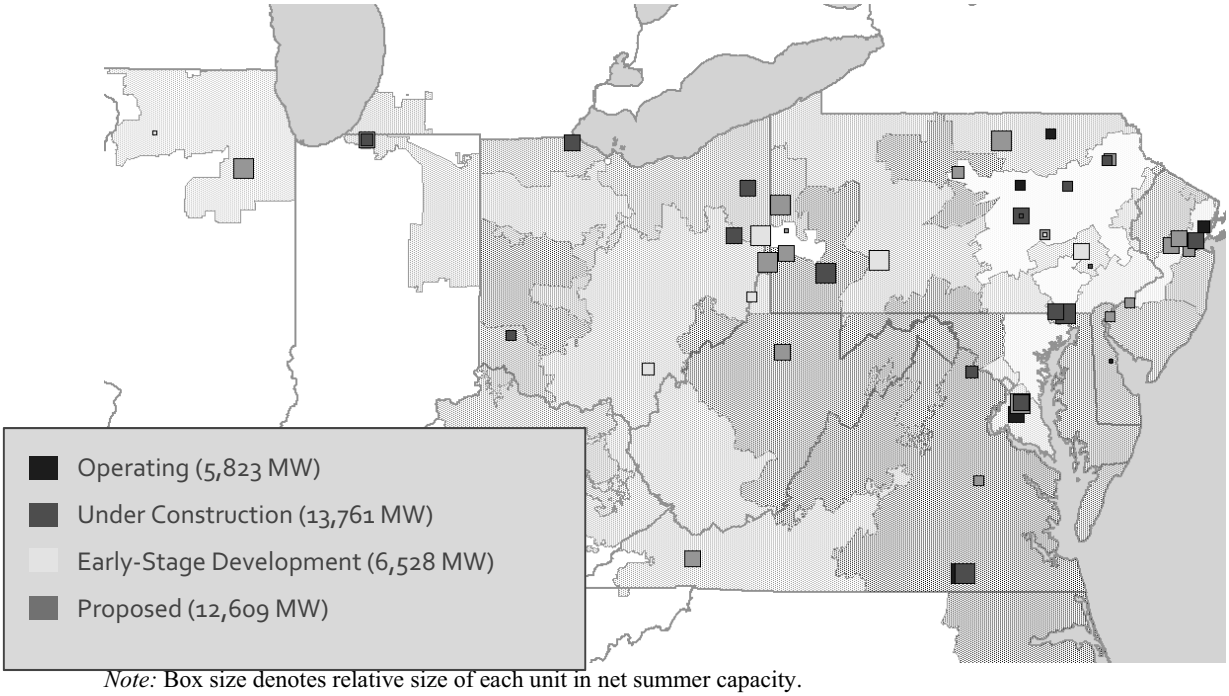
[59] *Id.*

[60] *Id.*

generation than last year's auction."[61] Given the harm that coal generation produces, that result would be inconceivable in an efficient market that valued environmental effects.

New entry also remains robust. Nearly 1,400 MW of new capacity, including uprates, cleared in the most recent auction.[62] While that is a slight decline from prior auctions, when 2-5 GW had cleared,[63] that tick downwards is exactly what one would expect given the historically high reserve margin. Indeed, looking forward, there are almost 40 GW of recently entered or potential near-term entrant gas combined-cycle plants spread across PJM—25% of the market:

Figure 1: The 40 GW Of Recently Entered Or Potential Near-Term Entrant Gas Combined-Cycle Plants In PJM



Note: Box size denotes relative size of each unit in net summer capacity.

Complainants suggest that recent state environmental initiatives have worked a sea change—implying that even if PJM's market is healthy today, state environmental programs will

lead investors to distrust market price signals and refuse to invest. This is a fiction. Sophisticated investors have always considered, as one of many regulatory risks they face, changes to environmental regulations.[64] If governments move to tighten (or loosen) emissions standards, for example, that can alter—dramatically—the returns that investors expected when they invested. The risk of such changes is business-as-usual. Likewise, it is nothing new that resources are receiving state-mandated payments for their environmental benefits (or other reasons).[65] For two decades, states have been implementing REC programs, as well as many other programs that impact wholesale market profits, including demand response and energy efficiency programs that reduce demand, net metering programs, and subsidies for storage. Investors have always understood that states might increase this commitment, and there is no reason to believe that this risk has changed PJM's market dynamics.

That is particularly true because PJM's markets are *designed* to maintain equilibrium, and safeguard resource adequacy, across a broad range of conditions. For example, if state programs reduce capacity prices, but tightening supply indicates that new entry is needed, prices will rise, and the downward sloping demand curve will ensure that the capacity price adjusts to reflect the costs of the generators that are necessary for resource adequacy.[66] In these circumstances, without any concrete evidence of a threat to reliability or investor confidence resulting from state environmental programs, there is no basis for Commission action under Section 206.

[64] *Compare, e.g.*, Calpine Corp., Form 10-K for Fiscal Year Ended December 31, 2007, at 6 (identifying "environmental regulations" as one of "[f]our key market 'drivers' [that] significantly affect our financial performance"), *with* Calpine Corp., Form 10-K for Fiscal Year Ended December 31, 2017, at 20-21 (identifying as a "risk" to "[m]arket prices" "federal and state power, market and environmental regulation and legislation, including mandating an RPS or creating financial incentives, each resulting in new renewable energy generation capacity creating oversupply" and "changes in prices related to RECs and other environmental allowance products").

II. Complainants' "Clean" MOPR Is Not Just Or Reasonable.

Even if the Commission perceived a problem, it cannot accept the "Clean" MOPR because it is not just and reasonable.

A. The "Clean" MOPR's Massive Expansion Of Mitigation Rules Is Inconsistent With Commission Precedent.

The "Clean" MOPR is not just and reasonable because it would result in an unprecedented expansion of buyer-side capacity market mitigation, in two respects—an expansion that would contradict the Commission's precedent concerning PJM's MOPR and that Complainants have not even attempted to justify.

First, Complainants ask the Commission to expand buyer-side capacity market mitigation beyond its original purpose: avoiding buyer-side market power. Combatting buyer-side market power is undoubtedly a legitimate concern under the FPA. Rates are "unjust and unreasonable … in violation of section 205(a) of the FPA" when they are "due to the exercise of market power."[67] The Commission narrowly crafted PJM's MOPR to address the concern that "net buyers might have an incentive to depress market clearing prices by offering … at less than a competitive level," and it found that the MOPR was "a reasonable method of assuring that net buyers do not exercise monopsony power."[68] The Commission has continued to describe the "very purpose"[69] and the "underlying objective[]" of "PJM's MOPR" as "to prevent the exercise of buyer-side market power."[70] Likewise, when the Commission has weighed modifications to PJM's MOPR, it has assessed whether those modifications are necessary to address buyer-side market power.[71]

[71] *See, e.g.*, *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 70 (2011) (revised threshold "reasonabl[y] … protect[s] against unreasonable exercises of market power"); *id.* at P 88 (amending rule that was "ineffective at

Under this precedent, Complainants' requested relief fails at the threshold. Complainants do not allege that buyers are exercising market power, or that a change is necessary to prevent the exercise of buyer-side market power. Instead, Complainants seek to transform mitigation rules into a roving tool to address any "effects" on "the wholesale capacity market" from external influences.[72] But such external influences are omnipresent and inescapable, as PJM has acknowledged,[73] and the project of "draw[ing] … lines between actionable and un-actionable" influences[74] is fraught. That is clear from the fact that Complainants' supposedly "Clean" MOPR leaves many material subsidies unmitigated.

Second, buyer-side mitigation has always, and for good reason, been limited to new resources,[75] including in CASPR.[76] If the intent is to exercise buyer-side market power by lowering prices, the best way to do it is with new resources that can be built quickly and have high capacity factors—new gas-fired plants. That is why the Commission found that PJM had properly limited its MOPR to new "gas-fired resources" as "those resources most likely to raise price suppression concerns," which the Commission determined "appropriately balanc[ed] the need for mitigation of buyer-side market power against the risk of over-mitigation."[77]

protecting against buyer market power"); *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 25 (self-supply exemption approved because it "will operate to identify those self-supply entities lacking the incentive to exercise buyer-side market power"); *id.* at P 109 (declining to "categorially exempt self-supply" because a "blanket exemption" would allow an "unacceptable opportunity to exercise buyer market power"); *id.* at P 56 (approving competitive entry exemption because qualifying entities "do[] not raise buyer-side market power concerns"); *id.* at P 166 (limiting MOPR to gas-fired generation as the "most likely" to "be used to exercise market power").

[75] *PJM Interconnection, L.L.C.*, 153 FERC ¶ 61,066, at P 3 (2015) ("PJM's MOPR is designed to protect against buyer-side market power by setting a price floor, i.e., a minimum bid, and by requiring that all *new*, non-exempted resources bid at that floor" (emphasis added)); *see also, e.g.*, *id.* at P 44 (approving self-supply exemption because it adequately addresses "the price effects attributable to uneconomic *new* self-supply" (emphasis added)).

[76] CASPR Order at P 8.

[77] *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 26.

By contrast, as explained in the Willig Declaration, the Clean MOPR extends the MOPR to existing units with no indicia to measure whether such an extension is guarding against the exercise of buyer-side market power, and no analysis by Complainants of whether such an extension could result in the exclusion of capacity that is efficient in the relevant time frame.[78] Indeed, existing resources are *not* a promising tool for exercising buyer-side market power, and MOPR's remedy does not fit. Existing resources already are participating in the market, and their capacity has contributed to prices the Commission has found just and reasonable. When PJM proposed extending the mitigation period to three years, the Commission rejected that request because, "given the market's demonstration of its need for the resource," there was "no reasonable basis for continuing to apply the MOPR."[79] Likewise, the mitigation remedy—resetting bids to Net CONE times the Balancing Ratio ("B")—does not fit existing resources. Their costs are largely sunk. Thus, as the Commission explained, this remedy "could lead to over-mitigation by requiring a commercially operational resource to bid at an offer floor … substantially above its going-forward costs."[80] Complainants' requested relief flouts the longstanding and well-grounded limitation of buyer-side mitigation to new entrants.

B. The "Clean" MOPR Would Result In An Inefficient Selection Of Resources.

There can be no dispute that market outcomes *should* account for environmental externalities.[81] The "Clean" MOPR, however, mitigates the programs that address these externalities and so willfully selects the wrong resources.[82] Instead of clearing clean resources that are economic after accounting for environmental externalities, the market clears marginal

[78] Willig Decl. ¶¶ 13(f)(iii), 16, 25-26.
[79] *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 211 (2013).

[81] *Supra* at 8.
[82] Willig Decl. ¶ 79.

fossil-fuel-fired resources that, when pollution costs are accounted for, are not economic.[83] As explained above, just and reasonable market rules cannot thwart states' pro-efficiency attempts to recognize the reality that fossil-fuel generators pollute the air and that clean generators do not. Rather, mitigation rules must exempt such programs.

C. The "Clean" MOPR Disrespects Settled Federalism Principles.

The "Clean" MOPR also violates the prime directive of the FPA's scheme of cooperative federalism—that the Commission must, when possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[84] The "Clean" MOPR attempts to thwart a broad swath of state programs by effectively forbidding resources participating in those programs from clearing in the wholesale markets. That includes not just the environmental programs targeted by PJM's April 9 filing, but also vertically integrated utilities that previously qualified for the self-supply exemption based on their "long-standing capacity procurement business models."[85] Yet Complainants offer no genuine evidence that taking a wrecking ball to state policies is necessary for the Commission to "fulfill [its] jurisdictional responsibilities."[86] And in fact, it is clear that even if the Commission believes there is a problem, the Commission has options for addressing any problem in the spirit of cooperative federalism—such as Capacity Repricing. With this more accommodating model available, it is not just and reasonable to adopt an approach that goes out of its way to frustrate state policy choices.

[84] *Cal. Indep. Sys. Operator Corp.*, 116 FERC ¶ 61,274, at P 1117; *see Conn. Light & Power*, 324 U.S. at 526 (Commission authority is "so drawn as to be a complement to and in no sense a usurpation of State regulatory authority," and Commission is obligated "to receive and consider the views of State[s]" (quoting legislative history of FPA)); *Panhandle E. Pipe Line Co. v. Pub. Serv. Comm'n of Ind.*, 332 U.S. 507, 517 (1947) (Commission authority has "no purpose or effect to cut down state power"; rather, its "primary purpose [i]s to aid in making state regulation effective, by adding the weight of federal regulation to supplement and reinforce it").

[85] PJM Filing at 75.

[86] *Cal. Indep. Sys. Operator Corp.*, 116 FERC ¶ 61,274, at P 1117.

Complainants make much of the CASPR Order's statement that the Commission would use "the MOPR as our standard solution" "[a]bsent a showing that a different method would" be effective.[87] But that statement referred to ISO-New England's narrower MOPR applying to only new resources, and even then, only two Commissioners endorsed it. The CASPR Order's actual *holding* was that ISO-New England's proposed reforms were just and reasonable precisely because the Commission concluded that they would succeed in ISO-New England's goal of reasonably "accommodat[ing] state sponsored resources … over time."[88] The Commission should not accept Complainants' invitation to embrace a default rule that is so inconsistent with the FPA's scheme of cooperative federalism.

D. The "Clean" MOPR Would Either Massively Increase Prices, Or Drive Much Of PJM Into FRR Plans, Or Lead To Ad Hoc Administrative Price-Setting.

The "Clean" MOPR will mitigate a massive quantity of resources, vastly more than Capacity Repricing or MOPR-Ex: at least 38 gigawatts, including renewable generators participating in RPS programs, nuclear generators participating in ZEC programs, and any generator owned by a vertically integrated utility that recovers costs through regulated rates.[89] By mitigating more than 20% of the market, the "Clean" MOPR will have one of three ill effects—perhaps all three.

First, as written, the "Clean" MOPR is designed so that the capacity market will clear at Net CONE times B. That is because the "Clean" MOPR incorporates MOPR-Ex's rules, while removing certain exemptions,[90] and mitigates offers with so-called "Actionable Subsidies" to Net CONE times B.[91] If nearly 20% of the market finds their bids reset to Net CONE times B, the

[87] CASPR Order at P 22.
[88] *Id.* at P 102.
[89] Schnitzer Decl. ¶¶ 10, 15, 20.
[90] Compl. at 18.
[91] PJM Filing at 104.

result is that the market will likely clear at Net Cone times B.[92] By contrast, the most recent capacity auction yielded "clearing prices that are between approximately 44% to 82% of Net CONE."[93] The result would be costs for customers that are $4.4 billion higher than today based purely on the increase in market prices—even leaving aside the additional costs from over-procurement and selection of an inefficient portfolio of resources, discussed elsewhere.[94] That price increase is wholly unjustified, particularly given the market's continuing oversupply. And as explained in the accompanying Schnitzer Declaration, this $4.4 billion increase is a likely result under current market conditions.[95]

Second, over the medium term, the "Clean" MOPR may drive states with substantial portfolios of affected resources to direct their utilities to elect the Fixed Resource Requirement ("FRR"), withdraw from the capacity market, and procure clean resources bilaterally.[96] The shift to FRR status is straightforward for vertically integrated utilities (and so will be virtually certain to occur across a broad swathe of PJM). It also may well happen in regions with retail competition but substantial portfolios of affected renewable and nuclear resources (where FRR could pose complexities for retail competition). Regardless, driving so much supply out of the market will only make the capacity market less liquid and more balkanized.[97]

Third, the only way to avoid these outcomes is if a large proportion of the mitigated 38 GW seeks and obtains unit-specific exemptions by showing that their avoidable cost rate and specific opportunity cost are less than Net CONE times B.[98] But that is unlikely, as explained in

[92] Schnitzer Decl. ¶¶ 22-24.
[93] PJM, 2021/2022 RPM Base Residual Auction Results at 1, http://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2021-2022/2021-2022-base-residual-auction-report.ashx.

[95] *Id.* ¶ 24.
[96] *Id.* ¶ 30-34.
[97] *Id.* ¶ 33.
[98] PJM Filing at 51.

the Schnitzer Declaration: Because the FRR option is all-or-nothing, entities with *some* units that will not clear at the prices that result from the unit-specific exemption process are more likely to withdraw *all* their resources from the market and elect FRR status.[99] And if reliance on the unit-specific exemption *were* widespread, that would again be a dramatic—and detrimental—shift in the RPM's underlying structure. While the current RPM has administrative elements, its core price formation mechanism sets the clearing price based on competitive offers determined by market participants.[100] The Clean MOPR would drive the market towards a nearly wholly administrative design where offer prices of the resources in the zone of marginality are determined by PJM (with input from the Independent Market Monitor).[101] In turn, both the market clearing price and which resources receive capacity obligations would be largely determined by administrative decisions.[102] The Commission should not approve market rules with that foreseeable effect.

E. The "Clean" MOPR Would Over-Procure Capacity And Distort Energy Prices.

The "Clean" MOPR also is not a just and reasonable solution because, unlike CASPR or Capacity Repricing, it will over-procure capacity and so impose billions in associated costs on customers. That is because mitigating clean generation policies differs fundamentally from mitigating exercises of buyer-side market power. If a buyer's goal is to suppress capacity prices by introducing new capacity, then applying the MOPR means the capacity will not get built. Building that capacity cannot further the buyer's price-suppressive goals.

Clean energy is different. As the Commission has recognized, state-supported clean energy "will be developed by the operation of state environmental and clean energy mandates, whether

[99] Schnitzer Decl. ¶ 32.
[100] *Id.* ¶ 25.
[101] *Id.* ¶ 26.
[102] *Id.*

that capacity clears the [market] or not."[103] Even if the capacity does not clear, it still provides environmental benefits as it produces energy. States thus continue to procure clean resources even when it will be mitigated in the capacity market. The experience in New England proves this. Despite ISO-New England's limited MOPR exemption for 200 MW of renewables, states still issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, and Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[104] There is no reason to think that PJM states will act any differently.[105]

Applying the MOPR will therefore "send an incorrect signal to construct new capacity that is not needed."[106] State-supported clean generation will go forward, yet the wholesale markets—ignoring that capacity—will signal that further capacity is needed. The Commission has always avoided creating this type of false price signal, either by exempting clean generation policies from mitigation,[107] or by ensuring that any mitigation provides a pathway to accommodate clean generation policies and avoid over-procurement, as in CASPR.[108] The "Clean" MOPR abandons both solutions and overprocures billions of dollars of excess capacity.[109]

Complainants do not dispute that this massive overprocurement will occur; their only response is that there is "nothing wrong" with it, and that the overprocurement is states' fault.[110]

---

[103] CASPR Order at P 45.
[104] *Id.* at P 4.
[105] Willig Decl. ¶ 81.
[106] *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 9 (2017).
[107] *Id.* at P 48 (exemption "for state-subsidized resources … so that customers may avoid having to pay for duplicative capacity").
[108] Notably, Capacity Repricing also avoids these problems. PJM Filing at 56 ("Capacity Repricing avoids … duplication, because it allows state-selected resources to commit as capacity….").
[109] Estimates indicated that PJM's MOPR-Ex would result in an overprocurement estimated to cost customers $14-24.6 billion over 10 years, Protest of Clean Energy Advocates at 105 & Grogging Aff., attached thereto, at ¶¶ 3-4, 15, *PJM Interconnection, L.L.C.*, Docket No.18-1314 (May 7, 2018) ("Clean Energy Advocates Protest"); *see* Exelon Protest at 46-48, and the Clean MOPR's costs would only be higher.
[110] Compl. at 21-22.

Not so. First, Complainants ignore the FPA's jurisdictional lines. States regulate generation, while capacity requirements in the organized markets are the Commission's responsibility.[111] So if capacity is procured inefficiently because the Commission has chosen to ignore capacity provided by state-supported resources, that flaw is with the rules governing the Commission's markets.

Second, there *is* something "wrong" with overprocuring capacity.[112] Generation resources will be built when they are not needed, customers will pay too much with no justification, and society will be worse off for no reason. Experience demonstrates that states will continue to support clean generation even if those resources are mitigated in the capacity market, and the Commission cannot ignore that reality.

That is particularly true given the certainty that this excess capacity will yield a second problem: As PJM admitted in connection with MOPR-Ex, expanding the MOPR is likely to "enabl[e] price suppression in the wholesale energy and ancillary service markets."[113] Because PJM's system will include both the clean generation that the capacity markets ignore, and the replacement generation that the capacity markets acquire needlessly, there will be "greater supply in the energy market than economic conditions … justify," which will, in turn, "suppress prices."[114] Those problems will be even greater with the "Clean" MOPR.[115] Even if the Commission believes there is a problem with capacity markets warranting action, it cannot accomplish its goals by distorting the energy markets.

[111] *See Conn. Dep't of Pub. Util. Control v. FERC*, 569 F.3d 477, 481 (D.C. Cir. 2009).

[115] Schnitzer Decl. ¶ 15.

F. The "Clean" MOPR Is Discriminatory.

Complainants claim that their "Clean" MOPR, by removing MOPR-Ex's categorical exemptions, places "all units … on an equal footing" by applying "a MOPR … to all subsidized resources."[116] This claim is false. The "Clean" MOPR is just more artful in its discrimination.

First, the "Clean" MOPR discriminates by smuggling in exclusions from the definition of "Material Subsidy" that chiefly exempt subsidies that fossil-fuel generators receive. That definition excludes:

- "incentives designed to incent, or participation in a program, contract or other arrangement that utilizes criteria designed to incent or promote, general industrial development in an area";
- "[P]ayments, concessions, rebates, subsidies or incentives designed to incent, or participation in a program, contract or other arrangements from a county or other local governmental authority using eligibility or selection criteria designed to incent, siting facilities in that county or locality rather than another county or locality."[117]

As Exelon explained in Docket No. ER18-1314-000, some marginal gas-fired generators would not exist without subsidies from various economic development programs.[118] Likewise, the pervasive practice of states and localities of offering subsidies "designed to incent … siting facilities in" particular locations assuredly results in development of some resources that, otherwise, would not exist *at all*. The same is true of indirect support that states provide to fossil-fuel generators, such as Pennsylvania's sales-tax exclusion for coal.[119] Indeed, some of these programs are enacted or expanded to spur development of *particular* plants. In Pennsylvania, for example, a coal-to-gas plant conversion was the "anchor tenant" for a new "Keystone Opportunity

[116] Compl. at 2, 20.
[117] PJM Filing at 70; *see* Compl. at 18 (stating that the Clean MOPR relies on PJM's definition of "Material Subsidy").
[118] A recent example is the $500 million St. Joseph Energy Center, which was built after the county granted a $60 million tax abatement that would be exempt under the "Clean" MOPR. *See* Ted Booker, South Bend Tribune, *Power plant in New Carlisle area aims for March opening* (Feb. 1, 2018), https://www.southbendtribune.com/news/local/power-plant-in-new-carlisle-area-aims-for-march-opening/article_bb595c6c-9aab-537d-bde0-4f38a7dd6885.html.
[119] Clean Energy Advocates Protest at 90.

Expansion Zone"—which enabled this plant to be built by eliminating state and local taxes through 2023.[120] Indisputably, those subsidies affect who participates in PJM's auctions and the prices that result. Yet because these subsidies support Complainants, the "Clean" MOPR ignores them.

Second, the "Clean" MOPR is discriminatory because it would mitigate only those federal "subsidies or other support granted after the date of this Complaint."[121] But if the Commission decides to get into the business of ridding the capacity markets of external influences, it should not matter whether "a federal, rather than a state" subsidy is at issue.[122] Nor does it matter whether the subsidies are enacted before or after May 31, 2018. The reason for Complainants' selectivity, perhaps, is that existing federal tax incentives subsidize fossil-fuel generators to the tune of $4.7 billion a year.[123] Complainants' supposedly "Clean" MOPR also exempts the federal government's Production Tax Credit for wind and Investment Tax Credit for solar. But just like state RPS programs, these federal programs provide significant payments and have significant effects.[124] Exempting federal, but not state, programs is thus discriminatory.

Indeed, Complainants' exemption of existing federal subsidies is internally inconsistent. The Complaint endorses the Protest of the PJM Power Providers Group ("P3") in Docket No. ER18-1314-000, identifying itself as a "vehicle" that is "[c]onsistent with P3's request" in that docket for the Commission to "require PJM to adopt [the] 'Clean MOPR'" proposed by P3 and its expert, Dr. Shanker—the same expert Complainants use here.[125] In that docket, P3 "propose[d] to remove PJM's proposed exclusion … dealing with federal … tax credits" *entirely*, and Dr. Shanker

[125] Compl. at 9.

opined that this step "is reasonable."[126] Yet now, Complainants propose to remove the exemption only for new federal subsidies, and Dr. Shanker—flip flopping—studiously "express[es] no opinion" on the issue.[127] This patent inconsistency merely attempts to paper over the discrimination inherent in the Clean MOPR proposal.

Third, the "Clean" MOPR continues to ignore the *implicit* subsidy that fossil-fuel generators receive from the ability to pollute without paying, which—as noted above—comes to $12.1 to $17.7 billion annually.

While the "Clean" MOPR's exceptions are indefensibly arbitrary, a broader point is at stake. Once the Commission starts down the path of expanding the MOPR beyond addressing buyer-side market power and applying it to some disfavored policies—even state environmental policies that promote market efficiency—there is *no* non-arbitrary stopping point. Energy policies are pervasive and all of them, as PJM puts it, "affect behavior of many market participants"[128] and in turn affect the clearing prices in the wholesale markets. PJM's Answer illustrates the point: It prefers to retain the Self-Supply and Public Entity Exemptions because it favors the state policies underlying these exemptions[129] (even though these policies affect wholesale prices).[130] As to federal subsidies, it asks the Commission to undertake a task that is hopelessly indeterminate: to "examine … federal programs as well as any potential actions taken by federal officials with particular attention on expressions of congressional intent and the relationship of that statutory

[129] Answer of PJM at 6. Because PJM filed its Answer on June 19, 2018, Exelon and PSEG have had only an incomplete opportunity to review and analyze it. Exelon and PSEG reserve the right to seek leave to respond further to PJM's Answer after analyzing it more fully.
[130] Exelon Protest at 27-28; Exelon Answer at 22.

authorization with the statutory requirement of just and reasonable rates under the FPA."[131] The way to avoid an endless quest to draw such untenable distinctions among different state and federal policies is to decline Complainants' invitation to try to create a wholesale capacity market that is "hermetically sealed from" outside forces.[132]

III. The Commission Should Direct PJM To Intensify Work On Solutions That Allow States To Achieve Their Legitimate Goals Through The Wholesale Markets, While Approving Capacity Repricing If It Deems Immediate Action Necessary.

For all of these reasons, the Clean MOPR takes PJM's markets in the wrong direction. Instead, the Commission should move forward in two steps. If the Commission determines that immediate action is needed, it should approve Capacity Repricing. And regardless, it should direct PJM to work with greater urgency on solutions that allow states to achieve their legitimate goals through the wholesale markets—for example, via a carbon price.

A. If The Commission Believes Immediate Action Is Needed, It Must Approve Capacity Repricing.

Complainants premise their request for Section 206 relief on the assertion that the Capacity Repricing approach that PJM has proposed under Section 205 is "unjust and unreasonable."[133] But if the Commission disagrees and determines Capacity Repricing is just and reasonable (or, with an appropriate conditional acceptance, can be *made* just and reasonable), there are no grounds for reaching Complainants' "Clean" MOPR over what PJM has identified as its "preferred approach."[134] In Docket No. ER18-1314-000, Exelon and PSEG have shown—through their Answer and the accompanying Declaration of Michael M. Schnitzer—that while Capacity Repricing unnecessarily raises prices, the broader attacks on Capacity Repricing by Complainants

[131] Answer of PJM at 8.

and others are meritless. Exelon and PSEG will not repeat those points here; instead, they attach these filings from Docket No. ER18-1314-000.

B. Regardless, The Commission Should Order PJM To Develop Solutions That Achieve States' Legitimate Goals Through The Wholesale Markets.

Whether or not the Commission orders an immediate tariff change, Exelon and PSEG respectfully suggest that the Commission should direct PJM to stop treating the symptoms and work with even greater urgency on a cure for the disease. The root cause is that PJM's markets do not presently account for the environmental effects of generating electricity via fossil fuels, as any rational and efficient market should.[135] By failing to address this negative externality, the wholesale markets subsidize fossil-fuel generators to the tune of $12.1 billion to $17.7 billion every year,[136] which exceeds—by orders of magnitude—the state payments that spurred the Complaint. States often determine that they must step into this gap, as the Federal Power Act authorizes them to do. That is why, as PJM's Answer puts it, "state-mandated RPS/REC programs [are] growing and will continue to increase."[137] But when individual states must address national problems, their efforts are necessarily uneven. As the Willig Declaration explains, problems like leakage largely preclude states from taxing carbon.[138] And while attribute payments avoid some of these problems,[139] state-level actions will always spur claims that they are distorting the wholesale markets. That leads, inevitably, to the Commission's current dilemma: State programs make the Commission's markets more efficient, yet because they affect market outcomes, they are said to be distortionary.

[135] Willig Decl. ¶¶ 32-33.
[136] *Supra* at 7.
[137] Answer of PJM at 7.
[138] Willig Decl. ¶ 37.
[139] *Id.*

The solution to this problem is clear. A broad range of stakeholders—including Calpine, the Independent Market Monitor, and PJM—have agreed that a carbon price is the "theoretical ideal market approach."[140] Likewise, at the 2017 technical conference, a broad range of stakeholder endorsed "Path 4"—that the Commission's markets should be designed to *achieve* states' legitimate goals, so that the markets themselves incorporate these goals.[141] Yet PJM has spent the last year on Band-Aids. The only way to permanently and sustainably address the present concerns with PJM's market rules is to modify those rules to price carbon. This approach could be accomplished, for example, by implementing an adder to the offers of fossil-fuel generators in the energy markets that accounts for the costs of the carbon emissions they produce.

Inevitably, some fossil-fuel generators—having embraced a carbon price as the ideal economic solution—will claim that the Commission lacks legal authority to implement it. Not so. The FPA gives the Commission authority to take account of environmental factors when regulating wholesale markets, and to approve, as just and reasonable, an ISO/RTO tariff that does so. Section 201(a) affirms that "the business of transmitting and selling electric energy for ultimate distribution

to the public is affected with a public interest."[142] The FPA's main purpose is "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices."[143] The Commission could reasonably conclude that prices are not just and reasonable when they do not account for tens of billions of dollars of harm that polluting fossil-fuel generators inflict. The Commission has wide discretion to consider non-cost factors—such as environmental harm—when assessing the justness and reasonableness of rates.[144] Indeed, the Supreme Court has expressly recognized that the FPA's "subsidiary purposes" include "conservation [and] environmental … questions."[145] Likewise, in Section 202(a), Congress authorized the Commission to establish ISOs/RTOs "[f]or the purpose of assuring an abundant supply of electric energy ... with the greatest possible economy *and with regard to the proper utilization and conservation of natural resources*."[146] These authorities provide the Commission ample power to implement a carbon price.[147]

Exelon and PSEG recognize that crafting market rules that integrate a carbon price will require work. But that is all the more reason that the Commission should direct PJM to commence work now and to formulate a proposed tariff within a year.

CONCLUSION

Exelon and PSEG respectfully request that the Commission deny the Complaint and reject Complainants' request to impose their "Clean" MOPR.

PJM Interconnection, L.L.C.	)	**Docket Nos. ER18-1314-000**
	)	**ER18-1314-001**
	)	
	)	

MOTION FOR LEAVE TO ANSWER AND ANSWER OF EXELON CORP. AND THE PSEG COMPANIES

Pursuant to Rules 212 and 213 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission"),[1] Exelon Corp. ("Exelon") and the PSEG Companies[2] move for leave to answer, and submit their answer, to the comments and protests filed in the above-captioned dockets.

MOTION FOR LEAVE TO ANSWER

Exelon and the PSEG Companies respectfully request that the Commission permit this Answer, and the attached Declaration of Michael M. Schnitzer ("Schnitzer Decl."), to protests and comments filed in the above-captioned dockets on May 7, 2018. The protests and comments include new evidence, including many new expert affidavits. Moreover, the protests and comments stake out novel positions—not just advocating for and against Capacity Repricing and MOPR-Ex, but suggesting modified versions of both, as well as entirely new approaches. Several protests and comments also respond to PJM's Section 205 filing by urging the Commission to act under Section 206. The Commission has allowed answers to protests where the answer provides

[1] 18 C.F.R. §§ 385.212, 385.213 (2017).
[2] The PSEG Companies include: Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC.

information that assists the Commission in its decision.[3] Exelon and the PSEG Companies respectfully suggest that this Answer will do so. In particular, the Schnitzer Declaration provides important new evidence concerning the Capacity Repricing proposal, in response to comments submitted by other parties.

ANSWER

The commenters clamoring for an expanded MOPR seek to exploit the Commission's commitment to markets and competition for ends that are profoundly anti-market and anti-competitive. While they purport to be purifying the Commission's markets from state intrusions, in reality they are seeking to entrench an unfair advantage they have enjoyed for decades: continuing to exploit the market's failure to value certain environmental attributes, and thereby imposing harm on society without paying for the costs. It is not a "level playing field" to treat resources that pollute as though they did not. When a coal or gas plant can underbid a wind farm, or a nuclear generator, by polluting the air we breathe, this is not a triumph of markets' power to drive efficient results. It is a market failure. When state policies attempt to internalize the pollution externality—through subsidies, taxes, or otherwise—they make markets more competitive and market outcomes more efficient.[4] This is, literally, textbook economics.[5] That is why there is broad agreement—even among advocates of MOPR-Ex—that markets should and must evolve, one way or another, to take into account environmental externalities like carbon.[6]

[4] Decl. of Robert D. Willig ¶¶ 32-37 ("Willig Decl."), attached to Protest of Exelon Corp. ("Exelon Protest").
[5] *See id.* ¶¶ 30 n.28, 31 n.29, 34 n.32 (citing P.A. Samuelson & W.D. Nordhaus, *Economics* at 346-355 (1995); R.S. Pindyck & D.L. Rubinfeld, *Microeconomics*, 639-657 (2d ed. 1992); A.C. Pigou, *The Economics of Welfare* (4th ed. 1932); W.J. Baumol & W.E. Oates, The theory of environmental policy, Ch. 3 (2d ed. 1995)).
[6] Exelon Protest at 44 & n.152; *see* PJM Filing at 54-55; *infra* at 20-21.

The Commission, of course, has decided so far that its market mechanism should be fuel-neutral. But the Commission can afford to ignore the different environmental profiles of different generation types only because *states'* policies are *not* fuel neutral. Resources thus bring with them to the Commission's fuel-neutral markets a cost structure that reflects whatever fuel-related benefits or penalties states have chosen to impose in light of state environmental priorities. The Commission's market mechanism selects the least-cost set of resources against the backdrop of those state policies. As Exelon's Protest showed, the Commission thus far has always crafted market rules to respect and accommodate state programs addressing environmental externalities.[7] Doing so adheres to the principle that the Commission must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role,"[8] consistent with the Federal Power Act's purpose to "complement," not "usurp[] … State regulatory authority."[9] For two decades, this is how the Commission's markets have operated. Thus, there is no truth to the allegation that this proceeding is a referendum on the Commission's commitment to markets.[10]

Advocates of MOPR-Ex ask the Commission to sweep away this market-based model of cooperative federalism in favor of one that countermands state environmental policies, so that the Commission's market yields the outcome that would result if the state policies did not exist. The Commission should not be fooled by these parties' rhetoric: while they cloak themselves in the language of market integrity and fairness, what these generators really want is to protect the market advantage they gain by polluting without paying. They urge PJM market rules that would neuter state policies compensating for the real benefits of cleaner fuels, and thus would strangle

[10] *See, e.g.*, Comments of the Independent Market Monitor for PJM at 6 ("IMM Comments"); Protest of the PJM Power Providers Group at 23 ("P3 Protest"); Protest and Comments of Electric Power Supply Association at 30-32 ("EPSA Protest").

competition from cleaner generators that, when pollution costs are taken into account, would outcompete the polluters.

As Exelon and the PSEG Companies showed in their Protests, such action is not only inconsistent with sound economics and principles of cooperative federalism, but also is unjustified in light of current PJM market conditions. The Commission's markets are achieving what the Supreme Court has identified as "the principal purpose of" the Federal Power Act: "the orderly development of plentiful supplies of electricity … at reasonable prices."[11] Supply is plentiful, prices are low, and new entry remains significant. The commenters declaring that the markets are on the verge of collapse never address this reality, nor offer any evidence at all to support their panicked assertions that PJM is in the midst of a crisis.

For these reasons, the Commission should reject both PJM proposals. But if the Commission nevertheless determines to take some action to bring capacity prices closer to the levels that would exist without state environmental policies, the Commission should approve Capacity Repricing. Advocates of MOPR-Ex, of course, prefer MOPR-Ex, because it shields them from competition and furthers their goal of ridding the capacity markets of their non-emitting competitors. But if the Commission is compelled to act and finds Capacity Repricing, "PJM's preferred approach,"[12] to be just and reasonable (or that it can be rendered just and reasonable with an appropriate conditional acceptance), the Commission must approve it without reaching MOPR-Ex. Capacity Repricing satisfies the Commission's standard for market design—that it be "workably competitive."[13] And even if the comparison to MOPR-Ex were relevant, from a policy standpoint, Capacity Repricing is clearly superior to MOPR-Ex.

[11] *NAACP v. Fed. Power Comm'n*, 425 U.S. 662, 669-70 (1976).
[12] PJM Filing at 53.
[13] *See, e.g.*, *PJM Interconnection, L.L.C.*, 110 FERC ¶ 61,053, at P 84 (2005).

Under MOPR-Ex: (1) The wrong resources clear (because clean resources should have the chance to out-compete polluters, after environmental harm is accounted for); (2) Too many resources clear (given the likelihood that the clean resources excluded by MOPR-Ex will continue to supply capacity without compensation from the market); and (3) Energy market price signals are corrupted (suppressed by forced overprocurement). The MOPR's proponents claim this harm is good because it "disincentiv[izes]" states.[14] But the Commission has no business trying to deter states from protecting citizens' health and welfare, and it is doubtful that the Commission could do so in any event.

Capacity Repricing avoids all these problems. The correct resources clear, after accounting for environmental harm; the right quantity of resources clears; and energy market prices are not distorted. Advocates of MOPR-Ex nevertheless argue that Capacity Repricing must be rejected because it yields a price-quantity pairing that is not on the demand curve, and because it may create opportunities for strategic bidding. But these critiques, even if true, are not fatal to Capacity Repricing, and they certainly are no reason to select MOPR-Ex in its stead. As to the price-quantity issue, this theoretical criticism has only modest practical effects. And MOPR-Ex *also* yields a price-quantity pairing that is not on the demand curve, once one accounts for the reality that states will continue support environmentally friendly resources that will effectively provide capacity to the system. Likewise, as to alleged incentives for strategic bidding, any effects "are likely to be modest and would reduce the cost of repricing to customers."[15] To the extent there is any effect, strategic bidding will tend to result in a clearing price that is still significantly higher than the status quo, but lower than the MOPR-Ex clearing price would be. In effect, Capacity Repricing strikes a middle ground. If the Commission remains concerned about bidding incentives, they can be

[14] IMM Comments at 14-15; EPSA Protest at 28-29.
[15] Schnitzer Decl. ¶ 15.

fixed. One example of a potential fix would be including an "opportunity cost" payment in the Capacity Repricing model. Such payments, by making resources indifferent between clearing and not, could virtually eliminate these bidding incentives. In a variety of contexts, the Commission has approved similar payments to align incentives with efficient behavior.

Thus, while there are good reasons to reject any mitigation of environmental payments, including Capacity Repricing, the broad criticisms of Capacity Repricing are overblown. Capacity Repricing is flawed because clean resources should be allowed to account for environmental attribute revenues and other state compensation in making capacity bids. These revenues reflect payments for separate services, and thus those resources, to cover their going forward costs, do not need to receive those amounts from the capacity market. But if the Commission disagrees, Capacity Repricing is the only proposed workable—and "workably competitive"—alternative.

I. The Comments Confirm That PJM's "Two Alternative[]" Approach Violates Section 205.

The comments underscore why Section 205 prohibits alternative filings like PJM's. Arrayed before the Commission are dozens of comments advocating for or against an unbounded universe of potential tariffs: Capacity Repricing,[16] MOPR-Ex,[17] and assorted permutations of MOPR-Ex without certain exemptions (with various commentators seeking to sever versions of the RPS Exemption, Self-Supply Exemption, Public Entity Exemption, Competitive Entry Exemption, and the carve out for federal subsidies, among others).[18] By placing this free-for-all

[16] A number of commentators show that no change is warranted, but that Capacity Repricing is vastly superior to MOPR-Ex. *See* Comments of American Electric Power Service Corp. at 1 ("American Electric Comments"); Protest of Dominion Energy Services, Inc. at 9-11 ("Dominion Comments"); Exelon Protest at 8; Comments of Nuclear Energy Institute at 1 ("NEI Comments"); Protest and Motion to Reject of the PSEG Companies at 2 ("PSEG Protest").

[17] Comments of American Petroleum Institute, J-Power USA Development Co., Ltd., and Panda Power Generation Infrastructure Fund, LLC at 7-8 ("API Comments"); EPSA Protest at 2; IMM Comments at 3.

[18] *See, e.g.*, Comments of LS Power Associates, L.P. at 18 ("LS Power Comments"); Comments of Natural Gas Supply Association at 8 ("NGSA Comments"); Protest of the NRG Companies at 25 ("NRG Protest"); P3 Protest at 20; Comments and Protest of Rockland Capital, LLC at 5 ("Rockland Comments"); Comments of Vistra Energy Corp. and Dynegy Marketing & Trade, LLC at 13 ("Vistra Comments").

before the Commission, instead of proposing a single tariff "stating plainly the change or changes to be made,"[19] PJM's filing is inconsistent with the "passive and reactive role" that Section 205 requires the Commission to play.[20] If PJM wishes to give the Commission broad discretion to set policy, it must attempt to carry Section 206's heavy burden, or else seek a declaratory judgment. Because Section 205 does not sanction PJM's approach, the Commission must reject its filing.

II. The Comments Confirm That The Commission Should Not Hesitate To Reject Both Of PJM's Proposals And Preserve The Status Quo.

Stakeholders of every stripe have identified significant problems with both of PJM's proposals. Yet proponents of mitigation urge the Commission to press ahead anyway based on claims that the sky is falling—that state programs are "wreak[ing] havoc with PJM's markets,"[21] which are supposedly facing a "serious threat"[22] and "will collapse."[23] These are serious charges that, if true, would yield evidence for all to see. But what the comments of mitigation proponents reveal, more than anything, is that no *evidence* backs up this rhetoric. And the *actual* evidence confirms that the crisis is manufactured. As shown by Exelon, the PSEG Companies, and others, reserve margins are historically high (23.3% for the 2020-21 BRA) at prices that are historically low ($86/MW-day)—yet still, new entry continues at a significant pace (including almost 40 GW of recently entered or potential near-term entrants across PJM).[24] These high reserve margins, moreover, have been sustained despite years of claims that the capacity markets face "imminent

and substantial," and even "existential," "threat[s]."[25] The efficacy of PJM's capacity markets, and investors' faith in them, speaks for itself.

While PJM does not need to point to a crisis to justify tariff revisions under Section 205, the absence of any on-the-ground problem means that the Commission should not hesitate to reject both of PJM's proposals. Instead, until PJM formulates a new tariff that is genuinely just and reasonable, the Commission should leave PJM's capacity market rules where they are—with the MOPR limited, as it has been, to counteracting buyer-side market power by new resources.[26] That cautious approach avoids all the problems that come from expanding mitigation. And it respects stakeholders' wishes: Of the comments filed that take a position on the merits, a substantial majority urge the Commission to reject both proposals.[27] That preference has been consistent since November 2017, when 64% of stakeholders stated that they preferred the status quo.[28]

III. Although The Capacity Repricing Proposal Is Unwarranted And Flawed, Claims That The Proposal Is Unworkable Are Incorrect.

Exelon and the PSEG Companies agree with the commenters who criticize Capacity Repricing as unwarranted and unnecessary because it needlessly raises prices for customers at a

time of oversupply with no corresponding benefit, and because it incorrectly mitigates payments recognizing the environmental value of clean generation. But to the extent the Commission disagrees and deems some departure from the status quo necessary, it is not "free to accept the better of the two approaches filed under Section 205," as the IMM incorrectly asserts.[29] PJM has identified Capacity Repricing as its "prefer[red]" approach, and thus the Commission must "assess first whether it can accept Option A, even if subject to suspension and further proceedings."[30] If the Commission determines Capacity Repricing is just and reasonable (or, with an appropriate conditional acceptance, can be *made* just and reasonable), it cannot reach MOPR-Ex. And while Capacity Repricing is unnecessary, the broader attacks on it are meritless. Capacity Repricing's auction mechanism can meet the Commission's "workably competitive" standard,[31] and can accommodate state programs while insulating capacity prices from those programs' effects.

A. The Criticisms Of Capacity Repricing's Auction Design Are Overstated And Can Be Remedied.

Several commentators note strategic bidding incentives that exist under Capacity Repricing's two-stage design—three such incentives, in particular. First, if a portfolio owner has high-cost resources that cannot hope to receive a capacity commitment at Stage 1, it might inflate the bids for those resources in the hope of contributing to higher Stage 2 clearing prices for other resources (what the Wilson Affidavit calls "clear-out-the-top").[32] Second, some "in between" resources—which might be economic at the Stage 2 clearing price, but cannot clear at Stage 1—may drop out.[33] Third, if resources would be economic at the anticipated Stage 2 clearing prices, they may have incentives to make offers below their forward costs in order to increase their

[29] IMM Comments at 3.
[30] PJM Filing at 46.
[31] *See, e.g.*, *PJM Interconnection, L.L.C.*, 110 FERC ¶ 61,053, at P 84 (2005).

[33] EPSA Protest at 11 n.46 and Affidavit of David W. DeRamus and Collin Cain ¶¶ 49-53.

chances of receiving a capacity commitment at Stage 1 (what the Wilson Affidavit calls "race-to-the-bottom").[34] The first two incentives tend to increase prices; the third, to decrease prices.

Even if these incentives exist, they are not *per se* fatal. Indeed, as the Schnitzer Declaration explains, "[w]hile commenters' witnesses point out these strategic bidding behaviors, they do not provide any well-supported analysis of their combined net impact."[35] And careful analysis shows that the concerns about Capacity Repricing are overblown. Any incentives to "clear-out-the-top" reflect issues that are already addressed by existing market rules, such as seller offer caps and the risk of Commission enforcement penalties for manipulative bidding.[36] Likewise, the effect of "in between" resources dropping out of the market will be limited given PJM's deep well of potential new entrants.[37] Finally, as between the three incentives, the effect termed "race-to-the-bottom" likely will affect a broader range of resources, and this price-reducing effect will likely swamp the other two price-increasing effects.[38] This effect, however, is also self-limiting: If a resource were the *only* one pursuing this strategy, perhaps it might steeply reduce its bid, predicting that Stage 2 would increase the clearing price.[39] But bidders take into account others' expected behavior.[40] And here, a resource will know that other bidders are also likely to reduce their bids—and thus if the resource reduces its bid too steeply, it risks losing money even at the higher Stage 2 price.[41] This will limit incentives to reduce bids.

The upshot of these incentives will be to mitigate the price increases that would otherwise result from Capacity Repricing. For example, one witness estimates that Capacity Repricing (and

[40] *Id.* ¶ 59.
[41] *Id.*

MOPR-Ex) would increase capacity prices by about 50% absent strategic bidding.[42] The bidding incentives, on plausible assumptions, lower this amount slightly to 39%.[43] Exelon and the PSEG Companies have shown that Capacity Repricing and MOPR-Ex both "will raise capacity market prices and costs for consumers"; the bidding incentives produced by Capacity Repricing thus somewhat limit that effect, yielding prices that are "elevated relative to the status quo, but below MOPR-Ex."[44] That is a reason to prefer it to MOPR-Ex.[45] Whatever the theoretical criticisms of Capacity Repricing's design, it cashes out as a compromise. It respects state policies by allowing state-supported clean generation to clear while still raising prices to offset this support—albeit not as much as certain fossil-fuel generators hope to achieve via MOPR-Ex.[46]

If the Commission remains concerned about Capacity Repricing's effects on bidding incentives, there are potential solutions. For example, the Schnitzer Declaration explains that resources whose offers are above the Stage 1 clearing price but below the Stage 2 clearing price could receive a "lost opportunity cost" payment equal to the difference between their offers and the Stage 2 clearing price.[47] The lower the offer, the higher the payment.

A "lost opportunity cost" payment largely could eliminate all three incentives detailed above: It could eliminate "clear-out-the-top" (artificially inflated offers would be costly, as they would reduce lost opportunity cost payments); the drop out of "in between" resources (who would receive an incentive, via the lost opportunity cost payment, to submit a bid); and the "race to the

[42] *Id.* ¶ 61.
[43] *Id.*
[44] *Id.* ¶¶ 18, 61.
[45] *Id.* ¶ 64.
[46] EPSA also contends that the effect termed "race-to-the-bottom" will cause the auction to procure too much capacity—because when the demand curve slopes down, lower offer prices will yield a larger quantity. EPSA Protest at 11. Because the demand curve is so steep, however, any such effect will be very small—on the order of 0.1% of the market, or 167 MW. Schnitzer Decl. ¶ 63.
[47] Schnitzer Decl. ¶ 67.

bottom" (as failing to clear at Stage 1 would no longer harm resources that can beat the Stage 2 price).[48] This modification could also address the concern that Stage 2 clearing prices will be set by resources with no capacity commitment at stake: A lost opportunity cost payment means that *all* resources that can beat the Stage 2 price have something at stake.[49] The size of these payments would likely be small—0.75% of total capacity payments.[50]

Nor would such payments amount to money for nothing: preparing bids is costly,[51] and PJM would be compensating generators for their expense in preparing cost-based bids that help the PJM market operate efficiently. Opportunity cost payments are already used by PJM to align bidder incentives with efficient behavior—for example, to address out-of-market dispatch for reliability reasons in energy markets, and in operating reserves markets.[52]

If the Commission concludes that a modification to Capacity Repricing is warranted, Exelon and the PSEG Companies respectfully suggest that the appropriate next step would be to reject the current filing as unjust and unreasonable, but indicate that the Commission would accept a Section 205 filing including such a modification.

B. The Broader Attacks On Capacity Repricing Are Meritless.

The broader attacks on Capacity Repricing—many pressed by fossil-fuel generators hoping to drive the Commission toward an unwarranted expansion of the MOPR—are baseless.

Clearance by state-supported resources. One supposed flaw is that clean generators receiving payments for their environmental value clear at the expense of other generators.[53] But this is Capacity Repricing's key *virtue*. As Dr. Willig's Declaration explains, this is the efficient

[48] *Id.* ¶¶ 68-72.
[49] *Id.* ¶ 68.

result when environmental externalities are taken into account,[54] and by permitting this result, Capacity Repricing avoids the costly overprocurement and distorting energy market effects that plague MOPR-Ex (as discussed further below). In this respect, Capacity Repricing follows the CASPR Order's lead—which also permitted, through a different mechanism, state-supported clean resources to replace existing polluting resources.

Effects on other states. Next, the proponents of a broader MOPR claim Capacity Repricing "would create a significant externality" by allowing "states … to shift th[e] costs of th[eir] polices … onto other" states.[55] Not so. State policies themselves do not impose any costs on other states—for example, the funds for Illinois' ZEC Program come entirely from Illinois customers—and the whole *point* of Capacity Repricing is to set prices where they would have been without state payments that qualify as Actionable Subsidies. That does not export any costs onto other states, or alter prices received by other generators. To the contrary, states *benefit* other states when they support clean generation, because the benefits of pollution abatement are experienced by citizens of all states, not only the state paying for the pollution abatement.

EPSA also repackages similar arguments as constitutional objections, claiming that Capacity Repricing unconstitutionally "[a]llow[s] [s]tates [t]o [r]egulate [b]eyond [t]heir [b]orders" by permitting "the actions of one state to affect[] … other states."[56] The Commerce Clause prohibits states from enacting extraterritorial legislation that "directly regulates transactions which take place across state lines."[57] Never could the Commission's *federal* approval of market rules violate that restriction on state authority. And regardless, EPSA does not

[54] Willig Decl. ¶ 52; *see* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms* at 10-12 (April 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf.

[56] *Id.* at 21 (internal quotation marks omitted).
[57] *Edgar v. MITE Corp.*, 457 U.S. 624, 641 (1982).

point to any "direct[] regulat[ion]" of interstate commerce;[58] at most, it alleges that one state's actions may have effects elsewhere.[59] But mere extraterritorial effects do not violate the Commerce Clause: "it is inevitable that a state's law … will have extraterritorial effects," and the "Supreme Court has never suggested that the … Commerce Clause" precludes such effects.[60] Indeed, EPSA's argument proves vastly too much. Whenever states have subsidized fossil-fuel plants, they have required citizens "in other states to shoulder much of the burden"—in less efficient wholesale electricity markets, and in more polluted air.[61] On EPSA's theory, all such subsidies would be unconstitutional. The Commerce Clause has never stretched so far.

Violation of constitutional limits on ratemaking. EPSA's other constitutional objection fares no better. EPSA argues that, as to resources that offer below the Stage 2 clearing price but do not receive a capacity commitment at Stage 1, Capacity Repricing violates the Constitution (and FPA) because it does not provide these resources the "*opportunity* to recover [their] costs,"[62] invoking *FPC v. Hope Natural Gas Co.*[63] and *Bridgeport Energy, LLC*.[64] That standard, however, does not apply here. When a utility is compelled to provide service to the public, as with a traditionally regulated utility, this standard forbids "confiscatory" rates for compelled service.[65] Likewise, when a generator is compelled to remain operational for reliability, the same standard governs.[66] In PJM, however, generators are not compelled to provide capacity. To be sure, generators that have sold capacity generally have a must offer obligation into the Reliability

[66] *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005).

Pricing Model. But if these resources choose to retire, they can do so upon 90 days' notice (and, presumably, upon covering any outstanding capacity obligations)—regardless of reliability implications.[67] In such circumstances, the Commission has held that "there can be no question of confiscation of a resource's property."[68]

Seller-side market power. The American Petroleum Institute ("API") claims, uniquely, that state support generally, and Capacity Repricing in particular, "facilitate the exercise of *supplier*"—not buyer—"market power"[69] via three anticompetitive tactics: (1) "predatory pricing"; (2) "entry deterrence"; and (3) "economic withholding" of a portion of an owner's portfolio.[70] As best Exelon and the PSEG Companies can discern, API's argument appears to be that these tactics require that the owner have the financial wherewithal to withstand temporary losses or losses in part of its portfolio, and that subsidies and Capacity Repricing "facilitate" these tactics by giving generators more money overall. But that money could just as well come from *anywhere*—utility operations, capital markets, or tax reductions. API's argument has nothing to do with Capacity Repricing.

Price/quantity pair not on the demand curve. EPSA criticizes Capacity Repricing because it yields a result that does not fall on "RPM's sloped demand curve": Because Stage 1 determines the quantity procured, and Stage 2 determines the price, Capacity Repricing yields a "price/quantity relationship" that does not appear on the demand curve.[71] But that theoretical flaw

[67] PJM Open Access Transmission Tariff, § 113.
[68] *Id.*; *see also N.Y. Indep. Sys. Operator, Inc.*, 124 FERC ¶ 61301, at P 58 (2008) (similar). To the extent EPSA's argument is that Capacity Repricing is unreasonable under the FPA because it does not "represent[] an appropriate balancing of consumer and investor interests," EPSA Protest at 19, Exelon and the PSEG Companies agree—but EPSA gets the imbalance backwards. For consumers, Capacity Repricing strikes the wrong balance because it raises prices with no sound justification. But for investors, it is not unfair that some polluting resources fail to clear due to states' efforts to address environmental externalities—which remains true even if these resources could have beaten the Stage 2 clearing price.
[69] Affidavit of Paul M. Sotkiewicz ¶ 6, attached to Comments of API.
[70] *Id.*
[71] EPSA Protest at 14; *see* Affidavit of David W. DeRamus and Collin Cain ¶ 38.

is no reason to reject Capacity Repricing absent some evidence that it is *actually* unworkable. And certainly, it is no reason to select MOPR-Ex over Capacity Repricing: As the Schnitzer Declaration explains, "the same is true of MOPR-Ex," which *also* yields a "price and quantity pair [that] does not fall on the demand curve," once one accounts for the resources that will continue to receive state support and effectively provide capacity to the system, even though they are not selected in the capacity auction.[72] "Indeed, because MOPR-Ex results in *significant over-procurement*, the effective price-quantity pair that results is even further away from the demand curve than Capacity Repricing."[73]

IV. The Proposals To Expand The MOPR Are Fundamentally Flawed.

Even if the Commission determined that a change must be made and that it could not approve Capacity Repricing (or a variant), it could not approve MOPR-Ex or any of the expansions of the MOPR proposed here. Both in theory and in execution, they are fundamentally flawed.

A. The Proposals To Expand The MOPR Are Flawed In Theory.

The commentators pushing for an expanded MOPR depict competitive markets as, by definition, insulated from the effects of state policies—which, when those policies involve payments for environmental benefits, they derisively call "subsidies."[74] Thus, they proclaim that "*all* subsidies" "are bad," "evil[]," and a "problem[]."[75] But the Commission will not find a citation to any economic authority that supports that broad proposition. That is because this proposition is false—for reasons Exelon has explained. Markets are not efficient when fossil-fuel generators inflict pollution on society without paying.[76] And state policies that attempt to

[72] Schnitzer Decl. ¶ 22.
[73] *Id.* ¶ 15 (emphasis added).
[74] *See, e.g.*, API Comments at 5; EPSA Protest at 12; NGSA Comments at 1-2; P3 Protest at 3.
[75] P3 Protest at 11 & Aff. of Roy J. Shanker, attached thereto, at PP 10, 34.
[76] Willig Decl. ¶¶ 13(c)-(d), 31.

internalize this externality, whether by taxing or penalizing pollution, or by supporting clean generation that abates pollution, make markets more efficient and competitive.[77] This is Economics 101.[78]

In reality, the MOPR's proponents do not really believe that *all* state interventions must be mitigated; instead, their pious rhetoric is only meant to encourage the Commission to adopt changes that harm cleaner competitors, while leaving untouched the massive subsidies they have long reaped. Thus, P3 proposes a supposedly "Clean MOPR" that removes MOPR-Ex's enumerated exemptions and also the carve-out from the definition of "Actionable Subsidy" for "federal production and investment tax credits."[79] But tellingly, P3 does not seek to remove the exclusion for various siting- or development-based subsidies—subsidies that happen to go to gas-fired generators. Likewise, there is not a peep about the untold billions in subsidies that coal-fired generators have and continued to receive, including both direct subsidies—$4.7 billion, just on the federal side, every year[80]—and indirect support, such as Pennsylvania's sales-tax exclusion for coal.[81] And all of this is in addition to the *implicit* subsidy that fossil-fuel generators receive from the ability to pollute without paying, which Exelon showed comes to $12.1 to $17.7 billion annually.[82] There is no justification for targeting government policies for mitigation *only* when they promote clean generation and make the Commission's markets more efficient.

[81] Clean Energy Advocates Protest at 90.
[82] Exelon Protest at 12.

The MOPR's proponents have no adequate answer for how their approach undermines not just sound economics, but federalism principles the Commission has long respected. As explained by Exelon and others, states have long exercised their FPA-protected authority as regulators of "facilities used for the generation of electric energy,"[83] and the Commission has reaffirmed that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[84] That means that when states regulate generators to protect the air citizens breathe, the Commission should not attempt to thwart or disincentivize those policies, no matter how much rhetorical noise the policies' opponents employ.

The MOPR's proponents insist that an expanded MOPR does not seek to thwart state environmental policies. But in more candid moments, they admit the opposite—that an expanded MOPR aims to create "a disincentive" for state policymaking favoring clean generation.[85] That is consistent with PJM's statement that applying the MOPR to federal payments to wind and solar resources would, in effect, "countermand … acts of Congress."[86] But under the FPA, the Commission has no authority to establish market rules that seek to deter states from legislating to protect their citizens' health and welfare, or to countermand state actions that do so.[87]

Again and again, the MOPR's proponents labor to narrowly limit the state authority over generation that the Commission must respect. First, they put states to an all-or-nothing choice—claiming that states forfeited any ability to influence the generation mix when they joined "an organized capacity market," and that states wishing to make any "policy decision[s]" concerning generation must "pursue Fixed Resource Requirement ('FRR') treatment."[88] But as many

[87] Exelon Protest at 18-19.
[88] P3 Protest at 21.

commentators note, that claim mocks history: In myriad states, restructuring went hand-in-hand with RPS programs.[89] That is why the D.C. Circuit has held that restructured states "retain the right to forbid new entrants from providing new capacity, to require retirement of existing generators, to limit new construction to more expensive, environmentally-friendly units, or to take any other action in their role as regulators of generation facilities."[90] Likewise, states' ability to fulfill their obligations under *other* cooperative-federalism statutes, like the Clean Air Act, often *depends* on influencing the generation mix that serves them.[91] Indeed, the Commission's organized markets have earned sustainable support precisely *because* the Commission has not required, as a condition of entry, that states give up their authority to influence the generation mix. To the contrary, in myriad ways, the Commission has actively "accommodate[d]" such policies.[92]

Second, the MOPR's proponents insist that states must make the perfect the enemy of the good. The IMM, for example, avers that states can address the harm caused by carbon dioxide only if they can agree on "a carbon price."[93] But unlike the IMM, states cannot wait for "[t]he theoretical ideal market approach."[94] They want to protect citizens *today*. Thus, acting under their police powers, states can—and often must—"take reform 'one step at a time, addressing [themselves] to the phase of the problem which seems most acute."[95] States, like the Commission, are permitted to adopt market-based approaches, entirely non-market mechanisms, or something

in-between. As Dr. Willig explains, well-designed environmental initiatives like Illinois' ZEC Program, which tie compensation to the value of the externality being abated and procure resources based on their environmental contribution, result in more efficient markets. There is no justification for thwarting those efforts simply because a carbon price would be superior.

Third, the MOPR's proponents imply that the Commission need not respect state policy choices because states may have different views about what externalities are most important to address—noting that FirstEnergy has identified, as "externalities," "fuel diversity" and "fuel security," and that resources possessing these attributes may be different from the clean generators targeted by MOPR-Ex.[96] But this concern is purely hypothetical. The *real* programs that states have enacted, and that MOPR-Ex targets, address environmental externalities like air pollution. Such environmental externalities are the easiest and clearest case. They are "the classic example found in almost every economics textbook."[97] So while the IMM disingenuously says that action may be warranted "[*i*]*f* society determines that carbon is a pollutant with a negative value"[98]—implying that carbon *might not* be a harmful pollutant—nobody *really* doubts that air pollution is a harmful externality, and that addressing it makes markets more efficient. At the May 2017 technical conference, even representatives of Calpine and NRG agreed that "carbon [is] an externality" that should be "price[d]."[99] Indeed, the federal government has *already found* that carbon is a harmful pollutant (in, for example, the EPA's "endangerment finding," which was affirmed on judicial review)[100]—and in any event, states need not wait for the federal government

to address threats to citizens' health and welfare. Whatever the scope of the externalities that states can permissibly address, environmental externalities are in the heartland of what states have historically addressed, and should be encouraged to address.

B. The Proposals To Expand The MOPR Are Flawed In Execution.

Apart from its conceptual flaws, MOPR-Ex is indefensible purely as a matter of auction design. The same is true of the broader variants, like "MOPR Clean." All should be rejected.

Proponents suggest that an expanded MOPR *must be* just and reasonable because PJM has a MOPR rule, which "already reflects stakeholder compromises."[101] Not so. The present MOPR is narrow in its purpose (combatting buyer-side market power), in the fuel sources it covers (gas only), and in the vintage it targets (only new generators).[102] The broader MOPRs proposed in this proceeding would twist this rule for a sweeping new purpose, and to a new universe of resources—counteracting the effects of disfavored state policies on wholesale markets, for both new and existing resources of any fuel type. PJM's MOPR was not designed for this new role, and has never been applied in this far-reaching manner. Stakeholders' agreement to, or the Commission's approval of, the narrow existing MOPR provides no support for the sea change sought here.[103]

Moreover, the comments confirm that the expanded MOPR's Swiss-cheese exceptions are incurably arbitrary. Stakeholders from all walks—generators, environmental groups, customer advocates—agree that the RPS Exemption is discriminatory: It exempts favored RPS programs for renewables, while mitigating environmental programs based on disfavored technologies (like nuclear or offshore wind), disfavored procurement processes, and even RPS programs with

[101] IMM Comments at 10; *see* API Protest at 10.
[102] Exelon Protest at 38-40.
[103] *Id.*

technology-specific tiers.[104] It does so even though the favored and disfavored programs pursue the same purposes and have the same effects on capacity markets, and even though disfavored programs like Illinois' ZEC Program may be more economically efficient than the exempted programs, by capping payments at the value of the environmental externality being abated.[105]

Likewise, myriad commentators explain why the Self-Supply and Public Entity exemptions are indefensible under MOPR-Ex's proposed new purpose of counteracting effects of state policies on wholesale markets. Because of the implicit subsidy provided by captive ratepayers, the vertically integrated utilities that qualify for these exemptions can build or maintain generation that "may be uneconomic" and that "would not have been built" or maintained, "but for being backed by ratepayer funds."[106] The state policies favoring the vertically integrated business model may be *older* than the pro-environmental policies that have spread over the last two decades. But that does not justify differential treatment.

Contra the suggestion of some fossil-fuel generators, these problems cannot be solved by blue-penciling MOPR-Ex's enumerated exemptions. One reason—again, acknowledged by several commentators—is that *NRG Power Marketing, LLC v. FERC*[107] precludes doing so.[108] But the more important reason is that once the Commission starts down the path of applying the MOPR to some disfavored policies—even state environmental policies that promote market efficiency—there is no non-arbitrary stopping point. The comments illustrate the point. Many commenters, as noted above, explain that MOPR's enumerated RPS Exemption, Self-Supply Exemption, and Public Entity Exemption are discriminatory. But even if the Commission severed these

exemptions, that would still leave the sundry additional subsidies that PJM excludes from the definition of "Actionable Subsidy"—subsidies that "promote … general industrial development in an area," subsidies that "incent … siting facilities in [a particular] locality," and federal tax credits.[109] As many commentators show, those subsidies also affect wholesale capacity markets by supporting resources that might not otherwise be economic, and they may be less efficient than well-designed state environmental programs.[110] There is no justification for applying the MOPR to state environmental policies, but not to these distorting subsidies. P3 trumpets its support for a "Clean MOPR."[111] But as explained above, P3 only proposes eliminating the exclusion for federal subsidies to renewables, not the state and local subsidies that generally benefit gas and coal generators. Even if those exclusions were eliminated, that would still leave the various upstream subsidies fossil-fuel generators receive—for example, Pennsylvania's sales tax exemption for coal.[112] The solution to this problem is not to embark along the path proposed by MOPR-Ex.

If, however, PJM's market rules exempt *some* state policies from an expanded MOPR, then the market rules must, at the least, exempt Illinois' ZEC Program. As Exelon has established, that program is more efficient than state RPS programs—not to mention state policies favoring vertically integrated utilities—because it links the externality payment to a conservative estimate of the participating plants' environmental value.[113] Failing to exempt the ZEC Program thus would be arbitrary. The ratepayer advocates for the District of Columbia, Maryland, and New Jersey defend an RPS-specific exemption on the theory that RPS programs are "long-standing" and

[109] *See* proposed PJM Tariff § 1, Definitions L-M-N (Option B).
[110] Exelon Protest at 24-25; *see* Clean Energy Advocates Protest at 8, 54-55; Duquesne Comments at 5; FirstEnergy Protest at 19-20; NEI Protest at 10-11; PSEG Protest at 10; Solar RTO Protest at 19, 25-26.
[111] P3 Protest at 20.
[112] Clean Energy Advocate Protest at 90.
[113] Exelon Protest at 24-25.

widespread across PJM.[114] Exelon and the PSEG Companies agree that RPS programs should not be subject to the MOPR, but once the Commission begins applying the MOPR to environmental programs, neither the vintage nor the political popularity of RPS programs is a reasoned ground for exempting them.[115]

The proponents of an expanded MOPR also have no adequate answer for the gross overprocurement of capacity that it will yield. They predict—without evidence—that an expanded MOPR will deter states from supporting clean resources. There is no reason to think that is so, and every reason to think the opposite. Despite ISO-New England's limited MOPR exemption for 200 MW of renewables, for example, states issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, and Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[116] And in PJM, if the unsupported predictions of the MOPR's proponents prove wrong, the result will be a massive overprocurement of capacity estimated to cost customers $14-24.6 billion annually.[117] The Commission should not adopt a policy premised on speculation that states will abandon *en masse* policies in which they have invested for a decade and to which they have shown increasing commitment in recent years. In the CASPR Order, the Commission found that clean energy "will be developed by the operation of state environmental and clean

[114] DC/MD/NJ Ratepayers Protest at 22.

[115] The ratepayer advocates also aver that RPS programs are different because they are "designed to bring new resources … online," rather than to "prevent[] the retirement of … older facilities." DC/MD/NJ Ratepayers Protest at 22. This is backwards: PJM's MOPR has only ever applied to *new* resources, precisely because those resources are better vehicles for buyer-side market power. *See* Exelon Protest at 39-40. The ratepayer advocates assert that the "long lead time for new entry" provides time for the market to "anticipate[] and absorb[]" these resources. DC/MD/NJ Ratepayers Protest at 22. But to the extent this argument is meant to distinguish RPS programs from the ZEC Program, it does not. Nuclear generators have been in operation for decades, and have been part of the markets from their origin. Market prices have always accounted for their operation.

[116] CASPR Order, at P 4.

[117] Clean Energy Advocates Protest at 105 & Grogging Aff. at PP 3-4, 15; *see* Exelon Protest at 46-48.

energy mandates, whether that capacity clears the [market] or not."[118] There is no reason to think that PJM states will act any differently.[119]

MOPR proponents say that if states do not acquiesce to the "disincentive" provided by an expanded MOPR, the overprocurement is states' fault.[120] But this ignores the FPA's jurisdictional lines. States regulate generation, while capacity requirements—how much must be procured, and what resources count toward satisfying the administratively determined obligations—rest with the Commission.[121] So if capacity is procured inefficiently—or if more capacity is procured than is needed to ensure resource adequacy, because the Commission is ignoring capacity provided by state-supported resources—that error is squarely within the Commission's domain. Moreover, proponents of the MOPR-Ex badly disrespect state authority in claiming that states can avoid overprocurement by relinquishing the ability to legislate to protect their citizens' health and welfare. Never has the Commission sought to deter states from implementing legitimate environmental policies in their domain by punishing their citizens—and those elsewhere in PJM, too—with unnecessary capacity costs. Instead, the Commission has made sure to accommodate those policies.[122]

MOPR's proponents also have no answer to the price suppression in energy markets this overprocurement will yield. PJM identified this problem in its filing.[123] Yet the MOPR's proponents barely attempt to respond. The Commission cannot approve an expanded MOPR when the problems it creates may be larger than the problems it purports to solve.[124]

Finally, the MOPR's proponents cannot account for the CASPR Order, which made clear that the Commission's policy is to accommodate rather than countermand state initiatives. This policy is not new: more than a decade ago, the Commission likewise emphasized that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[125] MOPR proponents make much of the CASPR Order's statement that the Commission would use "the MOPR as our standard solution" "[a]bsent a showing that a different method would" be effective.[126] But that statement referred to ISO-New England's narrower MOPR applying to only new resources, and even then, only two Commissioners endorsed it. The CASPR Order's actual *holding* was that ISO-New England's proposed reforms were just and reasonable precisely because the Commission concluded that they would succeed in ISO-England's goal of reasonably "accommodat[ing] state sponsored resources … over time."[127] Moreover, Exelon and the PSEG Companies respectfully suggest that it would be unwise for the Commission to establish a rule that it will apply the MOPR unless a different "market design proposal[]" is "developed by [an RTO] and [its] stakeholders,"[128] and is "the result of extensive compromise."[129] Under that rule, stakeholders that will financially benefit from an expanded MOPR—like EPSA's fossil-fuel generators—will never compromise, knowing that a default Commission action will award them what they cannot achieve through negotiation.

C. If The Commission Finds That It Cannot Approve Either Of PJM's Proposals, It Should Not Proceed Under Section 206.

A few stakeholders urge that, if the Commission rejects both Capacity Repricing and MOPR-Ex, it should proceed under Section 206 and craft new rules itself.[130] Exelon respectfully suggests that this would be a mistake. It would require the Commission to carry the dual burdens of showing that "existing rates are 'entirely outside the zone of reasonableness,'" and that the solution crafted by the Commission is just and reasonable.[131] In turn, that would require the Commission to show, based on substantial evidence, that it is necessary for just and reasonable rates to raise prices at a time of vast oversupply, and to apply PJM's MOPR for the first time to existing resources receiving payments for their clean-energy benefits under state environmental programs. The Commission would also have to craft new rules that avoid all of the fatal flaws that parties have correctly identified in PJM's proposals, and amass a majority of Commissioners to support them. The Commission should not embark on this venture. No imminent—or even foreseeable—threat to reliability or investment has been shown, and the Commission should instead simply reject PJM's filing.

[130] *See, e.g.*, *id.* at 2; NRG Protest at 1.

CONCLUSION

The Commission should reject PJM's filing as not just or reasonable.

Dated: May 22, 2018

20180620-5123 FERC PDF (Unofficial) 6/20/2018 4:03:20 PM

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

A. QUALIFICATIONS

1. My name is Michael M. Schnitzer. I am a director of The NorthBridge Group, Inc ("NorthBridge"). NorthBridge is a consulting firm that provides economic and strategic advice to the electric and natural gas industries. My business address is 30 Monument Square, Concord MA 01742.

2. In 1992, I co-founded NorthBridge. Before that, I was a Managing Director of Putnam, Hayes & Bartlett, which I joined in 1979. I have experience working with private sector clients in the electric utility, natural gas, and private power industries, as well as with public and nonprofit agencies. My electric industry work has focused on regulatory policy, finance, and market structure issues. I received an A.B. in chemistry, with honors, from Harvard University, and an M.S. in management from the Sloan School, Massachusetts Institute of Technology.

3. I have testified before the Commission on many matters and have participated in Commission technical conferences and workshops on capacity market and energy market design issues. I have also testified before the public utility commissions of Arkansas, California, Delaware, Illinois, Indiana, Louisiana, Maine, Maryland, Massachusetts, Mississippi, New Hampshire, New Mexico, New Orleans, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, and Wisconsin.

B. BACKGROUND AND PURPOSE OF TESTIMONY

4. On April 9, 2018, PJM Interconnection, LLC ("PJM") filed at the Federal Energy Regulatory Commission ("FERC" or "Commission") two proposals to modify its capacity market design.[1] In its filing, PJM requested that the Commission approve its preferred capacity market repricing proposal (referred to as "Capacity Repricing" or "Option A"), or if the Commission cannot approve PJM's preferred proposal, that it approve in the alternative PJM's MOPR-Ex proposal (referred to as "Option B").

[1] PJM Interconnection, L.L.C., Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, FERC Docket No. ER18-1314-000, April; 9, 2018 ("PJM Filing").

5. On May 22, 2018, I filed a declaration ("Prior Declaration")[2] on behalf of Exelon Corporation that concluded that the Commission should reject both of PJM's proposals in favor of the status quo, but that if it were to accept one of the proposals, it should accept the Capacity Repricing proposal over MOPR-Ex. My Prior Declaration is attached as Exhibit A.

6. On May 31, 2018, CPV Power Holdings, L.P., Calpine Corporation, and Eastern Generation, LLC (collectively "Complainants") filed a complaint under Section 206 of the Federal Power Act[3] requesting that the Commission reject both options presented in the PJM Filing and instead adopt a third option that they call the "Clean MOPR." The Clean MOPR is a modified version of PJM's "MOPR-Ex" proposal that would remove a number of exemptions offered to certain classes of resources under that proposal. Complainants supported this request with an attached affidavit from Dr. Roy J. Shanker.

7. I have been asked by Exelon Corporation to assess the impact of the Clean MOPR proposal on PJM markets relative to maintaining the status quo. Specifically, I assess the impact of the Clean MOPR on capacity price formation, both with respect to the likely level of prices, and the mechanics of how prices and capacity obligation awards are determined. Based on this analysis, I evaluate the longer term impact of the Clean MOPR proposal on overall market efficiency and its effects on market participants.

C. SUMMARY OF CONCLUSIONS

8. My conclusions are as follows:

9. Because the Clean MOPR proposal shares the same underlying structure as the MOPR-Ex proposal, it shares all the flaws associated with MOPR-Ex that I discussed in my Prior Declaration. The fundamental reason for this is that the design of both proposals re-prices the offers of affected resources to a higher level and does not award them a capacity obligation if they do not clear the market, thus greatly increasing the likelihood that they will not clear and receive a capacity obligation. As I discuss in my Prior Declaration, if the MOPR deters states from

[2] Declaration of Michael M. Schnitzer on Behalf of Exelon Corporation, Attached to Motion for Leave to Answer and Answer of Exelon Corp. and the PSEG Companies, Docket Nos. ER18-1314-000 and ER18-1314-001.

[3] CPV Power Holdings, L.P., Calpine Corporation and Eastern Generation, LLC, Complainants v. PJM Interconnection, LLC, Respondent, Complaint Seeking Fast Track Processing, Docket No. EL18-169-000, May 31, 2018 ("Complaint").

supporting economically efficient zero-emission resources such as the nuclear resources receiving state support, those resources will likely be permanently lost, leading to a reduction in total social surplus and an overall less efficient portfolio of capacity resources. To the extent that the MOPR does not deter states from continuing to support affected resources (as recent experience in New England suggests), those state-supported resources will continue to exist and provide capacity to the grid, but customers will be required to purchase additional, unneeded capacity from the resources that displace the state-supported capacity within the MOPR-Ex/Clean MOPR design. I conclude in my Prior Declaration that these flaws should lead the Commission to reject MOPR-Ex in favor of the status quo, or at a minimum to prefer PJM's Capacity Repricing proposal over MOPR-Ex. Because of the common underlying design between MOPR-Ex and the Clean MOPR proposal, these conclusions apply to the Clean MOPR as well.

10. The Clean MOPR would immediately cause the capacity offers for a very large group of existing capacity resources to be re-set upwards to the Minimum Offer Price Rule Floor ("MOPR Floor") price. Potentially as much as 38 gigawatts ("GW") of existing capacity resources, or roughly 23% of all capacity cleared in the May 2018 RPM Base Residual Auction, could be subjected to this offer modification. PJM's Capacity Repricing proposal, in comparison, would affect about 7 GW of existing capacity resources.

11. Because the Clean MOPR affects such a large portion of the capacity supply curve, a substantial portion of the affected resources would be needed to meet demand and would thus clear the market and likely set the clearing price, despite having their offers re-set to the MOPR Floor price. Thus, the determination of the capacity clearing price and of which resources actually receive a capacity award would largely rest on administrative decisions such as PJM's calculation of the MOPR Floor price for affected units, rather than on competitive offers determined by the resource owners themselves. By substituting administrative decisions for competitive offers in the price formation process, the Clean MOPR would drive inefficient entry and exit decisions, particularly for polluting units with unpriced negative externalities, and would send inefficient price signals to consumers.

12. If implemented without any resource owners electing the Fixed Resource Requirement ("FRR") option or receiving unit-specific exemptions, the Clean MOPR will result in significant and immediate capacity cost increases for consumers. If it had been applied to the May 2018

capacity auction for the 2021/22 delivery year, the Clean MOPR would have resulted in a market-wide capacity clearing price of approximately $234 per MW-day, or an increase of $78 per MW-day over the status quo clearing prices on a weighted-average basis. This increase in prices would increase consumer costs by $4.4 billion annually.

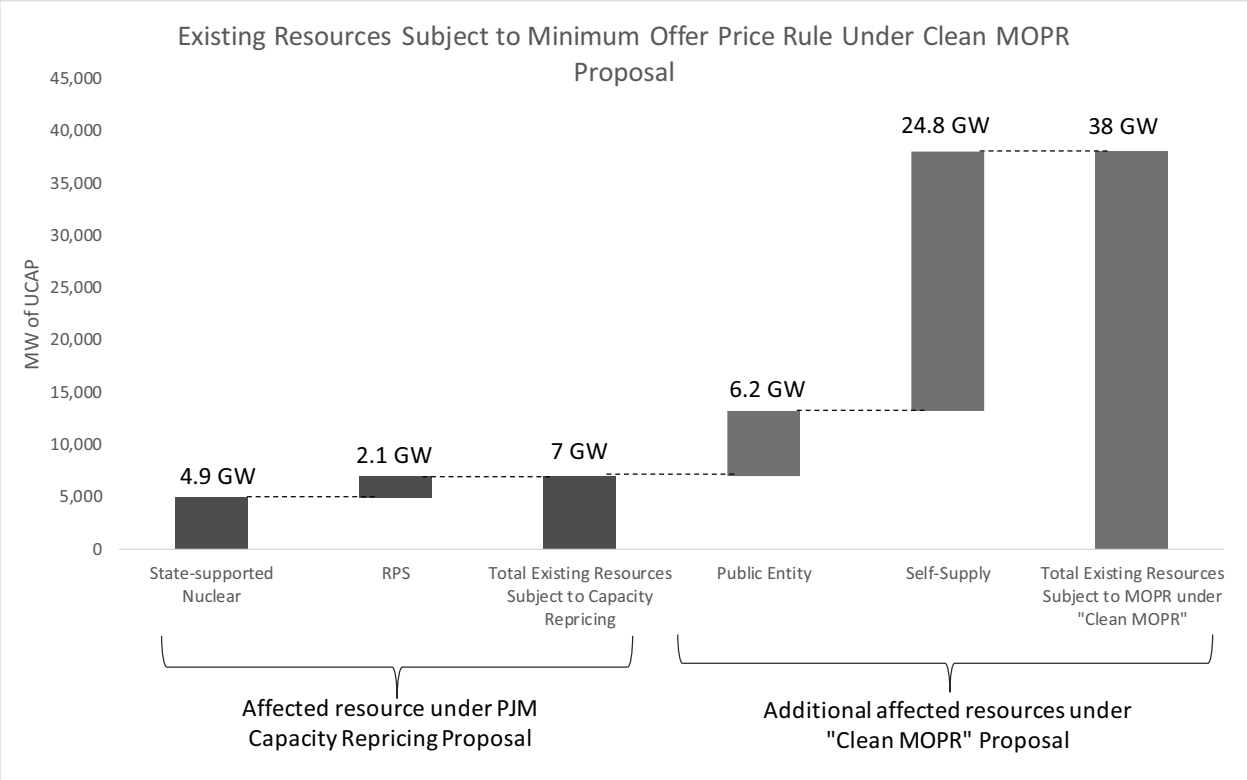
13. Over time, however, the Clean MOPR will likely create such an untenable situation for consumers in states with substantial amounts of affected capacity that load-serving entities ("LSEs") in those states will decide to elect the FRR option and cause the affected resources plus other resources selected for FRR to exit the capacity market, along with a matching amount of load. This is particularly true for vertically integrated entities where the resource owner and LSE are one and the same, but even in other cases, states with substantial amounts of state-supported nuclear and renewables will face a strong incentive to direct their resident LSEs to elect the FRR option. Under this outcome, the amount of capacity subject to MOPR treatment will likely be minimal, resulting in market clearing prices similar to the status quo. But in arriving at this result, the market will shrink substantially, making it less liquid and more fragmented.

II. THE CLEAN MOPR WILL AFFECT A VERY LARGE BLOCK OF RESOURCES

14. While complainants do not provide a detailed description of their proposal, or proposed tariff language, as I understand it, the Clean MOPR would adopt the structure of PJM's MOPR-Ex proposal with several modifications. First, the Clean MOPR would eliminate several of the exemptions provided in the MOPR-Ex proposal that shield from MOPR treatment certain resources that would otherwise be affected. Specifically, the Clean MOPR would remove the Renewable Portfolio Standard Exemption ("RPS Exemption"), the Public Entity Exemption, and the Self-Supply Exemption. The Unit-Specific Exemption and Competitive Entry Exemption would remain in place, although, as Dr. Shanker discusses, the Competitive Entry Exemption is made largely redundant by the requirement that resources must receive "actionable subsidies" to be subject to MOPR treatment. Second, the Clean MOPR proposal would expand the definition of "Actionable Subsidies" to include "material federal subsidies or other support granted after the date of this Complaint." The Capacity Repricing proposal, by comparison, does not include the RPS Exemption, but exempts municipal/cooperative entities and vertically-integrated regulated utilities in a similar fashion to MOPR-Ex.

15. The overall impact of the removal of exemptions on the total amount of capacity subject to MOPR treatment is very significant. As I discuss in detail below, under Capacity Repricing, about 7 GW of existing resources are likely subject to repricing. This includes 4.9 GW of existing nuclear capacity and 2.1 GW of existing renewable capacity that would likely not be subject to any exemption (other than the possibly the unit-specific exemption) under Capacity Repricing or the Clean MOPR. Removing the Public Entity and Self-Supply exemptions under the Clean MOPR adds 6.2 GW and 24.8 GW of capacity subject to MOPR treatment, respectively, for a total of 38 GW of affected capacity. Figure 1 below summarizes the impact of removing the exemptions:

Figure 1



Sources: PJM Interconnection, LLC, Commitments by Fuel Type & Delivery Year 2007/08 – 2021/22 and Resource Model for 2021/22 RPM auction.

16. Nuclear resources receiving state support from Illinois and New Jersey are likely to be deemed to be receiving "actionable subsidies" as defined under the both the Capacity Repricing

and Clean MOPR proposals, and they do not qualify for any of the blanket exemptions offered under either proposal. Resources falling in this category include 1,400 MW of the Quad Cities plant in Illinois and roughly 3,500 MW of nuclear capacity that may be supported by recently-enacted legislation in New Jersey, or about 4.9 GW total.[4]

17. The RPS Exemption, which applies to MOPR-Ex but not Capacity Repricing or the Clean MOPR, excuses from MOPR treatment certain resources that currently receive out-of-market payments for supplying renewable attributes for the purpose of enabling compliance with state renewable energy portfolio standards, either via tradeable renewable energy certificates, long-term contracts, or some other mechanism.[5] Approximately 2.1 GW of unforced capacity of wind, solar, and wood biomass resources cleared the 2021/22 Base Residual Auction.[6] Under both Capacity Repricing and the Clean MOPR, these resources would be subject to MOPR treatment.

18. The Public Entity Exemption excuses from MOPR treatment those resources that are owned or controlled by publicly-owned electricity providers such as municipal utilities and rural electric cooperatives, provided they conform to long/short limitations on the size of their generation portfolio relative to their load. Collectively, these entities own about 6.2 GW of capacity that participates in the RPM, with most of the capacity owned by two entities: East Kentucky Power Cooperative and Old Dominion Electric Cooperative. Removal of the Public Entity Exemption would subject these resources to MOPR treatment under the Clean MOPR.

19. The Self-Supply Exemption excuses from MOPR treatment those resources that are owned by suppliers with long-standing business models as either a vertically-integrated regulated utility, or a single customer power provider, provided again that they conform to long/short position limitations. Collectively, entities that qualify for the Self-Supply Exemption control

[4] The New Jersey legislation contemplates state support of nuclear, but no such state support has yet been awarded to specific plants.

[5] Under the Clean MOPR, while existing federal tax subsidies such as the Production Tax Credit and Investment Tax Credit are not actionable subsidies, out-of-market payments for renewable attributes would constitute an actionable subsidy and subject a resource to mitigation. Many, although not necessarily all, of the resources receiving RPS-related payments also receive, or have received, such federal tax subsidies. Likewise, most, if not all, resources receiving these federal tax subsidies also receive RPS-related payments.

[6] PJM Interconnection, LLC, Commitments by Fuel Type & Delivery Year 2007/08 – 2021/22. Spreadsheet available at http://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/rpm-commitment-by-fuel-type-by-dy.ashx?la=en. Note that these totals do not include any RPS-qualified hydro, liquid biomass, or landfill gas, all of which can potentially qualify as RPS resources under certain state programs (typically subject to specific conditions) and as such likely slightly underestimate the total amount of existing RPS resources in PJM.

approximately 24.8 GW of unforced capacity that participates in the RPM. About 80% of this capacity (about 20.4 GW) is owned by the Virginia Electric Power Co., with the remainder owned by the Monogahela Power Co. Removal of the Self-Supply Exemption would subject all this capacity to MOPR treatment under the Clean MOPR. Another 13 GW of capacity is controlled by entities currently electing the FRR option (primarily vertically-integrated subsidiaries of American Electric Power Co. Duke Energy operating in Indiana, Kentucky, West Virginia, and Michigan) and thus does not currently participate in the capacity market but would likely qualify for the Self-Supply Exemption when and if this capacity was to return to the market.

20. Collectively, Clean MOPR would result in a total of 38 GW of existing capacity being subject to MOPR treatment. This represents roughly 23% of the total capacity cleared (and 20% of capacity offered) in the May 2018 Base Residual Auction. By comparison, existing resources affected by the Capacity Repricing proposal would be limited to state-supported nuclear and renewables, or about 7 GW total.

III. THE CLEAN MOPR WOULD FUNDAMENTALLY CHANGE PRICE FORMATION IN THE CAPACITY MARKET AND WOULD RAISE COSTS FOR CONSUMERS

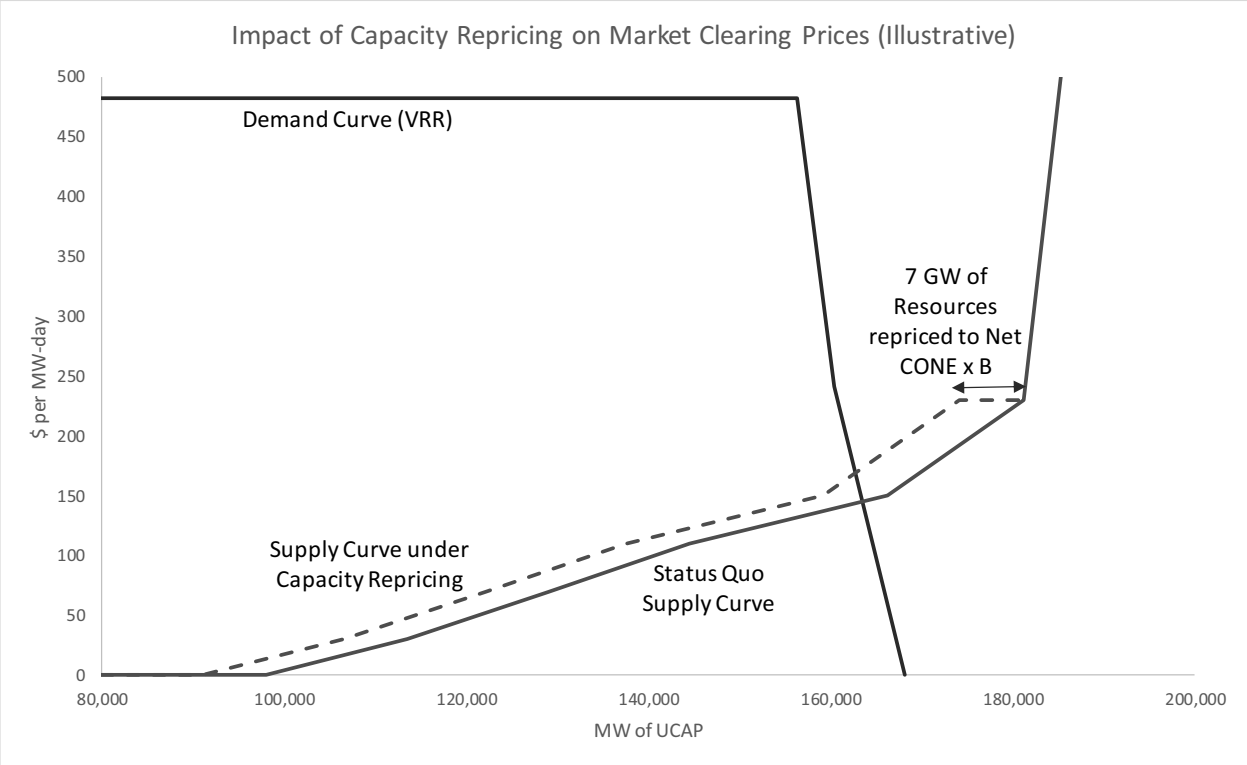
21. Under the Clean MOPR proposal, resources that are found to have "actionable subsidies," which include both explicit payments such as zero-emission credits ("ZECs") and regulated cost recovery treatment, would have their capacity offers adjusted upwards to a MOPR floor price to the extent their unadjusted offers fall below that level. The MOPR floor price would be set at the higher of the Net Cost of New Entry times the Balancing Ratio ("Net CONE times B") and the unit-specific Net Avoidable Cost Rate ("Net ACR"). Net CONE times B varies by zone but, with the exception of two small zones, ranged from $211 to $254 per MW-day for the May 2018 RPM auction, well above recent market clearing prices for most local delivery areas.[7]

22. Compared to PJM's Capacity Repricing proposal, the Clean MOPR proposal would result in a very different qualitative economic outcomes if the full 38 GW of affected capacity were subject to MOPR mitigation. Under Capacity Repricing, the amount of affected existing capacity is relatively small compared to the overall supply curve. As discussed previously, the existing capacity likely subject to Capacity Repricing is about 7 GW, or about 4% of the total

[7] The BG&E and PENELEC zones had Net CONE times B values of $181/MW-day and $158/MW-day, respectively.

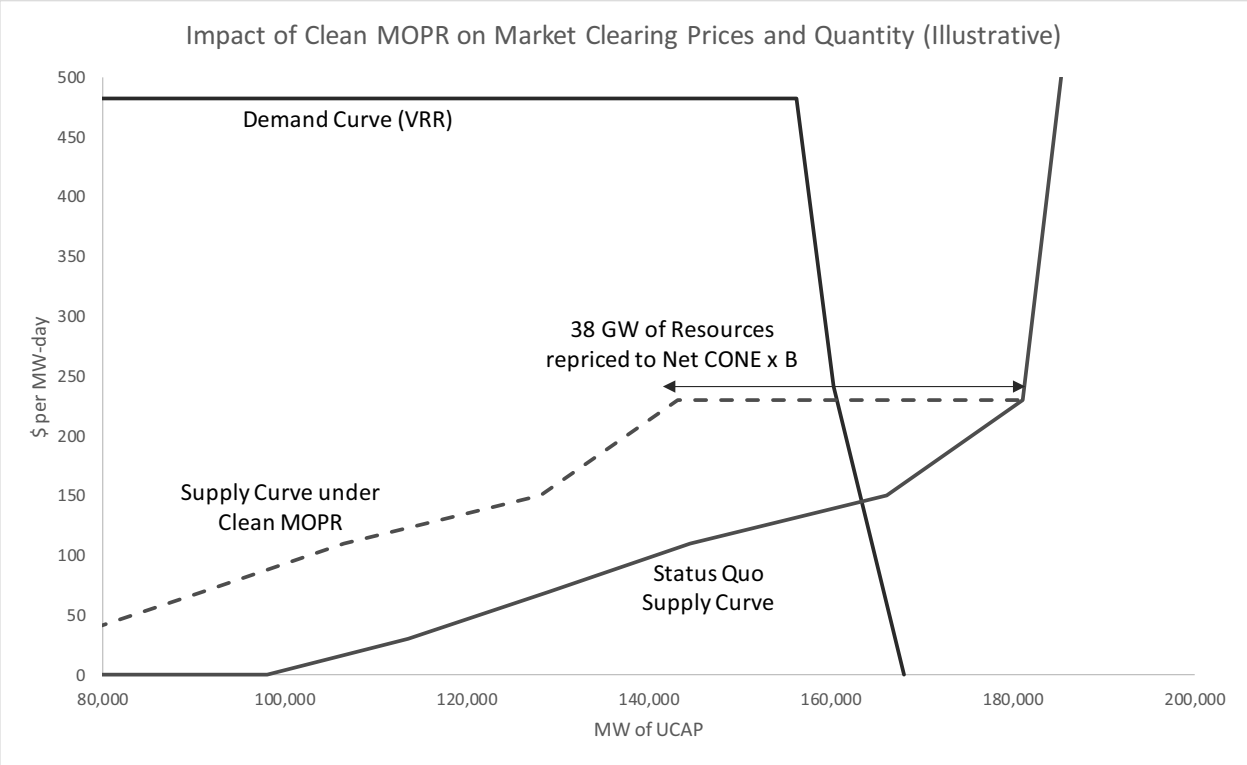
capacity offered in the May 2018 BRA. Because of this, in the price-setting run of Capacity Repricing, adjusting the offers of the affected resources to the higher "Actionable Subsidy Reference Price" (similar to the MOPR Floor price) would likely cause those resources to simply not set the price and rather be replaced by offers from non-affected resources further up the supply curve for the purposes of price-setting. Figure 2 shows this result in an illustrative fashion:

Figure 2



23. If Clean MOPR were implemented without a large amount of resources receiving a unit-specific exemption and/or electing the FRR option, the amount of affected capacity is so large – roughly 20% of the supply curve – that it is unlikely that there would be enough otherwise-uncleared excess capacity offered below the MOPR floor price to fully replace it. Therefore, the block of affected capacity subject to MOPR treatment would likely set the clearing price at the MOPR floor price. In addition, a portion of the capacity subject to MOPR treatment would likely clear the market despite having their offers increased to the MOPR floor price. Figure 3 shows this result:

Figure 3



24. Under the current supply and demand fundamentals in PJM, this outcome is very likely if the Clean MOPR is implemented without large amounts of resources existing via the FRR option or receiving unit-specific exemptions. In the May 2018 Base Residual Auction, about 21.7 GW of capacity offers did not clear the market. If we assume that (1) all of the uncleared capacity offered below Net CONE times B (a very conservative assumption) and (2) all 38.5 GW of potentially affected capacity under the Clean MOPR were re-priced to Net CONE times B, the following would happen as a result of application of the Clean MOPR: (1) the clearing price would rise to Net CONE times B, (2) the total amount of cleared capacity would decline by 2.5 GW due to the downward-sloping demand curve, (3) all 21.7 GW of the capacity that did not clear without the Clean MOPR would instead clear, and (4) 14.3 GW of the total 38 GW of capacity re-priced to the MOPR Floor price would clear. Historically between 1 and 3 GW of uncleared capacity in the RPM has bid above Net CONE times B,[8] which suggests that it is more likely that between 15 and 17 GW of affected resources would clear.

[8] The Brattle Group, *Fourth Review of PJM's Variable Resource Requirement Curve*, April 19, 2018, Figure 13. This estimate is based on a manual inspection of the graphic and is not precise.

25. The Clean MOPR thus would result in a dramatic shift in the underlying structure of the RPM. While the current RPM has administrative elements (such as the demand curve), its core price formation mechanism nonetheless relies on the clearing price being set by competitive offers determined by market participants. The Clean MOPR would upend this and drive the market towards a nearly wholly administrative design where the offer prices of the resources in the zone of marginality are determined by PJM and the Independent Market Monitor ("IMM"), rather than by competitive offers. The result of this is that both the market clearing price and which resources are awarded capacity obligations would be largely determined by administrative decisions made by PJM and the IMM with respect to the MOPR Floor prices imposed on different resources and the extent to which resources are granted unit-specific exemptions, rather than on competition.

26. By replacing the competitive price formation process with a largely administrative process, the Clean MOPR will greatly reduce the benefits of competition in the capacity market, to the point where one can legitimately question whether what remains can even be called a "market." As discussed previously, the Clean MOPR design creates a block of administratively-priced resources in the "zone of marginality" that will likely lead to prices clearing at a predictable administratively-determined level defined by the MOPR Floor price. Because of this, less efficient resources that would likely be in the "zone of marginality" under the status quo, including many resources with significant negative pollution externalities, would become infra-marginal resources under the Clean MOPR and would face minimal risk of not clearing, and thus will have reduced incentives to lower their costs and otherwise become more competitive. On the demand side, consumers will be presented with a capacity price signal indicating near-scarcity, despite such scarcity not existing in reality, leading to inefficient consumption decisions over time.

27. If we assume that the Clean MOPR is implemented without a large amount of affected capacity receiving the unit specific exemption and/or electing the FRR option, it would result in a market clearing price at the MOPR Floor price, which would subject consumers to a substantial increase in capacity costs relative to the status quo. To illustrate the magnitude of the potential cost increase, I have analyzed how the results of the May 2018 Base Residual Auction would have changed if the Clean MOPR were applied to its full extent and caused the market clearing price to rise to the MOPR Floor price.

28. Specifically, I have assumed that application of the Clean MOPR would cause the market clearing price to rise to the value of Net CONE times B for the Dominion zone, or $234 per MW-day. I chose the Dominion Zone because it comprises the largest block of resources in the group of resources affected by the Clean MOPR (roughly 20 GW out of 38.5 GW) and because it has a relatively low value for Net CONE times B compared to most other zones that also harbor potentially affected resources. If the market clearing price in the May 2018 RPM auction cleared at $234 per MW-day across the entire RTO, the weighted average clearing price paid to capacity resources would rise by $78 per MW-day, from $156 to $234 per MW-day, as shown in Table 1 below:

Table 1

LDA	UCAP Cleared MW	Clearing Price $/MW-day	Clearing Price w/ Clean MOPR $/MW-day	Price Increase $/MW-day
BG&E	1,938	200.30	234.13	33.8
PSEG	5,368	204.29	234.13	29.8
ComEd	22,358	195.55	234.13	38.6
ATSI	8007.3	171.33	234.13	62.8
Rest of EMAAC	23,921	165.73	234.13	68.4
Rest of RTO	102,036	140.00	234.13	94.1
Total	163,627	155.71	234.13	78.4

From a consumer perspective, application of the Clean MOPR would greatly increase the net load price to consumers, while slightly decreasing the capacity obligation due to the downward sloping demand curve. The net impact to consumers would be a cost increase of $4.4 billion per year, as show in Table 2 below:

Table 2

Zone	Status Quo UCAP Obligation	Status Quo Net Load Price	Status Quo Capacity Cost	UCAP Obligation Under Clean MOPR	Clean MOPR Net Load Price	Clean MOPR Capacity Cost	Cost Increase

This consumer cost increase does not account for the fact that some of the capacity procured in the Base Residual Auction may be duplicative and unnecessary for customers of entities with substantial amounts of affected capacity. For example, customers of regulated utilities whose capacity does not clear due to the Clean MOPR would likely continue to bear the cost of those resources embedded within their bundled regulated rates, in addition to incurring the incremental costs shown above.

29. Compared to the Clean MOPR, Capacity Repricing is likely to result in a lesser price impact simply because it affects a much smaller block of existing resources. As I discuss below, if affected resources under the Clean MOPR elect the FRR option in large numbers, this may eventually not be true, but without this forced market exit (which results in efficiency losses), the price impact of Capacity Repricing is likely to be substantially less.

IV. CLEAN MOPR COULD DRIVE ENTITIES WITH LARGE AMOUNTS OF AFFECTED RESOURCES TO SEEK THE FRR OPTION, RESULTING IN A SIMILAR PRICE OUTCOME TO THE STATUS QUO BUT WITH REDUCED EFFICIENCY AND MARKET DEPTH

30. The Clean MOPR puts resource owners and states that own or depend on significant amounts of affected capacity in an untenable position if they continue to participate in the capacity market and thus could drive those entities to cease participation in the market by electing the FRR

option. This is most obviously true for vertically-integrated entities that would have been covered under the Self-Supply and Public Entity exemptions and that have long-standing business models and rate designs centered around maintaining a portfolio of regulated generation resources paid for by a native customer base. The Clean MOPR would greatly undermine that business model by pushing a portion of those resources out of the capacity market and forcing the purchase of additional unneeded capacity in its place. If they wish to remain in the capacity market, the regulated entity, and its regulators, would be forced to choose between either requiring their customers to bear this unnecessary cost, or retiring core capacity resources whose costs are already embedded in regulated rates. Faced with these unattractive options, such entities are likely to instead decide to remove themselves from the market by electing the FRR option. As vertically-integrated entities that typically are both wires companies and franchised LSEs, electing the FRR option is administratively straightforward for these entities.

31. While electing the FRR option is less straightforward for states and entities that are no longer vertically-integrated, such states would still have an incentive to direct their resident entities to seek to elect the FRR option under the Clean MOPR (and MOPR-Ex) if they have large amounts of affected capacity. States that are providing support for nuclear facilities and renewables would be faced with the unappealing option of either discontinuing these programs and abandoning their environmental goals or having their ratepayers purchase capacity that is not needed. Such states would have a strong reason to avoid both of these bad outcomes by directing their resident LSEs to elect the FRR option and exit the market, despite the complexities it might pose for retail competition.

32. Resource owners would also have the option of seeking a unit-specific exemption as an alternative means of excusing affected capacity from MOPR treatment under both MOPR-Ex and the Clean MOPR. While it is certainly possible that some resource owners may seek to do this, the unit-specific exemption is likely to be either unattractive or non-viable for most owners of existing affected capacity, for several reasons. First, for vertically-integrated utilities or public entities with mixed portfolios, FRR requires that they include all their load in the FRR plan, not just a portion. Hence, they are unlikely to use the unit-specific exemption for any individual resources in their portfolios because all the resources will be needed to satisfy the needs of the FRR plan and will thus be withdrawn from the market. This removes the unit-specific exemption as an option for 31 out of the 38 GW of affected resources under the Clean MOPR. For the

remaining resources, state-supported nuclear is unlikely to qualify because without recognition of environmental externalities the resources in question have indicated that they are likely to retire. This leaves existing renewables as the only plausible candidates for the unit-specific exemption under Clean MOPR. However, to the extent such resources are supported by states that also support nuclear, the "all or nothing" feature of the FRR option discussed above may once again dominate and eliminate the unit-specific exemption as a viable option for even these resources.

33. Over time, then, a likely result of Clean MOPR is that the affected resources plus other resources needed to meet LSE reliability requirements are removed from the capacity market through exercise of the FRR to the point where the amount of affected resources remaining in the market is minimal. On its face, this would lead to a similar market price outcome as the status quo for the unaffected resources that remain in the centralized market. However, the market would shrink considerably in arriving at this outcome because a substantial portion of capacity would simply remove itself from the capacity market (well in excess of 40 GW, because LSEs must procure resources to meet their entire load requirement under current FRR rules). Thus, the centralized market would shrink substantially, administrative costs would increase due to numerous procurements, and the market would become less liquid and more fragmented.

34. Ultimately, then, this potential outcome simply reinforces the conclusions I put forth in my prior declaration: the status quo is the preferred option. The Clean MOPR would either result in a significant, inefficient, and unnecessary cost increase for consumers or would simply, through the exercise of the FRR option, revert to a similar market price outcome as the status quo but with reduced market depth and efficiency.

35. This completes my declaration.

A. BOTH CAPACITY REPRICING AND MOPR-EX RAISE COSTS 5
B. NEITHER CAPACITY REPRICING NOR MOPR-EX PRODUCE A PRICE AND QUANTITY RESULT WHICH FALLS ON DEMAND CURVE 6
C. THE STATUS QUO IS THE MOST EFFICIENT APPROACH 8

III. IF MODIFICATION TO THE CURRENT MOPR IS PURSUED, CAPACITY REPRICING IS A BETTER CHOICE THAN MOPR-EX 10

A. MOPR-EX RESULTS IN OVER-PROCUREMENT IF STATES ARE NOT DETERRED 11
B. IF STATES ARE DETERRED, MOPR-EX CHOOSES THE WRONG RESOURCES 11
C. CAPACITY REPRICING AVOIDS OVER-PROCUREMENT AND CHOOSES THE MOST EFFICIENT PORTFOLIO OF RESOURCES 13

IV. ISSUES RAISED BY COMMENTERS' WITNESSES WITH RESPECT TO CAPACITY REPRICING ARE NOT DISQUALIFYING AND DO NOT RENDER IT UNWORKABLE 14

A. MOPR-EX DOES NOT PRODUCE A RESULT ON DEMAND CURVE EITHER, AND PRODUCING A RESULT NOT FALLING ON THE DEMAND CURVE DOES NOT RENDER CAPACITY REPRICING UNWORKABLE 14
B. STRATEGIC BIDDING BEHAVIORS WILL REDUCE MARKET CLEARING PRICES UNDER CAPACITY REPRICING 14
C. STRATEGIC BIDDING BEHAVIORS CAN BE REMEDIED WITH A LOST OPPORTUNITY COST PAYMENT TO "IN-BETWEEN" RESOURCES 23

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

A. QUALIFICATIONS

1. My name is Michael M. Schnitzer. I am a director of The NorthBridge Group, Inc ("NorthBridge"). NorthBridge is a consulting firm that provides economic and strategic advice to the electric and natural gas industries. My business address is 30 Monument Square, Concord MA 01742.

2. In 1992, I co-founded NorthBridge. Before that, I was a Managing Director of Putnam, Hayes & Bartlett, which I joined in 1979. I have experience working with private sector clients in the electric utility, natural gas, and private power industries, as well as with public and nonprofit agencies. My electric industry work has focused on regulatory policy, finance, and market structure issues. I received an A.B. in chemistry, with honors, from Harvard University, and an M.S. in management from the Sloan School, Massachusetts Institute of Technology.

3. I have testified before the Commission on many matters and have participated in Commission technical conferences and workshops on capacity market and energy market design issues. I have also testified before the public utility commissions of Arkansas, California, Delaware, Illinois, Indiana, Louisiana, Maine, Maryland, Massachusetts, Mississippi, New Hampshire, New Mexico, New Orleans, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, and Wisconsin.

B. BACKGROUND AND PURPOSE OF TESTIMONY

4. On April 9, 2018, PJM Interconnection, LLC ("PJM") filed at the Federal Energy Regulatory Commission ("FERC" or "Commission") two proposals to modify its capacity market design.[1] In its filing, PJM requested that the Commission approve its preferred capacity market repricing proposal (referred to as "Capacity Repricing" or "Option A"), or if the Commission cannot approve PJM's preferred proposal, that it approve in the alternative PJM's MOPR-Ex proposal (referred to as "Option B").

[1] PJM Interconnection, L.L.C., Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, FERC Docket No. ER18-1314-000, April; 9, 2018 ("PJM Filing").

5. Both proposals seek to prevent capacity prices from declining, all other things equal, due to the alleged impact of state actions to support various types of generation not already covered by PJM's existing Minimum Offer Price Rule ("MOPR"), with particular focus on the increase in state sponsored zero-emission capacity resources. Under the Capacity Repricing proposal, state sponsored resources are allowed to clear in PJM's capacity auctions, while under the MOPR-Ex proposal (Option B), some state sponsored resources are allowed to clear in capacity auctions while others are not.[2]

6. Reply comments were filed by a wide range of industry stakeholders, including Exelon Corporation with an attached declaration by Robert E. Willig, on May 7th, 2018.[3]

7. I have been asked by Exelon Corporation to respond to certain issues raised by two commenters, The Electric Power Supply Association[4] and the Office of the People's Counsel for the District of Columbia, Maryland Office of People's Counsel, and New Jersey Division of the Rate Counsel[5] (collectively, "Commenters"), and their respective expert witnesses, David W. DeRamus and Collin Cain,[6] and James F. Wilson[7] (collectively, "Commenters' Witnesses"). Commenters, relying on the analysis of their respective expert witnesses, describe several issues with both of PJM's proposals, and several issues which particularly affect PJM's Capacity Repricing proposal. These issues include increased consumer costs, the fact that PJM's proposals do not produce results which fall on the capacity demand curve, and strategic bidding incentives created by Capacity Repricing. Commenters argue that these issues collectively are cause for the Commission to choose the MOPR-Ex proposal over the Capacity Repricing proposal.

[6] Affidavit of David W. Deramus, Ph.d. and Collin Cain, M.SC. on Behalf of the Electric Power Supply Association, Docket No. ER18-1314-000 (filed May 7th, 2018) ("DeRamus/Cain Affidavit")

[7] Affidavit of James F. Wilson in Support of the Protests of DC-MD-NJ Consumer Coalition, Joint Consumer Advocates, and Clean Energy Advocates, Docket No. ER18-1314-000 (filed May 7th, 2018) ("Wilson Affidavit")

8. The purpose of my testimony is to evaluate the issues raised by commenters' witnesses and place these issues in the broader context of the capacity market design choice before the Commission in these proceeding, namely whether the Commission should decline to adopt either Capacity Repricing or MOPR-Ex and preserve the status quo or, in the alternative, to choose one of the two alternatives.

C. SUMMARY OF CONCLUSIONS

9. My conclusions are as follows:

10. Commenters' witnesses raise several valid issues with respect to the two mitigation alternatives presented by PJM, Capacity Repricing and MOPR-Ex. Specifically, they show that neither alternative produces a solution that falls on the capacity demand curve and that both raise costs for consumers relative to the status quo. The issues they raise highlight the need for the Commission to confront two central economic questions. First, do the out-of-market payments at issue in this proceeding internalize externalities and contribute to retention and entry of the least-cost set of resources once social costs as well as production costs are accounted for, or are they subsidies that support uneconomic retention and entry? And second, even if the state actions driving these payments do represent inefficient subsidies, would MOPR-Ex deter this conduct or not?

11. Because the out of market payments at issue, in the main, do internalize externalities and promote economic retention and entry, the issues raised by Commenters' witnesses highlight the inefficiency of adopting either of the mitigation options proposed, and the Commission should instead choose the status quo approach. The status quo approach results in the most efficient price and resource selection, does not unnecessarily raise costs for consumers, and does not increase incentives to engage in strategic bidding. For the Zero Emission Credit ("ZEC") programs in particular, commenters provide no evidence that these payments are not an efficient mechanism for internalizing carbon emission externalities. Nor do they – or could they, given the current PJM energy market design – suggest a feasible alternative mechanism for internalizing these externalities. Under these circumstances, the Capacity Repricing alternative would be a distant "second choice" to the status quo from an efficiency standpoint, but, somewhat ironically, the strategic bidding issues identified by commenters' witnesses make Capacity Repricing less

inefficient in this case because their net effect is to push the market clearing price down closer to the price under the most efficient status quo approach.

12. If the Commission is not persuaded that the status quo is adequate, then as between the two alternatives before it, the Capacity Repricing proposal is a much better choice than MOPR-Ex. The advocates of MOPR-Ex implicitly assume that states will abandon their support of environmentally-friendly resources in response. The witnesses do not provide any theoretical or empirical support for this assumption. Yet if states do continue to make out-of-market payments to support environmentally-friendly resources, notwithstanding MOPR-Ex, then MOPR-Ex will result in the over-procurement of capacity, saddling customers with significant unnecessary costs.

13. If, on the other hand, mitigation does deter some states from enacting legitimate environmental programs, then MOPR-Ex will select the wrong set of resources to provide capacity. Resources that are more efficient once externalities are taken into account will be led to retire or will not enter. That outcome likewise leads to an inefficient mix of resources that makes society worse off than the status quo. Notably, MOPR-Ex includes a number of proposed exemptions, but these exemptions are not based on whether the out-of-market state payments promote or impair the efficient selection of resources. The ZEC program provides an illustrative example: the ZEC payments that MOPR-Ex targets are demonstrably the most economic form of carbon abatement available to the states and are the only form of support that the states can effectively utilize given PJM's energy market design. It would be unjust and unreasonable for the Commission to eliminate the only effective unilateral option that states have to support the economic retention of zero carbon resources.

14. Capacity Repricing, by contrast, avoids both of these problems. Capacity Repricing avoids over-procurement by allowing state-supported resources to clear. And Capacity Repricing selects a more efficient set of resources, by allowing the resource mix to be influenced by state programs accounting for environmental externalities.

15. Commenters argue that MOPR-Ex is preferable to Capacity Repricing, focusing on several points they allege make Capacity Repricing unworkable. First, they contend that Capacity Repricing leads to a price-quantity pair that is not on the demand curve. But the same is true of MOPR-Ex. Indeed, because MOPR-Ex results in significant over-procurement, the effective price-quantity pair that results is even farther away from the demand curve than Capacity

Repricing. Second, commenters identify potential strategic bidding issues associated with Capacity Repricing. These issues are real but are not disqualifying. The effects of such strategic bidding are likely to be modest and would reduce the cost of repricing to customers—even as Capacity Repricing significantly increases capacity prices relative to the status quo. To the extent these effects are nevertheless of concern to the Commission, the incentive to bid strategically can be largely remedied by a lost opportunity cost payment directed towards the small slice of resources that set the second stage price of Capacity Repricing without being cleared in the initial stage. Thus, strategic bidding concerns are not a valid basis to reject the PJM Capacity Repricing proposal.

16. In sum, the best course is for the Commission to maintain the status quo. If the Commission does believe some action is required, the Capacity Repricing alternative is workable and certainly preferable to MOPR-Ex.

II. COMMENTERS' WITNESSES RAISE VALID ISSUES WITH BOTH MOPR-EX AND CAPACITY REPRICING, WHICH REINFORCES THE CONCLUSION THAT CONTINUATION OF THE STATUS QUO IS THE PREFERRED APPROACH

17. Both Wilson and DeRamus & Cain correctly point out several issues with both MOPR-Ex and Capacity Repricing. These issues highlight the inefficiency of either proposal relative to the status quo.

A. BOTH CAPACITY REPRICING AND MOPR-EX RAISE COSTS

18. First, at the simplest level, commenters' witnesses show that both solutions proposed by PJM will raise capacity market prices and costs for consumers. Wilson provides an example, calibrated to the current PJM capacity demand curve and recent real-world supply curves, that shows that, relative to the status quo, Capacity Repricing with an assumed 9,000 MW of resources targeted for re-pricing (that is, with "actionable subsidies" per the terminology used by PJM) causes both the market clearing price and the capacity payments by consumers to rise by about 50%.[8] DeRamus & Cain provide a more stylized example that is directionally similar.[9]

[8] Wilson Affidavit at ¶ 48-49.

[9] DeRamus/Cain Affidavit at ¶ 29-30.

19. Specifically, Wilson's example begins with a status quo where 161,474 MW of UCAP is procured at a price of $102.8/MW-day, resulting in total customer costs of $6.1 billion. Under Capacity Repricing, the price rises to $154.53/MW-day while the quantity procured remains the same as under the status quo, increasing customer costs to $9.1 billion.

20. Wilson's example does not directly address MOPR-Ex, but if MOPR-Ex is analyzed using the same assumptions, it produces a very similar result. Under MOPR-Ex, the capacity clearing price would also rise to $154.53/MW-day but the quantity procured through the capacity market would fall to 159,800 MW. This results in capacity payments of $9.0 billion, a similar increase, 48%, as Capacity Repricing relative to the status quo. Unlike Capacity Repricing, MOPR-Ex does not clear or compensate the 9,000 MW of resources with actionable subsidies. If we assume that states continue to compensate these resources at the original status quo price to induce them to remain in the market, consumers in those states pay an additional $340 million for the capacity these resources provide outside the RPM mechanism. This additional cost raises the total cost of MOPR-Ex in Wilson's example to $9.4 billion, a 56% increase from the status quo.

B. Neither Capacity Repricing nor MOPR-Ex produce a price and quantity result which falls on demand curve

21. Commenters' witnesses correctly criticize Capacity Repricing for producing an ultimate price and cleared quantity outcome that is not located on the RPM demand curve.[10] Returning to Wilson's example, the clearing price of $154.53/MW-day corresponds to a cleared quantity of 159,800 MW on the RPM demand curve. But because Capacity Repricing clears resources using a lower supply curve in its first stage, the cleared quantity is 161,474 MW. The resulting price and quantity combination is off the demand curve. Because of this, Capacity Repricing is not consistent with the underlying reliability versus cost tradeoff embedded in the demand curve and it is costlier for customers because the elevated stage two price is paid to the resources cleared in stage one.

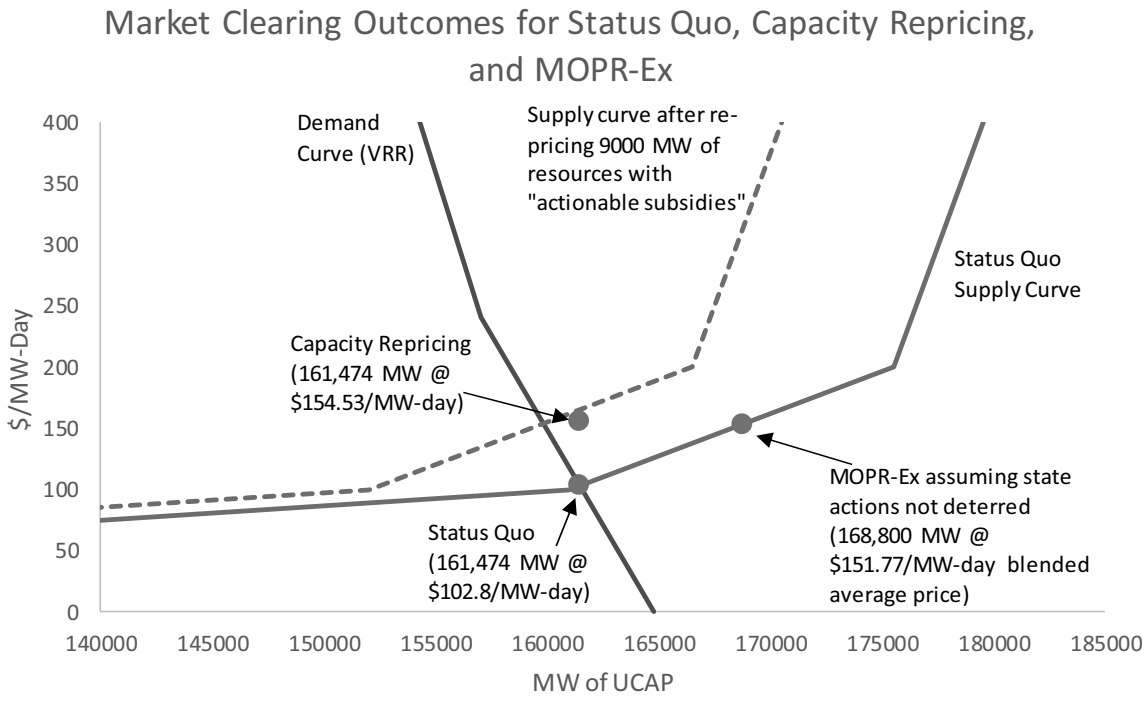
22. DeRamus & Cain claim that PJM's MOPR-Ex proposal, in contrast to Capacity Repricing, does produce a result that falls on the RPM demand curve.[11] That claim is only correct

[10] DeRamus/Cain Affidavit at ¶ 37 and Wilson Affidavit at ¶ 48-51.

[11] DeRamus/Cain Affidavit at ¶ 72.

if one assumes that states will be deterred from supporting environmentally friendly resources—and there is no evidence to support that assumption. It is true that the price and quantity capacity pair procured solely through the RPM under MOPR-Ex does fall on the demand curve. However, if MOPR-Ex does not deter states from continuing to provide compensation sufficient to retain these resources, then these resources would still effectively be committing their capacity to the market, and the total amount "procured" would not be on the demand curve. Further, it is likely that state compensation provided to these resources would need to be raised to offset the loss of capacity revenues, effectively forcing consumers in these states to pay more to retain environmental resources while simultaneously procuring more capacity than needed via RPM. Returning to Wilson's example, if all 9,000 MW of resources with actionable subsidies remain in the market and are paid the original status quo clearing price of $102.8/MW-day via increased state out-of-market payments (the actual amount of increased payments is uncertain, but an increase equal to the status quo price offsets the loss of capacity revenues under MOPR-Ex, making it a reasonable illustrative value for this example), the total capacity procured is 168,800 MW (159,800 MW directly through the market and 9,000 MW via state action) and the blended average price paid is $151.77/MW-day. This price and quantity pair also does not fall on the demand curve. The only instance where MOPR-Ex would result in a price and quantity pair that falls on the demand curve is an instance where all 9,000 MW of targeted resources were deterred from either entering or remaining in the market. Figure 1 below shows where the various options (status quo, MOPR-Ex, and Capacity Repricing) fall relative to the demand curve.

Figure 1



23. Of the three alternatives, the only approach that will always fall on the demand curve is the status quo.

C. THE STATUS QUO IS THE MOST EFFICIENT APPROACH

24. Most types of state out-of-market payments under consideration in this proceeding are intended to explicitly or implicitly account for positive environmental attributes that are not priced by RTO markets. These state actions contribute to economic retention and entry and increase overall market efficiency.

25. The subsidies that appear to primarily concern some commenters are ZECs and similar subsidies that are paid to the Quad Cities nuclear plant in Illinois and may be paid to certain nuclear plants under recently-passed legislation in New Jersey. As is discussed at length in the declaration of Robert E. Willig filed in this proceeding,[12] these subsidies, and similar subsidies for other types of zero-emission generation, are designed to correct, for the resources in question, the fact that carbon pollution externalities are not priced in PJM's markets, and thus the zero-emission attribute

[12] Willig Declaration ¶ 25-54.

of these resources is not appropriately compensated. By appropriately accounting for the positive externality they produce by displacing the pollution caused by carbon-emitting resources, ZECs and similar subsidies make the market more efficient, rather than less.

26. Thus, consideration of ZEC (or similar) revenue is appropriately part of the formation of a competitive capacity bid for these resources. That is, when developing competitive capacity bids, it is appropriate that these resources consider ZEC revenue as a deduction from production costs, similar to energy or ancillary services, which serves to reduce their capacity bid relative to where it would have been absent the ZEC. The resulting capacity bid is not artificially suppressed by the subsidy, but rather is the proper price for the resource considering the state-provided compensation for its environmental attributes.[13] ZECs in particular are designed to promote economic entry and retention because the environmental attribute payment is based on, and cannot exceed, the social cost of avoided carbon emissions, and the resource will only clear the capacity market and be economically retained if its total cost of retention, including the benefit of the positive externality it produces, is lower than the cost of alternatives.[14]

27. The status quo allows those resources to appropriately reflect the impact of the subsidies in their capacity market bids and does not re-price or adjust those bids to a higher level that purports to eliminate the impact of the subsidies, as is contemplated by Capacity Repricing and MOPR-Ex.[15] The status quo selects the most efficient mix of resources at the most efficient price. Compared to either Capacity Repricing or MOPR-Ex, the status quo does not result in unnecessarily high customer costs, it produces a result that falls on the demand curve, and it does not create any incremental strategic bidding incentives.

28. For the ZEC programs in particular, commenters provide no evidence that the state payments are not an efficient mechanism for carbon reduction. Nor do they suggest a feasible alternative under the current PJM energy market design. Several commenters (notably the PJM IMM)[16] suggest a market-wide carbon price as an efficient alternative. That alternative is not

[13] Willig Declaration at ¶ 39-44.

[14] Willig Declaration at ¶ 51-54.

[15] Willig Declaration at ¶ 13(i).

[16] Comments of the Independent Market Monitor for PJM, Docket Nos. ER18-1314-000 and ER18-1314-001 (filed May 7th, 2018), at 10-11.

available to individual states, and it is disingenuous to suggest it is a viable near-term option. If an individual state attempted to impose a carbon tax on generation within its borders, as Dr. Willig demonstrates under the present market design, a carbon price high enough to value carbon at the social cost set by the states and drive the desired emission outcome would suffer considerably from leakage issues that would render it unworkable.[17] Thus, under the present market design, ZEC programs remain the only feasible approach to efficiently accomplishing state environmental goals. The status quo approach correctly recognizes the positive externalities targeted by these programs in both the prices and resource selection that result in the capacity market.

III. IF MODIFICATION TO THE CURRENT MOPR IS PURSUED, CAPACITY REPRICING IS A BETTER CHOICE THAN MOPR-EX

29. If the Commission is not persuaded that the status quo is adequate, two central economic questions can help guide the choice between the primary proposal presented by PJM, Capacity Repricing, and its alternative, MOPR-Ex. The first question is whether the out-of-market payments at issue in this proceeding internalize externalities and contribute to the retention and entry of the least-cost set of resources, once social costs as well as production costs are accounted for. As discussed previously, most state actions under consideration in this proceeding do contribute to economic retention and entry. The second question is whether states will be deterred by a mitigation mechanism, like MOPR-Ex, that would prevent state-supported resources from clearing. Absent any reason to think that states uniformly would be deterred, MOPR-Ex risks substantial over-procurement of capacity, and thus significant unnecessary costs imposed on customers. On the other hand, if MOPR-Ex does actually deter certain state actions related to legitimate environmental programs, then it would prevent economic resources from clearing the capacity market, which will result in a less efficient mix of capacity resources.

30. Capacity Repricing avoids both problems that plague MOPR-Ex. Capacity Repricing does not depend upon how states react, and by allowing state-supported resources to clear, avoids any over-procurement. And by allowing state-supported resources to clear, Capacity Repricing also allows legitimate state environmental programs to influence the resource mix, which promotes efficiency once environmental externalities are taken into account.

[17] Willig Affidavit at ¶ 35.

A. MOPR-EX RESULTS IN OVER-PROCUREMENT IF STATES ARE NOT DETERRED

31. If states are not deterred in pursuing programs seeking to preserve certain types of generation, MOPR-Ex results in over-procurement. MOPR-Ex operates by adjusting the bids of targeted resources to a higher level that seeks to "undo" the effect of payments resulting from state actions. MOPR-Ex then clears the market in a single step incorporating these higher, modified bids. As a result, the resources targeted by MOPR-Ex will not likely clear the capacity market and will instead be replaced by other resources that would not have cleared had the targeted resources bids not been adjusted upwards. However, the targeted resources will nonetheless remain in the market if state action is not deterred. And the additional resources procured in their place under MOPR-Ex will also remain in the market.

32. As discussed in the example summarized in Figure 1, this over-procurement effect will effectively cause the market to retain a much larger portfolio of capacity resources than is needed and would be procured under either the status quo or Capacity Repricing. As Figure 1 shows, with 9,000 MW of resources targeted by Capacity Repricing, MOPR-Ex results in the effective procurement of 7,326 MW (68,800 MW vs. 61,474 MW) more resources than either the status quo or Capacity Repricing.

B. IF STATES ARE DETERRED, MOPR-EX CHOOSES THE WRONG RESOURCES

33. To the extent that MOPR-Ex does deter states from making out-of-market payments even when those payments internalize externalities, MOPR-Ex will select the wrong set of resources to provide capacity and will result in the inefficient exit of economic resources. Under this scenario, states either cease state actions when the resources in question are targeted by MOPR-Ex, or never engage in state programs they would otherwise have engaged in due to the threat of MOPR-Ex.

34. As discussed previously, in the case of state actions which compensate resources for positive externalities, the most efficient treatment is to allow those resources to reflect those payments in their capacity bids, which will generally lead to a reduction in their bid price. If the resource clears the capacity market when bidding in this fashion, its retention is economic and least cost and appropriately takes into account the value of the positive externality that it produces.

Thus, retention or entry of the resource is socially-efficient and the state action adds to the social surplus enjoyed by all market participants.

35. MOPR-Ex explicitly targets resources receiving such payments and makes it much less likely that they will clear the market and receive a capacity obligation. To the extent that these resources leave the market due to this treatment, either because the state action is discontinued, never occurs, or is not sufficient to cover the lost capacity revenue, the market as a whole is deprived of the social surplus added by the presence of these resources in the market. In place of these resources, higher cost resources (after taking account of externalities) will be cleared in their place and will displace them in the capacity portfolio. This outcome results in an inefficient mix of resources that makes society worse off than the status quo.

36. Notably, MOPR-Ex includes a number of proposed exemptions, but these exemptions do not reflect whether the out-of-market state payments promote or impair the efficient selection of resources. This is discussed at length in the Willig Declaration, and the ZEC program provides an illustrative example: the ZEC payments that MOPR-Ex targets are demonstrably the most economic form of carbon abatement available to the states and are the only form of support that the states can effectively utilize given PJM's energy market design. It would be unjust and unreasonable for the Commission to eliminate the only unilateral option that states have to support the economic retention of zero carbon resources.

37. MOPR-Ex thus implicitly assumes that all state programs other than the enumerated exceptions are inefficient. It also implicitly assumes that MOPR-Ex mitigation will deter states from pursuing these programs. Both of these implicit assumptions are incorrect. With respect to the first assumption, the state ZEC programs at which MOPR-Ex is aimed are a prime example of efficient state programs that promote economic entry and retention. MOPR-Ex proponents offer no evidence to support their conclusion that these programs are inefficient. And their arguments that states have better alternatives ring hollow in the face of PJM energy market design. With respect to the second assumption, there is no evidence that MOPR mitigation will deter state environmental action. One has only to consider the progression of state renewable energy programs and targets to reach this conclusion, including in states/regions where MOPR provisions currently apply or might be implemented. A recent example of this is the New England states, where ISO-New England put in place a modest exemption (200 MW per year) to its MOPR for

capacity entering to support state renewable portfolio standards, and several states issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, while Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[18] Another example is those states in PJM that are contemplating programs such as offshore wind that are not exempted under the MOPR-Ex proposal.

38. Thus, MOPR-Ex presents considerable risk on two fronts. If there is a significant likelihood that states will not be deterred in pursuing programs to support generation (and there is), it risks over procurement and additional costs to consumers. And if there is a significant likelihood that the state programs MOPR-Ex would mitigate enhance efficiency (and there is), there is risk that cost-effective, efficiency-enhancing resources will be excluded from the market.

C. CAPACITY REPRICING AVOIDS OVER-PROCUREMENT AND CHOOSES THE MOST EFFICIENT PORTFOLIO OF RESOURCES

39. Capacity Repricing, by contrast, avoids these risks. The most basic difference between Capacity Repricing (or the status quo) and MOPR-Ex is that resources receiving out-of-market payments are cleared based on their un-modified bids and are thus likely to receive a capacity obligation (and payment) under Capacity Repricing (or the status quo) whereas they are unlikely to be cleared and be paid for capacity under MOPR-Ex. In the event that states are not deterred by either option in continuing to pursue state actions to support generation, Capacity Repricing avoids the over-procurement problem suffered under MOPR-Ex because it recognizes the reality that these resources will remain in the market and provides them with a capacity obligation to the extent their un-modified bid is economic. Capacity Repricing thus avoids the inefficient excess procurement of capacity and results in a more efficient and cost-effective outcome for consumers, regardless of one's view on whether externality payments under state programs improve efficiency.

40. Capacity Repricing also chooses the most efficient portfolio of resources because resources are cleared based on their original, un-modified bid. As discussed previously, when these un-modified bids appropriately reflect the value of payments intended to internalize

[18] *See* ISO-NE Transmittal at 3-4, Docket No. ER18-619-000 (January 8, 2018).

externalities, these bids reflect the true total social cost of these resources. Because Capacity Repricing selects resources based on these costs, rather than modified bids that omit the social cost or value of externalities, it selects the most efficient, least-cost portfolio of resources.

IV. ISSUES RAISED BY COMMENTERS' WITNESSES WITH RESPECT TO CAPACITY REPRICING ARE NOT DISQUALIFYING AND DO NOT RENDER IT UNWORKABLE

41. Commenters argue that MOPR-Ex is preferable to Capacity Repricing, focusing on several points they allege make capacity repricing unworkable. First, they contend that Capacity Repricing leads to a price-quantity paid that is not on the demand curve. Second, they identify potential strategic bidding issues associated with Capacity Repricing that they contend are "fatal flaws." Both arguments are incorrect. I address each in turn below.

A. MOPR-EX DOES NOT PRODUCE A RESULT ON DEMAND CURVE EITHER, AND PRODUCING A RESULT NOT FALLING ON THE DEMAND CURVE DOES NOT RENDER CAPACITY REPRICING UNWORKABLE

42. As discussed previously, it is true that Capacity Repricing produces a result that does not fall on the demand curve. Indeed, this is one reason to prefer the status quo to either alternative offered by PJM. However, MOPR-Ex does not produce a result that falls on the demand curve either. As shown on Figure 1, unless states are deterred from pursuing the programs targeted by MOPR-Ex in all cases, MOPR-Ex will result in the procurement of significant excess capacity. The cost of this capacity will be paid for by consumers in the states in question. When this excess procurement is included, the effective price-quantity paid that results is even farther away from the demand curve than Capacity Repricing.

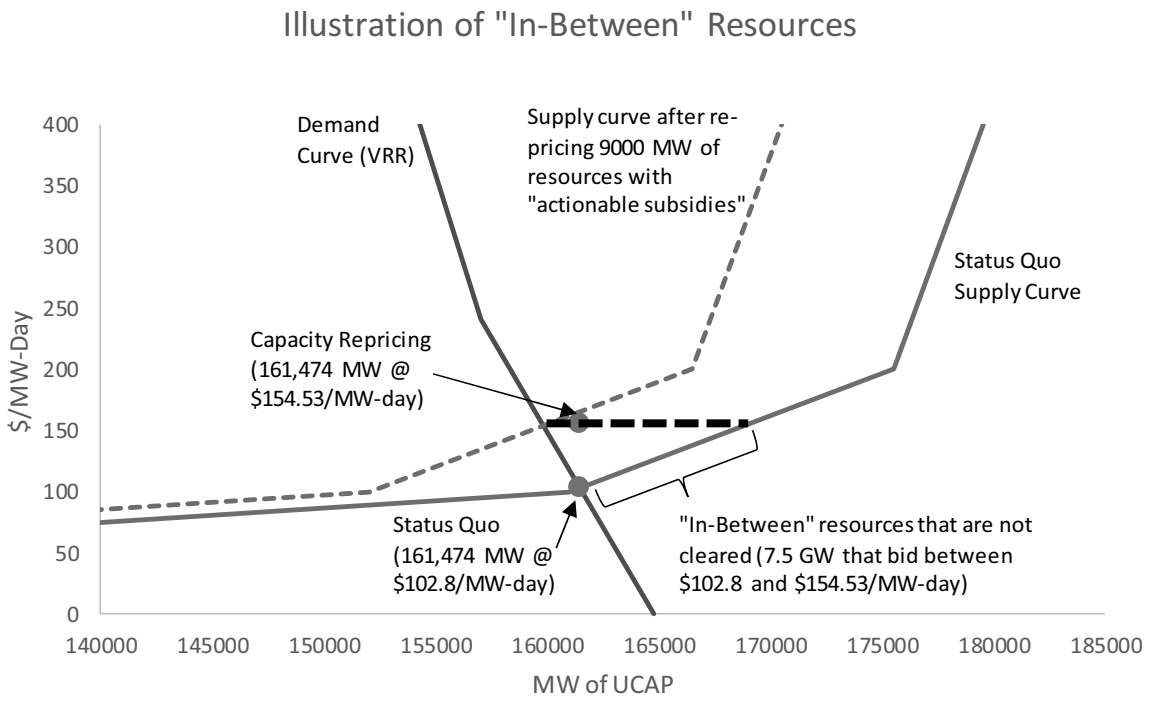
43. Second, even though the price-quantity pair resulting from Capacity Repricing does not fall on the demand curve, that does not render Capacity Repricing unworkable or impossible to execute. That is, the market clearing mechanisms identified by PJM are functional and should clear and produce stable and workable results.

B. STRATEGIC BIDDING BEHAVIORS WILL REDUCE MARKET CLEARING PRICES UNDER CAPACITY REPRICING

44. Commenters' witnesses also identify two issues associated with the two-stage market clearing mechanics of Capacity Repricing. Both issues stem from the fact that Capacity Repricing

does not jointly set the price and quantity of cleared resources. Rather, because resources with "actionable subsidies" are bid as-is in stage one but are re-priced at a higher price in stage two, the stage two price will be set by a class of resources whose bids fall at or below the stage two clearing price but who are not cleared in stage one and do not receive a capacity obligation. These resources are termed the "in-between" resources by Wilson. Figure 2 below shows the mechanics of this in graphical form:

Figure 2



45. The problems that commenters' witnesses identify with bidding under Capacity Repricing stem from the fact that the in-between resources are relied upon to set the stage two price but do not receive a capacity obligation or payment. First, commenters' witnesses claim that the resulting stage two price is arbitrary and not the result of a workably competitive process because it may be set by a resource offer that has nothing at stake in setting its offer price.[19] Second, they claim that the separation of price and quantity creates incentives for market participants to engage in a variety of strategic bidding behaviors that may cause bids to deviate either above or below their true costs, which may inappropriately increase or decrease the stage

[19] Wilson Affidavit at ¶ 75 and DeRamus/Cain Affidavit at ¶ 35-39.

two clearing price and will generally result in increased capacity price volatility. The first of these two problems is actually more of a theoretical complaint about this type of re-pricing mechanism. But the question before the Commission is not one of theory but rather of whether the specific PJM proposal is workable and will produce reasonable results. And the answer to that question turns on the specific complaints related to strategic bidding behaviors and their market implications, which I address below.

46. Commenters' witnesses collectively identify three specific strategic bidding behaviors that result from the two-stage clearing mechanics of Capacity Repricing that they collectively contend makes Capacity Repricing "unworkable." These are a "race to the bottom" or bid suppression effect, identified by both Wilson and DeRamus & Cain,[20] an enhanced incentive to engage in above-cost bidding for certain resources, termed the "clear out the top" behavior,[21] identified by Wilson, and a tendency for resources that repeatedly fall within the "in between" resource zone to cease participation in the market over the longer term, identified by DeRamus & Cain.[22]

47. The "race to the bottom" behavior arises from the fact that to receive a capacity obligation and be paid the higher stage two price, resources must clear at or below the lower stage one price. If they do not clear in stage one, even if they offer at or below the stage two price, they will not receive a capacity obligation and will realize no capacity revenue, becoming an "in-between" resource. As a result, resources generally have an incentive to reduce their bids below their cost of providing capacity to increase the likelihood of clearing in stage one. Because the stage two price will be higher than the stage one price and be set by resources higher up the supply curve that did not clear in stage one, this is a rational strategy for most resources that suspect they may be marginal or near-marginal in stage one. Its overall effect is to reduce capacity offer prices.

48. The "clear out the top" behavior identified by Wilson (but not DeRamus & Cain) describes an increased incentive for certain resources that are part of a larger portfolio to offer at a higher level than otherwise to the extent they believe they are unlikely to clear in stage one but may be marginal or near marginal in stage two. This stems from the fact that the opportunity cost

[20] Wilson Affidavit at ¶ 54-57 and DeRamus/Cain Affidavit at ¶ 40-49.

[21] Wilson Affidavit at ¶ 58.

[22] DeRamus/Cain Affidavit at ¶ 49-53.

of bidding at a higher level and not clearing is largely eliminated for those resources because as likely "in-between" resources they will not clear anyway. Because this opportunity cost is reduced or eliminated, the value to the overall portfolio of engaging in this strategy is incrementally increased, which may cause certain resources to bid higher than otherwise.

49. Finally, DeRamus & Cain suggest that over the longer-term resources that repeatedly fall in the "in-between" resource group, and particularly new entrant resources falling in this zone, will eventually cease participation in the market despite being ostensibly competitive at the stage two price because of the ongoing cost of preparing and standing behind their capacity offers. This effect will tend to steepen the supply curve in the in-between resource zone to the extent that these participants are not replaced with other new entrants at a similar offer level.

50. Of the three strategic bidding effects, one ("race to the bottom") will tend to reduce offer prices and lower the supply curve, while two ("clear out the top" and long-term exit of in-between resources) will tend to increase offer prices and/or raise the supply curve. The overall impact on market clearing prices and amount of cleared capacity under Capacity Repricing is thus ambiguous at first glance and depends on the relative strength and prevalence of the three effects.

51. While commenters' witnesses point out these strategic bidding behaviors, they do not provide any well-supported analysis of their combined net impact. Wilson provides an example, based on an approximation of the 2020/21 RPM RTO supply and demand curves, that purports to show that the "clear out the top" effect will tend to predominate, at least for purposes of determining the market clearing price, and will result in higher than otherwise prices, while the "race to the bottom" effect will drive a slightly higher cleared quantity in stage one.[23] This example, however, is completely driven by an arbitrary and unsupported assumption about which resources will choose a particular bidding strategy and the degree to which a given bidding strategy will cause them to change their offer prices. As I discuss below, a careful examination of each strategy indicates that the assumptions underlying this analysis are not representative of the likely outcome. DeRamus & Cain, on the other hand present an example that suggests that the effect is to decrease the stage two clearing price, while increasing the quantity cleared in stage one.[24]

[23] Wilson Affidavit at ¶ 60-62.

[24] DeRamus/Cain Affidavit at ¶ 45-46.

52. An analysis of the each of the strategic bidding behaviors identified by commenters' witnesses indicates that the impact of the "race to the bottom" behavior is likely to dominate the effect of the other two behaviors, leading to a net incremental reduction in offer prices and a decrease in the stage two clearing price.

53. The principal reason for this is that the "clear out the top" behavior is likely to be quite rare because it would only apply to certain resources that are part of unusually-constituted portfolios. This is because Capacity Repricing does not actually create a new incentive to engage in "clear out the top" bidding, but instead may slightly reduce the opportunity cost of engaging in this bidding strategy where there is already an incentive present. Thus, the incremental increase in the frequency of "clear out the top" bidding due specifically to Capacity Repricing is likely to be minimal. As a result, the "clear out the top" behavior will have little impact on the capacity supply curve.

54. Furthermore, it is important to note that the "clear out the top" bidding behavior, whether in the status quo or incrementally under Capacity Repricing, is bounded by existing market power mitigation rules. Existing generation resources under either the status quo, Capacity Repricing, or MOPR-Ex remain subject to the must-offer requirement, the safe harbor offer cap of Net CONE times the balancing ratio ("B"), and the requirement to justify offers above the safe harbor cap with a unit specific Avoidable Cost Rate showing. Thus, to the extent that any resource engages in the behaviors described previously, and to the extent that its offer is above "cost," it still must remain at or below Net CONE times B, which the PJM IMM and the Commission have stated is representative of the opportunity cost that resources face when choosing whether to take on a Capacity Performance obligation. The "clear out the top" behavior then is limited at most to replacing an offer for which the resource owner judges the private costs of providing capacity to be some lesser value than Net CONE times B with a different offer at some higher level that is nonetheless equal to or less than Net CONE times B. That is, the resource owner is replacing one competitive offer with a different, higher, but still competitive offer. Any argument that the prices resulting from such behaviors are somehow not competitive or otherwise inappropriate is an argument that the existing market power mitigation rules are somehow inadequate, rather than an argument against a particular market design; such an argument seems beyond the scope of this proceeding.

55. In addition, the resources that may have incentives to engage in "clear out the top" behavior will also have incentives to engage in the "race to the bottom" behavior as well. Wilson contends that resources can easily predict where they will fall within the relative range of "in-between" resources and can thus precisely determine what strategy is appropriate for them. In the real world, where bidders have highly imperfect information, this is unlikely to be the case. Resources' ability to predict where they will fall on the supply curve when formulating their offers is highly limited and imprecise.

56. Finally, as both Wilson and numerous other commenters amply document, recent experience with the PJM capacity market indicates that there is a very large pool of potential new entrants, particularly new build natural gas combined cycles, that are willing to enter the market at relatively low prices.[25] The ability of any market participant to influence prices through a particular bidding strategy will be sharply constrained by the competitive discipline provided by these potential new entrants. Any strategic bidding behavior that tends to raise prices, such as the "clear out the top" behavior, will likely be met by a new entrant response which will tend to offset its impact.

57. Like the "clear out at top" behavior, the potential impact of "in-between" resources dropping out of the market over the longer-term, identified by DeRamus & Cain, is likely to be offset by this deep pool of new entrant capacity. Evidence from recent auctions suggests that new entrants tend to bid as price takers, rather than as marginal resources, and will thus be likely to respond to any price increase caused by "in-between" resource exit simply by increasing the amount of new entrant capacity offered.

58. Unlike the other two behaviors, the "race to the bottom" behavior identified by both Wilson and DeRamus & Cain is broadly applicable to all resources and does not depend on a set of particular circumstances such as being part of a specifically-constituted portfolio. Indeed, as discussed above, even when resources potentially face countervailing incentives to engage in other behaviors such as "clear out the top," the "race to the bottom" incentive will still be present and in many cases will tend to dominate the other incentive. For this reason, of the three behaviors

[25] Wilson Affidavit at ¶ 19-22 and Exelon Protest at 32-37.

identified, "race to the bottom" is likely to be far more prevalent and will tend to dominate the other two effects.

59. While it is likely to dominate, the "race to the bottom" behavior is likely to be self-limiting to the extent that it is not likely to drive the stage two price below the stage one price. This is because rational bidders will build into their decision on how to offer their resource the expectation that most other bidders will also be engaging in the "race to the bottom" behavior. If only one bidder is reducing its bid below cost to clear in stage one, its expectation of the stage two price will remain relatively high, and thus an aggressively below-cost bid is very likely to clear stage one and will be rewarded with a relatively high stage two price. If, however, all other bidders are engaging in the same behavior, the risk of not clearing stage one is increased, and the stage two price is likely to be much lower, increasing the risk that if the resource does clear, it may not be paid a price that covers its costs. Thus, under the expectation that all resources are engaging in "race to the bottom," resources are likely to be less aggressive in reducing their bids below cost to clear in stage one.

60. To provide a sense of the likely overall aggregate magnitude of the bidding behaviors, given the likely dominance of the "race to the bottom" behavior over the others, I have modified the example provided by Wilson to show the outcome that results when resources only engage in the "race to the bottom" behavior.[26] Following Wilson's assumptions, I have assumed that 50% of resources with offers more than $80/MW-day and less than $170/MW-day reduce their offers by 20% relative to the status quo. Unlike Wilson, however, I do not assume that any offer modification due to "clear out the top" occurs. I otherwise adopt Wilson's underlying assumptions with regards to supply curve shape and other parameters. This modified example is shown in graphical form in Figure 3 and Figure 4 below:

[26] Wilson Affidavit at ¶ 60-62.

Figure 3

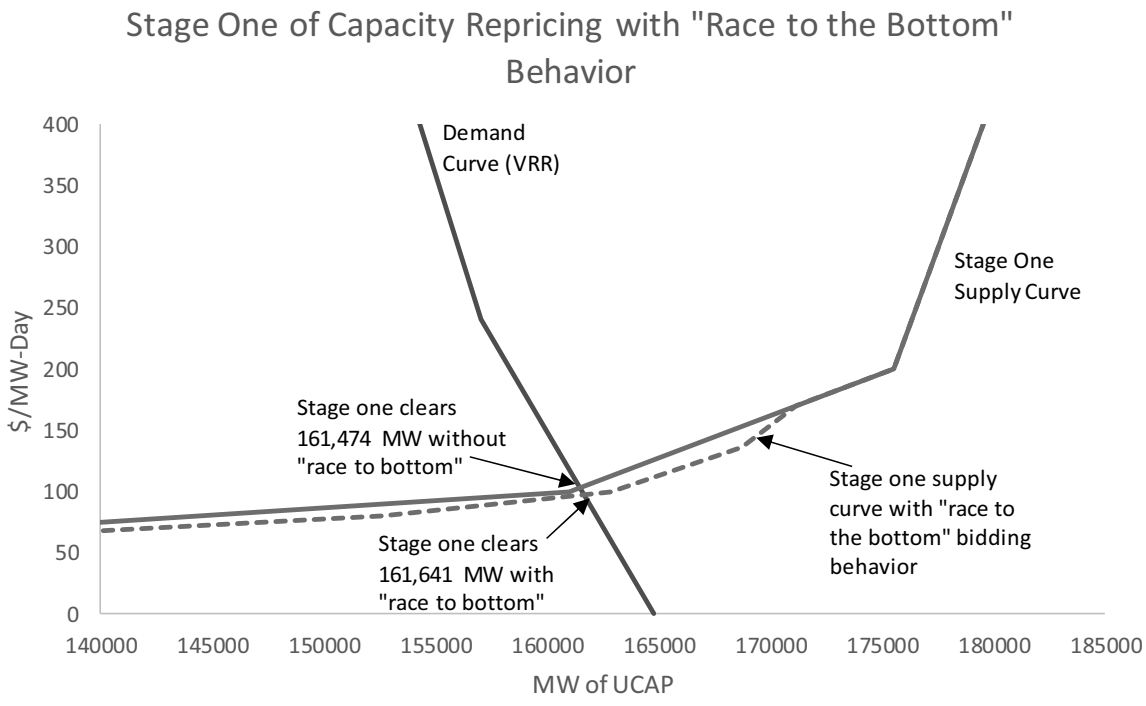


Figure 4

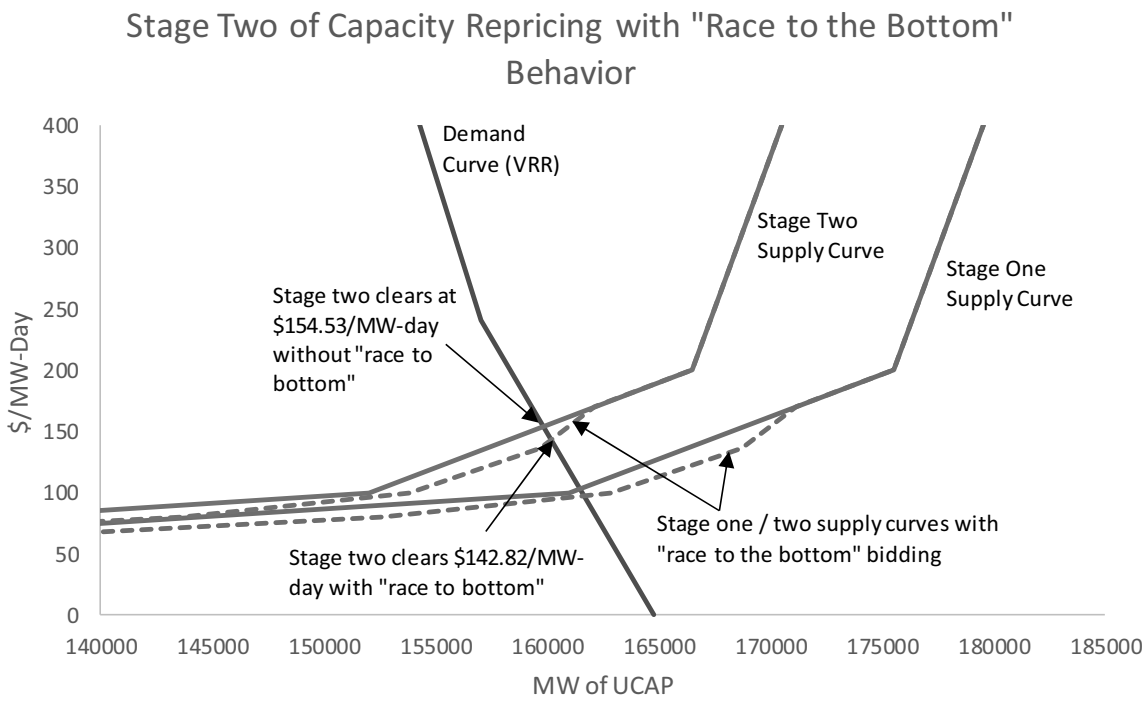


61. Without any strategic bidding behaviors, Capacity Repricing causes the capacity clearing price to increase from $102.8/MW-day in the status quo case to $154.53/MW-day in the Capacity Repricing case, with total unforced capacity cleared of 161,474 MW in both cases. Load payments thus rise from $6.06 billion in the status quo to $9.1 billion under Capacity Repricing, or a 50% increase. If we assume that the "race to the bottom" behavior dominates as per the assumptions discussed above, the total UCAP procured under Capacity Repricing rises slightly, by 167 MW to 161,641 MW, but the clearing price is $142.82/MW-day, or about 7.5% lower than it would have been without strategic bidding behaviors. Customer load payments with strategic bidding behaviors are $8.425 billion, or about a 39% increase relative to the status quo, rather than 50%. As discussed earlier, MOPR-Ex results in a customer cost increase of about 50% versus the status quo, so the effect of strategic bidding on Capacity Repricing in this example results in customer costs that are still considerably elevated relative to the status quo, but below MOPR-Ex.

62. The overall effect, then, of strategic bidding would be to drive the stage two clearing price under Capacity Repricing closer to the status quo price that would prevail absent Capacity Repricing. Generally, the resulting price should fall somewhere between the price absent strategic bidding (which is also the price that would result from MOPR-Ex) but above the status quo price that would result from no mitigation. Exactly where on this continuum the price would fall in this range is difficult to predict with precision, but the predominance of the "race to the bottom" behavior should ensure that it falls below the MOPR-Ex price while bidder rational expectations should ensure that it falls above the status quo price.

63. Strategic bidding would result in a total quantity procured slightly in excess of what it would be in the most efficient status quo case. Given the steepness of the demand, the incremental capacity procured because of this is minimal. In the example above, strategic bidding causes 167 MW of additional capacity to clear, or a 0.1% increase versus the status quo.

64. To the extent that the resources subject to mitigation are receiving payments addressing environmental externalities, the status quo price is more efficient than the Capacity Repricing price without these strategic bidding behaviors (which is also the same as the MOPR-Ex price). Thus, ironically, the effect of strategic bidding behaviors in the aggregate is to make Capacity Repricing less inefficient, not more inefficient, because collectively they drive a lower market clearing price that is closer to the efficient status quo price. As a result, the strategic bidding

behaviors incrementally increase the efficiency of Capacity Repricing and lower its cost to consumers. But whatever one's view of the state programs at issue, these behaviors are likely to have only modest effects that will yield a price somewhere between the status quo price and the MOPR-Ex price.

C. STRATEGIC BIDDING BEHAVIORS CAN BE REMEDIED WITH A LOST OPPORTUNITY COST PAYMENT TO "IN-BETWEEN" RESOURCES

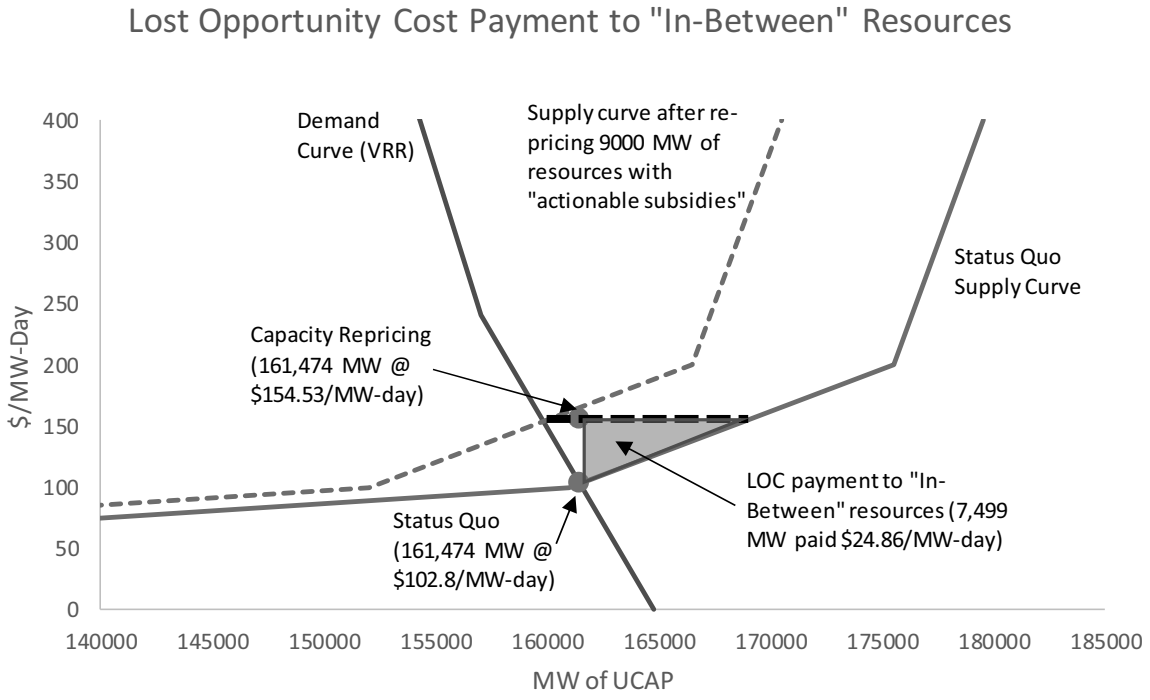
65. If the Commission does decide to proceed with Capacity Repricing but also determines that the strategic bidding behaviors identified by commenters' witnesses are undesirable, the behaviors could be largely eliminated by implementing a simple market design fix analogous to other market design fixes that the Commission has approved to address similar strategic bidding issues in RTO energy, ancillary service, and capacity markets. That is, rather than representing an insoluble "fatal flaw," these strategic bidding behaviors can easily be addressed within the broader market design. The market design fix in this case would be to implement a lost opportunity cost ("LOC") payment for "in-between" resources.

66. As discussed above, the root cause of all the potential strategic bidding behaviors identified by commenters' witnesses is the fact that "in-between" resources do not clear and thus do not bear any direct financial consequences for their bid. A LOC payment adds financial consequences for "in-between" resources in a manner that simulates the consequences that would occur if they did clear in stage two of Capacity Repricing, and in so doing largely eliminates the incremental incentives to engage in strategic bidding behaviors.

67. A LOC payment would be implemented by paying resources that do not clear in stage one the difference between the stage two clearing price and their individual bid price, if greater than zero. Despite receiving this payment, they would still not clear in stage one and would not receive a capacity obligation. The LOC payment would thus not carry an obligation that the resource receiving it remain in the market (for an existing resource) or subsequently enter the market (for a new resource); an existing resource could subsequently retire following the auction and still receive the payment. The LOC payment replicates the margin that the "in-between" resources would have earned by providing capacity if they were cleared and received a capacity obligation. That is, the stage two price represents the capacity revenue they would have received, while their offer price represents their private cost of providing capacity. The LOC payment pays

them as if they had cleared the market but recognizes that because they do not receive a capacity obligation they are able to avoid the cost of providing capacity, and thus deducts their offer price from the capacity clearing price. Figure 5 below shows how a LOC payment for "in-between" resources would work in graphic form:

Figure 5



68. The LOC payment restores financial consequences to the bidding decisions made by in-between resources. Because lack of financial consequences for their bidding decision is the root cause of the strategic bidding behaviors incentivized by Capacity Repricing, a LOC payment reduces the incentive to engage in these behaviors.

69. First, the incentive to engage in "race to the bottom" below-cost bidding is reduced because the LOC payment makes resources indifferent between clearing or not clearing in stage one. Working off the "race to the bottom" example provided by Wilson,[27] assume that a resource with costs of $115/MW-day is determining its offer price under the knowledge that an offer of $100/MW-day or less is needed to clear stage one, but the stage two price is likely to clear at around $150/MW-day. Without a LOC payment, this resource has an incentive to reduce its offer

[27] Wilson Affidavit at ¶ 55.

below its costs, to $100/MW-day or less, to avoid becoming an "in-between" resource. If it bids below costs and clears stage one, it earns a margin on its capacity sale of $35/MW-day, the difference between the stage two price of $150/MW-day and its costs of $115/MW-day. But if it bids its costs, it will not clear and will receive nothing. With a LOC payment, however, if it bids its costs of $115/MW-day, it receives a payment of $35/MW-day – the difference between the stage two price and its offer price. Thus, the resource owner's incentive to reduce its offer price to a level needed to clear stage one is eliminated – the resource's margin is equalized between the two outcomes.

70. It is true that a LOC payment likely does not fully eliminate the incentive to bid below cost in all situations. Resources that expect to fall within the "in-between" zone would have a modest incentive to reduce their offer prices slightly below cost in order to maximize the size of the LOC payment while still remaining a "in-between" resource. This incentive is much weaker, however, because it only produces gains if the resource still does not clear stage one despite reducing its offer below cost, and higher cost resources that engage in this strategy would run the risk of clearing in stage one and taking on a capacity obligation at a loss.

71. Second, the "clear out the top" behavior would be eliminated, to the extent it exists, because the LOC payment restores the opportunity cost of bidding a high cost "in-between" resource at above its costs. As discussed previously, this behavior arises because such resources are unlikely to clear in stage one and thus do not forgo any capacity margin by bidding above cost. With a LOC payment, however, bidding in this fashion would cause the resource to either forgo the payment (because it bids above the stage two price) or reduce its magnitude. Thus, the payoff to a "clear out the top" strategy of bidding such a resource above its costs is re-set back to the same level that exists under the status quo.

72. Finally, resources that consistently fall in the "in-between" region, particularly new entrant offers, will not face an incentive to stop bidding over time due to failure to cover their offer costs. LOC payments should provide sufficient compensation for such resources to continue preparing offers and participating in the market.

73. The cost of LOC payments is likely to be quite small relative to overall capacity cost. Returning to the example originally provided by Wilson, with an assumed 9,000 MW of re-priced resources, Capacity Repricing results in a clearing quantity of 161,474 MW and a clearing price

of $154.53/MW-day for stage two and $102.8/MW-day for stage one. Under these assumptions, and with the capacity supply curve assumed by Wilson, there are 7,499 MW of resources that do not clear stage one but bid below $154.53/MW-day (*i.e.*, "in-between" resources). These resources have an average bid price of $128.66/MW-day. A LOC payment system would pay this 7.5 GW of resources an average payment of $24.86/MW-day (the stage two price less their average bid). The total cost of these payments would be about $68 million, or about 0.75% of the total capacity payments under the example.

74. While LOC payments have not to date been utilized in capacity markets, they are widely used (and FERC-approved) in RTO energy and ancillary services markets to align bidder incentives and increase market efficiency. Examples include LOC payments to generators in the energy market to keep them whole when responding to out-of-market dispatch signals for reliability reasons, and co-optimization of energy and operating reserves markets, where lost opportunity cost forms the basis for the reserve price.

75. By comparison, there is no relatively simple adjustment, like a lost opportunity cost payment, that would fix the flaws in the MOPR-Ex proposal. MOPR-Ex by its nature pushes targeted resources out of the capacity market. As discussed previously, the flaws in MOPR-Ex arise from this fundamental feature of MOPR-Ex – either the resources remain and excess capacity is effectively procured, or economic resources may exit the market. There is no way to avoid these problems without changing this fundamental aspect of MOPR-Ex.

76. This completes my declaration.

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

A. QUALIFICATIONS

1. My name is Robert D. Willig. I am Professor of Economics and Public Affairs Emeritus at the Woodrow Wilson School of Public and International Affairs and the Economics Department of Princeton University. There I served for many years as the Field Coordinator for Economics at the Woodrow Wilson School and as the Faculty Chair of the Masters Program in Public Affairs. Before joining the senior faculty of Princeton University in 1978, I was Supervisor in the Economics Research Department of Bell Laboratories. My teaching and research have specialized in the fields of industrial organization, government-business relations, and social-welfare theory.

2. I served as Deputy Assistant Attorney General for Economics in the Antitrust Division of the U.S. Department of Justice from 1989 to 1991. I also served on the Defense Science Board task force on the antitrust aspects of defense industry consolidation and on the Governor of New Jersey's task force on the market pricing of electricity.

3. I am the author of *Welfare Analysis of Policies Affecting Prices and Products, Contestable Markets and the Theory of Industry Structure* (with William Baumol and John Panzar), and numerous articles in the professional literature of economics and law. I am a co-editor of *The Handbook of Industrial Organization*, and have served on the editorial boards of the *American Economic Review*, the *Journal of Industrial Economics* and the MIT Press Series on regulation. I am also an elected Fellow of the Econometric Society.

4. I have performed applied research and have developed expertise on market structure, competitive conduct, contractual relations, optimal pricing, micro-economic reforms, and the architecture and practice of infrastructure regulation. I have been a consultant to firms in many sectors of the economy, including telecommunications, transportation, energy, health care, pharmaceuticals, aeronautics, automobiles, information technology, chemicals, consumer products, and financial markets.

5. I have researched, taught, consulted, and testified on antitrust issues including horizontal mergers, vertical mergers, allegedly monopolizing conduct and allegedly collusive conduct in a host of industries. I have researched, taught, consulted, and testified on regulatory issues including

pricing, access, vertical and horizontal firm structure and the roles of governments and markets in the energy, telecommunications, and transportation industries.

6. I have worked as a consultant with the Federal Trade Commission, the Organization for Economic Cooperation and Development, the Inter-American Development Bank, the World Bank, and various private clients. I serve as a senior consultant to Compass Lexecon, an economic consulting firm that I helped to found. A list of my articles, books, and other professional publications and activities is presented in my curriculum vitae (Attachment A).

B. BACKGROUND AND PURPOSE OF TESTIMONY

7. On May 31, CPV Power Holdings, L.P., Calpine Corporation, and Eastern Generation, LLC ("Complainants") filed a complaint ("Complaint") alleging that the existing Minimum Offer Price Rule ("MOPR") of PJM Interconnection, LLC ("PJM") is unjust and unreasonable because the existing MOPR fails to mitigate resources receiving payments under certain state programs, and in particular, state environmental programs. Complainants further allege that both of the modifications to PJM's market design that PJM proposed in its April 9, 2018 filing[1] at the Federal Energy Regulatory Commission ("FERC" or "Commission"), called Capacity Repricing and MOPR-Ex, are also unjust and unreasonable.

8. Complainants ask the Commission to impose on PJM instead what they call a "Clean MOPR," which Complainants describe as "MOPR-Ex with the Unit-Specific Exception but without the Self-Supply, Competitive, Public Entity and RPS Exemptions."[2] The Clean MOPR, however, would continue to exempt from mitigation resources receiving payments under certain state and federal programs. Thus, Complainants' Clean MOPR proposal is designed to discriminate against resources receiving certain types of state support.

9. In particular, Complainants' Clean MOPR proposal would transform PJM's existing MOPR by applying it to certain existing capacity resources receiving a so-called "Material

[1] PJM Interconnection, LLC, Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, FERC Docket No. ER18-1314-000, April; 9, 2018 ("PJM Filing").

[2] Complaint at 18.

Subsidy."[3] By broadening the application of the MOPR to certain existing state-supported capacity resources (e.g., nuclear), Complainants propose to impose offer price floors that would likely prevent these resources from clearing in the capacity auctions. However, Complainants' Clean MOPR proposal would exclude from its definition of "Material Subsidy" state and local subsidies designed to promote "general industrial development in an area," or to incentivize "siting facilities in [one] county or locality rather than another county or locality."[4] The Clean MOPR would also exclude "federal subsidies or other support granted [before] the date of th[e] Complaint."[5] Capacity resources receiving such subsidies would be allowed to offer into PJM's capacity auctions at a price of zero.

10. The Clean MOPR would interact destructively with the Illinois Zero Emissions Standard (hereinafter "Zero Emissions Standard", "ZES" or "ZES Program"). On December 7, 2016 the Illinois legislature passed comprehensive energy legislation[6] intended to ensure that Illinois remains on track to meet its environmental goals by continued and increased reliance on zero-emission electric generation resources.[7] Among the legislative goals encompassed in the ZES is "[p]reserving existing zero emission energy generation and promoting new zero emission energy generation," which "is vital to placing the State on a glide path to achieving its environmental goals and ensuring that air quality in Illinois continues to improve."[8] The program's means of accomplishing this goal is to compensate nuclear generators that might otherwise retire for the environmental attributes of their continuing production.

11. To compensate certain Illinois nuclear generation units for the social benefits of their zero-carbon dioxide emissions generation—which would be lost if these units retired—the ZES calls for the creation of Zero Emission Credits ("ZECs"). The value of a ZEC is based on the U.S. government's estimated social cost of carbon emissions in force at the time of the program's enactment, which is not currently reflected in wholesale-power market prices. Under the ZES, the

[8] *Id.*

Illinois Power Agency ("IPA") developed a zero-emission standard procurement plan and procured contracts for ZECs from facilities capable of generating zero-emission credits cost-effectively in an amount equal to 16% of the electricity delivered by Illinois electric utilities with more than 100,000 customers in calendar year 2014.[9] Exelon's Quad Cities and Clinton nuclear plants were selected to provide ZECs based on a public interest standard that includes, among other things, minimizing carbon dioxide, sulfur dioxide, nitrogen oxide, and particulate emissions that adversely impact Illinois citizens.[10]

12. I have been asked by counsel for Exelon to provide an economic analysis of Complainants' claim that PJM's existing MOPR is not just and reasonable because it fails to mitigate resources receiving payments under state programs promoting environmentally friendly resources, as well as to provide an economic analysis of Complainants' proposed Clean MOPR.

C. SUMMARY OF FINDINGS AND CONCLUSIONS

13. I have reached the following findings and conclusions:

(a) In the analysis supporting its conclusion that reforms to market rules are needed, Complainants ignore a basic principle of economics: Actions taken by producers that impose social costs that are not accounted for in the producer's private costs result in negative externalities that harm the public interest. For example, when a coal power plant generates electricity, the plant owner incurs the private cost of operating the plant. The social costs of operating the plant, however, include not only the owner's private costs, but also the cost of pollution that the plant's operation imposes on the public. Economics teaches that when private costs diverge from social costs, the result will be an inefficient allocation of resources. For example, when a coal plant owner can operate the plant without bearing the costs of pollution, the plant owner will operate the plant more than would be efficient. Taxes and subsidies can be designed to internalize the costs to society from negative environmental externalities. For example, the government can impose a tax on the coal plant owner equal to the cost of the negative externality

[9] SB 2814 at (d-5) Zero emission standard (1).

[10] Illinois Commerce Commission, Public Notice of Successful Bidders and Average Prices, Illinois Power Agency, January 2018 Procurement of Zero Emission Credits from Facilities Fueled by Nuclear Power, January 25, 2018.

(environmental costs) that results from the plant's operation, which would predictably lead to a reduction in the plant's operations consonant with the internalization of the environmental costs borne by society. Or, the government can provide financial support to a clean source of power that rewards its positive externalities, including its displacement of coal or other fossil fuel plant emissions that reduces environmental costs borne by society.

(b) Complainants' Complaint makes the fundamental error of focusing on private production costs rather than social costs as the measure of efficiency that should be applied when evaluating its capacity market design. The proposal asserts that state public policies that seek to retain or induce the entry of environmentally friendly sources of generation by providing them with out-of-market payments "negatively impact RPM price signals and cause the retention of inefficient resources."[11] That is incorrect. The design objective of PJM's markets is to select the most efficient mixture of capacity resources to serve load. When environmental externalities are not accounted for in a marketplace, the result is an inefficient allocation of resources. To be sure, PJM's wholesale power markets are not themselves designed to require plant owners to internalize the costs of environmental externalities. But that is because FERC can rely on the states to regulate the environmental aspects of power generation. States can provide extra revenue to environmentally friendly producers (subsidize), or take revenue away from environmentally harmful producers (tax); and PJM's markets can then seek to select the least-cost set of resources against the backdrop of these state policies. The result is the most efficient set of resources to serve load, accounting for the impact of various state policies that reflect environmental externalities. Such state programs thus complement PJM's market design objective; they do not impede it. To the contrary, PJM's market design objective would be defeated by capacity market rules that would effectively prevent all environmentally friendly units receiving state support from clearing in the capacity market. The market would then select a group of resources that, from the standpoint of social welfare, is inefficient; and, moreover,

[11] Complaint at 12.

it would also select a quantity of capacity that is inefficient, by ignoring the capacity provided by the state-supported resources.

(c) The Illinois ZES Program provides an example of a state program that implements the principles of economics just discussed. It addresses the social benefits associated with eliminating a negative externality by facilitating a positive externality. The ZES Program provides compensation to nuclear power generation plants that is based on, and cannot exceed, the cost of carbon dioxide emissions that society avoids so long as these plants continue operating, but that would result from the production of electricity from the generation resources that would replace the nuclear plants. Thus, the program is designed to ensure that the estimated quantified benefit to society from the avoided carbon dioxide emissions is always greater than the amount paid to nuclear power plants to avoid those emissions. The economic rationale for the ZES is well grounded in the field of welfare economics. Compensating nuclear generation for its zero-emission attributes, thereby preventing its retirement, is a move toward greater economic efficiency as compared to allowing those plants to retire and be replaced by fossil fuel plants that impose environmental costs on the public. By offering appropriate environmental attribute payments tied to the value of the environmental externality, the ZES complements the workings of competitive wholesale electricity markets and ensures that there will be incentives to preserve existing nuclear generation if and only if it is socially efficient to do so, taking both externalities and private production costs into account. If the sum of market revenues and the value of the abated externality exceeds the costs of production, then production is socially worthwhile. A properly designed capacity market should seek to accommodate this state program, which complements and advances the goal of selecting the most efficient set of generation resources to serve load.

(d) From the standpoint of economics, the ZES Program compares favorably with other types of support programs, where compensation is not tied to the value of the environmental externality abated. For example, while renewable portfolio standard ("RPS") programs likewise provide financial support to environmentally friendly generation that would not otherwise be able to enter the market, compensation

under such programs is not often tied to the value of the environmental harm being abated. Such state compensation can result in the retention of units without regard to whether their retention is efficient or inefficient. The same is true of federal tax credits, such as the Production Tax Credit for wind and the Investment Tax Credit for solar.

(e) The zero emission certificate program recently passed by New Jersey ("New Jersey ZEC Program") also implements the principles of economics just discussed. The New Jersey ZEC Program's payments are based on a retail charge of $.004/kWh, and the program "is structured such that its costs are guaranteed to be … less than the social cost of carbon emissions avoided by the continued operation of [the] selected nuclear power plants."[12] The New Jersey ZEC Program improves efficiency compared with the status quo because it compensates the selected nuclear plants for their environmental benefits, and it does so in an amount that is guaranteed not to exceed the plants' environmental benefits.

(f) Complainants' Clean MOPR is unjustified from an economic point of view. It is based on the mistaken premise that it would defeat PJM's market design objective if capacity prices reflected state payments compensating environmentally friendly generation for abating externalities, and the Clean MOPR would unjustifiably frustrate these state programs.

i. First, by applying a MOPR to certain state-supported resources, the Clean MOPR would effectively prevent them from clearing in the capacity market. As a result, the capacity market would select an inefficient mixture of resources: it would select resources based primarily on the private cost of production, without fully accounting for the reduced social costs that result from state-supported environmentally desirable production. That mixture of resources would be less efficient than the mixture that would be selected when accounting for the positive environmental externalities associated with environmentally friendly resources. To put it another way, the absence of the

[12] Senate Bill No. 2313, § 1(b)(8).

internalization of the social cost of carbon emissions in market prices creates the appearance that certain clean resources—for example, financially challenged nuclear units—are not efficiently competitive. In fact, when externalities are taken into account, these units are economically efficient and their continued presence in the market should be viewed as pro-competitive.

ii. Second, the Clean MOPR would result in the over-procurement of capacity, imposing unnecessary costs on customers. The Clean MOPR ignores the availability of capacity from many state-supported resources, even though those resources may continue operating and supplying capacity to the grid notwithstanding the application of the MOPR to these resources. Instead, the Clean MOPR procures additional capacity from resources not requiring state support. That results in over-procurement of capacity and unnecessary costs for consumers.

iii. Third, the Clean MOPR proposes to extend the MOPR to existing capacity resources. PJM's MOPR has not previously been applied to existing resources as much of the cost of providing capacity is sunk once a resource is operating. The Clean MOPR extends the application of the MOPR to existing units with no indicia to measure whether such an extension is guarding against the exercise of buyer-side market power, and no analysis by Complainants of whether such an extension could result in the exclusion of capacity that is efficient in the relevant time frame.

(g) The Clean MOPR also draws arbitrary and discriminatory distinctions among different types of state support. These distinctions are not grounded in economics.

i. First, the Clean MOPR exempts only certain state support for clean generation, with no sound basis in economics for the distinctions it draws. It exempts certain state and local subsidies aimed to promote industrial development in an area or the siting of a project in a particular location. It also exempts existing federal subsidies. But the Clean MOPR does not consider the relevant question concerning the design of the program: whether the program is economically efficient and welfare enhancing. Complainants provide no

evidence that the programs exempted from mitigation under the Clean MOPR are likely to be economically efficient or welfare enhancing. Indeed, the Clean MOPR does not even consistently apply Complainants' apparent rationale for expanding the MOPR—that bids should not account for out-of-market support under state or federal programs, and that bids reflecting such support should be mitigated if they materially affect market outcomes. This rationale is not based on sound economics, as I have explained, but Complainants provide no evidence that the programs they exempt do not have the features that they elsewhere deem to warrant mitigation. Complainants' attempt to redefine the use of the MOPR away from preventing the exercise of buyer-side market power leaves them with no principled basis upon which to exempt some state and federal programs while not exempting others.

ii. There is no clearer example of the failings of the Clean MOPR proposal than its discrimination against existing generation units providing ZECs under the ZES Program and the New Jersey ZEC Program (together, the "ZES Programs"). Not only do ZECs raise no warranted concerns about their impact on the public interest, but ZECs will contribute to efficient and desirable outcomes in the capacity auctions. Moreover, the ZES Programs compare favorably from an efficiency perspective with the subsidies exempted from operation of the Clean MOPR, which Complainants have not shown promote economic efficiency. It is economically efficient and appropriate to not interfere with a narrowly-focused subsidy that will have a direct impact and achieve the desired result of reducing harmful environmental externalities in a cost-effective manner. The Clean MOPR arbitrarily discriminates against generation resources receiving ZECs.

(h) If PJM's MOPR remains confined to preventing the exercise of buyer-side market power, as I believe it should be, the ZES Programs should not be mitigated. There are a number of reasons why the ZES Programs are not exercises of buyer-side market power and the recipients of ZEC payments should not be subject to buyer-side market power mitigation.

i. First, the ZES Programs are clearly not an exercise of buyer-side market power because the estimated benefits of the programs exceed the costs without any consideration of the impact the programs may otherwise have on market prices. The cost of a ZEC and the financial benefit to its recipient cannot exceed the value of the externality being addressed—the social cost of the abated carbon dioxide emissions. This ensures that the receipt of the ZECs does not result in participating nuclear plants making economically inefficient decisions about whether or not to continue operating by overcompensating them for their environmental benefits. Again, if the sum of market revenues and the value of the abated externality exceeds the costs of production, then production is socially worthwhile. Improving the alignment of private and social incentives to produce power from the participating nuclear units is the core economically beneficial characteristic of the ZES Programs. In an exercise of buyer-side market power, by contrast, there is no alignment of social value and private incentives; instead, the exercise of market power is based on the buyer's private incentive to transfer value from other producers to itself by suppressing market prices, even if the added supply that suppresses prices is socially inefficient.

ii. Second, the ZES Programs do not insulate the participating nuclear generation unit owners from market risk or guarantee financially viable operations. Under the ZES Programs, the generating units could fail to produce and/or be retired in the event of significant unforeseen costs and/or operational problems. If the externality benefits of production, as reflected by the ZECs, are insufficient to close the gap between the expected private costs of production and the expected revenues derived from the market sales of production, then production from the participating units will not be compensatory. A program designed to exercise buyer-side market power, by contrast, would provide sufficient compensation to guarantee future plant operation even if the plant's operation were economically inefficient.

iii. Third, the ZES Programs do not require a unit to bid into the wholesale energy or capacity market, or clear in the wholesale capacity market. The ZES

Programs provide narrowly defined compensation associated with plant production, not sale of energy or capacity. By contrast, efforts to exercise buyer-side market power ordinarily, so as to warrant mitigation, would require bidding and clearing as a condition for compensation, in order to ensure that compensation is paid only if prices are suppressed through direct market participation. As such, the ZES Programs complement FERC's competitive market policies and do not interfere with FERC's market pricing mechanisms.

iv. A program intended to exercise market power would be structured differently without incentives so closely linked to emissions-reducing production. Compensation intended to support generation for the suppression of market prices would not be limited, as is compensation under the ZES Programs, to the social benefits of the averted carbon emissions. Instead, the exercise of buyer-side market power would motivate compensation up to the size of the buyers' financial gains from the lowered prices.

14. ZEC recipients should be allowed to bid into the organized electricity markets without the constraints of repricing or mitigation. The ZECs should be permitted to offset production costs in the determination of their recipients' market bids because the ZECs compensate real social benefits of the units' production that avert the social costs of negative environmental externalities. The resulting prices are not artificially suppressed; they are the proper prices in light of state-provided compensation for plants' environmental attributes.

15. The use of a MOPR should be confined to preventing the exercise of buyer-side market power. There is no sound economic basis for Complainants' proposed use of a MOPR as a general tool to regulate capacity resource developers' and existing capacity owners' arrangements and conduct. There is no demonstrated rationale for how a MOPR can be effective in a generalized fashion, no articulated discipline or public interest guidelines over PJM decisions about what arrangements should be regulated through the application of the MOPR, and no demonstration that application of a MOPR would be an effective and efficient corrective form of regulation generally over capacity developers' and existing capacity owners' arrangements and conduct where these are deemed to be unconducive to the public interest. In contrast, there are well known indicators of circumstances where bidding behavior may reflect the exercise of buyer-side market power, and

plain logic for why a MOPR could be an appropriate and effective tool to apply in those specific circumstances.

16. The Clean MOPR proposal exemplifies the above reasons why a MOPR should not be approved as a general tool for PJM to employ to regulate capacity developers' and existing capacity owners' arrangements and conduct. The proposal does not attempt to articulate any reasoned principle to identify what arrangements, beyond exercises of buyer-side market power, should be regulated by PJM through the application of the MOPR. For example, the proposal's exemptions from application of the MOPR are not supported by evidence that these domains are relatively likely to be free of the concerns that Complainants have expressed about capacity developers' and existing capacity owners' arrangements and conduct. Instead, the proposal's exemptions are discriminatory, and they are expressed without any justification that would show that they would promote the public interest or that they would provide needed guidance to developers and current owners of capacity resources about what types of arrangements and conduct might be subject to the MOPR in the future. Moreover, Complainants have not demonstrated that the MOPR, if applied for a broader purpose than addressing buyer-side market power, would effectively protect the public interest with respect to the broader concerns Complainants have raised.

II. PJM'S MINIMUM OFFER PRICE RULE

17. From its inception, the focus of PJM's MOPR has been preventing capacity buyers from exercising buyer-side market power by introducing uneconomic new supply resources into PJM's capacity auctions. As the MOPR has evolved, the Commission has declined to expand it beyond buyer-side market power, has not approved its application to existing capacity resources, and has created exemptions from the MOPR for circumstances that do not present a substantial risk of being an exercise of buyer-side market power. The Commission has previously authorized these exemptions even though the exemptions had the potential to lower capacity prices. The economic justification for these exemptions is thus linked to the economic justification for the MOPR itself.

18. A brief review of the evolution of PJM's MOPR, and the justifications for exemptions to it, is helpful. PJM's initial MOPR rules were refined not long after being approved by the Commission in response to the recognition that some elements of the original MOPR design undermined the MOPR's effectiveness for preventing the exercise of buyer-side market power or

were based on tariff language that was unclear. In particular, two previously defined tests, or screens, that limited the application of the MOPR and reduced its effectiveness were eliminated.[13] First, the net-short test provided an exemption from the MOPR for entities that were both buyers and sellers of capacity and whose capacity purchases in an auction were small relative to their load obligation (i.e., they were not materially "short" the capacity needed to meet their load obligation). However, the original structure of the MOPR did not prevent an entity that exceeded the net-short threshold from arranging for a new capacity addition that would not be associated with its portfolio to push down capacity prices and reduce capacity costs for the entity's net-short position. Second, a price impact screen allowed capacity offers that failed a buyer-side market power conduct test (i.e., offers below the MOPR floor) to be accepted based on a price impact test. That screen was found to be too lenient in that it allowed price depression that was substantial enough to represent an exercise of buyer-side market power. Thus, the screens were found to be ineffective and to possibly allow for an exercise of buyer-side market power.

19. In addition, disagreement over whether PJM's tariff provided a MOPR exemption for state-supported resources was reviewed by the Commission, and the Commission approved PJM's proposal to make clear that there is not an exemption from the application of the MOPR for state-supported resources that could represent exercises of buyer-side market power.[14] However, following approval of these changes, the Commission recognized that the MOPR floor could be inappropriately applied to a resource offer that was justifiably lower than the MOPR floor and approved a unit-specific exemption (or exception) process to provide resource sellers an opportunity to explain the basis for an offer below the MOPR floor.[15] Moreover, the Commission at the time reasoned that wind and solar generation resources were not resource additions associated with the exercise of buyer-side market power and allowed these resources to make offers in PJM's capacity auctions at a price of zero, effectively exempting these resources from the MOPR.[16]

---

[16] 135 FERC ¶ 61,022 (2011) at P 152 and 137 FERC ¶ 61,145 (2011) at P 109.

20. In late 2012, following PJM's first experience administering the MOPR unit-specific exemption process, PJM sought Commission approval to create two categorical MOPR exemptions: the competitive entry and self-supply exemptions. Under the competitive entry exemption, a resource would become exempt from the MOPR if it could demonstrate that it was not receiving revenues from a state utility ratepayer-backed non-bypassable charge. Under the self-supply exemption, an entity (public power, municipal or vertically integrated utility) whose business model was based on the principle of maintaining sufficient capacity to meet its expected peak demand was allowed to obtain an exemption from the MOPR for a new resource addition so long as the entity passed certain screening criteria. These screening criteria were designed to establish that the entity was not seeking to exercise buyer-side market power and was maintaining a capacity supply/demand balance consistent with its business model. These two exemptions were approved by the Commission in early 2013, and were used by PJM for several auctions, but were recently rescinded following an appellate court ruling.[17]

21. The competitive entry and self-supply exemptions are currently not in effect, but the economic basis for each of these exemptions is important. Each of these exemptions is grounded in the principle that the MOPR's purpose is to prevent the exercise of buyer-side market power. First, the competitive entry exemption was developed to recognize that there may be new generation capacity resource developers that are bringing supply to PJM's market with no indicia implying that an entity with an incentive to exercise buyer-side market power is subsidizing the developer.[18] In particular, to be eligible for the exemption the capacity resource seller had to demonstrate the following: 1) that no costs associated with the resource's development would be recovered directly or indirectly through a non-bypassable charge paid by retail consumers; 2) no costs are recovered through contracts with a term of a year or longer resulting from non-competitive and discriminatory state-supported or state-sponsored procurement processes; and, 3) the capacity resource seller did not have any formal or informal arrangements to receive material payments, concessions, rebates, or subsidies from a governmental entity.[19] The objective of the

[17] *See PJM Interconnection, LLC*, 161 FERC ¶ 61,252 (2017). In response to a U.S. Court of Appeals order, the Commission ordered PJM to eliminate changes to its MOPR approved in 2013 and revert the MOPR to its 2011 structure.

[18] *PJM Interconnection, LLC*, 161 FERC ¶ 61,090 (2013) at PP 27-31 and 53.

[19] *Id.* However, resource sellers were allowed to receive certain incentives to develop in specific areas (e.g., industrial

competitive entry exemption was to allow resource developers responding to market prices to be exempted from the application of the MOPR when there was clearly no exercise of buyer-side market power associated with the resource's development. These resource developers are independently financing their investments and just seek to maximize the revenues available from PJM's markets. In light of the MOPR's role as a tool to address exercises of buyer-side market power, the Commission's choice to create a competitive entry exemption was based on sound economic reasoning.

22. Sound economic principles also supported a self-supply exemption from the MOPR's focus on preventing the exercise of buyer-side market power. The objective of the self-supply exemption was to provide an entity that generally seeks to maintain a balanced capacity portfolio the opportunity to build new capacity resource(s) to meet expected future demand and not have the new resource(s) be subject to the MOPR.[20] This exemption allowed a self-supply entity the flexibility to participate in the capacity market without facing the risk that a new capacity resource would not clear in the market place, causing the entity to pay for capacity twice. Moreover, by identifying net-short and net-long thresholds that self-supply entities were required to meet in order to be eligible, the self-supply exemption carefully took into account whether the entities would be likely to be seeking to exercise buyer-side market power.

23. Because of the concern that an entity seeking to self-supply capacity may have a strong incentive to bring uneconomic new supply to market in order to lower its capacity acquisition costs, the self-supply exemption was reviewed extensively by PJM stakeholders and the Commission. As part of this review, the Commission posed several questions to PJM to understand the basis for the self-supply exemption and the net-short and net-long thresholds that were established to guide determination of eligibility for the exemption.[21] In response, PJM submitted to the Commission an extensive analysis of PJM's proposed self-supply exemption.[22]

---

parks) or within certain counties or localities, and federal production tax credits and investment incentives were excluded.

[20] *Id.* at PP 63-66.

[21] The self-supply exemption parameters are composed of measures of entities' capacity supply/demand balance, which provide a range within which an entity is not too "short" or too "long" capacity. If an entity met these guidelines, it was eligible for an exemption.

[22] *See PJM Interconnection, LLC*, Docket No. ER13-535-00, March 4, 2013 Response of PJM to the Commission's

PJM's analysis of the self-supply exemption focused on the ability of an entity that would be eligible for the self-supply exemption to successfully exercise buyer-side market power if it were assumed to support uneconomic entry in order to reduce its total costs of capacity. PJM's analysis showed that its proposed eligibility criteria protected against the potential exercise of buyer-side market power, and the Commission noted PJM's net-short and net-long thresholds when it initially approved the self-supply exemption.[23]

24. In both instances where the Commission recently approved PJM's requested exemptions to its MOPR, the analysis supporting the exemptions was focused on ensuring that the exemption did not allow an entity to exercise buyer-side market power by allowing uneconomic new capacity resources to escape application of the MOPR. The Commission was able to analyze these proposed exemptions in an economically rigorous and coherent manner because there are well known indicators of circumstances where bidding behavior may reflect the exercise of buyer market power, and plain logic for why a MOPR could be an appropriate and effective tool to apply in such circumstances.

25. In sharp contrast, the Complainants provide no rigorous and coherent economic analysis to support the broader application of the MOPR proposed in the Clean MOPR. The Clean MOPR would significantly expand the application of MOPR beyond the prevention of the exercise of buyer-side market power. The Clean MOPR would apply the MOPR to certain state programs just because offers of participating generators may depart from the offers they would make absent the state programs. But many programs are expected to have this effect, including state and federal programs exempted by the Clean MOPR.[24] The proposed Clean MOPR uses the MOPR to regulate only some of these programs. Complainants have not attempted to provide any reasoned principle to identify what programs, beyond exercises of buyer-side market power, should be regulated by PJM through the application of the MOPR. Nor have Complainants attempted to show that the MOPR, when applied for a broader purpose than remedying buyer-side market power, will be an effective remedy for that broader purpose; that it will not result in over-

February 5, 2013 Information Request.

[24] *See infra* PP 83-86.

mitigation; and that it will improve social welfare compared with an approach that limits the MOPR to its existing scope.

26. Application of buyer-side market power mitigation in the absence of anticompetitive concerns would thus be a serious policy mistake. In such instances, the MOPR could hamper low bids that are competitive and reflect truly low costs, where costs include offsets or subsidies based on positive environmental externalities that are not otherwise reflected in market operations. Programs that provide compensation for those positive externalities improve social welfare, as I explain elsewhere in this declaration. And while PJM and the Commission could, in theory, undertake a case-by-case inquiry into which state policy initiatives improve efficiency, there are substantial reasons to hesitate before adopting this approach. The administrative costs are likely to be substantial, errors are likely, and the PJM and the Commission will be placed in the position of sitting in judgment on state policies. I therefore urge that the MOPR remain limited to addressing buyer-side market power.

III. THE ECONOMICS OF ENVIRONMENTAL EXTERNALITIES.

27. In justifying the expansion of the MOPR beyond buyer-side market power, Complainants imply that state support programs are a concern because they can cause bids to depart from what they would be in the absence of the state support program. This view, however, ignores the economics of environmental externalities. The generation of electricity causes environmental externalities to different degrees depending on the generation technology and the fuel type. In particular, all electric generation resource technologies that consume fossil fuels in the production of electricity emit pollutants into the environment. The degree to which an electric generation production process emits pollutants depends on the type of fossil fuel consumed (i.e., coal, oil, gas, etc.), the efficiency of the fuel to electricity conversion technology employed by the electric generation unit, and the presence and usage of pollution control equipment. Electric generation resource pollutants impact air, water, and land. As a result, electric generation units have been the subject of extensive federal and state environmental regulation for decades. While fossil fuel generation creates pollution, zero-emission generation resources that displace these polluting generators yield positive externalities by reducing the pollution that would have otherwise occurred.

28. Various federal and state programs directly regulate the impact of electric generation units on air quality. One of the most well-known examples of air pollution regulation is a "cap and trade" air emission control policy. The U.S. Environmental Protection Agency has relied on a federal cap and trade policy to control emissions of sulfur dioxide and nitrogen oxides from electric power generation units for decades. More recently, California and the Northeastern and Eastern Mid-Atlantic States have relied on the same type of regulatory policy for control of carbon dioxide emissions.[25]

29. In the U.S., there is not a uniform federal regulatory policy that controls the costs imposed on society by emissions of carbon dioxide through cap and trade programs. Instead, there are numerous federal and state programs that promote investment in resources with zero carbon dioxide emissions, either with forms of subsidy or with regulatory requirements.[26] Such programs include renewable-resource production and investment tax credits, and a variety of renewable portfolio-standard programs, by just over half the states, that require investment in zero-emission resources.[27]

30. Programs to limit the negative externalities from carbon dioxide emissions are needed to complement otherwise socially inefficient electricity market mechanisms. PJM's capacity and energy wholesale markets are not currently designed to induce suppliers to account for the social externality costs of carbon emissions that result from generation in their decisions. Instead, the Commission has left environmental regulation to other federal agencies and state governments, and these other federal and state programs influence the decisions of participants in the Commission's markets so as to promote environmental goals.[28] As a result, even as PJM's wholesale markets are designed to stimulate and harness competition to yield an efficient allocation of resources, market outcomes would predictably be socially inefficient in the absence of complementary environmental programs adopted by other regulators. PJM's markets would result in the emission of too much carbon dioxide, creating corresponding social externality costs.

[27] *Id.*

[28] Thus, for example, Maryland and Delaware have chosen to participate in RGGI.

Complementary programs, whether implemented at the state or federal level, can align suppliers' market-based decision making with social efficiency by taking environmental externalities into account, without undermining the design and effectiveness of our competitive wholesale markets. Such programs can result in better outcomes for society, without conflicting with the policy goals or operations of competitive wholesale markets.

31. In the following sections I define and provide examples of externalities. I then explain how economists analyze the impact of externalities and identify policies, including taxes and subsidies, that can be adopted to complement markets and correct for the impact of externalities.

A. THE CONCEPT OF EXTERNALITIES.

32. Basic economics defines an externality as the effect of an individual's action on a bystander that is not taken into account by the individual undertaking the action.[29] Common examples of negative externalities are air and water pollution that reduce other individuals' welfare, but the associated costs to others are not accounted for by the individual polluter when deciding whether and how much to pollute.[30] Obversely, positive externalities arise when an individual's activity improves the welfare of others, but the individual does not account for these benefits when deciding whether and how much to engage in the beneficial activity.

33. Stated more formally, externalities exist when the private benefits or costs of actions are not equal to the social benefits or costs. The first formal analysis of the impact of externalities was provided by Arthur C. Pigou, who demonstrated that when marginal social costs or benefits diverge from private marginal costs or benefits, the market outcome is unlikely to be efficient.[31] Pigou showed that a tax or subsidy could be used to internalize the negative or positive externality so that it would be taken into account by market participants and correct for the market inefficiency that would otherwise result.

---

[29] *See, e.g.*, Samuelson, P. A. and Nordhaus, W. D., *Economics*, at 751, McGraw-Hill, Inc., 1995.

[30] Environmental externalities are the classic example found in almost every economics textbook. *See, e.g.*, Samuelson, P. A. and Nordhaus, W. D., *Economics*, at 346-355, McGraw-Hill, Inc., 1995 and Pindyck, R. S. and Rubinfeld, D. L., *Microeconomics*, Second Edition, at 639-657, Macmillan Publishing Company, 1992.

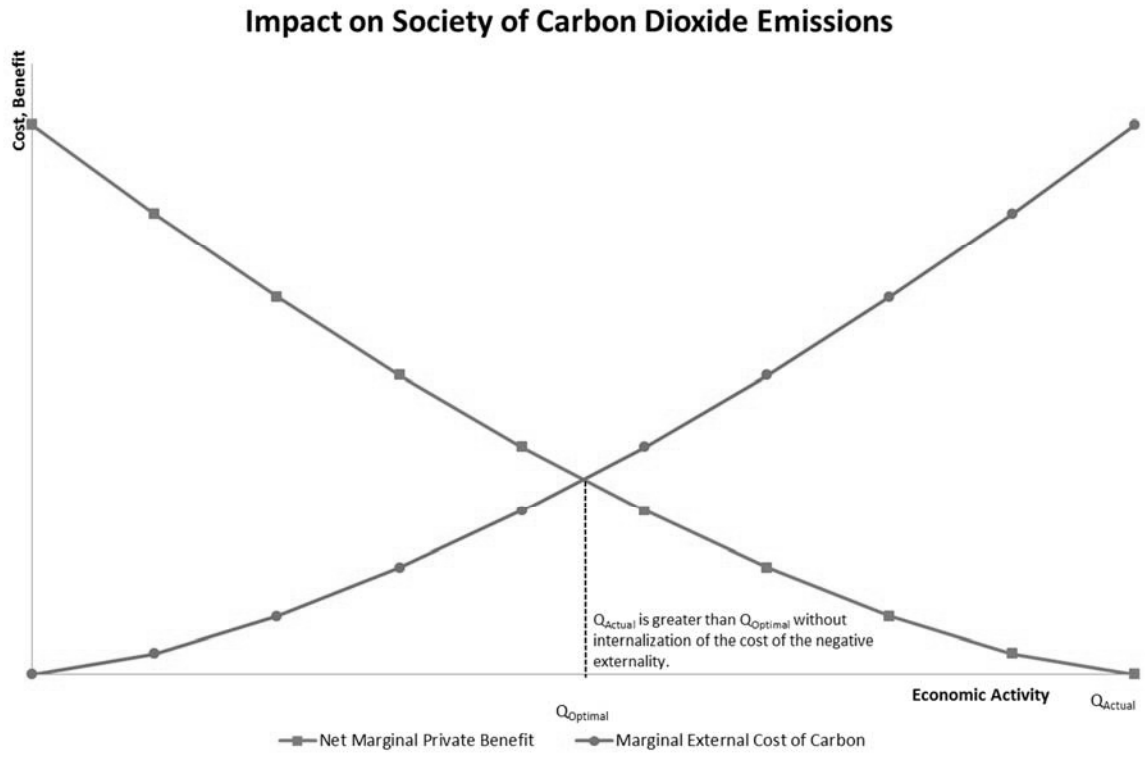
[31] Pigou, A. C. *The Economics of Welfare*, 4th edition, Macmillan and Co., 1932, available at: http://www.econlib.org/library/NPDBooks/Pigou/pgEW.html.

B. CORRECTING FOR THE IMPACT OF EXTERNALITIES.

34. Basic economics teaches that externalities can be corrected either through taxing behavior that results in harmful (negative) externalities, or subsidizing behavior that results in beneficial (positive) externalities, including behavior that prevents negative externalities. When seeking to correct for a negative externality, such as carbon dioxide emissions, an abstract theoretical approach is to measure the marginal external cost associated with the externality and compare it to the marginal private benefits net of marginal private costs (i.e., net marginal private benefits) in order to assess the cost of the externality that is not being captured by private individuals in their decision making. This idea is illustrated conceptually in Figure 1. Marginal external cost rises as economic activity increases, while net marginal private benefits decline. Increases in marginal external cost represent the impact of the damage from the amount of atmospheric carbon dioxide on society, expressed monetarily. Decreases in the net marginal private benefit represent the decline in private profitability as production levels increase and produce higher levels of atmospheric carbon dioxide.[32]

[32] This example assumes markets are competitive, however the conceptual application can apply more generally.

Figure 1



35. As Figure 1 shows, economic activity (production) is assumed to be at an equilibrium without any policy intervention to reflect the externalities where net marginal private benefits equal zero (i.e., marginal cost equals marginal revenue). Here, without market participants internalizing the marginal external cost associated with their activities, the level of actual production (shown as Q_{Actual}) is greater than its optimal level ($Q_{Optimal}$), represented as the intersection of the curves showing marginal external cost associated with the externality and net marginal private benefits. Although the exhibit depicts a stylized framework, there is an ever-increasing body of empirical analysis that estimates a range of values for the social external cost of carbon dioxide emissions over an assumed future trajectory of economic activity.[33] By having

[33] *See, e.g.*, Technical Support Document (2016): Technical Update of Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866 Interagency Working Group on Social Cost of Greenhouse Gases, United States Government, August 2016, available at: https://www.epa.gov/sites/production/files/2016-12/documents/sc_co2_tsd_august_2016.pdf. Note that the values for the social cost of carbon reported in this technical support document are reported after adjusting for expected inflation in the following document: Proceeding on Motion of the Commission to Implement a Large-Scale Renewable Program and a Clean Energy Standard, Order

a measure of the social external cost of carbon emissions, it is possible to approximate the marginal external cost of activities that emit carbon dioxide and, through a tax or subsidy, internalize the cost of the negative externality or its abatement.

36. A classical theoretical approach for internalizing the cost of a negative environmental externality, such as carbon dioxide emissions associated with fossil fuel combustion, is the imposition of a Pigouvian tax.[34] The objective of a Pigouvian tax is to internalize the marginal external cost associated with the externality that is otherwise not accounted for in producers' marginal costs. As such, producers experience higher costs due to the tax, charge higher prices, experience less demand, move away from technologies that create relatively more of the harmful externality, and reduce production to reflect the social cost of the externality.

37. A general tax on carbon emissions has not been the policy action of choice in the U.S. for addressing the social cost of carbon, for many complex and practical reasons.[35] For example, if Illinois had sought to impose a tax on electric generation resources that emit carbon dioxide, it would have encountered difficulties designing the tax so as to ensure carbon dioxide reduction. Most prominent among these difficulties would be two types of leakage: 1) Instances where high-emitting in-state resources impacted by the tax shift their facilities out-of-state, and 2) Instances where high-emitting out-of-state resources not impacted by the tax in adjacent geographic regions substitute for taxed in-state generation resources. Experiences to date in California and RGGI make clear the complexity that would be faced by a small geographic region considering the use of a cap and trade policy (which is effectively a tax) to reduce carbon dioxide.[36] The use of a

Adopting a Clean Energy Standard, Case Nos. 15-E-0302, et al. (Aug. 1, 2016), Appendix E at 11, ("2016 SCC Estimate"), available at http://documents.dps.ny.gov/public/Common/ViewDoc.aspx?DocRefId=%7b44C5D5B8-14C3-4F32-8399-F5487D6D8FE8%7d.

[34] Baumol, W. J. and Oates, W. E., *The theory of environmental policy*, Second Edition, Chapter 3, Cambridge University Press, 1995.

[35] Although the carbon dioxide cap and trade programs in certain parts of the U.S. do seek to internalize the externality, the resulting cost per ton of carbon emissions under these programs has been lower than the estimated social cost of carbon.

[36] *See, e.g.*, Bushnell, J., Peterman, C., and Wolfram, C., Local Solutions to Global Problems: Climate Change Policies and Regulatory Jurisdiction, *Review of Environmental Economics and Policy*, volume 2, issue 2, summer 2008 at 175-176. Note also when California implemented its carbon emissions cap and trade policy, it struggled with complex issues associated with trying to accommodate what would be considered acceptable resource shuffling. *See* State of California Air Resources Board, California Cap-and-Trade Program, Resolution 12-51, October 18, 2012, Appendix A. Similarly, emissions leakage continues to be an important issue for the RGGI program, with ongoing studies analyzing the impact. *See* Ramseur, J. L., The Regional Greenhouse Gas Initiative: Lessons Learned and Issues for

targeted subsidy—such as the payment of environmental attribute credits—simplifies and ensures that the costs incurred will directly reduce carbon dioxide emissions.

38. In the U.S. there has been a mixture of federal tax incentives and state RPS programs that provide subsidies to zero-emission resources. States generally rely on RPS programs to account, in part, for environmental externalities arising from emissions of carbon dioxide. California is a leading example where a cap and trade program and RPS work in combination to reduce emissions of carbon dioxide and provide a less carbon-intensive footprint for the future. In particular, California has determined that "[m]eeting the state's climate change goals by reducing emissions of greenhouse gases associated with electrical generation" is itself justification for the implementation of an RPS.[37] Moreover, several other states have evaluated the impact of RPS programs on emissions of carbon dioxide and sought to estimate the costs avoided by reduced emissions.[38]

39. Estimates of the social cost of carbon emissions are a theoretically sound basis for incorporating the external cost of carbon emissions into zero-emission resource subsidization policies.[39] Given that the policy purpose of compensating zero-emission attributes is to avoid the harm that would be caused by otherwise higher emissions of carbon dioxide from more carbon-intensive resources, it is appropriate to base the level of the subsidy on the avoided social cost of carbon dioxide emissions (assuming that the subsidy is paid in accordance with output).

C. THE MARKET IMPACT OF CORRECTING FOR EXTERNALITIES.

40. Correcting for externalities—whether via appropriate taxes or subsidies—is likely to affect prices and the mix of resources in the market. However, economic theory teaches that such taxes and subsidies are complementary to the ordinary workings of competitive markets, and help to

Congress, Congressional Research Service, 7-5700, April 27, 2016 at 16.

[37] Cal. Pub. Util. Code § 399.11(b).

[38] *See, e.g.*, Heeter, J., Barbose, G., Bird, L., Weaver, S., Flores-Espino, F., Kuskova-Burns, K. and Wiser, R., 2014, A Survey of State-Level Cost and Benefit Estimates of Renewable Portfolio Standards, *National Renewable Energy Laboratory. NREL/TP-6A20-61042(May 2014)* at 52-56, available at: http://www.res4med.org/uploads/studies/1402067633NREL.pdf.

[39] Comprehensive analyses that estimate the social cost of carbon have been completed under the auspices of the U.S. government. *See* Technical Support Document (2016): Technical Update of Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866, Interagency Working Group on Social Cost of Greenhouse Gases, United States Government, August 2016. These estimates are based on the results of a number of detailed modeling analyses that evaluate the future costs of carbon emissions on society.

guide private economic supply and demand decisions towards socially efficient outcomes that reflect both the underlying positive and negative externalities, along with the privately experienced costs of production and benefits of consuming the production's outputs. The impacts of Pigouvian taxes or subsidies on the outcomes of competitive markets improve social welfare by internalizing to the private decision-makers the costs of negative externalities through the tax, and the benefits of positive externalities through the subsidy, thus ensuring that the private decision-makers take the externalities into account and adjust accordingly.

41. It is possible to design a subsidy to encourage production from resources whose generation does not impose negative externalities, where, but for the subsidy, generation would result in negative externalities. For example, consider a program that offers subsidies to production that prevents harmful environmental externalities, where the per-unit subsidy is equated to the social external cost of the negative externality that the unit of production prevents. Such a program does not necessarily guarantee the production. But it does efficiently complement market incentives, so that production will be motivated to occur if the market price of production output plus the unit subsidy exceeds the private cost of production. This motivation is socially efficient since the production is socially worthwhile if its value to its purchaser, which is reflected by the price of its output, plus its value from reducing negative externalities, which is reflected by the unit subsidy, together exceed the cost of production. Without the subsidy program, such socially efficient production would be lost if the output price alone failed to cover the cost of production.

42. Complainants characterize the subsidization of zero-emission resources that improve social welfare as "negatively impact[ing] … RPM price signals and caus[ing] the retention of inefficient resources."[40] Complainants, however, make a fundamental error: they assume that PJM's current market design results in an efficient capacity resource mixture in the absence of any state policies aimed at preventing pollution. But PJM's market design does not incorporate the impact of important environmental externalities. Thus, without environmental regulation, PJM's capacity markets will not result in the efficient capacity resource mixture. Rather, the efficiency

[40] Complaint at 12.

of the capacity resource mixture is increased when a well-structured subsidy is put in place to counteract the environmental impact of negative externalities.

43. Complainants cite a "simple example" provided in PJM's April 9, 2018 filing that purports to "illustrate" how state subsidies decrease capacity markets' economic efficiency.[41] But a corrected version of PJM's simplified analysis shows how its results are misleading and inaccurate.

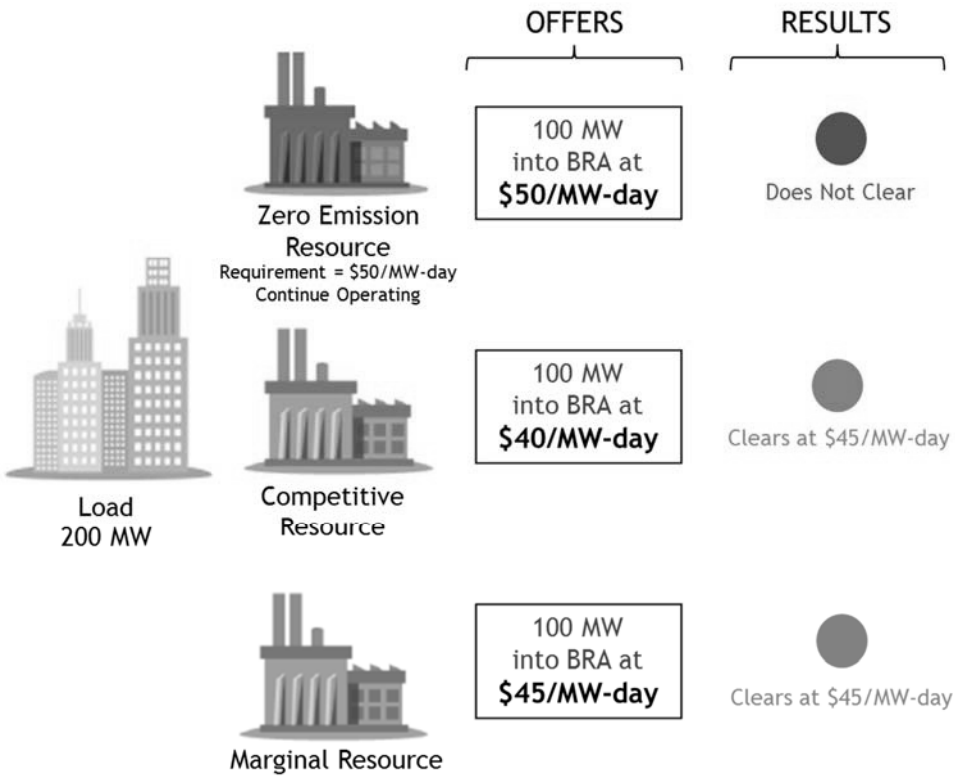
44. Consider Figure 2, which is an illustration similar to that provided by PJM in its April 9 filing. First, Figure 2 slightly changes PJM's illustration to eliminate the misperception that a new generation resource would be likely to place an offer at the margin and would be likely to be displaced by zero-emission subsidization programs. As PJM has noted in numerous results reports for its capacity market auctions, new generation capacity that participates in its capacity auctions solicit competitive entry exemptions and practically all new entry that offers into the capacity auctions clears in the capacity auctions (implying these resources bid to clear).[42] As Mr. Keech notes in his affidavit attached to the PJM Filing, "if a seller anticipates that it will recover its resource costs fully in PJM's energy and ancillary service markets, then it can safely offer into the capacity market at zero price."[43] Figure 2 instead replaces the new entrant with a "marginal resource." The marginal resource represents a conventional generation resource that earns minimal margins from the energy and ancillary services markets, and relies on the capacity market for a significant amount of its net market revenue.

[41] *See* Complaint at 5 & n. 20, 7 & n.28, 16 & n.74.

[42] *See, e.g.*, PJM 2017/2018, 2018/2019, 2019/2020 and 2020/2021 RPM Base Residual Auction Results, at Table 2A, available at: http://www.pjm.com/markets-and-operations/rpm.aspx, under Delivery Years, Base Residual Auction.

[43] Keech Affidavit, Attachment E to the PJM Filing, at P 14.

Figure 2: Without State Intervention

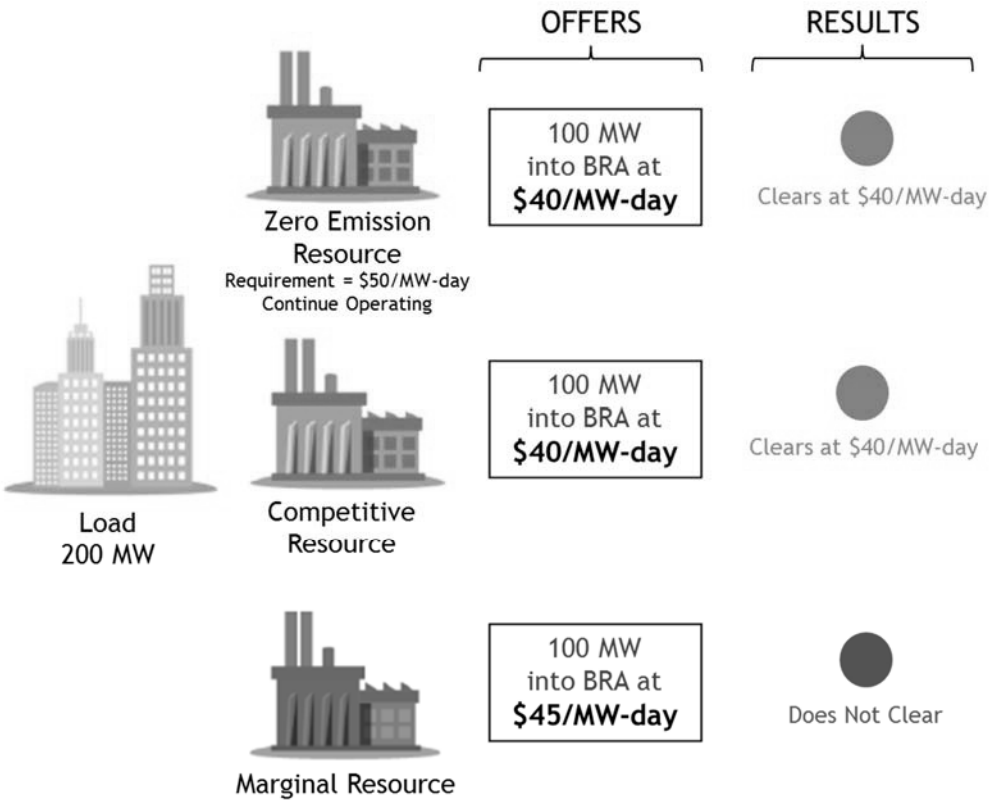


45. Figure 2 parallels PJM's illustration. PJM assumes that the outcome of its capacity market absent state subsidization would be the retirement of a zero-emission resource ("financially challenged resource" in PJM's terminology).[44] As Figure 2 shows, assuming the zero-emission resource does not clear, another conventional resource clears in its place and is the marginal resource. In this example, the marginal resource, however, will be among the highest cost and least efficient capacity resources. Thus, PJM's hypothetical assumes that the efficient market outcome is one where the zero-emission resource with no value attributed to its environmental attributes should not clear in the auction and retire, to be replaced by a conventional resource able to externalize the costs of its pollution on society. This outcome is clearly inefficient as PJM's marketplace does not account for the value of reducing harmful environmental impacts.

[44] PJM's illustration treats a financially challenged resource as generic. However, given PJM's numerous references to the Illinois ZES Program, I have assumed that this illustration is targeting subsidization of zero-emission resources.

46. Figure 3 below illustrates the impact of a subsidy that supports the continued operation of the zero-emission resource.[45] As Figure 3 shows, providing a $10/MW-day subsidy to the zero-emission resource, reflecting the environmental value of its continued operation, allows the zero-emission resource to reduce its bid in the capacity auction from $50/MW-day to $40/MW-day. It now clears the auction, along with the competitive resource, and the market clearing price is $40/MW-day instead of $45/MW-day. The marginal resource does not clear. The state subsidy results in a more efficient mixture of resources clearing in the capacity auction after accounting for the positive externality of the zero-emission resource. The state program complements, rather than defeats, the capacity market's design objective.

Figure 3: With State Intervention (Subsidy)



[45] This example is structured similarly to PJM's and assumes a $10/MW-day subsidy is paid to the zero-emission resource, and that other resource offers do not change as a result of the subsidization.

47. Complainants nevertheless assert that state subsidization "negatively impact[s] … RPM price signals and cause[s] the retention of inefficient resources."[46] This conclusion, however, is based on two faulty premises. First, Complainants argue that the impact of particular state subsidized resources on capacity market prices results in a reduction in prices that is harmful to other market sellers. But all subsidies (and taxes) impact market prices. The fact that there is an impact on prices does not mean that the impact is economically harmful, or disruptive to PJM's competitive market design. As Figure 3 illustrates, PJM's markets are designed to effectively respond to the changes in the underlying costs of resources, regardless of whether resources are subsidized or taxed by state and federal policies. The key economic principle at work is to ensure that resources are allocated efficiently, and that the capacity resource mixture resulting from PJM's marketplace accounts for all costs, including the social cost of environmental externalities.

48. Second, Complainants' assertion that subsidization may discourage new entry, and threaten resiliency, is purely speculative and wholly ignores the underlying design principles of PJM's capacity market.[47] PJM's subsidization illustration was designed in a way that suggests that new conventional generation resources would be discouraged from offering in capacity market auctions if PJM's market design is not changed to respond to increased state reliance on subsidization to support environmentally friendly resources. But this claim ignores the key design principles underlying its capacity market auction: PJM's capacity market sets an explicit reliability requirement and establishes a capacity market demand curve that tracks the administrative estimate of the cost of new entry. It is the existence of this durable market mechanism that provides resource developers the market expectations to support long-term investment decisions.

49. As the Commission has recognized consistently, capacity market designs that incorporate sloped demand curves with price schedules based on the estimated net cost of net entry are a critical capacity market design feature.[48] These capacity market designs consider the total estimated costs of a proxy new entrant (net of expected energy and ancillary services markets margins) and base the capacity price schedule on these estimated costs. To the extent that the continued operation and ongoing development of state-supported resources reduces expected

[46] Complaint at 12.

[47] *Id.* at 13, 16-17.

[48] *See, e.g.*, *PJM Interconnection, LLC.*, 119 FERC ¶ 61,318 (2007) at PP 26 and 99.

energy market revenues relative to these resources not operating, the impact is offset in part by an increase in the capacity market demand curve pricing schedule. Developers of new capacity resources can be expected to understand this key market design feature and incorporate into their projections of future revenues the collective impact of state subsidization programs, including recognizing how capacity revenues will change over time.[49] To the extent that PJM's marketplace requires new capacity resources, the capacity market design ensures capacity price signals that will bring forth new investment when needed.

IV. THE ILLINOIS ZES PROGRAM IS A WELL-STRUCTURED STATE PROGRAM THAT COMPLEMENTS PJM MARKETS AND RESULTS IN MORE EFFICIENT MARKET OUTCOMES, AS IS THE NEW JERSEY ZEC PROGRAM.

50. In the following sections, I examine the structure and implementation of the Illinois ZES Program, explain why it improves market efficiency and is a cost-effective policy for valuing the environmental attributes of zero-emission nuclear generation, and explain why it does not represent an attempt to exercise buyer-side market power. I then evaluate the New Jersey ZEC Program and conclude that my analysis of the Illinois ZES Program applies equally to the New Jersey program.

A. STRUCTURE OF THE ILLINOIS ZERO EMISSIONS STANDARD.

51. The ZES Program is an effort to correct for the harmful environmental negative externalities of fossil fuel generation by providing environmental attribute payments to zero-emission generation that might otherwise retire. As the ZES Program states, "a zero emission standard, [] will increase the State's reliance on zero emission energy through the procurement of zero emission credits from zero emission facilities, in order to achieve the State's environmental objectives and reduce the adverse impact of emitted air pollutants on the health and welfare of the State's citizens."[50]

52. The implementation of the ZES Program requires that the IPA procure on an annual basis for 10 years a quantity of ZECs defined as 16% of the actual amount of electricity delivered by Illinois electric utilities with more than 100,000 customers during calendar year 2014 (20.119

[49] *See* Keech Affidavit at P 14, which discusses capacity seller offer development.

[50] SB 2814 at Section 1.

million MWh).[51] The IPA was charged with developing a procurement plan to select nuclear facilities that will be awarded contracts to supply ZECs up to the 16% volumetric total defined above, and completed the procurement plan on January 25, 2018.[52] Under the procurement process, the selection of winning ZEC suppliers was based on public interest criteria that include: 1) "minimizing carbon dioxide emissions that result from electricity consumed in Illinois," 2) minimizing sulfur dioxide, nitrogen oxide, and particulate matter emissions that adversely affect the citizens of the State," and 3) "the incremental environmental benefits resulting from the procurement, such as any existing environmental benefits that are preserved by the procurements … and would cease to exist if the procurements were not held, including the preservation of zero emission facilities."[53] Exelon's Quad Cities and Clinton plants were selected to receive ZEC contracts.[54]

53. The program is designed to ensure that compensation for the environmental attributes of nuclear facilities that are awarded ZEC contracts does not exceed the estimated cost to society associated with the displaced carbon emissions.[55] In particular, under the ZES Program, the value of the ZEC payments is based upon the social cost of carbon ($/ton of emissions) as reported by the United States Interagency Working Group ("USIWG") in effect at the time of the promulgation of the law. The social cost of carbon is converted from $/ton to $/MWh based upon the emission rates of newer gas-fired generation facilities serving the PJM region.[56] Thus, the social cost of

[51] SB 2814 at (d-5); Zero emission standard and Illinois Commerce Commission, Public Notice of Successful Bidders and Average Prices, Illinois Power Agency, January 2018 Procurement of Zero Emission Credits from Facilities Fueled by Nuclear Power, January 25, 2018. The volume of ZECs also includes those associated with 16% of a small amount of energy being procured by the IPA on behalf of MidAmerican Energy Company customers in Illinois.

[52] Id. The IPA's ZEC Procurement was approved by the Illinois Commerce Commission ("ICC") on September 11, 2017. *See* 2017 WL 4074307 (Ill.C.C.), 339 P.U.R.4th 293.

[53] SB 2814 at (d-5) Zero emission standard (1) (C).

[54] Illinois Commerce Commission, Public Notice of Successful Bidders and Average Prices, Illinois Power Agency, January 2018 Procurement of Zero Emission Credits from Facilities Fueled by Nuclear Power, January 25, 2018.

[55] The value of a ZEC under SB 2814 is initially set at $16.50/MWh until June 1, 2023 (increasing thereafter $1/MWh each year for the final four years of a ZEC contract term).

[56] The initial ZEC value corresponds to a carbon dioxide emission rate of 800 lbs/MWh (.40 tons CO_2/MWh * $41.40/ton CO_2 (from 2016 SCC Estimate for the year 2017) ~ $16.50/MWh). The ZEC value is based on the emission rate of a new gas-fired combined cycle. For example, a new-gas fired combined cycle plant with a heat rate (a measure of efficiency) of 7 MMBTU/MWH would emit 819 lbs CO2/MWH (7 MMBTU/MWH* 117 lbs CO2/MMBTU gas). For carbon dioxide content emissions from natural gas combustion, see U.S. Energy Information Administration, "How much carbon dioxide is produced per kilowatthour when generating electricity with fossil fuels?", available at: https://www.eia.gov/tools/faqs/faq.cfm?id=74&t=11. For heat rate of new gas-fired combined cycle plant, see "Cost

carbon used in the legislation reflects the value associated with the carbon emissions that the nuclear plants avoid by continuing to operate, assuming they would be replaced by state-of-the-art gas-fired generation facilities.

54. The environmental value provided by the nuclear plants' continued operation is in reality significantly higher than the maximum ZEC value. This is so for two reasons. First, if nuclear plants retire, their output is unlikely to be replaced entirely by new gas-fired generation plants. Instead, their output is more likely to be replaced by some new gas-fired generation plants as well as less efficient, higher emitting generation units, including some coal plants. Indeed, the mixture of existing electric generation units in the PJM and MISO geographic region includes numerous coal and less-efficient gas-fired generation units (among nuclear, hydro-electric, oil and other renewable resources as well). As a result, the average carbon dioxide emissions rate associated with the generation fleet in PJM and MISO is higher than the emission rate of a newer gas-fired generation facility.[57] Moreover, the resources that are most likely to replace retiring nuclear generators hour-to-hour (i.e., at the margin) are those that are likely to be even higher emitting, especially so in the PJM region.[58] Second, the social cost of carbon does not account for the value of avoiding the emission of other harmful locally emitted pollutants, such as particulate matter and mercury. Thus, the actual cost to society of nuclear unit retirements in PJM or MISO is significantly higher than the social cost of carbon used in the legislation.

---

of New Entry Estimates for Combustion Turbine and Combined Cycle Plants in PJM With June 1, 2018 Online Date," The Brattle Group, May 15, 2014, at 16, available at: http://www.brattle.com/system/publications/pdfs/000/005/010/original/Cost_of_New_Entry_Estimates_for_Combustion_Turbine_and_Combined_Cycle_Plants_in_PJM.pdf.

[57] The initial ZEC value corresponding to a carbon dioxide emission rate of 800 lbs/MWh is approximately 20% lower than the 2015 PJM-wide average carbon dioxide emission rate of 1,014 lbs/MWh. *See* PJM 2012-2015 CO2, SO2 and NOX Emission Rates, March 18, 2016, at 4, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20160318-2015-emissions-report.ashx. The MISO region also relies on coal-fired resources to meet a significant amount if its electricity demand. *See* Potomac Economics, MISO 2015 State of the Market Report, Appendix: Prices and Load, at Table A1, June 2016.

[58] PJM reports that its average marginal carbon dioxide emission rate (~1,600 lbs/MWh, 2015) is higher than the average carbon dioxide emission rate such that the value of a ZEC is set at a level considerably less than the expected avoided social cost of carbon in the PJM region throughout the term of the ZEC contracts. *See also* Potomac Economics, MISO 2015 State of the Market Report, Appendix: Prices and Load, at Figure A5, June 2016 (showing that MISO coal generators are part of the resource mixture relied upon to meet hourly demand).

B. THE EFFICIENCY OF THE ILLINOIS ZERO EMISSIONS STANDARD.

55. Even if the Commission considered expanding the MOPR to any state program that might distort wholesale market outcomes, the MOPR properly should not apply to the ZES Program. The ZES Program does not distort wholesale market outcomes but only improves their efficiency. By providing zero-emission generators with compensation for the external benefits they provide, the ZES Program reduces the amount of carbon emissions and improves the social desirability of the market outcome.[59] This is especially the case, where, as with the ZES Program, the design of the procurement process specifically targets the preservation of zero-emission resources that might otherwise exit the marketplace. These nuclear resources' current production significantly reduces negative environmental externalities associated with the generation of electricity, to the extent that this production replaces output by carbon-emitting generators. Since the level of the proposed environmental attribute payments corresponds closely to the social value of reduced carbon dioxide emissions, the total direct costs of those payments are aligned with the benefits realized by society.[60]

56. Moreover, it is not a socially inefficient outcome if compensating nuclear units for their environmental attributes results in lower production from, or retirement of, polluting resources. Aligning private incentives with social welfare, whether through a tax or subsidy, will shift the market's generation resource mix as resources that impose environmental costs on society through their carbon emissions will face reduced production levels and reduced net revenues.

57. Compensating nuclear generators for their zero-emission attributes is a move toward greater efficiency relative to compensating only renewable resources going forward. This is because preserving existing nuclear generation may very well be more socially cost effective than

---

[59] *See, e.g.*, Case, K. E., Fair R. C., and Oster, S. M., *Principles of Microeconomics*, Ninth Edition, Prentice Hall, 2009 at 327 (noting that "[a]ctivities that provide such external social benefits may be subsidized at the margin to give decision makers an incentive to consider them").

[60] The value of a ZEC adopted by the ZES of $16.50/MWh until June 1, 2023 (increasing thereafter $1/MWh each year for the final four years of a ZEC contract term) corresponds to a carbon dioxide emission rate of 800 lbs/MWh (.40 tons CO_2/MWh * $41.40/ton CO_2 (from 2016 SCC Estimate for the year 2017) ~ $16.50/MWh). This value is approximately 20% lower than the 2015 PJM-wide average carbon dioxide emission rate of 1,014 lbs/MWh. *See* PJM 2012-2015 CO2, SO2 and NOX Emission Rates, March 18, 2016, at 4, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20160318-2015-emissions-report.ashx. Moreover, because PJM's average marginal carbon dioxide emission rate (~1,600 lbs/MWh, 2015) is higher than the average carbon dioxide emission rate, the value of a ZEC is set at a level considerably less than the expected avoided social cost of carbon throughout the term of the ZEC contracts.

allowing its retirement, in view of its positive externalities, and it may be a more efficient method of abating carbon emissions than subsidizing new renewable construction. By offering appropriate subsidies, the ZES complements and supports the workings of competitive wholesale markets so that there will be incentives to preserve existing nuclear generation only if doing so is socially efficient, taking externalities and private production costs into account.

58. Finally, and critically, the ZES Program is entirely consistent with the Commission's policy of reliance on competitive markets. The ZES Program complements the FERC-approved markets by providing compensation for environmental attributes that does not exceed the value of environmental externalities that FERC has left other regulators to address. This Program works in tandem with FERC-approved market mechanisms to produce outcomes that are more socially efficient. If the facilities receiving ZECs are cheaper than fossil-fueled competitors once the value of the environmental externality is taken into account, then the facilities receiving ZEC revenues should run. The ZES represents a narrow, targeted approach to contribute to the objective of complementing FERC's wholesale power markets.

C. ELIGIBILITY CRITERIA FOR THE ZES THAT MAY LIMIT IT TO NUCLEAR UNITS AT RISK OF RETIREMENT ENSURES PROGRAM COST EFFECTIVENESS.

59. The ZES establishes eligibility criteria for facilities seeking to participate in the ZEC procurement process. Among these criteria is the requirement that a candidate zero-emission facility submit to the IPA annual cost projections over the next 6 delivery years.[61] The ZES Program also requires that the IPA take into account in its ZEC procurement process "any existing environmental benefits that are preserved by the procurements […] and would cease to exist if the procurements were not held, including the preservation of zero emission facilities."[62] Thus, the ZEC procurement process includes evaluating and considering the expected operating and ongoing maintenance costs of facilities that participate in the ZES. Targeting the payment for ZECs to facilities that may otherwise be financially challenged and face retirement is a cost-effective policy decision that is in the public interest of the State of Illinois.

[61] SB 2814 at (d-5) Zero emission standard (1)(A).

[62] SB 2814 at (d-5) Zero emission standard (1)(C).

60. The purpose of a subsidy is to incentivize behavior that would not otherwise take place. Here, the goal of the ZES Program, together with other statutory changes directed at the Illinois renewable portfolio standard, is to place a value on zero-emission generation in order to incentivize that generation. The ZES Program provides for a payment for those nuclear generation facilities that can provide ZECs now at the least cost, for a given quantity, recognizing that a failure to provide the subsidy will result in a loss of zero-emission generation that cannot be timely replaced. Moreover, under the cost-effectiveness standard of the ZES Program, the cost of ZECs must compare favorably relative to the costs of additional increments of renewable resources.[63] Finally, as explained above, the cost of the ZECs is limited by the estimated marginal social cost of carbon emissions not otherwise reflected in wholesale power prices already, ensuring that Illinois consumers enjoy positive net benefits from the avoided carbon emissions resulting from the ZES Program. The ZES Program's eligibility criteria and procurement process appropriately focus on minimizing ZEC expenditures and the value of implementing the program beginning in 2017 to reduce the likelihood of nuclear facility closures.

61. Financially viable nuclear plants do not need attribute payments to continue generating, however. Private incentives are already sufficiently aligned with social welfare for these plants that environmental attribute payments are not necessary to ensure that society continues to receive the benefits. Thus, at this time it is in the public interest to target the ZEC payments to the plants that may be otherwise at risk of retirement. The ZES Program appropriately focuses on facilities that may face shut-down that would detrimentally impact Illinois consumers by the loss of their zero-emission attributes.

62. While a single uniform tax on carbon emissions, or a single uniform subsidy for production that displaces carbon emissions, would accomplish the needed internalization of externalities and correction of incentives, and would make advance information unnecessary on whether entities would or would not otherwise behave as they would with the tax or subsidy, such a program is not in the offing, perhaps due to its complexities, distributional impacts, and necessary implementation costs. The theoretical benefits of such a program should not be viewed, in its absence, as a valid argument against more practical programs like ZECs, inasmuch as the latter contribute to environmental benefits without causing inefficient interference with well-functioning

[63] SB 2814 at (d-5) Zero emission standard (1)(C-5).

wholesale markets for electric capacity and energy. The ZES's targeted subsidy design ensures that costs borne by consumers result in a direct reduction of a harmful environmental externality.

63. The ZES Program's reliance on an explicit linkage to the avoided social cost of carbon for setting the price of ZECs compares favorably to other state RPS programs. Few state RPS programs are guided by analysis of the social costs and benefits.[64] Instead, state policymakers tend to focus on the costs of the RPS programs to consumers, and the regional economic benefits that are expected to result from state RPS programs. However, in some instances the costs associated with RPS programs can be considerably greater than estimates of the negative externalities they avoid. For example, under New Jersey's clean energy program, prices for solar renewable energy credits ("SRECs") are reported to consistently exceed $220/MWh in recent years.[65] Resources participating in state RPS programs, of course, have also historically benefited from federal production and investment tax credits that reduce the costs borne by state consumers, but that bear no direct relationship to the avoided costs of emissions. The ZES Program's linkage to an objective estimate of the negative externalities it reduces compares favorably with state RPS programs.

D. THE ZES IS NOT AN EXERCISE OF BUYER-SIDE MARKET POWER.

64. Compensating zero-emission resources for their environmental attributes using a payment structure like the ZES Program does not give rise to the buyer-side market power concerns that justify the application of a MOPR as structured under PJM's current tariff. The ZES is a legitimate environmental program aimed at addressing the externalities of carbon-based power generation, and not an exercise of market power. The ZES clearly explains that "to achieve its environmental goals, Illinois must expand its commitment to zero emission energy generation and value the environmental attributes of zero emission generation that currently falls outside the scope of the existing renewable portfolio standard, including, but not limited to, nuclear power."[66] The

[64] *See* Cavicchi, J., Rethinking Government Subsidies for Renewable Electricity Generation Resources," *The Electricity Journal* 30 (2017) at 2-3.

[65] New Jersey's Clean Energy Program, Solar Activity Reports, SREC Pricing, available at: http://njcleanenergy.com/renewable-energy/project-activity-reports/srec-pricing/srec-pricing. Note that the recent U.S. government's estimated social cost of carbon is approximately $16.50/MWh based on a gas-fired combined cycle's carbon dioxide emission (see notes 57 and 61.).

[66] SB 2814 at Section 1.

Act explains further that the creation of ZECs allows Illinois to "achieve the State's environmental objectives and reduce the adverse impact of emitted air pollutants on the health and welfare of the State's citizens."[67] None of these aims is price suppression.

65. There are a number of objective characteristics of the ZES Program that bear out Illinois' stated purpose and distinguish the program from an exercise of buyer-side market power. First, the cost of a ZEC and its financial benefit to its recipient are based on the social cost of the abated carbon dioxide emissions—which is the value of the externality being addressed—and cannot rise above that amount. The cost of a ZEC may decline over time as power market conditions change (see above), and PJM's generation mix becomes cleaner, but it will not increase based on the financial obligations of the generating units. This ensures that nuclear generators will participate in the program and continue producing electricity only if they believe it will be sufficiently compensatory, and it aligns with economic efficiency, taking into account the social cost of the abated carbon emissions. In contrast, buyer-side market power increases the private incentives to build electricity plants beyond the plants' social value by the suppression of market prices caused by the plants' construction.

66. Second, ZEC payments to the nuclear units do not guarantee that the facilities will remain in operation over the 10-year term of the contracts. If the units receiving ZECs do not remain financially viable due to operational or other issues resulting in unexpected capital investment needs, even after their carbon abatement value is accounted for, market forces will impel the units to retire, which would be the socially efficient outcome under those circumstances. Thus, the ZEC payments do not shelter the units from market forces as would a program that sought to guarantee that they would remain operational in order to suppress prices.

67. Third, the ZES Program does not insulate eligible units from market risk. The generating unit owners still bear the risk of increasing costs and the risk that market prices will fall below levels that prevailed at the time the ZES Program was approved. The program is designed to align the incentives for the decision to continue operation with social efficiency, inclusive of the impact on emissions.

[67] *Id.*

68. Fourth, the ZES does not require any bid into the wholesale energy or capacity market, nor that the unit clear the wholesale capacity market.[68] Thus, if the units fail to clear the capacity market, ZEC payments will still be made, in accordance with actual production, and it is that actual production that has the positive environmental impact of displacing substitute production that creates socially costly emissions. If the ZES Program sought to exercise buyer-side market power, it would clearly condition payment on generation unit participation in the capacity market in order most directly to forestall increases in capacity prices.

69. Finally, there is no exercise of buyer-side market power as the benefits of the ZES Program exceed the costs regardless of any ancillary impact on market prices. The ZES Program's requirement that the procurement of ZECs meets a cost-effectiveness standard ensures that the benefits from the avoided costs of carbon emissions exceed the financial costs of the program.[69] The costs of the ZECs to consumers cannot exceed $16.50/MWh.[70] This ceiling is an under-estimate of the avoided costs of carbon emissions that would result from production that would replace potentially retired nuclear production. It is set conservatively at a level that is approximately 20% lower than that applicable to PJM's recently reported 2015 average system wide emission rate.[71] The value of the ZES to consumers is the benefit it provides through the preservation of zero-emission resources, and the resulting avoidance of carbon-emissions. By

[68] PJM, however, is likely to require participating nuclear units to make energy and capacity bids in its wholesale markets.

[69] SB 2814 at (d-5) Zero emission standard (C).

[70] Note that this initial value is adjusted upward by $1/MWh each year for the last four years of the ZEC contract term. This adjustment does not alter the conclusion that the benefits will exceed the costs throughout the ZEC contract term. In particular, the estimated social cost of carbon increases each year from 2017-2027 resulting in just over a 50% total increase. The increase in the ZEC cap of $4/MWh over the last four years of the contract term is just under 25%, which less than half the increase in the social cost of carbon. Thus, the ZEC cap will be at a level that does not grow as fast as the social cost of carbon. Moreover, because the ZEC cap is based upon a high-efficiency, low-emission modern gas-fired combined cycle generator, PJM's system wide average and marginal emission rates are substantially above the ZEC cap, ensuring that the cost of the ZECs to consumers will be less than the avoided social cost of carbon dioxide emissions (see notes 31 and 58).

[71] As explained above, because the ZEC cap is based on the marginal emission rate of a new gas-fired combined cycle, the PJM system would have to be composed entirely of new gas-fired combined cycles for the ZEC cap to correspond to actual system-wide emissions rates. PJM's currently reported marginal emission rates are considerably higher, as coal fired resources continue to be a large portion of the generation fleet. *See* PJM 2012-2015 CO2, SO2 and NOX Emission Rates, March 18, 2016, at 4, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20160318-2015-emissions-report.ashx.

contrast, in a typical exercise of buyer-side market power it is rewarding for an owner to pay for an uneconomic resource only because of the price-suppression benefits that result.

70. In contrast, the previously proposed Maryland and New Jersey new generation-unit subsidization programs resulted in state regulatory agencies directly interfering with prices set in FERC-regulated capacity market auctions. These programs were not attempting to address an environmental externality. However, as I have explained before, a program that subsidizes a generation technology based on its environmental attributes is "just another element of compensation for the benefits that the state feels that generator is bringing to the population through the environmental impact. So it doesn't displace, it influences, but it doesn't displace the market mechanism."[72]

71. In summary, the features of the ZES Program indicate that it is not designed to have any particular impact on market prices and that any potential impacts on prices are incidental to the attainment of the environmental goal of the program. As explained above, a program intended to exercise market power would be structured differently, without its incentives so closely linked to emissions-reducing production. A program focused on exercising market power would place its emphasis on providing long-term plant financial guarantees and would condition payment on bidding and clearing in wholesale power markets.

E. THE NEW JERSEY ZEC PROGRAM ALSO IMPROVES CAPACITY MARKET EFFICIENCY.

72. My conclusion that the Illinois ZES Program improves market efficiency also holds as to the New Jersey ZEC Program. As the legislation states, the New Jersey legislature determined that a program that "recognizes and compensates nuclear energy generators in a manner similar to other non-emitting energy generation resources" would "further the State's interest in environmental protection" and avoid the "substantial increase in emissions of several serious pollutants, and associated adverse public health and environmental impacts" that would result from

[72] Testimony of Robert D. Willig, In the United States District Court for the District of Maryland Northern Division, Case No. MJG-12-1286, March 8th, 2013 at 81.

the "abrupt retirement of … nuclear power plants … that provide electricity to customers in New Jersey."[73]

73. The New Jersey ZEC Program provides for the New Jersey Board of Public Utilities ("Board") to award ZECs to selected nuclear power plants in an amount up to "40 percent of the total number of megawatt-hours of electricity distributed by electric public utilities in the State."[74] The Board selects power plants based on how well the nuclear power plants satisfy the criteria set forth in the statute.[75] Those criteria include, *inter alia*, whether the plant "makes a significant and material contribution to the air quality in the State by minimizing emissions that result from electricity consumed in New Jersey"; whether "if the nuclear power plant were to be retired, that that retirement would significantly and negatively impact New Jersey's ability to comply with State air emissions reduction requirements"; whether the plant's "air quality, and other environmental attributes are at risk of loss because the nuclear power plant is projected to not fully cover its costs and risks, or alternatively is projected to not cover its costs including its risk-adjusted cost of capital"; and that "the nuclear power plant will cease operations within three years unless the nuclear power plant experiences a material financial change."[76] The Board has not yet implemented the statute.

74. The New Jersey ZEC Program is "structured such that its costs are guaranteed to be significantly less than the social cost of carbon emissions avoided by the continued operation of selected nuclear power plants," based on the "social cost of carbon, as calculated by the U.S. Interagency Working Group on the Social Cost of Carbon in its August 2016 Technical Update."[77] In particular, the New Jersey ZEC Program effectively sets the ZEC price at $0.004 per kilowatt hour, which the legislation states "reflects the emissions avoidance benefits associated with the continued operation of selected nuclear power plants."[78] The state of New Jersey Office of Legislative Services reports that the estimated cost of a ZEC is $10/MWh, which is significantly

[73] N.J. Senate Bill No. 2313 § 1(b)(1), (5).

[74] *Id.* § 3(g).

[75] *Id.* § 3(f).

[76] *Id.* § 3(e)(2)-(3).

[77] *Id.* § 2(b)(8).

[78] *Id.* § 3(j)(1).

less than a conservative estimate of the avoided social cost of carbon for PJM of $16.50/MWh.[79] The legislation further states that "to ensure that the ZEC program remains affordable to New Jersey retail distribution customers," the payments may be reduced in later years if the Board "determines that a reduced charge will nonetheless be sufficient to achieve the State's air quality and other environmental objectives by preventing the retirement of the nuclear power plants that meet the eligibility criteria established" under the statute.[80]

75. The New Jersey ZEC Program improves efficiency for the same fundamental reason as the Illinois ZES Program. By providing zero-emission generators with compensation for the environmental benefits they provide by avoiding carbon emissions, the New Jersey ZEC Program improves social welfare. As with the Illinois ZES Program, the New Jersey ZEC Program complements the FERC-approved markets by providing compensation for environmental attributes that does not exceed the value of environmental externalities that FERC has left other regulators to address.

76. As with the Illinois ZES Program, the provisions in the New Jersey ZEC Program that take into account a plant's financial viability are in the public interest. As explained above, financially viable nuclear plants do not need attribute payments to continue generating because private incentives are already sufficiently aligned with social welfare for these plants that environmental attribute payments are not necessary to ensure that society continues to receive the benefits. Thus, it is a cost-effective policy to target the ZEC payments to the plants that may be otherwise at risk of retirement. Likewise, for similar reasons, it is cost-effective and in the public interest for the New Jersey ZEC Program to allow the Board to reduce the effective ZEC price if it reduces retail customers' costs while not threatening the continued delivery of the nuclear plants' environmental benefits.

77. Finally, the reasons that the Illinois ZES Program is not an exercise of buyer-side market power also apply to the New Jersey ZEC Program: First, the Program caps payments at less than the social cost of the abated carbon dioxide emissions. Second, the Program does not guarantee that the facilities will remain in operation; rather, the facilities may retire if their costs

[79] See Legislative Fiscal Estimate, Senate No. 2313, State of New Jersey, 218th Legislature, April 5, 2018 and notes 57 and 61.

[80] *Id.* § 3(j)(3)(a).

are unexpectedly high, or if the facilities' carbon abatement value does not justify their retention. Third, the Program does not insulate units from market risk; rather, the generating unit owners still bear the risk of increasing costs and the risk that market prices will fall below levels that prevailed at the time the Program was approved. Fourth, the Program does not require any bid into the wholesale energy or capacity market, nor that the unit clear the wholesale capacity market. Fifth, there is no exercise of buyer-side market power as the benefits of the Program exceed the costs regardless of any ancillary impact on market prices. That is because, as I explain above, the New Jersey ZEC Program ensures that the program's benefits—from the avoided costs of carbon emissions—exceed the program's financial costs by setting a ZEC rate that is considerably lower than a conservative estimate of the avoided cost of carbon. In contrast, in a typical exercise of buyer-side market power, it is rewarding for an owner to pay for an uneconomic resource only because of the price-suppression benefits that result.

V. THE CLEAN MOPR PROPOSAL IS NOT GROUNDED IN SOUND ECONOMIC REASONING

78. The Clean MOPR is unjustified when considered in a sound economic framework because it would in effect prevent efficient state-supported resources from clearing the capacity auction. As a result, the resources selected by the auction would not be the most efficient set of resources. Additionally, the Clean MOPR would result in the over-procurement of capacity resources, as customers would be providing funds both to the state-supported resources and to redundant capacity procured through the auction.

A. THE CLEAN MOPR LEADS TO AN INEFFICIENT SELECTION OF CAPACITY RESOURCES

79. Complainants' Clean MOPR, by applying a MOPR to certain state-supported resources, would prevent them from clearing in the capacity market auctions (absent receipt of a unit specific exception). As a result, the resource set that clears in the capacity market auctions would exclude resources that are economically efficient after accounting for externalities, and it would constitute an inefficient mixture of resources. In particular, applying the MOPR to these state-supported resources restricts their offers to their private costs of providing capacity, which excludes the significant positive social benefits from the reduction in social costs that result from these resources' production. When the social cost of carbon emissions is not internalized in capacity market offers, it appears that financially challenged nuclear units are not efficiently

competitive. In fact, these units are economically efficient, and their continued presence in the market should be viewed as pro-competitive.

B. The Clean MOPR Will Perpetuate Excess Capacity Supply

80. The Clean MOPR's likely effect is to increase capacity prices closer to the level that would result from the absence of state-supported capacity, and potentially to penalize states that wish to promote welfare-enhancing environmental policies by preventing resources receiving efficiently designed subsidies from reflecting those subsidies as credits in the calculation of their MOPR offer floor prices. If these subsidized resources do not clear in the capacity auctions as a result of the Clean MOPR mitigation, states may be faced with the choice of tolerating inefficient and costly excess capacity supply, or else abandoning their subsidization program, which could result in an inefficient capacity resource mixture.

81. When states have enacted policies offering financial support to environmentally beneficial capacity resources, they are unlikely to cease these policies even if the resources are ineligible for an exemption from the MOPR and even if the resources do not receive capacity market revenues.[81] As Dr. Giacomoni of PJM notes in the affidavit provided with PJM's April 9, 2018 filing and attached to the Complaint, state policies favoring environmentally beneficial resources are driven by legislation that calls for financial support for the development of specific resource types, and steady year-to-year growth in zero-emission resource capacity.[82] States thus can be expected to continue to support environmentally beneficial generation. But because this capacity may not clear the capacity market, the market may select additional duplicative resources. Inasmuch as PJM's capacity mixture includes environmentally friendly capacity that does not clear in capacity auctions due to the Clean MOPR, consumers will incur excess costs above the efficient level.[83]

82. Excess capacity supply can also be expected to put downward pressure on electric energy prices, all other things being equal. Some capacity resources that clear in the auctions as a result of the application of the Clean MOPR to environmentally friendly resources may exceed the

[81] Many renewable resources provide relatively little dependable capacity due to their intermittency.

[82] Giacomoni Affidavit, Attachment F to the PJM Filing, at 2-10.

[83] The impact on efficiency of the RPS policies will be dependent upon whether they are designed to increase social welfare.

amount otherwise necessary to meet PJM's reliability requirements. Inasmuch as these resources have low enough short-run marginal costs to operate frequently during a year, they will push other more expensive resources up the supply curve, resulting in lower electric energy prices and lower market revenues for other capacity suppliers.

C. The Clean MOPR's Exemptions Are Not Based on Sound Economic Analysis

83. While the Clean MOPR proposal eliminates the enumerated categorical exemptions under MOPR-Ex, in effect it exempts certain categories of state and federal programs by excluding them from the definition of "Material Subsidy." In particular, the Clean MOPR excludes certain state and local subsidies designed to promote "general industrial development in an area," or to incentivize "siting facilities in [one] county or locality rather than another county or locality."[84] The Clean MOPR also excludes "federal subsidies or other support granted [before] the date of th[e] Complaint."[85]

84. An appropriate economic evaluation of the proposed Clean MOPR's exemptions would determine if they maintain or improve capacity market efficiency. Complainants, however, do not provide a principled economic analysis that attempts to demonstrate that the proposed exemptions promote more efficient capacity market outcomes. To the contrary, the proposed exemptions draw discriminatory lines that are not supported by sound economic reasoning.

85. The Commission has previously determined that state and local subsidies that "a project might receive from a town or county to locate in that vicinity" or whose stated purpose is to provide "incentives for general industrial development," would not trigger application of the MOPR.[86] The Commission did so, however, because it determined that the "MOPR's purpose is to protect the market from the exercise of buyer-side market power," and in this context, the Commission agreed with PJM that these types of subsidies "do not raise price suppression concerns" associated with buyer-side market power.[87] But here, the stated purpose of Complainants' Clean MOPR is

[84] Complaint at 18; *see* PJM Filing at 70.

[85] Complaint at 19.

[86] *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 66 n.47 (2013).

[87] *Id.* at P 56, 66 n.47.

to offset the effects of any "below-cost offers for resources receiving out-of-market subsidies," not only to avoid exercises of buyer-side market power.[88] Thus, the Clean MOPR would substantially expand the application of the current MOPR, and exemptions that at one time were acceptable in the context of guarding against buyer-side market power must be re-evaluated.

86. By proposing to exempt resources that receive certain subsidies (defined as material), while not exempting resources that receive other types of subsidies, Complainants may be implying that certain subsidies are perceived as less likely to suppress capacity prices. However, any capacity resource that receives certain federal, state, and local subsidies may be caused to make lower-cost offers that may affect auction results. Complainants present no evidence that the federal, state, and local subsidies exempted from mitigation under the Clean MOPR will not result in the submission of lower-cost offers, or that these lower-cost offers will not affect auction results. Any type of financial subsidy might affect PJM's energy and capacity market auction results, and the Clean MOPR's proposed differential treatment of capacity resources based on the source of the subsidy can result in discrimination.

87. Moreover, expanding the use of the MOPR in the absence of any sound economic analysis and reasoning upon which to base a determination of its applicability will discriminate against and mitigate capacity resources whose operation improves social welfare (e.g., nuclear units receiving ZECs). The Clean MOPR proposal will result in the mitigation of capacity resources with no consideration of whether those resources' current or future operation enhances economic efficiency. Any expansion of the use of the MOPR should exempt capacity resources whose subsidization enhances social welfare by reflecting environmental benefits not captured in PJM's electricity markets, and any such expansion should not exempt subsidies when there is no reason to believe that those subsidies improve overall social welfare.

88. While an exemption from the MOPR is justified and necessary if a subsidy program to reduce pollution improves economic efficiency, Complainants provide no evidence that the programs proposed to be exempted from the Clean MOPR are likely to improve economic efficiency. In particular, programs whose stated purpose is to promote general industrial

[88] Complaint at 1. While Complainants use the term "below-cost" to imply that actual resource costs upon which offers are based should be higher, I assume that the impact of an appropriate subsidy would be to lower a resource's actual costs resulting in a lower cost offer.

development in a particular area, or to locate facilities in one locality rather than another, cannot validly be presumed to improve overall welfare. There is no reason to believe that such programs generally improve overall welfare, and to the extent a particular program ends up improving overall welfare, it is likely to do so only for reasons well beyond the conditions that the Clean MOPR stipulates for the exemption. In contrast, the environmental benefits of programs to support renewable or zero emissions nuclear generation, where the subsidy costs are less than the harms of the avoided pollution, contribute to social welfare directly and by design. Thus, if the MOPR were to be expanded as proposed, it would create incentives to provide inefficient financial support to resources based upon criteria unrelated to improving market efficiency and exclude, with discriminatory impact, programs that improve market efficiency.

89. The Clean MOPR's exemption for existing federal subsidies is discriminatory for an additional reason. While an exemption for existing subsidies might arguably be justified as respecting the expectations of resource owners that have incurred sunk costs, the Clean MOPR does not provide a similar exemption for existing non-federal subsidies. Complainants do not attempt to justify why those expectations should be respected only where the subsidy is from the federal government, rather than a state.

90. This completes my declaration.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C.	)))))	Docket No. AD17-11-000

POST-TECHNICAL CONFERENCE COMMENTS OF THE PSEG COMPANIES

Pursuant to Rule 212 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission" or "FERC"), 18 C.F.R. § 385.212 and the Commission's May 23, 2017 "Notice Inviting Post-Technical Conference Comments" the PSEG Companies[1] hereby submit the following comments.

I. EXECUTVE SUMMARY

The PSEG Companies have a broad perspective on the evolution of the competitive markets administered by Regional Transmission Organizations ("RTO") and Independent System Operators ("ISO") in the northeast and how those markets have been impacted by the policy goals of the states in those regions. We have operated in these markets since their inception in the 1990's and were among the original handful of vertically integrated utility companies in PJM Interconnection, L.L.C.'s ("PJM") market to champion the restructuring of the generation side of the industry toward competition. The PSEG Companies have steadfastly supported the markets to date because of the benefits that competition has brought in lowering prices, increasing innovation and protecting ratepayers. More efficient dispatch of the generating fleet has created billions in saving for consumers. In addition, markets forces have driven

[1] The "PSEG Companies" consist of PSEG Power LLC ("PSEG Power"), PSEG Energy Resources & Trade LLC and Public Service Electric and Gas Company.

SI-SSA-0010-0994

investment in new more efficient generating resources and the retirement of older less efficient generating plants. The PSEG Companies have been on both sides of this equation: we have built and are now building new generation in PJM, ISO New England Inc. ("ISO-NE") and the New York Independent System Operator, Inc. ("NYISO") markets and have retired units in all three ISOs as well.

The singular focus of the markets in driving efficiency gains is consistent with their original purposes. But this limited scope is no longer sufficient as we grapple with the need to achieve other policy goals associated with the electric grid while maintaining the beneficial aspects of competition. The markets must adapt quickly to accommodate state actions designed to advance widely-accepted public policy goals such as reduction of environmental emissions and resiliency. Failure to do so will lead to less efficient solutions, other unintended consequences and an overall weaker electric grid. The longer term objective is to modify market structures to achieve these goals and other widely supported policy directives in the most efficient manner possible. But the PSEG Companies are concerned that these needed design changes cannot be accomplished quickly enough to avoid the permanent loss of critical infrastructure, including nuclear resources. Therefore, for the immediate future, it is essential that FERC not interfere with state actions designed to retain this critical infrastructure. Empowering states to pursue goals related to environmental improvements and resiliency presents an immediate solution that sustains the existing benefits markets have achieved, while also allowing for the development over time of appropriate market solutions.

The technical conference clearly revealed the urgency with which FERC must act to find a means to bridge the gap between the increasing number of state actions to preserve or develop specific resources within their jurisdictions and the current market structures which are not

valuing the desirable attributes of those resources. The need to preserve the currently existing nuclear fleet is an important objective and the efforts to achieve this objective must be launched immediately. State action is the only viable approach that can be implemented in the short-term. Most fundamentally, the Commission should not thwart state efforts to advance goals associated with carbon abatement and resiliency.

In addition, FERC has initiated several reforms that attempt to improve overall price formation. The current delays in implementing these reforms fall most heavily on nuclear base load generators that derive most of their revenues from energy markets. The Commission has made substantial strides in addressing these shortcomings but current actions should be accelerated and additional improvements should be pursued. Energy market pricing reforms to better reflect the cost of operating the marginal units – such as the reforms recently proposed by PJM – will not provide a complete solution to the immediate problems facing the Commission, but they can be a significant part of the solution.

The PSEG Companies' comments attempt to offer a roadmap to the Commission for approaching this issue in stages so that urgent issues can be addressed in the near-term through an approach that facilitates state action along with improvements in energy market pricing. The Commission should direct the RTOs/ISOs to lay the groundwork for developing solutions that achieve widely recognized state public policy goals through market designs. The initial steps, which should begin immediately, should be a requirement that the ISOs/RTOs consider the value of achieving these policy goals, and on-going efforts to improve energy market price formation reforms should be accelerated. While we do not believe that these initiatives will provide a complete solution, they could make a significant contribution.

II. COMMENTS

a. The Wholesale Markets Were Not Designed to Recognize and Procure Desirable Attributes that Advance the Public Policy Goals of States

The organized markets for energy, capacity and ancillary services were developed to improve efficiency in the production costs of electricity while maintaining the reliability of the system. This effort has been extremely successful. For example, based on an examination of hourly supply and demand patterns on the U.S. electrical grid, research for the National Bureau of Economic Research, recently estimated that competitive electric supply reduced aggregate electricity generation costs by $3 billion a year.[2] Competitive markets, moreover, serve to insulate consumers from the risks associated with generator obsolescence and changing market conditions affecting generator profitability. Most of the generation located in PJM and the other eastern organized markets is owned by independent generators. If those generators are retired or fail to operate profitably, any unrecovered costs are borne by investors, not ratepayers. The elimination of this "stranded cost" risk to consumers provides tremendous value.

It has become clear, however, that existing market designs are not doing enough. Desirable attributes of generators such as favorable environmental characteristics and fuel diversity are not being valued in the market. Unless steps are taken immediately, generators with these desirable characteristics will be permanently lost. The risk of losing nuclear generation is a point of particular concern. Consumers suffer because the cost of achieving state environmental goals will be increased exponentially if nuclear zero-carbon resources are not part of the resource mix. Also, if the fuel diversity of the system degrades through the loss of nuclear plants,

[2] *See* "Imperfect Markets versus Imperfect Regulation in U.S. Electricity Generation." Steve Cicala, (NBER Working Paper No. 23053),Summary available in April 2017 NBER Digest ("He finds that markets encouraged both increased trade across areas, and reduced usage of higher cost units. The 20 percent improvement in each of these metrics reduced production costs by about $3 billion per year."), available at: http://www.nber.org/digest/apr17/w23053.shtml.

consumers will be exposed to a greater risk of low probability, high impact events resulting in fuel delivery disruptions.

b. The Commission Should Address the Emergent Issues It Faces Related to the Preservation of Particular Technologies Needed to Address Carbon Abatement and Fuel Diversity Goals; The Commission Need Not Address Every Potential Issue Related to State Public Policy Initiatives At this Time

FERC should take immediate steps to address the emergent issues it faces with existing market designs failing to value important generator attributes, namely, the achievement of environmental goals and ensuring energy resiliency. "An agency enjoys broad discretion in determining how best to handle related yet discrete, issues in terms of procedures, and priorities." *Mobil Oil Exploration & Producing Southeast Inc. v. United Dist. Co.*, 498 U.S. 211, 230 (1991) (citations omitted). The Commission should not feel compelled at this time to develop an all-encompassing intellectual framework to justify steps for determining which public policy goals are appropriate to pursue. "[A]n agency need not solve every problem before it in the same proceeding. This applies even where the initial solution to one problem has adverse consequences for another area that the agency was addressing." *Id.* at 231 (citations omitted). The Commission should direct its efforts towards what needs to be done now; other matters should be addressed in time.

Two areas now before the Commission – environmental goals and fuel diversity – have clearly emerged as providing a legitimate basis for the Commission to take steps to foster their achievement. For example, in PJM and the other eastern markets, the vast majority of states have adopted renewable standards. The fact that not every state has adopted standards and that standards vary among states should not deter the Commission from acknowledging the need to address this goal in a broad sense. Indeed, the Commission has already done so. In *ISO New England et. al.*, 147 FERC ¶ 61,173, P 1 (2014), the Commission approved an exemption to the

buyer-side mitigation rules to "permit[] market participants to satisfy their renewable portfolio standards without imposing additional costs on consumers." As the Commission further explained in that order, it was acting "to complement[] state programs promoting renewable resources." *Id.*, P 82. The Commission thus can (and should) determine on this basis that market designs should be adopted that include measures to achieve – or at least not thwart the achievement by states – of environmental enhancements. Although accommodating, this policy fails to ensure a competitive price is achieved. An improved structure would utilize these resources to satisfy the capacity obligation and adopt a price based on an appropriate reference level. The appropriate reference level should reflect the actual cost of that resource adjusted for the economic value ascribed to the attributes that it provides to achieve certain policy objectives.

Similarly, the value of fuel diversity and resiliency is being recognized at the state level as important attributes of the electric grid. For example, Commissioner Richard Mroz, speaking as President of the New Jersey Board of Public Utilities, framed this issue as "whether we can maintain orderly markets to ensure the [existing] diverse portfolio of energy markets across the PJM [and] whether we are valuing them appropriately."[3] With respect to nuclear units, specifically, he noted that "they are valuable, they continue to help to provide for the long-term a diverse energy mix."[4] Further, in terms of which resource attributes not currently being valued, should be valued, he stated that "First is fuel diversity."[5] Or, as stated by Robert Klee, Commissioner of Connecticut's Department of Energy and Environmental Protection, "I am actually a fan of the role that states can play in bringing diversity of resources and reliability of

[3] State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C., Technical Conference Transcript, May 1, 2017, p. 210 (Docket No. AD17-11-000) ("Technical Conference Transcript").

[4] *Id.,* p. 209.

[5] *Id.*, p. 231.

resource into play when the market isn't delivering them.[6] Susan Tierney, senior advisor at the Analysis Group, summarized the role of states at the technical conference with respect to resiliency issues stating: "So states, indeed are working a lot on resiliency issues, because of this problem of assuring that people don't die and are not harmed during [certain events]. So I do think that there is going to be increasing attention [on resiliency] because [of] cyber – because of extreme weather events."[7]

FERC is uniquely positioned to take a leadership role in these areas. Because it oversees organized markets that serve some of the most populous areas of the country, it has the ability to foster the achievement of these goals in a way that can benefit millions of people. Conversely, if FERC fails to take hold of the reins, the adverse consequences to the country could be dire. If nuclear units retire prematurely, the cost of meeting environmental goals that affect the health and welfare of citizens and the financial viability of businesses would be increased substantially imposing unnecessary economic hardships. A potentially even more devastating consequence would be the failure to achieve the desired environmental enhancements at all with the resultant adverse impacts on the health of individuals.

Failure to preserve the fuel diversity which currently is inherent in the generation mix of many markets – PJM in particular – could also have very deleterious impacts on consumers. Fuel diversity enhances the robustness of the electric grid against potential loss-of-load events – even "Black Swan" events that cannot be foreseen by limiting the impact of common mode failures. These types of events, while rare, can be extremely costly when they do occur. For example, the loss of electric power associated with Superstorm Sandy had a devastating impact

[6] *Id.*, p. 28.

[7] Technical Conference Transcript, May 2, 2017, pp. 517-518.

on the region resulting in a tremendous loss of productivity and wages as well as the spoilage of millions of dollars in perishable goods. Further, retaining fuel diversity within the generation portfolio also provides protections against price volatility. If a system has several types of generators, it will be less susceptible to price spikes associated with any single type of fuel.[8]

c. For the Present, the Commission Should Avoid Taking Steps to Interfere with State Initiatives Related to the Achievement of Environmental Goals and Fuel Diversity or Seek to Accommodate Those Goals; The Adoption of Procedures to Achieve Such Goals should be a Future Effort

Notwithstanding the vital importance of the matters at issue, it is apparent that the Commission on its own cannot act in a sufficiently timely manner to prevent irreversible harm from befalling energy and capacity markets associated with potential generator retirements. Nuclear plants throughout the eastern markets are facing severe financial challenges. Nuclear units throughout the country have retired or have announced retirements. State legislatures in Illinois and New York have adopted measures to assure the continued operation of at risk nuclear plants in recognition of their desirable attributes not currently valued in the markets. Measures to preserve nuclear generation in New Jersey, Pennsylvania, Ohio and Connecticut are under discussion. The PSEG Companies, moreover, are experiencing the challenges facing nuclear generation first hand. A subsidiary of PSEG Power, PSEG Nuclear LLC ("PSEG Nuclear"), is the operator of two nuclear plants, the co-owned Salem plant and the wholly owned Hope Creek plant located in southern New Jersey. As PSEG Nuclear has stated publicly, it will not keep the

[8] *See* "The Value of US Power Supply Diversity" Makovitch, Marks and Martin, July 2014, "Employing the diverse mix of fuels and technologies available today produces lower and less volatile power prices compared to a less diverse case with no meaningful contributions from coal and nuclear power and a smaller contribution from hydroelectric power," available at: http://www.energyxxi.org/sites/default/files/USPowerSupplyDiversityStudy.pdf.

units in-service if the plants are not economically viable – an event that it has indicated could occur within the next three years.[9]

FERC's immediate imperative, accordingly, should be to avoid thwarting the efforts of the states to address carbon abatement and fuel diversity by supporting nuclear generation or other types of generation associated with achieving these goals. In the parlance of the technical conference, FERC should either "affirmatively decide" not to mitigate resources receiving support payments ("path 1") or take steps to "accommodate" these state goals ("path 2"). Adopting path 1 would allow nuclear units receiving support payments to participate in energy and capacity markets as they do now. This approach would satisfy the basic goal of not creating obstacles that would interfere with the efforts of the states to achieve these important objectives.

An "accommodative" approach, however, would be a better option provided that it is designed correctly. The PSEG Companies believe that, in this context, a mechanism to accommodate state actions designed to preserve nuclear generation in order to achieve state environmental or resiliency goals should have three elements:

(1) allow the resources receiving support payments to receive capacity obligations on payments at the same level as other resources ensuring customers do not "overpay" for policy objectives;

(2) do not commit more resources than those needed to meet demand; and

(3) the establishment of a "competitive" price for capacity.

Each of these elements is critical. First, if resources receiving state support payments do not also receive capacity market payments, the burdens placed on the state to achieve their goals may be

[9] "N.J. Nuclear Plants Could Go Dark Without Subsidies, PSEG Warns," available at: http://www.nj.com/news/index.ssf/2017/03/nuclear_plants_could_do_dark_without_subsidies_pse.html.

magnified significantly. Second, unless the mechanism includes a means to assure that resources will not be over-procured, prices in both capacity and energy markets will be depressed below competitive levels thus exacerbating the problem that the market design reform is intended to correct. Third, it is important that committed resources lacking the attributes that make them eligible for support payments receive competitive payments in order to adequately support their operation and send proper pricing signals for entry and exit from the market.

An "accommodative" approach that would appear to have these characteristics, for example, would be a bifurcated capacity market design – along the lines of one of PJM's proposals – that would provide capacity commitments and payments to resources that receive support payments. Under this proposal, nuclear plants receiving state support payments to achieve their goals would qualify as capacity resources in the first "commitment" auction. Although nuclear units (and any other generators receiving support payments) committed in the first auction would be mitigated in the second "pricing" auction, they would still receive the competitive price realized in that auction regardless of whether they clear. Further, PJM would avoid over-procurement by not assigning a capacity commitment to resources that cleared only in the pricing auction. We believe this type of mechanism could be workable. Fundamentally, FERC should not take actions that would make it more difficult for the states to achieve policy goals designed to promote environmental improvements and resiliency.

Over the longer-term, the Commission should seek to implement an "achieves" approach to fostering carbon abatement and fuel diversity though the market design. This would provide a more efficient way of addressing these issues but will likely require years of work to implement. This could include measures such as carbon pricing in energy markets and enhanced ISO/RTO payments made directly to generating plants needed to meet fuel diversity standards adopted for

the region. While this is a longer term goal, the Commission should begin building the foundation for this work immediately. Specifically, ISOs/RTOs should be directed to study the impacts of these types of reforms and to begin discussions in their stakeholder processes for their implementation over the next few years. Periodic reports to FERC regarding the progress being achieved should also be required.

Further, the Commission clearly has the jurisdiction to accomplish this. State public policy goals are a reality. FERC need not (and should not) ignore the existence of state programs and the adverse impacts on electricity markets that their piecemeal implementation would have. Rather, the Federal Power Act ("FPA") clearly arms FERC with the necessary authority to implement tariff reforms that can incorporate public policy goals into the markets when to do so improves overall efficiency.

Under the FPA, the Commission is held to a standard of setting rates that are "just and reasonable" and has authority over practices that "affect" wholesale rates. As shown in the recent decision in *EPSA v. FERC*, the Commission does *not* impermissibly intrude on state jurisdiction when it regulates activities initiated by the states which are reasonably designed "to enhance the wholesale, not the retail, electric market."[10] Here, failing to incorporate widely supported public policy goals into markets over which FERC has jurisdiction, will lead to market outcomes that are inconsistent with core goals of the FPA such as "encourag[ing] the orderly development of plentiful supplies of electricity . . . at reasonable prices"[11] and in "maintaining competition to the maximum extent possible consistent with public interest."[12] FERC should

[10] *EPSA v. FERC*, 136 S. Ct. 760, 779 (2016).

[11] *Nat'l Ass'n for Advancement of Colored People v. Acusport Corp.*, 425 U.S. 458, 671 (1980).

[12] *Otter Tail Power Co. v. U.S.*, 410 U.S. 366, 374 (1973).

thus be vested to have the authority to place tariffs into effect designed to effectuate public policy goals when doing so "break[s] down regulatory and economic barriers that hinder a free market in wholesale electricity."[13]

d. Efforts to Get the Prices Right in the Energy Markets Should Continue on a Parallel Track to the Efforts to Preserve the Existing Nuclear Fleet

The PSEG Companies applaud the leadership role that the Commission and its staff have taken over the last several years to push the RTOs and ISOs to address the inefficiencies in the wholesale energy markets that have been exposed by declining wholesale energy prices. In response to the Commission's initiative, we analyzed the different market designs of the three eastern RTOs in which we operate and were able to identify "best practices" that we believe should be implemented across the three regions. Notably, in March of 2015, the PSEG Companies submitted comments to the Commission describing some of the "best practices" that we observed from NYISO that could be implemented in the other RTOs.[14] The Commission subsequently implemented a number of key reforms that have ensured that wholesale energy prices more accurately reflect the cost and value of servicing load during all periods. These reforms relate to offer caps, shortage pricing, hourly re-offers and five-minute settlement intervals. While we appreciate the Commission's efforts to direct these reforms, we believe that the Commission should continue to engage with stakeholders to determine additional areas where improvements can be made and push the RTOs to make those enhancements to their respective market designs.

[13] *EPSA v. FERC*, 136 S. Ct., at 768 (*quoting Morgan Stanley Capital Grp*, 554 U.S. 527, 538 (2008).

[14] *See* "Post Technical Conference Comments of the PSEG Companies," *Price Formation in Energy and Ancillary Services Markets Operated by Regional Transmission Organizations and Independent System Operators*, Docket No. AD14-14-000 (March 6, 2015).

For example, recently, the Commission issued a notice of proposed rulemaking ("NOPR") concerning the transparency practices of certain RTOs and ISOs related to uplift payments, operator-initiated commitments and transmission constraint penalty factors. While we support this NOPR, we believe that it is important for the Commission to continuing stressing efforts to enhance the transparency surrounding RTO/ISO dispatch and commitment decisions. In particular, all ISOs should ensure that published market information is clearly defined and is consistent with the information used in dispatch, scheduling and price calculation. The correct amount of transparency allows generators to compete more efficiently because they are able to better understand what products and characteristics of resources the system operators value most. Transparency is critical because it highlights the elements of the RTO/ISO dispatch and commitment procedures that are not effective and could be improved. Additional transparency enables market participants to understand why certain dispatch and commitment decisions are made and thereby appreciate the problems that are being addressed rather than guessing what the operator is attempting to accomplish.

The Commission has also recently issued a NOPR proposing that RTOs/ISOs modify their rules governing fast-start resources (*i.e.*, resources that can start up in 10 minutes or less, have a minimum run time of one hour or less and have submitted an economic energy offer to a market). Fast-start resources typically are committed in real-time, very close to the interval when needed and can respond quickly to unforeseen system needs. However, without fast-start pricing, some fast-start resources are ineligible to set prices due to inflexible operating limits. As a result, prices may not reflect the marginal cost of serving load. While we support the reforms described in the NOPR, we believe that it targets only a limited set of resources.

PJM appears to share our view and recently issued a whitepaper proposing to expand the class of resources that are eligible to set prices. In the whitepaper PJM states that "the range of resources eligible to set price should be expanded to include all units whose output is needed to serve load or control transmission constraints in a given interval."[15] To address this issue, PJM is proposing to allow inflexible units to set LMP, thereby "transparently indicating the cost of the most expensive unit necessary to economically serve the load."[16] PJM is proposing to accompany the pricing eligibility reform with implementation of a load-following product, "which would compensate flexible resources forced to ramp up or down uneconomically to meet demand when a larger, inflexible resource must operate at a minimum output level."[17] While the details surrounding PJM's proposal still need to be worked out, we believe that the proposal shows promise and its goals – to value flexibility and increase the universe of resource classes that are eligible to set price – are steps in the right direction. However, while we do not believe that either the Commission or the RTOs/ISOs should let up on their efforts to improve energy price formation, we caution that these reforms are not the complete solution to the challenges facing nuclear units. Consequently, the efforts to improve energy price formation should be done in parallel with efforts to enhance marginal pricing and develop ways to incorporate public policy attributes into the market. While these efforts are developed, it is essential that the Commission's efforts do not interfere with important state transitional actions.

III. CONCLUSION

The Commission is at a crossroads. It must act quickly and decisively to address a problem that, if not handled correctly, could have adverse impacts on millions of consumers for years to come. The PSEG Companies respectfully request that the Commission consider their comments as providing a practical means to address the most pressing matters first and then to implement a long-range solution after the crisis has passed.

Respectfully submitted,

By: *Kenneth R. Carretta*

PSEG Fossil

Reactive Power Capability

June 30, 2016

Jason Sine

PSEG Fossil LLC

SI-SSA-0010-1010

Reactive Power Capability

2.1 What costs do synchronous generators incur to install and maintain Reactive Supply capability?

A. Installation costs: In order to supply reactive capability, a generator must be designed/sized larger than the desired megawatt output during installation. This includes the:

- Excitation system
- Transformers
- Generator bus
- Generator breakers
- Cooling systems, must be sized larger in order to provide the increased current requirements of supplying reactive power and cooling requirements to dissipate the heat produced in the generator, bus, and transformers when providing the reactive power.

Example:

- If reactive power is NOT to be supplied (PF=1.0), a 100 MW generator can be sized at 100MVA
- If reactive power is to be supplied (ex. PF=0.9, 100 MWs, 50 MVARs), the 100MW generator would need to be sized to 111.1 MVA.
- All electrical equipment from the generator to the point of interconnection must be sized to handle the increased current in supplying the reactive power.

2.1 What costs do synchronous generators incur to install and maintain Reactive Supply capability? (continued)

B. Maintenance costs:

- To supply reactive capability, maintenance costs are the same as if not supplying reactive power as long as the equipment is sized and rated to adequately handle the reactive power.
- As equipment ages, degraded conditions can possibly occur within a generator that supplying reactive power can accelerate and cause damage to specific components within the generator. For example leading reactive power can accelerate any existing core iron insulation issues, and may result in a de-rate if the degraded condition is not repaired.

Reactive Power Capability

2.2 Is the equipment required for synchronous generators to maintain Reactive Supply capability the same as that required to produce and deliver real power, or must additional costs be incurred to provide Reactive Supply capability?

- The equipment is the same, but it is required to be a larger size if it is intended to provide reactive capability

Reactive Power Capability

2.3 Would synchronous generators be designed or operated differently were it not for the Reactive Supply capability requirements of their respective Interconnection Agreements or Reactive Supply reliability requirements?

- Design:
  - Without reactive supply capability requirements, the size/rating of the equipment (generator, bus, transformers, cooling equipment) could be reduced and a generator operated as close to unity power factor as possible.

- Operation:
  - Without reactive supply capability requirements, the unit would be operated at unity power factor

2.4 What costs do synchronous generators incur in real-time to provide Reactive Supply service?

- Aux power for Cooling:
  - Additional auxiliary power will be consumed to run the larger cooling systems required for cooling the generator, bus, and transformers.

- Aux power for Excitation:
  - **Lagging**: To provide lagging reactive power, the generator requires an increase in field current, resulting in an increase in auxiliary power used by the excitation system.
  - **Leading**: Conversely, to provide leading reactive power , the generator requires a reduction in field current, resulting in a decrease in auxiliary power used by the excitation system.
  - Increases heat losses.

Reactive Power Capability

2.5 How are the costs required for synchronous generators to maintain Reactive Supply capability and to provide Reactive Supply service recovered?

- Most of PSEG Power's generating units are located in PJM and thus are paid under the *AEP* methodology.

- The *AEP* methodology calculates a cost-of-service rate for generating units providing reactive power services based on three components of production plant directly related to the production of VARs: (i) the generator and exciter; (ii) accessory electric equipment that supports operation of the generator and exciter; and (iii) remaining total production investment required to provide real power and operate the exciter. Recovery of the costs of incremental heating losses which are incurred in the production of reactive power are also allowed.

Reactive Power Capability

2.5 How are the costs required for synchronous generators to maintain Reactive Supply capability and to provide Reactive Supply service recovered? (continued)

- The *AEP* methodology correctly recognizes that generating units required to be capable of providing reactive power incur capital and maintenance costs that they would not incur otherwise but may not adequately compensate units for these costs in some cases.

- The allowance for incremental heating losses under the *AEP* methodology may not adequately compensate for the additional auxiliary power consumed to run the larger cooling systems needed for cooling the appropriately-sized generator, bus, and transformers required to provide reactive power services.

REQUEST FOR REHEARING OF THE PSEG COMPANIES

Pursuant to Section 313(a) of the Federal Power Act ("FPA")[1] and Rules 212 and 713 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("FERC") or the "Commission"),[2] Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC (collectively, the "PSEG Companies") hereby seek rehearing of FERC's June 29, 2018 Order ("Order")[3] in these proceedings.

[1] 16 U.S.C. § 825(a) (2012).

[2] 18 C.F.R. §§ 385.212; 385.713 (2017).

[3] Order, 163 FERC ¶ 61,236.

20180730-5222 FERC PDF (Unofficial) 7/30/2018 3:55:23 PM

Fundamentally, the Order errs by purporting to address a problem that has not been shown to exist. The Commission found PJM's current Open Access Transmission Tariff ("Tariff") to be unjust and unreasonable because it allegedly fails to mitigate the price-suppressive impacts of out-of-market payments to generators and further found that action must be taken to revise PJM's Tariff, based upon this determination.[4] The Commission initiated a Federal Power Act ("FPA") section 206 proceeding in Docket No. EL18-178-000 and set the proceedings for a paper hearing.

The stated bases for the Order's FPA Section 206 conclusions do not, however, withstand even rudimentary analysis. As pointedly demonstrated in Commissioner Glick's dissent, the PJM capacity market is adequately – indeed much more than adequately – performing its intended functions by any reasonable measurement. For example, the record reflects that PJM's current reserve margin is nearly double what the North American Electric Reliability Corporation ("NERC") has determined is necessary, meaning that the region currently has tens of thousands of additional MW of generating capacity beyond what it requires.[5] Moreover, there are nearly 40 GW of natural gas-fired generation under development within PJM's footprint—equivalent to 25 percent of the installed capacity in the region—with over half of those MW in a relatively advanced state of development.[6] A wealth of other evidence attesting to the health of the PJM capacity procurement mechanism can also be found in the record. The concerns that the

[6] Clean Energy Advocates Protest at 36-37 (Docket No. EL16-49)(citing data compiled by S&P Global Market intelligence); Exelon Protest at 35-36.

Order purports to identify with respect to prices being suppressed below competitive levels are not only theoretical but are actually completely at odds with the facts on the ground. The Commission simply lacks the necessary support to meet its statutory burden and make a finding that the current PJM capacity market structure is not just and reasonable.

The Order is also flawed as a matter of law. It defies the carefully balanced statutory structure of the FPA by imposing its own narrow vision of which social policies should be pursued ignoring the statutorily acknowledged role of state policy makers. The states are vested with the exclusive jurisdiction over "facilities used for the generation of electric energy." As the case law makes clear – including recent Supreme Court decisions – the Commission and the states should cooperate to the extent possible in performing the roles assigned to them under the FPA. The Order contends that capacity prices are being suppressed by state actions to value generation attributes; attributes the Commission has already acknowledged are legitimate for states to pursue. The economic evidence that was presented in this proceeding [7] clearly demonstrates that these actions are not suppressive; in fact, they achieve the most efficient overall outcome. Taking account of the states' policy goals thus would actually do a better job of selecting the most economical generating units than does the current market mechanism.

The direction the Commission should take in addressing the matter before it is to incorporate widely supported public policy goals, such as carbon abatement and resiliency, into its market designs. The structure of the FPA contemplates coordination between state and federal regulatory bodies. Except to the extent that measures are "targeted" or "aimed" towards intentionally interfering with the statutorily assigned role of the other, the states and the

[7] Exelon June 20, 2018 Protest (Docket No. EL18-169-000), Declaration of Robert D. Willig.

Commission should work together to achieve their respective goals. And given that there is no indication that the goals of states to achieve clean air goals and fuel security are attempts to interfere with efficient market outcomes, the Commission's approach is simply indefensible

Pursuant to Rule 713 of the FERC's Rules of Practice and Procedure, 18 C.F.R. § 385.713,[8] the PSEG Companies hereby seek rehearing of the Order in this proceeding and request that the Commission maintain the status quo and reverse its decision to initiate an FPA 206 proceeding to seek modification of the PJM Tariff. In support of this rehearing request, the PSEG Companies respectfully shows as follows:

I. STATEMENT OF ISSUES AND SPECIFICATION OF ERRORS

Pursuant to Rule 713(c)(2) of the Commission's Rules of Practice and Procedure,[9] the PSEG Companies request rehearing of the following issues:

1. The Order errs by failing to meet the statutory burden of FPA Section 206 demonstrating that PJM's current Tariff is unjust and unreasonable where:

(i) There is no substantial evidence in the record to support a finding that there is a resource adequacy problem in PJM or that the capacity market is otherwise unjust and unreasonable or unduly discriminatory or preferential;

(ii) The Order never justifies theoretical concerns regarding price suppression; and

(iii) The Order never adequately addresses the claims of intervenors demonstrating that the capacity market is achieving its intended goals related to meeting reliability standards.

2. The Order errs because it interferes with the exclusive jurisdiction of the states under the FPA over generating facilities.

[8] 18 C.F.R. § 385.713 (2010).

[9] *Id.* at (c)(2).

3. The Order errs by failing to comply with the statutory framework of the FPA requiring that the Commission coordinate with state agencies regarding the achievement of state public policy goals within their authority provided that the states' actions are not attempts to target or aimed at thwarting legitimate federal goals in circumstances in which:

(i) States have identified clean air and fuel security initiatives that could be incorporated into market designs; and

(ii) The inclusion of widely-supported state goals for improving air quality and fuel security would actually improve market efficiency by pricing additional societal costs into market outcomes.

4. The Order violates the FPA and the Administrative Procedure Act, ignores record evidence and legitimate objections raised by parties, and fails to make a decision based on substantial evidence.[10]

II. BACKGROUND

On April 9, 2018, PJM filed, pursuant to section 205 of the FPA, to modify its capacity market design ("PJM Filing").[11] The PJM Filing consisted of two alternate proposals designed to address the price suppressing effects of state out-of-market support for certain resources.[12] PJM's first approach was comprised of a two-stage annual auction, with capacity commitments first determined in stage one of the auction and the clearing price set separately in stage two ("Capacity Repricing"). PJM's second, alternative approach, revised PJM's MOPR to mitigate capacity offers from both new and existing resources, subject to certain proposed exemptions ("MOPR-Ex"). In its filing, PJM requested that the Commission approve its preferred "Capacity Repricing", or in the alternative PJM's MOPR-Ex proposal.

[10] FPA section 205, 16 U.S.C. § 824d; FPA section 313, 16 U.S.C. § 824l(b); *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto Ins. Co.*, 463 U.S. 29, 43 (1983); *See PPL Wallingford Energy LLC v FERC*, 419 F.3d 1194, 1198 (D.C. Cir. 2005) (quoting *Canadian Association of Petroleum Producers v. FERC*, 254 F.3d 289, 299 (D.C. Cir. 2001) ("[U]nless the [agency] answers objections that on their face seem legitimate, its decision can hardly be classified as reasoned.").

[11] PJM Filing.

[12] *Id*. at 17.

Previously, the Complaints in Calpine, *et. al*. ("Calpine Complaint")[13] had argued that PJM's MOPR should be expanded to "prevent the artificial suppression of prices in the Reliability Pricing Model ('RPM") market by below-cost offers for existing resources whose continued operation is being subsidized by State approved out-of- market payments."[14] Complainants argued that the MOPR should cover not only new resources receiving out-of-market subsidies, but existing resources as well, subject to several limitations. [15]

On June 29, 2018 FERC issued the instant Order. FERC found that it has become necessary to address the price suppressive impact of resources receiving out-of-market support. Part of FERC's rational is that PJM's existing MOPR does not, because it applies only to new, natural gas-fired resources. As such, based on the combined records of the Calpine Complaint proceeding and the PJM Filing, FERC determined that PJM's Tariff is unjust and unreasonable and granted the Calpine Complaint, in part, and *sua sponte* initiated a paper section 206 proceeding.

III. REQUEST FOR REHEARING

A. THE COMMISSION FAILED TO MEET ITS BURDEN TO SHOW THAT PJM'S TARIFF IS UNJUST AND UNREASONABLE

The Administrative Procedure Act directs a reviewing court to "hold unlawful and set aside agency action, findings, and conclusions found to be – (a) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law; ... [or] (e) unsupported by substantial evidence ...."[16] "[T]o survive this review, FERC must "examine the relevant data and articulate

[13] Calpine Complaint, *et al*., Docket No. EL16-49-000 (March 21, 2016).

[14] *Id.* at 2.

[15] *Id*.

[16] 5 U.S.C. §706(2).

a satisfactory explanation for its action including a rational connection between the facts found and the choice made."[17] An agency acts arbitrarily when it "entirely fail[s] to consider an important aspect of the problem, [or offers] an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise."[18] "Among other things, [a]n agency's failure to respond meaningfully to objections raised by a party renders its decision arbitrary and capricious."[19] Thus, FERC "must respond to objections and address contrary evidence in more than a cursory fashion."[20]

Therefore, under the Administrative Procedure Act,[21] the Commission is required to render all of its decisions in accordance with reasoned decision-making and articulate a satisfactory explanation for its decision, including a "rational connection between the facts found and the choice made."[22] The Commission must also ensure that the record it has developed is both complete and articulate and that it has satisfied its affirmative duty to inquire into and consider all relevant facts presented by the parties.[23] Further, the courts have found an agency's

[17] *PSEG Energy Res. & Trade LLC v. FERC*, 665 F.3d 203, 208 (D.C. Cir. 2011) (quoting *PPL Wallingford Energy LLC v. FERC*, 419 f.3d 1194, 1198 (D.C. Cir. 2005) (quoting *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983)).

[18] *Motor Vehicle Mfrs. Ass'n*, 463 U.S. at 43.

[21] 5 U.S.C. § 551, et seq.

[22] *Motor Vehicles Mfrs. Ass'n v. State Farm Mutual Auto Ins. Co.*, 463 U.S. 29, 43, 48, 48, 57 (1983), *citing Burlington Truck Lines, Inc. v. United States*, 371 U.S. 156, 371 U.S. 168 (1962) ("[A]n agency must cogently explain why it has exercised its discretion in a given manner.").

[23] *See Confederate Tribes and Bands of Yakima Indian Nation v. FERC*, 746 F.2d 466, 472 (9th Cir. 1984), (*quoting Scenic Hudson Pres. Conference v. FPC*, 354 F.2d 608, 620 (2nd Cir. 1965)).

ruling to be "arbitrary and capricious" if the agency "ignores important arguments or evidence."[24]

Here, FERC's Order fails to satisfy the requirements of the Administrative Procedure Act in multiple ways. First, FERC fails to identify substantial evidence justifying its determination that PJM's Tariff is unjust and unreasonable. Second, the suppositions and assumptions relied upon by FERC lacked meaningful probative value and were wholly unsupported by record evidence. Third, in many instances, FERC ignored or evaded various objections and arguments entirely.

Commissioner LaFleur aptly notes that the instant proceeding is too important to proceed on the basis of theory and conjecture:

> Here, the FERC, "through a 90 day paper hearing, is proposing the most sweeping changes to the PJM capacity construct since the market's inception more than a decade ago. If ultimately adopted, this proposal would fundamentally rebalance the resource adequacy responsibilities of the states, the Commission, and PJM….the end result is a proceeding to "overhaul the PJM capacity market based on **a thinly sketched concept**, a troubling act of regulatory hubris that could ultimately hasten, rather than halt, the re-regulation of the PJM market."[25] (emphasis added)

The Commission claims that PJM's capacity construct has become "untenably threatened" by out-of-market payments resulting from state initiatives."[26] This thinly sketched concept is fundamentally flawed and unsupported by any record evidence. Instead, the Commission, in a conclusory fashion, espouses this theory, seemingly as evidence.

In fact, the capacity markets have continued to fulfill the FPA's mandate of "encourage[ing] the orderly development of plentiful supplies of electricity … at reasonable

[24] *Natural Res. Def. Council v. U.S. EPA*, 822 F.2d 104, 111 (D.C. Cir. 1987); *Consumers Union of the United States v. Consumer Prod. Safety Council*, 491 F.2d 810, 812 (2nd Cir. 1974).

[26] *E.g.*, Exelon January 30, 2017 Protest at 14-15 (Docket No. EL16-49).

prices."[27] Energy prices are at historic lows, and capacity prices are well below the cost of new entry. That basic pattern continued in the most recent auction, where reserve margins barely dipped even as prices rose.[28] The record is bereft of any evidence that there is a resource adequacy problem in PJM.

The Commission has blatantly ignored important arguments and evidence, thereby rendering its ruling arbitrary and capricious. The evidence in the record actually reflects that PJM's capacity market has a capacity surplus that is in excess of the level required to reliably meet the region's electricity demands.[29]

For example, the record reflects that PJM's current reserve margin is nearly double what NERC has determined is necessary, meaning that the region currently has tens of thousands of additional MW of generating capacity beyond what it requires.[30] Moreover, there are nearly 40 GW of natural gas-fired generation under development within PJM's footprint—equivalent to 25 percent of the installed capacity in the region—with over half of those MW in a relatively advanced state of development.[31] Both examples offer clear, record evidence of the fact that the PJM region continues to attract new "competitive" generation resources.

Again, the Commission engages in speculation and conjecture to justify its determination that, at some point in the future, the capacity market may no longer secure sufficient resources at

[27] *PJM Interconnection, L.L.C.*, 155 FERC ¶ 61,157, at 30 n.39 (2016) (quoting *Pub. Utilities Comm'n of Cal. v. FERC*, 367 F.3d 925, 929 (D.C. Cir. 2004)).

[28] *E.g.*, Exelon January 30, 2017 Protest at 14-15 (Docket No. EL16-49).

[29] Order, 163 FERC ¶ 61,236, (Glick, dissenting, p. 2).

[30] *E.g.*, Exelon January 30, 2017 Protest at 14-15 (Docket No. EL16-49) ("The market is producing resource adequacy—achieving a reserve margin of 22 percent, exceeding its target of 16.5 percent."); Maryland Commission Protest at 5 ("Regarding investment in generation, PJM's Base Residual Auction (BRA) provides ample capacity and has consistently exceeded its target reserve margins."); Consumer Coalition Protest at 12 ("PJM has the most drastic capacity *oversupply* of any RTO in North America.").

[31] Clean Energy Advocates Protest at 36-37 (citing data compiled by S&P Global Market intelligence); Exelon Protest at 35-36.

just and reasonable rates.[32] The Commission opines that "action must be taken" because PJM's Tariff is unable "to adequately address *the evolving circumstances* presented by resources that receive out-of-market support."[33] However, the evidence in the record does not support this theory. In fact, it is again exactly to the contrary. The most recent auction continued to incentivize new entry, even though PJM's reserve margin far exceeds what is needed for reliability. The 2021/2022 Reliability Pricing Model ("RPM") Base Residual Auction ("BRA") cleared 163,627.3 MW of unforced capacity in the RTO representing a 22.0% reserve margin. The reserve margin for the entire RTO is 21.5 percent, considerably higher than the target reserve margin of 15.8 percent, when the Fixed Resource Requirement ("FRR") load and resources are considered. This reported reserve margin of 21.5 percent does not even reflect the additional 22,877.5 MW of uncleared capacity.[34]

The Commission hypothesizes that PJM's Tariff is unjust and unreasonable because it does not mitigate state policies, thereby creating uncertainty for "competitive" resources that do not know whether they will be competing against other resources that receive a subsidy considered by the Commission to be problematic.[35]

> Commissioner Glick, in his dissent, correctly and soundly debunks this theory:
>
> > Uncertainty in many forms—commodity price uncertainty, demand uncertainty, and, yes, policy uncertainty—pervades the electricity industry and the Commission leaves it to private companies to manage that uncertainty. Nothing in today's order explains why the uncertainty created by certain state policies is any different or why that difference is sufficient to render PJM's Tariff unjust and

[32] Order, 163 FERC ¶ 61,236 at P 19.

[33] *Id.* at P 32.

[34] PJM Answer at 10.

[35] *Id.* at P 150. It is unclear why the Commission limits this uncertainty to "competitive" resources. Every resources faces uncertainty that policy developments relatively favorable to its competitors will make its position less advantageous.

> unreasonable. And it is ironic to bemoan policy uncertainty when Commission's and PJM's constant tinkering with the capacity market is one of, if not the, single biggest sources of uncertainty facing capacity market participants.[36]

As there is no substantial evidence in the record to support a finding that PJM's Tariff is unjust and unreasonable and, in fact, there is evidence directly to the contrary that was disregarded by the Commission, rehearing on the Order must be granted.

B. THE ORDER ENCROACHES ON THE STATES EXCLUSIVE JURISCTION, GRANTED PURSUANT TO THE FPA

The FPA is often described as drawing a "bright line" between state and federal jurisdiction over the electricity sector. This division of authority gives the federal government jurisdiction over the interstate aspects of the electricity industry, while leaving the states to regulate its intrastate aspects.[37] As such, the FPA is clear that the states, not the Commission, are the entities responsible for shaping the generation mix. Although the FPA provides the Commission with jurisdiction over wholesale sales of electricity as well as rates and practices affecting those wholesale sales, Congress expressly precluded the Commission from regulating "facilities used for the generation of electric energy," instead vesting the states with exclusive jurisdiction over those facilities.[38] Alongside those grants of power, however, the Act also limits FERC's regulatory reach, and thereby maintains a zone of exclusive state jurisdiction. Congressional intent is clearly articulated in § 201's text: FERC's reach "extend[s] only to those

[36] *ISO New England Inc.*, 162 FERC ¶ 61,205 at 5 n.13 (Glick, Comm'r, dissenting in part and concurring in part) ("[C]hange has been the only consistent feature of capacity markets in recent years.").

[37] 16 U.S.C. § 824.

matters which are not subject to regulation by the States."[39] States retain exclusive authority to regulate "facilities used for the generation of electric energy."[40]

As maintained by Commissioner Glick in his dissent, the FPA is clear that a state's development of generation support is clearly within states' authority, and the Order impermissibly intrudes upon the states' exclusive jurisdiction:

> The state programs of which the commission disapproves are precisely the sort of actions that Congress reserved to the states when it enacted the FPA. The Commission's role is not — and should not be — to exercise its authority over wholesale rates in a manner that aims to mitigate, frustrate, or otherwise limit the states' exercise of their exclusive authority over electric generation facilities. As contemplated, the commission's proposal would effectively force state-sponsored resources out of the capacity market, depriving them of a payment for capacity that they will actually provide and leaving it to the states to pick up that tab,"[41]

The FERC Order thus oversteps the Commission's statutory authority and, accordingly, must be reversed on rehearing.

C. THE ORDER ERRED BY FAILING TO CREATE MARKET MECHANISMS DESIGNED TO VALUE PARTICULAR GENERATOR ATTRIBUTES IDENTFIED BY STATES AS NEEDED TO ACHIEVE LEGITIMATE PUBLIC POLICY GOALS

In the past, the Commission has always crafted market rules to defer to and accommodate state programs addressing environmental externalities. Doing so adheres to the principle that the Commission must "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role,"[42] consistent with the Federal Power Act's purpose to

"complement," not "usurp[] … State regulatory authority."[43] As a number of recent court decisions make clear, state and federal regulatory authorities should seek to coordinate their roles when possible, not attempt to neutralize each other. The FPA's jurisdictional overlap is intentional. It reflects the "congressionally designed interplay between state and federal regulation,"[44] which is limited by the principle that neither the states nor the Commission may impose measures that "target[]" or "aim[] at" the other's areas of exclusive responsibility.[45]

Yet, the Order departs dramatically from this paradigm. Until now, the Commission has decided that its market mechanisms should be fuel-neutral, but it has always accepted that state policies are *not* fuel neutral. Resources confront a cost structure that reflects whatever fuel-related benefits or penalties states have chosen to impose in light of state environmental priorities. The Commission's market mechanism selects the least-cost set of resources against the backdrop of those policies. And thus far, the Commission has always crafted market rules to respect and accommodate state programs addressing environmental externalities.[46] The Commission's role is not—and should not be—to exercise its authority over wholesale rates in a manner that aims to mitigate, frustrate, or otherwise limit the states' exercise of their exclusive

authority over electric generation facilities.[47] Rather than interfering with state policies that address externalities associated with electric generation, such as greenhouse gas emissions that contribute to the existential threat of climate change, the Commission should be striving to accommodate and give effect to those state initiatives.[48]

Nor can the Commission claim that the achievement of state policies designed to value clean air or fuel diversity attributes of generation would be inconsistent with the fundamental goals of markets. The loss of these desirable generator attributes would impose real costs on the citizens of the states that seek to promote them. The fact that the electricity markets designed by the Commission to date do not include these costs does not give provide license for the Commission to ignore them when they have been identified by states. Nevertheless, the Commission now claims that the "integrity and effectiveness" of PJM's capacity market "have become untenably threatened by out-of-market payments provided or required by certain states for the purpose of supporting the entry or continued operation of preferred generation resources."[49] This amounts to the Commission imposing its narrow vision of markets on the states and thus infringing on the states' role. Indeed, given the vast number of subsidies and discriminatory policies that the approach outlined in the June 29th Order ignores entirely, the order's targeting of certain state policies goals is an arbitrary and capricious exercise to inhibit state efforts to price the externalities of electricity generation, while permitting other federal, state, and local policies that interfere with the functioning of the markets. This approach is tantamount to arbitrarily picking winners and losers among various externalities (or "subsidies")

purportedly impacting the capacity markets. The Commission fails to explain why it deems some "threats" as warranting redress, while others do not. As stated in Commission Glick's dissent:

> Rather than interfering with state policies that address externalities associated with electric generation, such as greenhouse gas emissions that contribute to the existential threat of climate change, the Commission should be striving to accommodate and give effect to those state initiatives….the Commission fundamentally misunderstands that the state policies that it targets compensate resources for their environmental attributes, not their capacity. As contemplated, the Commission's proposal would effectively force state-sponsored resources out of the capacity market, depriving them of a payment for capacity that they will actually provide and leaving it to the states to pick up that tab. [50]

As such, the Commission's Order erred because it failed to respect the statutory interference with the scheme of the FPA by refusing to give effect to state policy choices that do not conflict with basic market design principles.

CONCLUSION

The PSEG Companies respectfully requests that the Commission grant this request for rehearing and the relief requested herein.

Respectfully submitted,

Public Service Electric and Gas Company

COMMENTS OF THE PSEG COMPANIES

Pursuant to Rules 212 and 214 of the Federal Energy Regulatory Commission's ("Commission" or "FERC") Rules of Practice and Procedure,[1] Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC (collectively, the "PSEG Companies") file these comments in response to the proposed changes to PJM Interconnection, L.L.C.'s ("PJM") Open Access Transmission Tariff ("Tariff") described in the June 29, 2018 Order Rejecting Proposed Tariff Revisions, Granting In Part and Denying In Part Complaint, and Instituting Proceeding Under Section 206 of the Federal Power Act ("Order").[2]

20181002-5283 FERC PDF (Unofficial) 10/2/2018 4:34:44 PM

The PSEG Companies do not agree that PJM's current capacity construct is unjust and unreasonable and thereby requires modification.[3] There is a wealth of support in various dockets before the Commission attesting to the health of the PJM capacity market. The PSEG Companies' believe that the direction the Commission should take in addressing any concerns with the PJM markets sending the correct investment and retirement decisions is to incorporate widely supported public policy goals such as carbon abatement and resiliency into those markets.

However, we acknowledge that FERC has determined that action is needed in order to preserve the "integrity and effectiveness of the capacity market administered by PJM Interconnection, L.L.C." because of the challenges posed by states' legitimate efforts to advance certain public policy initiatives by providing support payments to resources with desirable attributes.[4] To address its concern over the impact of "increasing out-of-market support" and perceived shortcomings with PJM's current Minimum Offer Price Rule ("MOPR") provisions, the Commission has proposed to modify PJM's tariff to: (1) expand the MOPR to cover new and existing resources that receive out-of-market payments with few or no exceptions; and (2) allow resources receiving out-of-market support to choose to be removed from the PJM capacity market, along with a commensurate amount of load, for some period of time ("FRR-Alternative").[5] The Commission contends that this approach, specifically the FRR-Alternative, is intended to accommodate resources that receive out-of-market support by allowing them to "remain on the system, despite their inability to compete in the capacity market based on their

[3] *See* The PSEG Companies Request for Rehearing, Docket No. EL18-178-000, *et al*., (submitted July 30, 2018) ("PSEG Rehearing Request") (discussing the PSEG Companies' position on why the current tariff was improperly found to be unjust and unreasonable).
[4] Order, PP 1-2.
[5] *Id*. at P 8.

costs, by permitting them to exit the capacity market with a commensurate about of load and operating reserves."[6]

The PSEG Companies support FERC's proposed approach because, if implemented correctly, it represents a fair mitigation mechanism applicable to all resources coupled with a process that accommodates and appropriately recognizes states' rights to direct the types of generation investments that advance their public policy goals. While an FRR-Alternative type mechanism could accomplish the Commission's goal of accommodating state public policy resources, it must be designed in a manner that is fair to both generators and consumers. To achieve this objective, certain key principles must be contained in the mechanism ultimately adopted by the Commission.

First, any mitigation scheme must be universally applied to resources that receive any type of support payment, consistent with the Commission's proposal that the MOPR be designed with few or no exceptions.

Second, it is critical to the proper functioning of the markets that the structure adopted by FERC account for existing generation and avoid sending erroneous price signals that incent new build when it is not truly needed.

Third, the loads and resources that are carved out of the market should have the same obligations as their equivalents participating in the markets. Specifically, generation and load pairings should include sufficient reserve procurements to match the market-based outcome. FRR-Alternative resources should also be subject to the Capacity Performance resource requirements.

[6] *Id.* at P 160.

Fourth, given the complexity of the proposed changes and need to fill in additional details around FERC's proposal, a transitional mechanism should be adopted for the first auction to allow states and market participants to implement the new design in a workable manner.

Finally, we are signatories to the shared principles submitted by the Joint Brief of Consumer Advocates, NGOs, and Industry Stakeholders. While these principles provide guidance to the Commission, the details of the PJM tariff provisions ultimately approved by FERC are important and must be carefully crafted in a manner that achieves reasonable market outcomes. The PSEG Companies therefore offer in these comments a number of design principles that are critical to achieving a well-functioning, effective capacity market.

I. COMMENTS

A. FERC's Proposal Is Only Workable If Both Aspects are Approved – A Clean MOPR and the FRR-Alternative

The PSEG Companies support FERC's proposed modifications to the existing PJM capacity market with two key structural features aimed at both protecting the competitive market and accommodating states' rights to pursue legitimate public policies for their generation supply mix. It is particularly critical that both of these features be incorporated in any approved change to PJM's Tariff in order to ensure that the new market structure avoids the very problems that led to the current complaint, namely inefficient market signals and uncertainty regarding how state sponsored generation resources should be allowed to participate in the PJM markets.

The first of these two symbiotic structures is the expanded MOPR that "would apply to new and existing resources that receive out-of-market payments, regardless of resource type, but would include few to no exemptions."[7] The PSEG Companies agree that the expanded MOPR, which would provide protection to the competitive market, must be applied broadly to all

[7] Order, P 8.

resources that receive out-of-market payments with essentially no exemptions. This is the only way to avoid the pitfalls of undue discrimination and preferential treatment that led to the determination that the current market structure is unjust and unreasonable. With very few exceptions, mostly related to materiality or administrative convenience, there is no just and reasonable explanation that supports allowing exemptions for out-of-market supported resources given the flexibility provided by the second element of the proposed modifications to the market structure – the FRR-Alternative. If a resource is receiving material out-of-market support, it should be mitigated. Any other result allows exactly the sort of market distortion that was the subject of the original complaint, regardless of the type of resource or who is providing the out-of-market support or the form of the out-of-market support.

The resource specific FRR structure ensures states that want to pursue legitimate public policy goals related to selecting or encouraging specific generation mixes to supply their customers' load, have the ability to do so. This is a critical component of a workable, just and reasonable market design. States, which have clearly and unambiguously retained regulatory authority over "facilities used for the generation of electric energy,"[8] must not be frustrated in exercising that authority by market structures that effectively ignore the fact that policy supported generation resources will be available to supply both energy and reliability (capacity) services. Appropriate, just and reasonable market structures will achieve the combined, complementary, and coequal goals of recognizing the reality that these policy resources will be providing these physical services, while separating them from having material impact on the market price setting process. Application of a MOPR without the complementary option for state supported resources to enter a resource specific FRR, would result in distorted prices in

[8] *See* Federal Power Act, section 201(b)(1).

both the energy and capacity markets, and force customers to over procure and likely unjustly over pay for overall electric supply services.

Specifically, if public policy resources are subject to a MOPR, and thereby ignored in the capacity market, capacity prices will clear at a higher level than they otherwise would if the reliability contribution of these resources were recognized (as the resource specific FRR structure does by associating appropriate load with those generators). Conversely, if the policy resources do in fact enter or remain in the markets in fulfillment of the states' goals, then they will in fact supply energy along with all resources not subject to the MOPR that clear in the capacity market, resulting in an oversupply situation and depressed energy prices. The resulting undervaluing of the energy market and overvaluing of the capacity market has the consequence of shifting reliance of all resources to capacity revenues and discourages, or at least undervalues efficiency in the energy market. This is exactly the opposite of what should be the intent of an efficient market design where value is placed on the delivered product (energy), and the "missing money" that is supplied by the capacity market is minimized. FERC's proposed dual market structures of a clean MOPR coupled with the resource specific FRR, elegantly avoids this inefficient outcome, recognizes the contributions of policy supported resources, and isolates prices setting in the remaining competitive market to competitive merchant participants.

Although the purest and theoretically best application of the MOPR would be to mitigate any out of market support, in practice it may be preferable to have some limited exceptions to this rule. PJM has proposed, and the PSEG Companies support, a materiality threshold that would avoid unnecessarily complicating both PJM's role in implementing, and bidders' roles in participating in the capacity market. The PJM proposed threshold of 1% of actual or anticipated market revenues is an appropriately strict standard.

The current PJM tariff also provides for a unit size based exemption threshold for application of the MOPR of 20 MWs. While the PSEG Companies can support a very small unit-size (MW) exemption for the same reasons that a subsidy-size materiality threshold may make sense, we do not agree with the existing MW 20 level. Many state policy supported resources are small in nature and can be easily added (or uprated) in small increments that would conveniently avoid tripping the proposed 20 MW level in any given year or at any single site, while over time adding considerable total capacity. To avoid or at least minimize the market impact of large overall increases through the use of smaller resources, any approved unit size based exemption from the MOPR should be set at a level that minimizes this risk such as not greater than 1 MW.

Other than those materiality driven exceptions, there should be no other exemptions from application of the MOPR. Other proposed exemptions such as self-supply and federal program subsidies which are not available to all resource types cannot be supported by any principled rationale for an exemption and would only serve to perpetuate discriminatory and preferential flaws in the market design which will likely lead to future successful challenges. It is not enough to continue these exemptions, along with the distortive impacts they have on the capacity market, simply because they previously existed in a market design that the Commission has now found to be unjust and unreasonable. The purer, more defensible structure of a clean MOPR and a flexible resource specific FRR, along with the existing FRR rules in the PJM Tariff, provides a workable accommodation of legitimate state policy goals, including any desire of states to avail themselves of the financial benefits associated with technology specific federal subsidy programs, as well as any load serving entities' desire to self-supply.

1. FRR-Alternative resources must be matched with the appropriate amount of load consistent with the reliability requirement

FERC's order clearly provides that when subsidized resources are paired with load and removed from the market, the subsidizing entity should have to procure its load and its associated reserve requirement. This is the appropriate solution because it ensures that the subsidizing entity meets its full obligation with its selected resource, and avoids utilizing the market to its advantage at the expense of others in procuring sufficient reliability. This approach achieves FERC's desire to provide transparency to the impacted load as to the full cost associated with the resource procurement.

2. The Reserve requirement must be defined appropriately to avoid free riders

It is important that the construct ultimately adopted by the Commission define the reserve requirement in a manner that will enable appropriate price signals to be achieved and will avoid price shifting between resources participating in the market and those resources that select the FRR-Alternative. To accomplish this objective, the reserve requirement for the load associated with the FRR-Alternative should be set at the reserve margin determined by the auction. If the value is fixed at a targeted reserve margin and the market clears at a higher reserve margin – as it almost always does – the subsidized resource and associated load would benefit as free riders from the additional reliability procured through the market without having to contribute toward that benefit.

For example, in the most recent PJM Base Residual Auction ("BRA"), the auction cleared at a reserve margin of approximately 22% while the targeted reserve margin was approximately 16%. If the FRR-Alternative resource and the associated load only had to satisfy the targeted reserve requirement, their economic contribution to the system reliability would only be at the 116% level. However, by being part of the larger PJM market, these resources and their

associated load would receive the reliability benefits associated with a 122% reserve requirement. Effectively FRR-Alternative resource and associated load would gain additional reliability from the remainder of the market while not having to pay for that benefit thereby advantaging them at the expense of the market.

As discussed above, it is important that FERC adopt a construct where the reserve requirement for the load associated with an FRR resource be set at the auction established reserve margin to prevent cost shifting from market participants to carved out resources. While the cost shifting issue exists in the current PJM construct, it has not been a significant problem because FRR participation has been limited to a small part of the PJM market. The Commission's recommendation for a MOPR with few to no exemptions has the potential to change that dynamic significantly. It is therefore important that the PJM tariff provisions adopted as part of this FERC Order address this issue, not just for FRR resources, but also for the FRR construct as well. Entities that are currently participating in the FRR construct – as of the 2021/2022 BRA – are subject to mandatory stay-in and stay-out provisions and therefore have made their decisions based on the construct that exists today where resources are procured at the targeted reserve margin. Changing the rules midstream for those entities would be arbitrary and disruptive to their business model. We therefore recommend that entities that participated as FRR resources in the 2021/2022 BRA be grandfathered into the existing rules. Finally, we believe that it is critically important that PJM be directed to modify its Tariff to ensure that resources that elect the FRR-Alternative for the 2022/2023 BRA and beyond be required to achieve a reserve margin consistent with levels established through the market.

B. <u>The Administration of the New Construct Must be Conducted By PJM, Including the FRR-Alternative Mechanism</u>

In order for the FRR-Alternative to be accomplished efficiently, the mechanism adopted

by FERC must require that PJM administer and clear the auction appropriately. Carving out certain resources and load can create significant administrative difficulties, including clearing the appropriate reserve margins (as discussed above) and honoring locational constraints in the PJM system. Although the FRR-Alternative resources are being removed from the market in the proposed approach, the physical existence of these resources and load does not change. Accordingly, the most efficient approach to achieving a just and reasonable outcome for all resources is to allow PJM to manage the auction clear with the participation of all resources and load and then adjust the outcomes by removing the FRR-Alternative resources and associated load. PJM is well positioned to manage all appropriate market outcomes and to settle all obligations as they move to delivery. For these reasons, it is our recommendation that PJM continue to manage and serve as the administrator of all aspects of the capacity market, including the coordination of FRR resources with their associated load.

1. <u>The clearing mechanism should include elements that will minimize the need for complicated location determinants</u>

The PSEG Companies recommend that the tariff provisions ultimately adopted by the Commission contain a clearing mechanism that is administered by PJM and includes the following elements:

1. All load within PJM must be included and represented on the demand curve;

2. All resources participating in the market must be represented at their offer price;

3. All resources receiving out-of-market payments that are not matched with an associated load must be represented at their MOPR price;

4. All FRR-Alternative resources with a matched load must be represented at their chosen offer price;

5. PJM must administer the auction with all resources included; the FRR-Alternative resources and their associated load (with the associated reserve margin established by the auction clear) should be included in the auction and then removed from the clearing results;

6. The revenue that would have been received by the FRR-Alternative resources should be credited against the costs of the associated loads to ensure both come out of the market with the correct impacts and a net zero effect on the market;

7. All other resources and load should settle consistent with the existing PJM rules; and

8. The FRR-Alternative resources and their associated load should balance their accounts with PJM (providing their own unique negotiated settlement terms to PJM) and be settled through PJM billing.

This approach minimizes the need for complicated locational determinants because all locational constraints will be appropriately recognized and compensated and all reliability requirements will be satisfied. The potential for cost shifting between the FRR-Alternative resources and the remaining market participants is minimized and the appropriate reserves would be procured by all entities. Administering settlement through PJM also facilitates the correct allocation of all cost responsibilities and is supportive of states' efforts to align parts of their load with their desired resources.

Alternative approaches that will likely be proposed by other commenters may raise issues concerning, among other things: (1) locational differences; (2) allocation of transfer capability between Locational Deliverability Areas ("LDAs"); (3) altering auction parameters; (4) determining appropriate reserve levels; and (5) appropriate cost allocations. The Commission's Order clearly outlines an approach that it will deem acceptable. The PSEG Companies submit

that an auction mechanism that is administered by PJM and includes the elements described above will be the most effective means to achieving the Commission's goals in this proceeding.

Finally, states may elect different ways of supporting public policy resources. Given these potential differences, different entities may be responsible for the support payments versus the direct capacity payments through the FRR-Alternative construct in lieu of capacity payments through the RPM clearing mechanism. Therefore, states need the flexibility to direct the credit back to load that comes from removing the policy resource from the auction clearing results. As a default, the PSEG Companies recommend crediting the "associated load" – the load that was identified by the state as sponsoring the public policy resource. States should also have the flexibility to direct this credit differently, provided however, that such credit allocation is consistent with promoting a competitively neutral wholesale power market.

C. The PJM Tariff Adopted By FERC Should Contain Certain Specific Design Principles

1. Reference Prices Applied to Resources Subject to the MOPR Should Be Based on Technology Type Without an Option for Unit-Specific Determinations

The MOPR must include methodologies for determining reference prices for units that are deemed to be receiving "actionable subsidies." For new units, the references prices should be based on the gross Cost of New Entry ("CONE") applicable to the class of generation technology to which the units belong. For existing units, the reference prices should be based on the Avoidable Cost Rate ("ACR") for the unit technology class – the costs that could be avoided if the unit retired or was mothballed. Unit technology classes recognized for MOPR reference prices should have a reasonable degree of granularity to reflect material cost differences. However, it would not be necessary to have separate reference prices to reflect every difference in unit characteristics.

Generally, the CONE for new units should be calculated in the same manner as the CONE is determined for the combustion turbine and combined cycle plants under the current MOPR procedures. This is an analysis that builds up the costs of constructing and operating these plants – including costs for equipment, labor, maintenance, operating and financing, levelized over an assumed useful life. PJM and the Independent Market Monitor for PJM ("IMM"), moreover, have experience in calculating ACRs for many unit types including nuclear and coal units. These same techniques could be used for other technology types recognizing that existing renewable resources generally will have very low ACRs reflecting the lack of significant going-forward costs.

The gross CONE and ACR values need to be adjusted to reflect offsets for energy, capacity and ancillary services. While this calculation should reflect the location of the resource, it should be based on historical data.[9] Attempting to apply forecasts would add much greater complexity and would be fraught with controversy.

The MOPR will also need rules to distinguish between new and existing units. The current PJM rule that "new" units clearing an auction with a mitigated reference price offer become "existing" resources should be retained. However, in order to accommodate state public policies, there also needs to be a rule that allows new subsidized units to eventually qualify for ACRs even if they do not clear an auction. There does not appear to be an obvious bright-line test for when to allow this to occur. Consideration could be given to creating a maximum period for application of the new unit reference prices. Five years may be a reasonable duration for this purpose, showing a significant level of commitment by the State or other governmental agency towards achieving the policy underlying the support payments.

[9] In the current PJM tariff, this calculation is done based on the three year historical average of energy and ancillary service revenues at the unit's specific location.

Finally, the existing unit-specific exemption under the MOPR should not be retained. The Commission previously favored the unit-specific resource exemption because of concerns that prices to consumers would be increased unnecessarily if units with particularly low costs were not allowed to bid consistently with their true economics. However, this concern is diminished under the FRR-Alternative because many units that receive support payments will be removed from the auction entirely along with a commensurate level of load. Further, the unit-specific exemption has produced controversial outcomes in the past and has required the expenditure of significant resources by PJM and the IMM. These administrative difficulties and implementation burdens would be magnified exponentially when the MOPR is expanded to apply to many more units. Accordingly, on balance, the unit-specific MOPR exemption should be removed.

2. Application of the MOPR Entry and Exit Provisions

The FRR-Alternative should include a mechanism to allow units removed from RPM auctions because of their out-of-market payments to participate in future RPM auctions when they no longer receive those support payments. To accommodate this, it remains critical to minimize potential negative market outcomes. First, it would be disruptive of market outcomes if resources were allowed to toggle back and forth between being FRR-Alternative resources and RPM auction participants. Second, resources should not automatically be permitted to perform significant capital improvements while receiving support payments and then re-enter the RPM market with the advantages gained through making those improvements.

Balancing these considerations, while it seems clear that FRR-Alternative units should not be categorically prevented from re-entering RPM markets when support payments expire or the units cease to qualify, it is also evident that there needs to be some restrictions to prevent market manipulation or disruptions. A practical approach would have these resources offer and

clear in the market using the applicable MOPR price. This would prevent toggling and would ameliorate the impact of units that return to the market after making substantial capital improvements. It would also be appropriate to consider whether these units should cease to be subject to the MOPR provisions after a specified period of time.

3. The Approved Tariff Provisions Should Include a Transition Mechanism for the Implementation of the FRR-Alternative Mechanism for the Upcoming Base Residual Auction Schedule for August 2019

The proposed changes to the MOPR and proposed introduction of the FRR-Alternative would be very significant changes to the existing RPM design. Implementing these changes in time for the upcoming BRA now scheduled for August 2019 will be challenging for PJM and the IMM. But states face even greater challenges in implementing the FRR-Alternative. They must determine whether they have existing statutory authority to utilize the FRR-Alternative and, if they determine that they do have such authority, will need to modify whatever supply procurements mechanisms are used in the state to allow FRR-Alternative resources to be included in the capacity portfolio serving the state. For states that lack existing statutory authority, it would be necessary to introduce and obtain passage of changes to currently effective state laws. In either event, for states to complete all of the necessary tasks to implement the FRR-Alternative in time for the August 2019 BRA filing requirement deadlines will be difficult if not impossible.

Recognizing these challenges and the desire of the Commission to accommodate the states' implementation of their policies, the Commission should direct PJM to create a transitional mechanism for the August 2019 BRA that will have relaxed standards for the FRR-Alternative. First, PJM has proposed that states wishing to use the FRR-Alternative should be required to give three months advanced notice. This appears to be unnecessarily long. Two

months should be sufficient. Second, and most importantly, PJM should be directed to relax the documentation requirements places on the state to utilize the FRR-Alternative. The PSEG Companies support strong documentation and commitment requirements for the PJM auctions in general, but recommend for the August 2019 BRA, that the appropriate state commission or other state agency with oversight of the procurement of supply within the state have the ability to use the FRR-Alternative for an identified capacity resource based on an order or declaration that it will engage in reasonable good faith efforts to implement the FRR-Alternative. A demonstration of this along with a definitive timeline outlining the mechanism to achieve this objective should be supplied prior to one week before the commencement of the BRA in August of 2019. Failure to meet this standard will result in resources with actionable subsidies entering the market at MOPR mitigated levels.

20181002-5283 FERC PDF (Unofficial) 10/2/2018 4:34:44 PM

II. CONCLUSION

The PSEG Companies respectfully requests that, if the Commission continues to deem it necessary to modify PJM's RPM, it adopt the expanded MOPR and the FRR-Alternative as a package as well as the design elements and principles described above.

Respectfully submitted,

FINAL PSEG Comments on Docket EL18-178.PDF.....1-18

20171010-5390 FERC PDF (Unofficial) 10/10/2017 4:52:49 PM

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

ANSWER OF THE PSEG COMPANIES IN OPPOSITION TO MOTION TO EXTEND TIME FOR COMMENTS

Pursuant to 211 and 213 of the Federal Energy Regulatory Commission's ("Commission" or "FERC") Rules of Practice and Procedure,[1] the PSEG Companies[2] respectfully submit this answer opposing the joint motion of Advanced Energy Economy, American Biogas Council on Renewable Energy, American Petroleum Institute, American Public Power Association, American Wind Energy Association, Business Council for Sustainable Energy, Electric Power Supply Association, Electricity Consumers Resource Council, Energy Storage Association, Interstate Natural Gas Association of America, National Rural Electric Cooperative Association, Natural Gas Supply Association and Solar Energy Industries Association (collectively, "Movants") for an extension of the comment period for the initial comments and reply comments.[3] The PSEG Companies respectfully request that the Commission deny the Motion.

The Secretary of the Department of Energy's Notice of Proposed Rulemaking ("NOPR") states that the premature retirements of fuel-secure resources impose serious risks to the electric grid and the Commission must take immediate action.[4] The NOPR further explains that "the

[3] Joint Motion for Extension of Time and Request for Expedited Treatment of the Energy Industry Associations, Docket No. RM18-1-000 (filed October 3, 2017) (the "Motion").

[4] Secretary of Energy's Direction that the Federal Energy Regulatory Commission Issue Grid Resiliency Rules Pursuant to the Secretary's Authority Under Section 403 of the Department of Energy Organization Act, (Sept. 28, 2017) at 1-2, 6, 11 ("NOPR").

Commission has developed an extensive record on price formation in the Commission-approved ISOs and RTOs."[5] Notably, over the last several years, the Commission has held workshops, technical conferences and invited comments on a number of important issues, including, but not limited to, various price formation reforms,[6] the intersection of state policies and the wholesale markets,[7] and the functioning of the wholesale capacity markets.[8] Through these proceedings, market participants have had the opportunity to provide the Commission with a full record regarding the market design flaws that need to be addressed and to propose solutions to address those flaws. The Commission can draw upon its existing record as well as the comments submitted in this proceeding to craft its final rule. Importantly, the NOPR requires the Commission to take final action within 60 days of the publication of the NOPR in the *Federal Register*. The Commission should not delay the opportunity for the industry to comment on the proposal contained in the NOPR or shorten the timeframe in which it has to evaluate those comments. Accordingly, the PSEG Companies respectfully request that the Commission deny the Motion.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

COMMENTS OF THE PSEG COMPANIES

Pursuant to Section 212 of the Federal Energy Regulatory Commission's ("Commission" or "FERC") Rules of Practice and Procedure,[1] the PSEG Companies[2] submit these comments in response to the Secretary of the United States Department of Energy's ("Secretary") proposed rule for final action by the Commission ("DOE Proposal")[3] and the questions posed by the Commission on October 4, 2017.[4]

I. Executive Summary

The PSEG Companies support immediate implementation of the DOE Proposal as an interim measure to prevent the premature retirement of fuel-secure baseload units that are undervalued as a result of distortions in organized electricity markets. The DOE Proposal calls for the full recovery of the costs for certain eligible units physically located within the Commission-approved organized markets. Under the DOE Proposal, units would be eligible for cost recovery if they are able to provide essential energy and ancillary reliability services and have a 90-day

[1] 18 C.F.R. § 385.212 (2017).

[2] The PSEG Companies are comprised of Public Service Electric and Gas Company ("PSE&G"), PSEG Power LLC ("PSEG Power") and PSEG Energy Resources & Trade LLC ("PSEG ER&T").

[3] Department of Energy, *Grid Resiliency Pricing Rule,* Notice of Proposed Rulemaking, 82 *Fed. Reg*. 46940 (October 10, 2017).

[4] Grid Reliability and Resilience Pricing, Docket No. RM18-1-000 (issued October 4, 2017).

20171023-5555 FERC PDF (Unofficial) 10/23/2017 4:41:59 PM

fuel supply on site.[5] The resource must also be compliant with environmental regulations and must not be subject to cost-of-service rate regulation by any State or local authority.[6] Finally, the rule requires the regional transmission providers ("RTO") or independent system operators ("ISO") to establish just and reasonable rate tariffs for the recovery of costs and a fair rate of return.[7]

The PSEG Companies support the Secretary's efforts to immediately address the erosion of resiliency of our electric grid due to the risk of premature retirements of baseload generation. Failing to act immediately would cause irreparable harm to these generation units and risk disastrous consequences for consumers. The Commission and its jurisdictional RTOs/ISOs also must develop permanent solutions that improve price formation in the markets and eliminate distortions that harm baseload units.

Current market designs fail to value generator attributes that contribute to the strength and reliability of the grid. The current market does not ensure that the grid can withstand disruptions as a result of overreliance on gas-fired generators whose fuel requirements are met from remote, just-in-time supply sources. Not only is there the potential for serious adverse economic consequences but the loss of a diverse fleet of baseload resources would also pose national security concerns and threaten the welfare of American citizens. As recently stated by Commissioner Tim Echols of the Georgia Public Service Commission:

> God forbid that we have a terrorist hop the fence and use a shape charge filled with explosives to blow one or all of the national pipelines that deliver this "just-in-time" resource, [i.e. natural gas] to power plants. With more and more plants

[5] DOE Proposal at 7, 11, 18.

[6] *Id.* at 7, 11-12.

[7] *Id.* at 7, 12.

20171023-5555 FERC PDF (Unofficial) 10/23/2017 4:41:59 PM

> using natural gas to generate electricity, a lengthy outage would create chaos in many states.[8]

The risk to the electric grid and to the citizens of our country if we have a portfolio of generating resources that is overly reliant on a single fuel source – particularly one that is dependent on "just-in-time" fuel – is very real. Putting our heads in the sand will not make the risk go away. Moreover, the premature retirement of nuclear units threatens critical national security interests associated with our military capabilities and with the avoidance of nuclear weapons proliferation.

Adopting the DOE Proposal as an interim measure would preserve these critical assets under cost-of-service rates and assure that the baseload resources that would be most critical to withstanding a protracted disruption of gas supplies are not prematurely retired. It is imperative that the Commission take steps now to staunch the flow of retirements of fuel-secure baseload units while effective market-based solutions to value the attributes these resources provide both to the grid and to society as a whole are developed. Implementing the DOE Proposal as an interim step would stabilize the earnings for qualified nuclear and coal units until a comprehensive, long-term market-based solution or set of solutions can be integrated into the RTO/ISO market designs.

This interim step, moreover, would safeguard the long-term efficiency of competitive markets which are currently undermined by distortions. Current market designs distort efficient market outcomes due to the disharmony between public policies and market operations. These designs fail to recognize the resiliency attri30butes of units with significant levels of on-site fuel and do not adequately value the critical reliability services being provided.

[8] Commissioner Tim Echols, *Why Nuclear Energy is a Matter of National Security*, Public Utilities Fortnightly, September 2017, at 66.

Preserving the viability of these units – particularly the nuclear units – through a short-term regime of cost-of-service payments accomplishes what the competitive markets would accomplish if they operated efficiently and properly valued all of these units' attributes. Implementing the DOE Proposal to preserve eligible units is thus a necessary interim step towards achieving an efficient market-based solution. Moreover, as discussed in detail below, we have included for the Commission's consideration, potential conceptual approaches for long-term solutions that would value resiliency and fuel security though market mechanisms.

Adopting the DOE Proposal as an interim measure should not delay the work that the Commission is undertaking to address price formation reforms that would avoid some of the continued distortions of competitive market results that disadvantage baseload resources. Thus far, the Commission has implemented a number of reforms including new rules on shortage pricing, offer caps and hourly re-offers. There is more work that needs to be done in this area. Notably, the fast-start pricing rules[9] and reforms in uplift allocation and market transparency are near-term items that the Commission could act on immediately. Also, the PJM energy price formation proposal[10] should be evaluated as part of the comprehensive solution to the challenges facing baseload units.[11] The Commission should also consider requiring the RTOs/ISOs under its jurisdiction to demonstrate that the reforms already implemented are achieving their intended

[9] Fast Start Pricing in Markets Operated by Regional Transmission Organizations and Independent System Operators, Notice of Proposed Rulemaking, 157 FERC ¶ 61,213 (December 15, 2016).

[10] PJM Interconnection, L.L.C., Energy Price Formation and Valuing Flexibility (dated June 15, 2017), available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170615-energy-market-price-formation.ashx.

[11] U.S. Department of Energy, Staff Report to the Secretary on Electricity Markets and Reliability, August 2017 ("DOE Staff Report"), available at: https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf. The DOE Staff Report recommended that FERC expedite its efforts to improve energy price formation and observed that after several years of fact finding and technical conference, the record now supports energy price formation reforms such as those proposed by PJM. DOE Staff Report at 126.

objectives, especially regarding the shortage pricing reforms. We therefore respectfully request that the Commission promptly finalize the fast-start pricing reforms and direct PJM through the Commission's Federal Power Act ("FPA") Section 206 authority to submit its energy price formation proposal so that it can be fully evaluated by the Commission.

II. Comments

A. The Commission Must Take Immediate Action to Prevent the Premature Retirement of Baseload Resources

The DOE Proposal states that "[i]t is time for the Commission to issue rules to protect the American people from energy outages expected to result from the loss of … fuel-secure generation capacity."[12] The PSEG Companies agree that immediate action is needed to preserve fuel-secure baseload resources given the important resiliency and security contributions they provide to the electric grid. Nuclear plants are being financially challenged by current and expected market conditions. To a degree, the RTO/ISO wholesale markets are achieving their original objectives – creating market signals that incent both new build and retirements through energy and capacity market prices. Time has revealed, however, that the scope of the original intent is too narrow. The energy markets are currently designed to incorporate only the direct costs of generating unit operations such as fuel, labor and maintenance costs. "External" costs such as those associated with the loss of fuel diversity and fuel security that expose consumers to potential catastrophic losses due to low probability, high impact events are completely ignored.

As discussed in the attached affidavit of Dr. Lawrence J. Makovich, a fuel diverse and resilient mix of generation technologies is an innate quality of an efficient electric market

[12] DOE Proposal at 3.

construct.[13] The current decline in fuel diversity thus exposes an *inefficiency* in existing markets. As Dr. Makovich explains:

> Efficient market price signals shape a diverse power supply portfolio with inherent resilient supply attributes. These resilience attributes exist because a cost effective supply portfolio involves a diverse mix of fuels and technologies with fuel and technology specific risk factors that are weakly correlated. Quite simply, there are significant benefits to an efficient electricity market outcome that generates a power supply portfolio that does not put all of the nation's power supply eggs in one basket.[14]

However, "[p]ublic policies that mandate and subsidize intermittent renewable technologies . . . result in inefficient market outcomes … ."[15] The lack of harmony between these public policies and the wholesale market construct "disproportionally reduce the market cash flow of non-peaking power plants,"[16] which in turn, is "causing premature baseload power plant retirements."[17] There have been announced retirements of 20 nuclear plants in the United States although in some cases the retirements have been averted due to state intervention.[18] PSEG's Chief Executive Officer Ralph Izzo succinctly explained the challenges that nuclear owners face in stating that: "… the need to be good stewards of your capital, and as much as we think these

[13] *See* Attachment A, "Affidavit of Dr. Lawrence J. Makovich," Docket No. RM18-1-000 (October 23, 2017) ("Makovich Affidavit").

[14] Makovich Affidavit at 3-4.

[15] *Id.* at 4.

[16] *Id.*

[17] *Id.* at 6.

[18] Jeremy Carl and David Fedor, Keeping the Lights on at America's Nuclear Plants, Hoover Institution Press (2017), at 107-108, attached Attachment B: Recent Nuclear Plant Closures. The PSEG Companies wish to underscore that, to the extent the States continue to perceive a need to take action in order preserve critical generation attributes, the Commission should not interfere with those efforts. These matters are clearly within the purview of the States particularly given the lack of a comprehensive effort by the Commission to address this area. *See e.g.,* Pre-Technical Conference Comments of Lathrop Craig on Behalf of The PSEG Companies, State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C., Docket No. AD17-11-000 at 4 (filed April 26, 2017).

[nuclear] assets are critically important to the nation and to our company, if they are not economically wise to continue to operate, we won't operate them."[19]

PJM, in particular, historically has enjoyed a diverse and resilient portfolio of generating resources consisting primarily of coal, gas and nuclear generation. However, in recent years, both coal and nuclear plants have retired or have announced plans for retirement. This trend is moving the PJM resource mix towards a greater reliance on natural gas-fired generating resources[20] and exposing the power supply portfolio to a greater risk of single mode failure. The Commission should act immediately to address the current gap between public policies and market operations in PJM and develop a mechanism that ascribes value to resiliency attributes.

1. Resiliency is a Critical Component to a Cost Effective Electric Supply Portfolio

A truly resilient system is one that anticipates, prepares for and recovers quickly from high impact, low frequency events.[21] The RTOs/ISOs and the North American Electric Reliability Corporation ("NERC") have focused primarily on traditional measurements for system reliability that focus on protecting the system from short-term disruptions.[22] However,

[19] PSEG Financial Conference held March 6, 2017, materials available at: http://investor.pseg.com/event/conference/pseg-financial-conference.

[20] *See* PJM's Evolving Resource Mix and System Reliability (dated March 30, 2017), available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx.

[21] Achieving resiliency has become an industry-wide concept that applies not only to generation resources, but also transmission system planning given the integrated nature of the electric grid. Notably, PJM is currently engaged in an effort with its stakeholders to develop criteria for resiliency in system planning. These efforts are equally as important as achieving resiliency of the generation fleet and should be vigorously pursued. *See* Resiliency in System Planning, PJM Planning Committee (dated August 10, 2017), available at: http://www.pjm.com/-/media/committees-groups/committees/pc/20170810/20170810-item-07-grid-resilience-in-system-planning.ashx.

[22] NERC recently raised concerns about how the changing resource mix, including the premature retirement of baseload generation, is altering the operating characteristics of the bulk power system. NERC noted that "[c]oal fired and nuclear generation have the added benefits of high availability rates, low forced outages, and secured on-site fuel. Many months of on-site fuel allow these units to operate in a manner independent of supply chain disruptions." Letter from Gerry Cauley, President and CEO of NERC to Secretary of Energy Rick Perry dated May

recent events have revealed that reforms are needed to create a robust system that anticipates and protects the grid from extended disruptions that could occur from natural or man-made events. At a minimum, reforms are needed to establish measures that ensure that the power supply portfolio is sufficiently diverse and therefore capable of continuing to provide consumers with electric services that cover basic needs when operating conditions deviate from normal, especially in an unexpected way for an extended period.

The 2014 Polar Vortex provides a clear example of the need for reforms that ensure that the electric grid is resilient, fuel diverse and fuel secure. The abnormal weather conditions during the Polar Vortex drove the power system demand for electricity to an all-time high winter peak demand in PJM and caused a higher-than-normal unavailability from natural gas-fired generating units. As the DOE Proposal explains, "[d]uring the Polar Vortex, PJM Interconnection ("PJM") struggled to meet demand for electricity because a significant amount of generation was not available to run. According to the DOE Staff Report, the loss of generation capacity could have been catastrophic, but a number of fuel-secure plants that were scheduled for retirement were called upon to meet the need for electricity."[23] The DOE Staff Report also noted that "overall nuclear generators performed extremely well during the Polar Vortex, with an average capacity factor of 95 percent."[24] Accordingly, diversity in the PJM generation portfolio during the Polar Vortex enabled nuclear units and oil and coal-fired units to continue supplying power to the system when the natural gas-fired units were experiencing fuel delivery constraints. Despite the demonstration of the value of diversity, the PJM portfolio has

9, 2017, Synopsis of NERC Reliability Assessments, The Changing Resource Mix and the Impacts of Conventional Generation Retirements at 2, available at: https://www.eenews.net/assets/2017/10/03/document_ew_01.pdf.

[23] DOE Staff Report.

[24] DOE Proposal at 5 (citing DOE Staff Report at 98).

become less diverse since the Polar Vortex. Dr. Makovich analyzed the outcome of the Polar Vortex under today's less resilient PJM power supply portfolio, including reductions for the Oyster Creek and Three Mile Island nuclear plants which are expected to retire in the near future. Under this analysis, there would have been a 1.4 GW average loss of load for 5 hours during extreme winter conditions.[25] He calculated the cost of such an outage to be around $1.2 billion.[26] Dr. Makovich also conducted an analysis of the potential Polar Vortex event assuming that plants now being evaluated for premature closure — Perry and Davis Besse — were no longer available. Under this analysis, the expected outcome is a 2.4 GW average loss of load for 9 hours with an associated outage cost of around $3.7 billion.[27]

The Polar Vortex, moreover, is only one type of event that could place the electric grid at risk. Other examples of *knowable* low probability, high impact events that have been recently experienced include Super-storm Sandy that hit New Jersey in 2012, a gas supply disruption like the Texas Eastern pipeline explosion that occurred in western Pennsylvania in 2016 and the gas storage field issues associated with the Aliso Canyon natural gas facilities in California in 2015. Other *knowable* conditions with which we have familiarity would be natural events such as wildfires, heat waves and droughts. But there are still other events, that while *knowable* in theory, we have had very little real experience with such as physical and cyber-attacks on the electric system by terrorists. Finally, there are completely unpredictable political events, such as the possibility of a ban on fracking or totally unknown risks that cannot even be fathomed at this time. Some of these events could be much more impactful than the Polar Vortex, and there is

[25] Makovich Affidavit at 11.

[26] *Id.*

[27] *Id.*

always the risk of two negative events that occur simultaneously, *e.g.*, a pipeline failure at the same time as an extreme cold weather event.[28]

To "put all of the nation's power supply eggs in one basket" would be a sadly misguided policy. The costs and adverse impacts on human beings associated with a single event that triggered a common mode failure of a particular technology on which we have placed disproportionate reliance, could wipe out decades of claimed savings associated with "market efficiencies." A long-term practical view that takes into account both cost and non-cost factors is the only prudent policy choice.

While the Polar Vortex revealed a number of market flaws and the potential impacts of those flaws, it incented the RTOs, particularly PJM and ISO New England Inc. ("ISO-NE"), to propose reforms that were specifically focused. The new reforms did not consider whether it was appropriate to provide value to resiliency attributes that would be needed to meet extended disruptions of gas pipeline services. The new capacity market designs implemented by PJM and ISO-NE addressed specific concerns around unit availability and the non-firm nature of most gas pipeline services used by generators. These reforms placed the risk of performance on market participants in the face of a very specific type of event; the reforms, however, do not ensure that the electric power system is configured in a way that would be able to sustain, adapt and recover from physical disruptions such as of gas supply force majeure events which even excuse performance of firm delivery obligations.

[28] *See generally*, Makovich Affidavit at 12-13.

2. Maintaining Diversity and Fuel Security in the Generation Portfolio and, In Particular, Maintaining Nuclear Generation is Necessary as a National Security Objective

Maintaining fuel diversity and fuel security is also a matter of national security for the United States. This is particularly true with respect to nuclear generation. As stated recently by Admiral James O. Ellis Jr., (USN) (ret.) and George P. Shultz in the foreword to *Keeping the Lights on at America's Nuclear Power Plants:*[29]

> Someone concerned with security can appreciate that the fuel of nuclear power plants can be provided entirely from friendly suppliers, with low-price volatility, and long-term supplies stored on-site and not subject to weather disruptions. * * * More broadly, a well-functioning domestic civil nuclear "ecosystem" is intertwined with our space and military nuclear capabilities, such as the reactors that power our aircraft carriers and submarines.[30]

All of these aspects of nuclear generation's contributions need to be recognized, but the existing RTO/ISO power markets do not do so.

As further explained by Jeremy Carl, one of the authors of *Keeping the Lights on at America's Nuclear Power Plants*:

> America's maintaining its nuclear technological capability has profound impacts on America's national security. * * * Without a course correction [to support nuclear generation] we will see the future of nuclear energy determined by China and Russia, who continue to move aggressively in this area. China will complete five new nuclear power plants this year alone.[31]

"[T]he atrophy of our domestic nuclear-power sector would mean a profound loss of capability in our military."[32] In addition, "[t]he U.S. has traditionally used its leadership

[29] Jeremy Carl and David Fedor, Keeping the Lights on at America's Nuclear Plants, Hoover Institution Press (2017).

[30] *Id.* at vii.

[31] Jeremy Carl, *Keeping the Lights on at America's Nuclear Plants,* National Review (2017), available at: http://www.nationalreview.com/article/450114/how-save-americas-nuclear-industry.

[32] *Id.*

in the supply of nuclear technologies to make it very difficult for nuclear-power-plant operators to proliferate the technology."[33] It is appropriate for the Commission to be cognizant and to take steps to preserve all of the important, unique contributions made by nuclear generation as part of a diverse portfolio of generation assets in our country. As Mr. Carl states, "[nuclear generators] have substantial strategic dimensions, more than any other form of energy."[34]

B. The Commission Should Adopt the DOE Proposal As an Interim Measure

The Commission should take the opportunity presented by the DOE Proposal to correct the market distortions disfavoring fuel-secure baseload generators caused by the disharmony between public policy goals and market operations as well as the failure of the markets to explicitly value resiliency attributes such as fuel diversity and fuel security. As a first step, the Commission should halt the immediate threat of losing vital fuel-secure baseload resources and allow eligible resources to be compensated through cost-of-service payments, including a reasonable return on investment, in order to preserve the fuel diversity, resilient and fuel secure generation portfolios that currently exist in each of the RTOs/ISOs. This mechanism should be implemented as an interim measure to prevent the further loss of units until an effective market-based solution is developed and implemented by the RTOs/ISOs. Although a superior, market-based mechanism could be developed for the future, as shown by Dr. Makovich, "[o]n an interim basis, the Proposed Rule provides an immediate step to avoid the further erosion of existing diversity of the nation's generation portfolio."[35]

[33] *Id.*

[34] *Id.*

[35] Makovich Affidavit at 17.

Claims will undoubtedly be made that this step is not justified because the threats have not been adequately quantified, resiliency has not been adequately defined, the exact amount of cost-effective resiliency needed has not been established and the like. The Commission can and should resist these attempts to delay or avoid decisive action to protect the electric grid. Because the individual threats faced are low probability events, they are not conducive to being analyzed in this fashion. What is known is that the risks are real and that, if they do occur, they could be catastrophic. Moreover, as Dr. Makovich demonstrates, the probability of some event that will stress particular generator technology types, in the aggregate, is much higher.[36] There is an urgent issue facing the country and "analysis paralysis" is not a solution.

Declining to act on the basis that exact determinations of costs and benefits associated enhancing grid reliability cannot be calculated precisely would be neither necessary nor appropriate. The Commission is not required to "engage in painstaking cost benefit analysis" when setting rates, *Process Gas Consumers Group v. FERC,* 866 F.2d 470, 477 (D.C. Cir. 1989). When evaluating the justness and reasonableness of a rate, the Commission must only conduct a "candid, common-sense assessment," *Process Gas,* 866 F.2d at 477, which can include the "consider[ation of] non-cost factors." *Pub. Utils. Comm'n of Cal. v. FERC,* 367 F.3d 925, 929 (D.C. Cir. 2004) (citing *Permian Basin Area Rate Cases,* 390 U.S. 747, 791 (1968)). These include the critically important benefit of reliable power. *See, e.g., NAACP v. FPC,* 425 U.S. 662, 670 (1976) (FERC must "promote the orderly production of plentiful supplies of electric energy ... at just and reasonable rates"). The Commission has a more than sufficient basis to adopt the DOE Proposal in order to protect consumers and our national security.

Indeed, Courts have affirmed, again and again, that system reliability is a significant

[36] Makovich Affidavit at 11-13.

benefit to customers. *See Elec. Consumers Resource Council v. FERC,* 407 F.3d 1232, 1240 (2005) (affirming Commission's policy judgment in balancing short-term cost increases with the long-term reliability benefits of reducing price volatility and encouraging entry of new capacity resources); *see also Cent. Hudson Gas & Electric Corp. v. FERC,* 783 F.3d 92, 110-11 (2015) (affirming both the Commission's focus on reliability and its predictive judgments about long-term benefits in adopting new capacity zone); *Ill. Commerce Comm'n v. FERC,* 721 F.3d 764, 775 (7th Cir. 2013) (recognizing that system reliability is a benefit to market participants and consumers); *Blumenthal v. FERC,* 552 F.3d 875, 879 (2009) (describing system reliability as "a primary goal").

The Court of Appeals for the District of Columbia Circuit reaffirmed this point recently in *Advanced Energy Management Alliance v. FERC*, 860 F.3d 656 (D.C. Cir. 2017) in upholding the PJM "capacity performance" program. The Court stated:

> [T]he Commission decided that, on balance, increased system reliability justified even a net increase in costs. *See Consol. Edison Co. of N.Y., Inc. v. FERC*, 510 F.3d 333, 342 (D.C. Cir. 2007). Increased costs can be "just and reasonable" if the costs are warranted. 16 U.S.C. § 824d(e). The Commission explained the important non-cost reasons for approving PJM's proposal. It does not have to find net savings. *Process Gas Consumers Grp. v. FERC*, 866 F.2d 470, 476-77 (D.C. Cir. 1989). We defer to the Commission's weighing of the various considerations and ultimate "policy judgment." *Md. Pub. Serv. Comm'n v. FERC*, 632 F.3d 1283, 1286 (D.C. Cir. 2011).

Similarly, the DOE Proposal for cost-of-service support to fuel-secure baseload generators with important resiliency characteristics that address highly disruptive loss of load events provides "increased system reliability" and is justified based on "important non-cost reasons."

In any event, the Commission need not be concerned with causing a rise in costs to consumers by taking steps to preserve nuclear generation. To the contrary, preserving nuclear generation, particularly in PJM, will save consumers millions of dollars. As Dr. Makovich

explains, "the current diversified U.S. electric supply portfolio lowers the cost of electricity production by about $114 billion per year and lowers the average retail price of electricity by 27% compared with a less efficient diversity case."[37] Further, [p]reventing the erosion in reliability associated with a less resilient electric supply portfolio mitigates an additional cost of $75 billion per hour associated with more frequent power supply outages… ."[38] Dr. Makovich also compared the broader economic impacts of the less efficient diversity case with the IHS Markit baseline simulations of the U.S. economy and found that within three years of the retail price increase: (1) the 27% retail power price increase associated with the less efficient diversity case causes a decline of real US GDP of 0.8% equal to $158 billion; (2) there will be a reduction in 1 million jobs; and (3) a reduction in real disposable income per household by about $845 (2016 dollars) annually, which is equal to 0.76% of the 2016 average household disposable income.[39]

There is Commission precedent for a limited out-of-market solution such as the suggested approach. Specifically, beginning in 2013, ISO-NE proposed tariff reforms that would provide out-of-market payments to certain resources in order to maintain reliability during the winter months ("Winter Reliability Program"). ISO-NE stated in its filing that the Winter Reliability Program was a "time-limited, discrete, out-of-market solution" while a number of longer-term solutions were being developed to address the problems that necessitated the Winter Reliability Program. The Commission explained that "given the importance of ensuring reliability in New England" in the face of the particular challenges facing ISO-NE, such as increased reliance on

[37] Makovich Affidavit at 15-16.

[38] *Id.* at 16.

[39] *Id.*

natural gas-fired generation resources, the Commission would accept the Program for the limited period requested.[40] Moreover, in response to discrimination claims concerning the programs' limited participation, the Commission stated that "limiting participation to certain resource types is not unduly discriminatory but is a reasonable response to the challenge of balancing the competing goals of procuring incremental energy in time for this winter while attempting to reduce any resulting market distortions to the extent possible."[41]

The Commission's approval of the Winter Reliability Program provides a paradigm for the approached proposed here. Specifically, the premature retirement of nuclear units presents fuel diversity and security issues issue that must be immediately addressed by a time limited, discrete solution. As with the Winter Reliability Program, this interim solution would be implemented to address urgent circumstances and would provide the RTOs/ISOs with the breathing space needed to adequately study and evaluate a long-term market-based solution without further jeopardizing the overall strength of the electric system. If this step is bypassed, the lengthy stakeholder process to develop new rules may result in many of these resources being retired before a solution is developed.

C. The Criteria Contained in the DOE Proposal Are Appropriate

The DOE Proposal allows the full recovery of costs for certain eligible units physically-located within the Commission-approved organized markets.[42] According to the DOE Proposal, "eligible units must be able to provide essential energy and ancillary reliability services and have

[40] *ISO New England Inc.*, 144 FERC ¶ 61,204 at P 42 (2013).

[41] *Id.* at P 50.

[42] DOE Proposal at 11.

a 90-day fuel supply on site in the event of supply disruptions caused by emergencies, extreme weather or natural or man-made disasters."[43]

i. The Ninety-Day Fuel Requirement

The 90-day on-site fuel requirement is a reasonable criterion for an interim program as a benchmark of fuel security for the electricity grid, particularly as applied to the Mid-Atlantic and Northeast regions of the country. In these areas, the summer and winter periods when the peak demand typically occur are generally about three months in duration. A generation unit that has at least three months of fuel on-site thus can be assured of having sufficient fuel to be available to meet peak system demands even if it the unit cannot replenish its fuel supply at all during this period.

Further, recent experience demonstrates that gas pipeline fuel disruptions can last 90 days or longer. On April 29, 2016, an explosion occurred on a Texas Eastern 30 inch natural gas pipeline operated by Spectra Energy in Salem Township, Westmoreland County Pennsylvania.[44] In addition to the damaged pipeline, Texas Eastern stopped deliveries on two other pipelines in the area.[45] Because corrosion levels were at a rate of about five times the expected "normal" corrosion rate at a weld where the explosion occurred,[46] Texas Eastern evaluated all the welds on the three pipelines and excavated more than 600 sites to observe suspect welds.[47] Of these,

[47] *Id.* at 27:27.

repairs were effectuated at about a third of approximately 400 excavations completed at the time of a town hall meeting in Salem Township on September 13, 2016.[48] In addition, at the time that meeting was held, the pipelines were still not being operated at their full capabilities – more than four months after the incident occurred.[49]

PSE&G also recently experienced the protracted repair of a segment of pipeline it owns buried about 15 feet below the bed of the Hudson River. The "B" and "C" lines are 345 kV electric cables encased in oil-filled pipelines extending from Jersey City, New Jersey to New York City. In October 2016, a sheen of dielectric oil in the vicinity of the pipelines was detected near the New Jersey shore line.[50] While measures to contain the leaking oil were undertaken immediately, efforts to locate and repair the leak were delayed by the existence of debris from a collapsed pier wall on top of the right of way as well unsafe conditions created by instability in the existing pier structures.[51] These conditions had to be corrected before repair efforts could even commence.[52] Final repairs required excavation of the riverbed and a pain-staking inspection of the pipelines by divers. Repairs to the damaged "B" line – after the leak was located – were not completed until September 2017 – more than 11 months after the leak was first detected.

[51] *Id.*

[52] *Id.*

Ninety days of on-site fuel is thus reasonable because the approximate length of the Summer and Winter periods when the electric system is most likely to be under stress is ninety days. Further, assuring that resources with ninety days of fuel supply are preserved, thereby reducing the risk of electric curtailments caused by gas pipeline disruptions during peaks, enables pipeline repairs that take longer than ninety days to be done during non-peak periods when system demand is expected to be lower. Effectively, pipeline repairs could take up to nine months without necessarily causing system disruptions, *e.g*. September to May (two shoulder demand periods and one winter peak period). Periods longer or shorter than ninety days could possibly also be justified as reasonable; the Commission need not find that ninety days of on-site fuel is the *only* reasonable standard. Ninety days of on-site fuel supply is *a* reasonable fuel-security standard and ninety "does not have to be better than other estimates." *Advanced Energy Management Alliance v. FERC*, 860 F.3d 656, n. 8 (D.C. Cir. 2017).[53]

ii. <u>Capability To Supply Essential Energy and Ancillary Reliability Services</u>

The proposed tariff language provides that an eligible plant must be "able to provide essential energy and ancillary reliability services, including but not limited to voltage support,

[53] *See e.g, Elec. Power Supply Ass'n*, 136 S. Ct. 760 at 782 (2016) (Court "is not to ask whether a regulatory decision is the best one possible or even whether it is better than the alternatives," but rather must affirm the agency's finding so long as it examined the relevant data and articulated a rational connection between the facts found and the choice made."; *N.J. Bd. of Pub. Utils. v. FERC*, 744 F.3d 74 at 109 (3d Cir. 2014)("[T]he fact that there may be a better, or more accurate, calculation does not render PJM's proposal unjust or unreasonable, or FERC's approval of it arbitrary and capricious."); *Serono Labs, Inc. v. Shalala,* 158 F.3d 1313, 1321 (D.C. Cir. 1998) ("[C]ourts are bound to uphold an agency interpretation as long as it is reasonable – regardless of whether there may be other reasonable, or even more reasonable, views"); *Fla. Gas Transmission Co. v. FERC*, 604 F.3d 636, 645 (D.C. Cir. 2010) ("[W]e do not ask whether record evidence could support the petitioner's view of the issue, but whether it supports the Commission's ultimate decision."); *see also Permian Basin Area Rate Cases*, 390 U.S. 747, 767 (1968) ("[T]his Court has often acknowledged that the Commission is not required by the Constitution or the Natural Gas Act to adopt as just and reasonable any particular rate level; rather, courts are without authority to set aside any rate selected by the Commission which is within a 'zone of reasonableness.'") (quoting *FPC v. Nat. Gas Pipeline Co*., 315 U.S. 575, 585 (1942)). *Duke Energy Trading & Mktg., L.L.C. v. FERC*, 315 F.3d 377, 382 (D.C. Cir. 2003).

frequency services, operating reserves, and reactive power."[54] Nuclear generators are capable of providing all of these services and under normal operations they provide voltage support and reactive power services. The PSEG Companies' experience as the operator of the Salem and Hope Creek nuclear plants, moreover, is that nuclear generators are among the largest providers of voltage support and reactive power services on the PJM system.

We understand that some parties are contending that the DOE Proposal expressly requires that eligible resources supply *all* of these services *all* of the time and that nuclear generation should somehow be *per se* disqualified. This is clearly contrary to the DOE Proposal's goals and common sense not to mention the fact that nuclear generation is expressly identified as one of the technology types the DOE Proposal is designed to address. Accordingly, to the extent deemed necessary to address such claims, the Commission should clarify that resources which routinely provide any of these ancillary services meet the eligibility requirements.

iii. Specific Components of the Cost-of-Service Recovery Mechanism

The PSEG Companies recommend the following specific components for inclusion in the cost-of-service mechanism:

- The level of the cost-of-service payments should be determined in a manner consistent with typical practices of regulated entities subject to FERC jurisdiction and should include a reasonable return on investment; also, cost-of-service recoveries should be net of market revenues so that units do not over-recover their costs.
- Units receiving cost-of-service payments should be required to bid into the energy markets at their short-run marginal costs and consistent with the unit parameters for the

[54] DOE Proposal at 18.

particular technology type; These requirements would preserve efficiency in the energy markets.

- In capacity markets, units receiving cost-of-service payments should be price-takers. Because the units would be expected to clear as capacity resources in an efficient market, participating in capacity markets replicates an efficient market outcome and assures that customers do not pay twice for the same capacity.
- RTOs/ISOs should adopt tariffs that authorize cost-of-service payments to preserve resiliency from the entire RTO/ISO in which the unit is located on a *pro rata* basis since the unit would help support the entire region in the event of a gas supply disruption.
- Units receiving cost-of-service payments should still be subject to performance penalties and should not be allowed to consider assessed performance penalties in determining net cost-of-service payments. This will create proper incentives for performance.
- Units eligible for cost-of-service payments should have the option to voluntarily seek cost-of-service rates from the Commission though a cost-of-service filing within 60 days of the effective date of a final order; because this will be an interim program to be effective until a market-based program can be developed, units should be required to demonstrate compliance with the eligibility criteria at the time of filing.
- The decision to participate in the program should be a one-time election that would terminate once the Commission has implemented the market reforms necessary to properly value generation attributes.

Certain of these recommendations are similar to the treatment accorded by the Commission to units receiving "reliability-must-run" payments in the past.

D. Adoption of an Interim Cost of Service Payment Mechanism for Eligible Plants Would Not Adversely Impact Competitive Market Outcomes

Adoption of a cost-of-service payment mechanism as an interim measure would not interfere with competitive market outcomes. The PSEG Companies anticipate that many commentators will contend that adoption of a cost-of-service payment mechanism will undermine competitive markets and will likely maintain that units receiving support payments result in "uneconomic retention" of those units. Such claims however do not hold up under analysis.

For "uneconomic retention" to be present it would need to be demonstrated that, in a competitive market, the affected units receiving the cost-of-service payments would otherwise retire. However, such is not the situation here, particularly as concerns the nuclear generators subject to the risk of retirement. As Dr. Makovich demonstrates in his affidavit, the current markets are distorted due to the disharmony between policy goals and the market construct.[55] He shows that the adverse impacts of the market dysfunctions fall most heavily on baseload generators.[56] Stated otherwise, in an efficient market, baseload generation would be more highly valued. In addition, the most prominent public policy goals creating market dysfunctions center around efforts to reduce carbon and other emissions into the atmosphere. In a properly designed market that valued carbon and other emissions abatement, nuclear baseload generation would receive higher revenues due to its low emissions footprint. Claims regarding "uneconomic retention," particularly as regards nuclear generation, thus ring hollow.

Commission precedent, moreover, supports this analysis. In *Independent Power*

[55] Makovich Affidavit at 2, 3, 5.

[56] *Id.* at 5.

Producers of New York, Inc. v. New York Independent System Operator, Inc., 150 FERC ¶ 61,214 (2015) ("*IPPNY")*, the complaint maintained that "reliability-must-run" support payments made to certain generators needed for local reliability requirements constituted "uneconomic retention" of those units that injured the competitive market.[57] The Commission rejected this claim:

> We agree with Dr. Patton that "the units are economic from the perspective of satisfying the NYISO's reliability requirements .... If the reliability needs satisfied by these units were reflected in the capacity market, the units would both clear." As Dr. Patton notes, these units would also contribute to addressing the NYCA capacity requirement in meeting the local reliability need. Thus, we agree with Dr. Patton that "it is efficient for these units to clear in the NYISO capacity market, [and] [a]ny provisions imposed that would cause them not to clear would be unreasonable."[58]

The situation here is directly analogous to that addressed in *IPPNY*. The units that would receive the cost-of-service payments under the DOE Proposal – in particular the nuclear units – would be "economic" if the market design were efficient. Similarly, if the market design included a component that valued resiliency, the units would also be expected to be "economic."

Finally, it should be noted, that about 30% of the units in PJM are currently under cost-of-service regulation[59] and that the PJM Independent Market Monitor deems both the energy and capacity markets to be competitive. It would thus be disingenuous to suggest that competition in the PJM market is incompatible with cost-of-service treatment for generators. If it were, the fact that almost 30% of the suppliers operate under a cost-of-service regime could not be reconciled with competitive operations. There is no apparent reason why competition would be extinguished if some set of additional resources also received cost-of-service support.

III. Energy Price Formation Reforms Are Critical in Establishing the Right Price Signals

The rapid and large decline in overall wholesale energy prices has exposed a number of energy price formation inefficiencies. Getting energy prices right is critical to ensuring that the correct price signals are sent to incent efficient investment and market exit. The energy markets provide the primary economic signal to all commercial entities in the market and therefore, it is extremely important for energy prices to reflect the marginal cost of providing power to the grid. Real-time market prices influence the forward markets, which are essential to efficiently managing the cost and risk of providing physical service. Poor real-time prices distort the forward markets and interfere with the reliability objectives they are designed to achieve.

The Commission has been engaged on issues concerning energy and ancillary services price formation in the markets operated by the RTO/ISO since 2014 when Commission Staff convened a series of technical conferences. These technical conferences provided a forum for the Commission and the industry to discuss the elements of each RTO/ISO that appear to be working best. As a result of the information received, the Commission directed the RTOs/ISOs to implement a number of important tariff reforms concerning settlement intervals and shortage pricing in markets operated by RTOs/ISOs[60] and offer caps in markets operated by RTOs/ISOs.[61] However, there remain pending two proposed reforms, which should be finalized without delay: uplift cost allocation and transparency in markets operated by RTOs/ISOs[62] and fast start pricing

[60] *Settlement Intervals and Shortage Pricing in Markets Operated by Regional Transmission Organizations and Independent System Operators,* Order No. 825, 155 FERC ¶ 61,276 (June 16, 2016).

[61] *Offer Caps in Markets Operated by Regional Transmission Organizations and Independent System Operators,* Order No. 831, 157 FERC ¶ 61,115 (November 17, 2016).

[62] *Uplift Cost Allocation and Transparency in Markets Operated by Regional Transmission Organizations and Independent System Operators,* Notice of Proposed Rulemaking, 158 FERC ¶ 61,047 (January 19, 2017).

in markets operated by RTOs/ISOs.[63] Additionally, the Commission should also consider requiring the RTOs/ISOs under its jurisdiction to demonstrate that the reforms already implemented are achieving their intended objectives, especially regarding the shortage pricing reforms where current system limitations appear to be limiting the ability to price transient shortages in a manner consistent with Order No. 825.[64] Additionally, the Commission is taking steps to evaluate primary frequency response service and should continue to develop proposals that facilitate economic evaluation of all essential reliability services.

Finally, we note that PJM has drafted a proposal that would allow marginal units to set price at any point in their operating range.[65] We believe this is an important reform that not only establishes the correct energy price, but also can eliminate one source of distortion presented by negative bidding resources. Therefore, we respectfully request that the Commission direct that PJM submit proposed tariff revisions concerning their proposal to expand the eligibility for all units required to supply energy on the system to set price so that it can be fully evaluated by the Commission. This logical extension of the concepts raised in the proposed fast-start pricing reforms will prevent the pernicious energy market price suppressive effect of running generators to supply load or other critical reliability services when LMP's are persistently below the generator's bid costs.

[65] PJM Interconnection, L.L.C., Energy Price Formation and Valuing Flexibility, *supra* note 10.

IV. Potential Long-term Solutions for the Commission's Consideration

As discussed above, we believe that the DOE Proposal providing cost-of-service payments to qualified resources should be implemented immediately as an interim solution while a long-term market-based solution is developed. We have described below several potential market-based approaches for consideration. Naturally, all of these approaches would need to be further evaluated and developed before any could be deployed. In addition, it may be possible that while a single approach may not be sufficient in its own right, a set of solutions could be used.

(a) **Carbon Pricing**: An important long-term solution that the Commission should consider as a means to achieving some of the goals of the DOE Proposal would be to impose a carbon price on emitting resources dispatched through the RTOs/ISOs.[66] Both PJM and the New York Independent System Operator, Inc. ("NYISO") are in the process of considering mechanisms to integrate the price of carbon into their wholesale markets. On August 23, 2017, PJM issued a concept paper in which it offers to facilitate a coordinated carbon policy through the PJM market. The proposal provides states with the flexibility to opt in or opt out of the program.[67] NYISO, in coordination with the New York Public Service Commission, has also issued a report which proposes and examines the cost impacts of incorporating carbon pricing into NYISO's wholesale energy markets.[68] The Commission should consider directing all RTOs/ISOs to integrate carbon pricing in their regions.

[66] *See* Makovich Affidavit at 17.

[67] Advancing Zero Emissions Objectives through PJM's Energy Markets: A Review of Carbon-Pricing Frameworks (August 23, 2017), available at: http://pjm.com/~/media/library/reports-notices/special-reports/20170502-advancing-zero-emission-objectives-through-pjms-energy-markets.ashx.

[68] "Pricing Carbon into NYISO's Wholesale Energy Market to Support New York's Decarbonization Goals," Prepared by The Brattle Group (August 10, 2017), available at:

(b) **Fuel Security Value Curve**: Consideration could be given to including in capacity market payments an adder for the resiliency attributes that baseload resources provide to the grid, including fuel diversity and fuel security. This payment mechanism could be integrated into the existing PJM capacity market construct. To employ this mechanism, it would be necessary to establish a minimum standard for operating the grid during an extended period of a fuel supply disruption. A "fuel security value curve" could then be developed to determine an appropriate resiliency adder at various offer levels of eligible resources.

(c) **Progressive Clearing of Resources Base on On-site Fuel Characteristics**: Another potential capacity market mechanism would be to clear capacity auctions in a progressive manner that enforces a prescribed share of resources with certain characteristics. For example, there could three tranches procured in the capacity auction: Tranche 1 (say 50%) could consist of resources with the least robust fuel security characteristics; Tranche 2 (say 30%) could consist of resources that have an intermediate level of fuel security; and Tranch 3 (say 20%) could consist of resources with significant on-site fuel supply.

(d) **Clearing of Resources Based on Technology Type**: Another capacity market approach could be to establish separate capacity auction tranches for different resource technology types. The tranches could specify required quantities for each tranche as a percentage of the total capacity commitment but not specify which resource type corresponds with each tranche. Each technology type would receive a separate capacity payment based on clearing the bids within the segment. Capacity prices paid would vary within the technology segment which would provide incentives for appropriate entry and exit within the asset class.

---

http://www.nyiso.com/public/webdocs/markets_operations/documents/Studies_and_Reports/Studies/Market_Studies/Pricing_Carbon_into_NYISOs_Wholesale_Energy_Market.pdf.

(e) **More Robust Scarcity Pricing**: A possible energy market approach that could address this issue to some extent would be to increase the impact of scarcity pricing in the energy markets. In general, under this approach, steep operating reserve demand curves with maximum values tied to the value of lost load would be used to set locational marginal prices in day-ahead and real-time markets. This would not dictate a specific resource mix, but because improved scarcity pricing would result in greater volatility in energy prices, market participants would have stronger incentives to invest in resiliency enhancements.

(f) **Setting Resiliency Payments Based on Expected Outcomes If Market Inefficiencies Are Removed**: Dr. Makovich proposed an alternative to encourage an economic level and pace of retirements.[69] He suggests that the expected efficient market outcome could be used to determine the eligibility for grid reliability and resilience payment that offsets the consequences of current market distortions.[70]

IV. Conclusions and Recommendations

The Commission stands at an important crossroads. It is faced with an urgent problem that, if not handled, could have tremendous harmful impacts on the lives of millions of Americans and even on the national security of our country. At the same time, determining the best long-term solutions to the problem will require additional study and a massive collaborative effort among many stakeholders. The Commission will undoubtedly be told that it should not act now because the exact scope of the problem is not defined and the costs of implementing the cost-of-service mechanism proposed in the DOE Proposal cannot be precisely determined. But this would be the wrong lens to use for analysis. The potential for there to be severe adverse

[69] Makovich Affidavit at 17.

[70] *Id.*

20171023-5555 FERC PDF (Unofficial) 10/23/2017 4:41:59 PM

consequences if the country irretrievably loses a substantial portion of its fuel-secure baseload fleet is too grave to delay action. As an interim measure, the DOE Proposal should be implemented to assure that Americans are not exposed to the potentially catastrophic risks that would be attendant to a "wait and see" response.

Moreover, it is clearly within the scope of the Commission's authority under the FPA to address this issue based on the record before it as supplemented in these comments and as the PSEG Companies anticipate will be developed through other submittals. The record supports the existence of a major concern associated with the operation of electric markets that the Commission has the power to rectify. The Commission does not require a cost/benefit analysis to address this problem. The potential impacts on reliability and national security provide ample justification. Finally, it bears noting that, at least regarding the nuclear plants, their preservation actually will save billions of dollars for consumers and would provide billions of dollars' worth of additional benefits to society as a whole.

Nor should the Commission be swayed by the inevitable assertions that approving the DOE Proposal, even for an interim period, will destroy competitive markets. As explained above, if the markets were operating efficiently, or if resiliency was expressly valued as an attribute, the units expected to receive the cost-of-service support payments – and, in particular the nuclear units – would be expected to have a reasonable financial basis for continued operation. The cost-of-service support payments thus actually will serve to help realize outcomes consistent with the expected end result of true competition.

Finally, the Commission should take the opportunity before it to direct the RTOs/ISOs to expeditiously address the remaining price formation initiatives that are pending before it and under consideration in each region's stakeholder processes. Further, in the case of PJM, the

Commission should direct PJM under the FPA Section 206 authority to file the proposed enhancements to its energy market pricing mechanism to enable all generators, whose output is required to supply the grid power balance to be eligible to set locational marginal prices. These improvements would not fully address the issue but a better foundation for energy market price formation will be of assistance in addressing the problem of revenue adequacy for fuel-secure baseload units.

The PSEG Companies therefore recommend that the Commission take the following steps:

(i) The Commission should adopt the DOE Proposal to become effective immediately for an interim period ending when a long-term solution that adequately values generator fleet resiliency is developed. This should include the proposed eligibility requirements of having a 90-day supply of on-site fuel and of providing essential energy and ancillary services; provided however, the final rule should clarify that a unit that supplies substantial quantities of one or more essential energy and ancillary reliability services;

(ii) The Commission should direct all affected ISOs/RTOs to file tariff modifications providing for the recovery on a pro-rata basis from all ISO/RTO customers of cost-of-service payments authorized by the Commission for generating units located within the ISO/RTO region;

(iii) The Commission should direct all companies that qualify under the final rule for cost-of-service support, within 60 days following the effective date of the rule, to file (on an optional, voluntary basis) an application justifying rates for cost-of-service payments and demonstrating compliance with the eligibility requirements as of the date of such application;

(iv) The Commission should direct all affected RTOs/ISOs to commence, on an expedited schedule, stakeholder meetings for the purpose of developing a long-term market-based methodology for valuing resiliency in the generator fleet; the RTOs/ISOs should endeavor to complete the stakeholder processes within one year and to file periodic reports with the Commission regarding their progress;

(v) The Commission should expedite the implementation of all the energy market price formation issues pending before it and before the RTOs/ISOs; and

(vi) The Commission should direct PJM, under the Commission's authority derived from FPA Section 206, to file its proposal for allowing units, whose output is required to supply to grid power balance, to be eligible to set locational marginal prices.

Respectfully submitted,

By: *Kenneth R. Carretta*

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

AFFIDAVIT OF
DR. LAWRENCE J. MAKOVICH

My name is Lawrence Makovich. I am Vice President and Senior Advisor for Global Power for IHS Markit; a company that provides data, analyses, and strategic insights to businesses around the world focusing on energy, automotive, chemical and defense industries. I am an energy economist specializing in the analysis of the electric power industry. My current research focuses on electric power market structures, demand and supply fundamentals, wholesale and retail power markets, emerging technologies, least cost CO_2 emission abatement pathways, and asset valuations and strategies. I hold a Ph.D. in Public Policy from the University of Massachusetts/Boston, an MA in Social Science from the University of Chicago, and a BA in economics from Boston College. My work address is IHS Markit, 55 Cambridge Parkway, Cambridge, MA 02142, USA.

A linkage exists between electric supply portfolio fuel and technology diversity and power supply resilience. I have studied the value of U.S. power supply diversity and produced reports on the subject in 2014 and 2017. I also produced a report this year based on my research as a Senior Fellow at the Mossavar-Rahmani Center for Business and Government in the John F. Kennedy School of Government at Harvard University that analyzed the impacts on fuel and technology mix of U.S. generation portfolio from public policies that do not distort the economic trade-offs that determine efficient power supply portfolios.

I provide this Affidavit in support of the comments of the PSEG Companies on the Secretary of the Department of Energy's Notice of Proposed Rulemaking ("NOPR") issued in the captioned proceeding by the Federal Energy Regulatory Commission ("Commission") on September 28, 2017. I previously provided pre-conference comments to the Commission as well as testimony on May 2, 2017, in its proceeding on State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C., in Docket No. AD17-11-000.

The purpose of this Affidavit is to respond to some of the questions and issues raised in the October 4, 2017 request from the Federal Energy Regulatory Commission Director of the Office of Energy Policy and Innovation regarding the proposed rule on grid reliability and resilience pricing. In particular, I will address the need for reform due to the lack of harmony between public policies and efficient wholesale electric market operations, and also address the importance of supply diversity and how the premature retirement of baseload plants raises consumer electricity prices. I will discuss what I refer to as the imposed "missing money" problem in RTO/ISO markets caused by the mandates of subsidized intermittent generation resources beyond their cost effective levels. These policies are the root cause of the decline in resilience because these policies suppress wholesale energy market prices, reduce non-peaking generation resource market cash flows, and increase the probability of premature baseload power plant closures that result in a less efficient diversity in the electric supply portfolio compared to the outcome expected in an efficient wholesale electricity marketplace.

1. Need for Reform

The current lack of harmony between public policies and efficient market operations create the need for electricity market policy reform.

An efficient electricity market outcome requires the harmonization of public policies and market operations. Harmonizing public policies with market operations requires internalizing all relevant costs, including an appropriate CO_2 emission charge because an efficient market outcome does not involve externality costs. Further, an efficient electricity market outcome also requires public policies with fuel and technology neutral impacts on market operations. Under these conditions, the harmonization of public policies and market operations allows effective competitive forces to produce the right wholesale price signals. The right price signals determine the economic trade-offs that shape an efficient electric supply portfolio comprised of a diverse fuel and technology mix capable of providing consumers with the reliable electric services that they want, when they want them, at the lowest cost, subject to the security of supply and network constraints in the AC power system that defines the bounds of the marketplace.

Consumers reveal a preference for reliable, affordable power supply and predictable power bills. Reliable electric service and predictable power bills involve resilient power supply. Resilience is a measure of the ability of a power supply portfolio to avoid, react and recover from the impacts of deviations in electric operating conditions from expected normal operating conditions. Efficient market price signals shape a diverse power supply portfolio with inherent resilient supply attributes. These resilience attributes exist because a cost effective supply portfolio involves a diverse mix of fuels and technologies with fuel and technology specific risk factors that are weakly correlated. Quite simply, there are significant benefits to an efficient

electricity market outcome that generates a power supply portfolio that does not put all of the nation's power supply eggs in one basket.

Market distortions prevent the wholesale electricity market from generating the right price signals. As a result, the distorted market price signals do not shape a cost effective supply portfolio. In particular, public policies that mandate and subsidize intermittent renewable technologies are neither fuel nor technology neutral policy approaches, and therefore result in inefficient market outcomes whenever mandates of subsidized intermittent renewables result in a greater wind and solar generation shares than are cost effective. In organized electricity markets, this inefficient market outcome suppresses wholesale electric energy prices. This is an "imposed" missing money problem for competitive generators.

Capacity markets and operating reserve demand curves are designed to close the gap between energy market cash flows and the revenue streams necessary to cover the costs of peaking technologies. As a result, these mechanisms provide a backstop for peaking technology investments when energy market distortions suppress energy market cash flows. But no such cash flow backstop exists for non-peaking power plants. These power supply resources rely on the capacity market cash flows to cover part of their upfront costs, and rely on energy market cash flows to cover the additional upfront costs associated with other attributes including investments in a lower CO_2 emissions profile, operating resilience, and the greater efficiency in transforming primary energy into electricity compared to a peaking technology. As a result, current market distortions disproportionately reduce the market cash flows of non-peaking power plants and lead to underinvestment in their production attributes. This market distortion creates the need to provide support for the flexible generation that cost effectively aligns with the variable segment of power system net-load, as well as creates the need to support the baseload

power plants that cost effectively align with the majority of electric generation associated with the steady base load segment of aggregate consumer demand. For example, the cash flow suppression in the California ISO marketplace drove the implementation of FERC approved tariffs for flexible ramping products to provide payments supporting the generating technologies providing the necessary dispatchable, net load following generation in the power supply portfolio. These flexible resources are predominately natural gas-fired generating technologies and this market reform indicates that cash flow shortfalls for non-peaking power resources are not simply the result of low natural gas prices. Instead, the problem arises from disharmony between public policies and wholesale market operations distorting market prices, as described in the U.S. Department of Energy Staff Report to the Secretary on Electricity markets and Reliability.[1]

Market distortions that suppress prices for non-peaking generating resources from the levels expected in an efficient market outcome result in greater retirements of existing non-peaking power plants than expected in an efficient market outcome. Getting wholesale price signals right translates into getting the size and pace of existing power plant retirements right. This efficient retirement outcome arises when an electricity market is in long run demand and supply balance and existing generators are confronted by market prices that support the cash flows of the most cost effective replacement power supply resources. Under these conditions, a power plant retires when it is lower cost to replace its energy, capacity and ancillary service outputs as well as replace its resilience and environmental attributes, than the cost to keep it operating.

[1] U.S. Department of Energy, Staff Report to the Secretary on Electricity Markets and Reliability, August 2017, at p.110-112, available at: https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf.

Current policy initiatives that ratchet up subsidized renewable generation shares are increasing market distortions and causing premature baseload power plant retirements. This trend is eroding the inherent resilience characteristics of a cost effective electric supply portfolio by moving U.S. electric supply portfolios away from the diverse fuel and technology mix expected from an efficient market outcome. Therefore, the efficient market outcome provides the benchmark to evaluate market interventions designed to offset the consequences of persistent market distortions created by discordant public policies and wholesale market operations.

Analyses of efficient U.S. power system demand and supply responses to a range of possible appropriate CO_2 emission charges in the absence of discordant public policies provide estimates of the expected outcomes from an efficient wholesale electricity marketplace.[2] The research indicates that, based on the typical going-forward costs of existing nuclear power plants, these non-CO_2 emitting electric supply resources would not be expected to prematurely retire in an efficient wholesale marketplace that does not suffer from an imposed missing money problem, and that does internalize an appropriate CO_2 emission charge. Therefore, an economic argument exists to support public policies that provide support to these nuclear resources through compensation for the resilience attributes that these resources provide to the power supply portfolio and move the current distorted market outcome toward the results expected in an effective competitive marketplace. Such policies improve economic efficiency in the electricity sector.

Analysis of U.S. efficient power system demand and supply responses to a range of possible appropriate CO_2 emission charges in the absence of discord between public policies and

[2] Lawrence Makovich, *Tilting at Windmills: Making a case for reframing electric sector climate policies,* Mossavar-Rahmani Center for Business and Government Associate Working Paper No. 78, June 2017, available at: https://www.hks.harvard.edu/centers/mrcbg/publications/awp/awp78.

market operations indicates that fossil fueled generation resource generation shares decline but are not eliminated from a cost effective electricity supply portfolio. Therefore, the problem of premature retirements of fossil-fired electric generation resource retirements is also a policy concern, as illustrated by the California flexible ramping products interventions.

As long as the lack of harmonization exists between public policies and wholesale market operations, there is an economic argument to support market interventions to offset distortions and move electricity market outcomes back toward the expected outcome of the efficient competitive market benchmark.

The October 4, 2017 request from the Federal Energy Regulatory Commission Director of the Office of Energy Policy and Innovation regarding the proposed rule on grid reliability and resilience pricing asked for descriptions of alternative approaches to the proposed rule. The 90 day fuel storage rule for cost recovery eligibility can stem the immediate problem of premature baseload retirements. However, an alternative could be developed for the longer term to encourage an economic level and pace of retirements. In particular, the expected efficient market outcome could be used to determine the eligibility for grid reliability and resilience payment that offsets the consequences of current market distortions. This benchmark provides relatively simple rules—eligibility for cost recovery support exists when a generating resource market cash flow is not sufficient to cover the costs of continued power plant operation when these costs are lower than the unsubsidized cost of the new resources that are being added to the power system to provide the equivalent energy, capacity, ancillary services outputs and resilience attributes of the existing resource. The size of the resilience payment simply reflects this cost recovery shortfall between the cost of continued operation and market cash flows.

2. Polar Vortex and Other Recent Disruptions

The proposed rule references the events of the 2014 Polar Vortex as an example of the need for reforms. I agree that the Polar Vortex provides lessons regarding the value of resilience in a power supply portfolio.

A retrospective analysis of the Polar Vortex conditions in PJM illustrates the benefits of the resilience provided by the diverse technology and fuels in the electric supply portfolio at that time. Figure 1 shows the aggregate consumer hourly load, net of demand resources, on January 7, 2014 when the Polar Vortex caused a significant deviation from expected normal operating conditions for the PJM power system and caused PJM to hit a record wintertime peak demand of 141.8 GW.

Figure 1

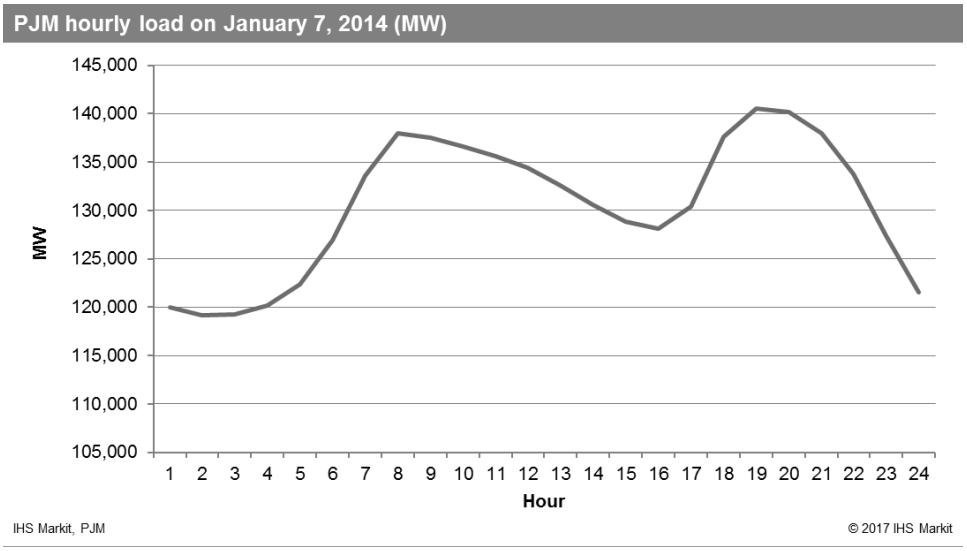

Table 1 reflects the actual PJM installed capacity in January 2014 derated by technology and fuel type based on the actual outage rates experienced during the Polar Vortex on January 7, 2014.[3] During the Polar Vortex, 90 percent of the available installed capacity came from

[3] In the May 2014 report, "Analysis of Operational Events and Market Impacts During the January 2014 Cold Weather Events," PJM quantified power supply reserves available to its system during the peak period on January 7,

conventional nuclear, coal and natural gas-fired resources. PJM was in a fortunate position that a surplus of installed capacity was present in 2014 when the reported system-wide reserve margin was above 20 percent rather than the installed reserve margin being at the target level of around 16 percent.[4] Otherwise, PJM would have confronted the polar vortex with over 7,000 MW less of installed capacity.

Table 1

PJM Net dependable capacity on January 7, 2014

Generator Fuel Type	Installed Capacity, January 1, 2014		Forced Outages		Other Non-Forced Outages	Net Dependable Capacity
	MW	% Total Installed Capacity	*MW*	% Installed Capacity	MW	*MW*
Coal	75,545	*41%*	13,700	18%		61,845
Gas	53,395	*29%*	19,000	36%		34,395
Nuclear	33,077	*18%*	1,400	4%		31,677
Hydro	8,107	*4%*				8,107
Oil	11,314	*6%*				11,314
Renewables	956	*1%*				956
Other	701	*0%*				701
Not Classified			6,100	N/A	2,412	(8,512)
Total	**183,095**		**40,200**		**2,412**	**140,483**

The Polar Vortex caused significantly higher than normal unavailability from natural gas-fired generating units linked, in many cases, to abnormal natural gas pipeline supply constraints. While the severe weather conditions also affected the availability of the other electric supply resources, the natural gas-fired resources were by far the hardest hit. Yet despite these conditions, the diversity in the PJM power generation portfolio allowed nuclear, oil and coal-

2014, including: 500 MW of 10-minute synchronized reserves, 1,167 MW of 10-minute non synchronized reserves and 1.1 – 2.0 GW of temporary voltage reduction. While other actions may have been available such as purchasing additional emergency energy or recalling shared reserve obligations from neighbors, this analysis does not include the potential for PJM to purchase additional energy or recall additional obligations that PJM provided to neighbors.

[4] PJM Interconnection, L.L.C., "Summer 2014 PJM Reliability Assessment" (dated June 2014) available at: http://www.puc.pa.gov/Electric/pdf/Reliability/Summer_Reliability_2014-PJM.pdf.

fired power plants to back-up and fill-in for the disproportionate limitations on natural gas-fired resources and thus, avoid costly outages.

Sensitivity analysis of PJM outcomes during the Polar Vortex to changes in the supply portfolio indicate the resilience provided by the fuel and technology mix in place in 2014. To see this, a second scenario involves holding all PJM Polar Vortex conditions constant except that the December 31, 2016 power supply portfolio shown in Table 2 shows the substitution of the 2016 supply portfolio for the actual supply portfolio on January 7, 2014.

Table 2

PJM capacity analysis for January 7, 2014: December 31, 2016 capacity mix

Generator Fuel Type	Installed capacity as of 12/31/2016		Forced Outages		Other Non-Forced Outages	Net Dependable Capacity
	MW	*%*	*MW*	*% Installed Capacity*	*MW*	*MW*
Coal	66,622	*37%*	12,082	18%		
Gas	65,110	*36%*	23,169	36%		
Nuclear	33,043	*18%*	1,399	4%		
Hydro	8,850	*5%*

Renewable	1,281	*1%*			A	
Other	769	*0%*				
Not Classified			6,100		2,412	
Total	**182,449**		**42,749**		**2,412**	**137,288**

Back casting the outcome during the Polar Vortex with the 2016 rather than 2014 PJM power supply portfolio in place indicates that the probability of some loss of load during the Polar Vortex would have been higher with the current supply portfolio. In this case, PJM would have had to rely on the estimated remaining emergency operating procedures that provided an equivalent of 2.7 to 3.6 GW of firm capacity.[5] If emergency operating procedures were at the low end of this range, then as Table 3 shows, the expected outcome in the alternative scenario is

[5] PJM, "Analysis of Operational Events and Market Impacts During the January 2014 Cold Weather Events," May 8, 2014, pp.4-5, http://www.pjm.com/~/media/library/reports-notices/weather-related/20140509-analysis-of-operational-events-and-market-impacts-during-the-jan-2014-cold-weather-events.ashx.

a 301 MW average loss of load for 3 hours. The associated cost of this outage is around $153 million.

Table 3

Polar Vortex scenario analysis to determine the resiliency value of the existing diverse supply portfolio

	December 31, 2016 capacity	December 31, 2016 capacity less Oyster Creek and Three Mile Island (1.47 GW)	December 31, 2016 capacity less Oyster Creek, Three Mile Island, Davis-Besse and Perry (3.65 GW)
Hours of outage	3	5	9
Average shortfall (MW)	301	1,386	2,407
Total shortfall (MWh)	903	6,930	21,663
Cost per unserved MWh	170,000	170,000	170,000
Total cost of shortfall	**$153,473,809**	**$1,178,157,861**	**$3,682,704,776**

Since the Oyster Creek nuclear power plant has already announced its planned closure and Exelon has announced that it has taken the first steps to close Three Mile Island, another sensitivity analysis involves back casting the outcome of the Polar Vortex with the 2016 PJM power supply portfolio in place except for the presence of the Oyster Creek and Three Mile Island capacity. Again, holding all else constant in this analysis results in an expected outcome that involves a 1.4 GW average loss of load for 5 hours. The associated cost of this outage is around $1.2 billion. Similarly, if the alternative scenario also includes the loss of nuclear power plants being evaluated for premature closure or sale—Perry and Davis Besse—then the expected outcome is a 2.4 GW average loss of load for 9 hours with an associated outage cost of around $3.7 billion.

One of the lessons from the Polar Vortex back casting analysis is that when low probability but high impact events brought PJM reliability conditions close to the edge of losing load, small changes in available supply were capable of producing large and increasing outage costs. These lessons triggered PJM market rule revisions regarding capacity performance. As the PJM response to the Polar Vortex demonstrates, anticipation and preparation are keys to power supply resiliency, proving the old adage that an ounce of prevention is worth a pound of cure.

The proposed rule also references the impacts of other extreme weather events. This is an important concern because preventing future outages requires resilience to a much broader set of risks than simply those posed by another Polar Vortex episode. The probability of another Polar Vortex episode like 2014 may be one in ten years or less. Such a low probability of recurrence or the existence of some changes specific to cold weather operating challenges that were put into place can lead to complacency or a false sense of security. However, the probability of another hurricane like Sandy in 2012 hitting New Jersey may also be one in ten years or less. Likewise, the probability of another pipeline disruption such as the 2016 Texas Eastern pipeline disruption in Pennsylvania may also be one in ten years. Other low probability but high impact possible deviations from normal operating conditions include a natural gas storage failure similar to what recently happened at the Aliso Canyon natural gas storage facility, as well as wildfires, heat waves, droughts and physical or cyber-attacks. In addition, political risks exist. For example, the growing anti-fossil fuel movement that is delaying the development of the natural gas supply infrastructure to keep pace with the increased requirements of the electricity sector. Such political risks can shift the power production operating environment suddenly. For example, a severe seismic event associated with hydraulic fracturing wastewater injections somewhere in the U.S. could lead to a wide-spread ban on hydraulic fracturing for natural gas production everywhere. Even if such a ban were temporary, the price and deliverability of natural gas would likely be dramatically affected. Although the probability of any one of these events happening in any given year is low, the probability of some type of high impact event that challenges electric system resilience is much higher because the probability of at least one of these events happening is the sum of the probabilities of these independent risk factors. Further, the consequences of these risk factors can increase when two or more high

impact events occur simultaneously. The bottom line is that prudent planning ought to account for a better-than-even chance that a major disruptive event affecting the availability of one type of electric generating resource in the supply portfolio of a US power system will occur within the next decade.

When power system operating conditions deviate from expected normal operating conditions, the price signals expected in an efficient market outcome ought to incentivize cost effective resilience investments by competitive generators. Consequently, market distortions and cash flow suppression result in underinvestment in power supply resilience. But the risk profile of U.S. power systems may expand beyond the operating environment of the power system and include threats such as terrorist attacks. Analyses of power system resilience to this expanded multi-dimensioned risk profile could lead to the conclusion that market interventions to restore the inherent supply resilience of the diverse electric supply portfolio expected from an efficient market outcome may not be enough to manage the all of the risk exposures of the future.

3. The value of the current diverse U.S. power supply portfolio

The proposed rule references Congressional concern regarding the potential further loss of valuable baseload generation. I agree that the potential exists for further loss of valuable baseload generation. Current U.S. consumers benefit from a reliable, resilient, and cost-effective electric supply portfolio that employs a diverse set of technologies and fuel sources. If supply diversity is reduced by distorted market prices discouraging the continued operation of cost effective existing baseload generating facilities and encouraging the additions of a more expensive combination of natural gas-fired units and renewable resources, then consumers will see electric prices that are both higher and more volatile. For example, public policies are supporting the addition of wind and solar resources with unsubsidized costs of around 85 to 201

$(2015)/MWh that are integrated by flexible natural gas-fired technologies with unsubsidized costs over 64 $(2015)/MWh while suppressed market cash flows are leading to the closure of nuclear power plants with going-forward costs of less than 45 $(2015)/MWh.[6] Consumers incur higher electricity costs because, although mandates and subsidies suppress wholesale prices, these subsidies do not reduce power supply costs. Instead, mandates add out-of-market costs and subsidies shift costs among consumers or from power bills to tax expenditures. This trend toward premature baseload retirements and expanding intermittent renewables and natural gas-fired generation beyond what is cost effective is discussed and analyzed at length in the IHS Markit report I directed entitled *Ensuring Resilient and Efficient Electricity Generation* dated September 2017.[7]

In 2014, I directed research and analysis of the value of fuel and technology diversity in the current U.S. power supply portfolio.[8] The analysis showed that the current diversified portfolio of U.S. power supply lowers the cost of generating electricity by more than $93 billion per year compared to a less diverse portfolio with no meaningful contributions from coal-fired or nuclear power plants, a smaller contribution from hydro-electric resources (4% of generation), and significant increases in wind and solar (22% of generation) and natural gas-fired power plants accounting for the remaining power production (74% of generation). The less diverse power supply case produced monthly power bills that were 25% higher, and twice as variable, as the current power bills reflecting the costs of the current diverse power supply portfolio.

[7] Lawrence Makovich and James Richards, *Ensuring Resilient and Efficient Electricity Generation: The value of the current diverse US power supply portfolio*, IHS Markit Report, September 18, 2017, available at: http://ihsmark.it/FezQ30feH62 (copy attached).

[8] IHS Energy, The Value of US Power Supply Diversity, July 2014.

In light of the accumulating premature baseload power plant retirements and public policy initiatives to ratchet up the generation share mandates for subsidized renewable resources, I directed the September 2017 IHS Markit study to take a fresh look at what is at stake for U.S. consumers if the U.S. supply portfolio continues to move toward a less efficient and less resilient electric supply portfolio end state. The research compared the recent U.S. electricity portfolio outcomes from 2014 to 2016 with analyses of the expected outcome from a less efficient diversity portfolio case that involved little or no coal, oil or nuclear generating resources, less hydroelectric resources, and involved a tripling of the current wind and solar generation shares with the remaining majority of electric output relying on natural gas-fired resources.

The less efficient diversity case may initially appear as an extreme change from current conditions. Yet, such a dramatic transition can unfold within a couple of decades. California is an example of a transition that began in 2002 with its first renewable mandate. Since then, California has little or no coal or oil in its generation mix, reduced nuclear generation (scheduled to be eliminated by 2025), and diminished hydroelectric resources, while intermittent wind and solar generation shares increased from 2 to 15 percent and natural gas-fired generation increased from 50 to 60 percent of in-state electric production. Along the way, the average retail price of electricity in California increased from a level 30 percent above the U.S. average price in 2002 to a level 50 percent above the U.S. average in 2015 while the CO_2 emissions from in-state generation did not decline even though in-state generation was a smaller share of overall power supply.

The comparison of these alternative cases indicates the consequences of the U.S. electricity sector following a similar path as California including:

- The current diversified U.S. electric supply portfolio **lowers the cost of electricity production by about $114 billion per year and lowers the average retail price of electricity by 27%** compared with the less efficient diversity case.

- Avoiding the consumer adjustment to the higher retail prices in the less efficient diversity case preserves current levels of electric consumption and **avoids an annual $98 billion loss in consumer net benefits** from electricity consumption.

- The resilience of the current diversified U.S. electricity portfolio to the delivered price risk profile of the fuel inputs to electric generation **reduces the variability of monthly consumer electricity bills by about 22%** compared with the less efficient diversity case.

- Preventing the erosion in reliability associated with a less resilient electric supply portfolio **mitigates an additional cost of $75 billion per hour** associated with more frequent power supply outages that add to the current US average expected outage rate of 2.33 hours per year.

Comparing the broader economic impacts of the less efficient diversity case with the IHS Markit baseline simulations of the U.S. economy indicates the following U.S. macroeconomic impacts within three years of the retail price increase:

- The 27% retail power price increase associated with the less efficient diversity case causes a **decline of real US GDP of 0.8%, equal to $158 billion** (2016 chain-weighted dollars).

- Labor market impacts of the less efficient diversity case involve a reduction of **1 million jobs**.

- A less efficient diversity case **reduces real disposable income per household by about $845 (2016 dollars) annually**, equal to 0.76% of the 2016 average household disposable income.

4. Other

The October 4, 2017 request from the Federal Energy Regulatory Commission Director of the Office of Energy Policy and Innovation regarding the proposed rule on grid reliability and resilience pricing asked for descriptions of alternative approaches to the proposed rule. An economic argument exists to support offsetting market interventions for non-peaking generating resources through flexibility and resilience payments as long as market distortions continue.

Such interventions can be temporary if an alternative approach involved the determination that further significant state subsidies or mandates of renewable generation shares are unreasonable intrusions into the interstate commerce conducted in wholesale electric market operations and discriminatory to similarly situated non-zero emitting generating resources. Such a ruling would indicate that regional approaches to putting an appropriate charge on CO_2 emissions are the necessary policy formulations to harmonize public policies and wholesale market operations.

5. Conclusion

The Proposed Rule is an attempt to address the decline in power supply resilience caused by the increasing distortions in wholesale electricity markets that are eroding the inherent resilience of the fuel and technology mix expected in a power supply portfolio shaped by efficient market price signals. I agree that something should be done to move electricity market outcomes closer to the expected outcome in an efficient marketplace. On an interim basis, the Proposed Rule provides an immediate step to avoid the further erosion of existing diversity of the nation's generation portfolio. Over the longer term, I suggest a modified approach that would employ the conditions of an efficient market outcome to determine the eligibility and level of support for baseload generation at risk for premature uneconomic retirements.

About the authors

LAWRENCE J. MAKOVICH, Vice President and Senior Advisor for Global Power, IHS Energy, is a highly respected expert on the electric power industry. He directs IHS CERA research efforts in the power sector as part of IHS Energy's Office of the Chairman. He is an authority on electricity markets, regulation, economics, and strategy. His current research focuses on electric power market structures, demand and supply fundamentals, wholesale and retail power markets, emerging technologies, and asset valuations and strategies. Dr. Makovich is currently advising or has recently advised several large utilities in major strategic engagements. He has testified numerous times before the US Congress on electric power policy. He has advised the government of China on electric power deregulation and transmission in competitive markets, and the Brazilian Congress invited him to testify on power liberalization. He examined the impact of deregulation on residential power prices and the development of resource adequacy mechanisms in the IHS Energy Multiclient Study *Beyond the Crossroads: The Future Direction of Power Industry Restructuring.* He was also a project director for the IHS Energy Multiclient Study *Crossing the Divide: The Future of Clean Energy,* the author of the IHS Energy Multiclient Study *Fueling North America's Energy Future: The Unconventional Natural Gas Revolution and the Carbon Agenda,* and the study director of the IHS Energy Multiclient Study *Smart Grid: Closing the Gap Between Perception and Reality.* Among Dr. Makovich's other significant IHS CERA studies are examinations of the California power crisis in *Crisis by Design: California's Electric Power Crunch* and *Beyond California's Power Crisis: Impact, Solutions, and Lessons.* Dr. Makovich has been a lecturer on managerial economics at Northeastern University's Graduate School of Business. He holds a BA from Boston College, an MA from the University of Chicago, and a PhD from the University of Massachusetts.

AARON MARKS, Associate, IHS Energy, is a member of the Power, Gas, Coal, and Renewables group and specializes in North American Power. He provides analysis on power market fundamentals, regional power markets, power generation technologies, and electricity resource planning. Prior to joining IHS Energy, Mr. Marks worked in growth strategy consulting with Treacy and Company, specializing in manufacturing and insurance. He holds BS and MS degrees from Carnegie Mellon University.

LESLIE MARTIN, Senior Principal Researcher, IHS Energy, is a member of the Power, Gas, Coal, and Renewables group and specializes in North American Power. She provides analysis on power market economics, power market fundamentals, and strategic planning. Prior to this role, Ms. Martin held roles in portfolio strategy; investment banking; and energy market consulting in which she supported energy industry mergers, acquisitions, financings, investments, and restructurings, and analyzed US and international electricity market policy and regulation. She holds a BS degree from the University of Colorado.

Acknowledgments

We extend our appreciation to IHS Vice Chairman Daniel Yergin, who offered critical insight, guidance, and support in reviewing the methodologies and findings from this study. This report offers an independent assessment of the value of fuel diversity to the US electricity sector. This research was supported by the Edison Electric Institute, the Nuclear Energy Institute, and the Institute for 21st Century Energy at the U.S. Chamber of Commerce. IHS is exclusively responsible for this report and all of the analysis and content contained herein. The analysis and metrics developed during the course of this research represent the independent views of IHS and are intended to contribute to the dialogue on the value of fuel diversity in the discussion and development of electricity sector investment plans, regulation, policy, and education.

IHS™ Energy

The Value of US Power Supply Diversity

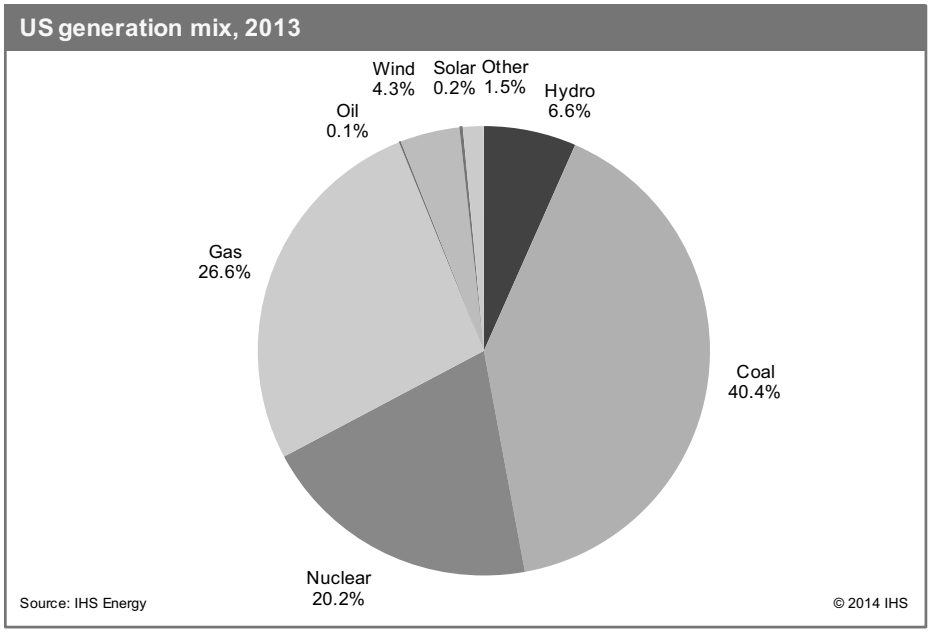
Lawrence Makovich, Vice President and Senior Advisor, IHS Energy
Aaron Marks, Associate, IHS Energy
Leslie Martin, Senior Principal Researcher, IHS Energy

Executive summary

Engineering and economic analyses consistently show that an integration of different fuels and technologies produces the least-cost power production mix. Power production costs change because the input fuel costs—including for natural gas, oil, coal, and uranium—change over time. The inherent uncertainty around the future prices of these fuels translates into uncertainty regarding the cost to produce electricity, known as production cost risk. A diversified portfolio is the most cost-effective tool available to manage the inherent production cost risk involved in transforming primary energy fuels into electricity. In addition, a diverse power generation technology mix is essential to cost-effectively integrate intermittent renewable power resources into the power supply mix.

The current diversified portfolio of US power supply lowers the cost of generating electricity by more than $93 billion per year, and halves the potential variability of monthly power bills compared to a less diverse supply. Employing the diverse mix of fuels and technologies available today produces lower and less volatile power prices compared to a less diverse case with no meaningful contributions from coal and nuclear power and a smaller contribution from hydroelectric power (see Figure ES-1). In this less diverse scenario, called the *reduced diversity case,* wind and solar power make up one-third of installed capacity (up from about 7% in the base case) and 22.5% of generation; hydroelectric power capacity decreases from about 6.6% to 5.3% and represents 3.8% of generation; and natural gas–fired power plants account for the remaining 61.7% of installed capacity and 73.7% of generation.

FIGURE ES-1



Power supply in the reduced diversity case increases average wholesale power prices by about 75% and retail power prices by 25%. Energy production costs are a larger percentage of industrial power prices, and many industrial consumers buy power in the wholesale power market. Thus a loss of power supply diversity will disproportionally affect the industrial sector. These higher electricity prices impact the broader US economy by forcing economic

20171025 3333 FERC PDF (Unofficial) 10/25/2017 4:11:39 PM

adjustments in production and consumption. If the US power sector moved from its current diverse generation mix to the less diverse generating mix, power price impacts would reduce US GDP by nearly $200 billion, lead to roughly one million fewer jobs, and reduce the typical household's annual disposable income by around $2,100. These negative economic impacts are similar to an economic downturn. Additional potential negative impacts arise from reducing power supply diversity by accelerating the retirement of existing power plants before it is economic to do so. For example, a transition to the reduced diversity case within one decade would divert around $730 billion of capital from more productive applications in the economy. The size of the economic impact from accelerating power plant turnover and reducing supply diversity depends on the deviation from the pace of change dictated by the underlying economics.

Maintaining and preserving a diverse US power supply mix is important to consumers for two reasons:

- Consumers reveal a strong preference for not paying more than they have to for reliable electricity.
- Consumers reveal preferences for some degree of predictability and stability in their monthly power bills.

The economic benefits of diverse power supply illustrate that the conventional wisdom of not putting all your eggs in one basket applies to power production in much the same way as it does to investing. This is the *portfolio effect*. In addition, diversity enables the flexibility to respond to dynamic fuel prices by substituting lower-cost resources for more expensive resources in the short run by adjusting the utilization of different types of generating capacity. This ability to move eggs from one basket to another to generate fuel cost savings is the *substitution effect*. Looking ahead, the portfolio and substitution effects remain critically important to managing fuel price risks because of the relative fuel price dynamics between coal and natural gas.

The shale gas revolution and restrictions on coal are driving an increased reliance on natural gas for power generation and provide strong economic benefits. However, this past winter demonstrated the danger of relying too heavily on any one fuel and that all fuels are subject to seasonal price fluctuations, price spikes, and deliverability and infrastructure constraints. The natural gas price spikes and deliverability challenges during the past winter were a jolt for a number of power systems that rely significantly on natural gas in the generation supply. These recent events demonstrated that natural gas deliverability remains a risk and natural gas prices continue to be hard to predict, prone to multiyear cycles, strongly seasonal, and capable of significant spikes. The root causes of these price dynamics are not going away anytime soon. The best available tool for managing uncertainty associated with any single fuel or technology is to maintain a diverse power supply portfolio.

Maintaining power supply diversity is widely supported—the idea of an all-of-the-above approach to the energy future is supported on both sides of the aisle in Congress and at both ends of Pennsylvania Avenue. Four decades of experience demonstrate the conclusion that government should not pick fuel or technology winners, but rather should create a level playing field to encourage the economic decisions that move the power sector toward the most cost-effective generation mix.

Maintaining a diverse power supply currently is threatened by three emerging trends:

- **Awareness.** The value of fuel diversity is often taken for granted because United States consumers inherited a diverse generation mix based on decisions from decades ago.

© 2014 IHS

20141023 3333 FERC PDF (Unofficial) 10/23/2014 4:11:39 PM

- **Energy policy misalignment.** Legislation and regulatory actions increasingly dictate or prohibit fuel and technology choices. The resulting power supply is increasingly at odds with the underlying engineering/economic principles of a cost-effective power supply mix.

- **Power market governance gridlock.** Market flaws produce wholesale power prices that are chronically too low to produce adequate cash flows to support and maintain investments in a cost-effective power generation mix. This "missing money" problem is not being addressed in a timely and effective way through the stakeholder governance processes found in most power markets. As a result, the loss of power supply diversity is accelerating because too many power plants are retiring before it is economic to do so. Consequently, they will be replaced with more costly sources of supply.

US power consumers are fortunate to have inherited a diverse power supply based on fuel and technology decisions made over past decades. Unfortunately, the current benefits of US power supply diversity are often taken for granted. This undervaluation of power supply diversity means there is no counterweight to current pressures moving the United States toward a future generation mix without any meaningful contribution from nuclear, coal, or oil and a diminished contribution from hydroelectric generation.[1]

The United States needs to consider the consequences of a reduced diversity case involving no meaningful contribution from nuclear, coal-fired, or oil-fueled power plants, and significantly less hydroelectric power. A reduced diversity case presents a plausible future scenario in which the power supply mix has intermittent renewable power generation capacity of 5.5% solar, 27.5% wind, and 5.3% hydro and the remaining 61.7% of capacity is natural gas–fired power plants. Comparing the performance of current US power systems to this possible reduced diversity case provides insights into the current nature and value of diversity in the US generation mix.

IHS Energy assessed the current value of fuel diversity by using data on the US power sector for the three most recent years with sufficient available data: 2010 through 2012. IHS Energy employed its proprietary Power System Razor (Razor) Model to create a base case by closely approximating the actual interactions between power demand and supply in US power systems. Following this base case, the Razor Model was employed to simulate the reduced diversity case over the same time period. The differences between the base case and the reduced diversity case provide an estimate of the impact of the current US power supply fuel and technology diversity on the level and variance of power prices in the United States. These power sector outcomes were fed through to the IHS US macroeconomic model to quantify the broader economic impacts of the resulting higher and more varied power prices along with the shifts in capital deployment associated with premature retirements that accelerate the move to the reduced diversity case.

The difference between the base case and the reduced diversity case is a conservative estimate of the value of fuel diversity. The portfolio and substitution values would be greater over a longer analysis time frame because uncertainty and variation in costs typically increase over a longer time horizon. In addition, the estimate is conservative because it excludes indirect feedback effects from a higher risk premium in the reduced diversity power supplier cost of capital. This feedback is not present because the analysis alters only the generation capacity mix and holds all else constant. This indirect cost feedback would increase capital costs in this capital-intensive industry and magnify the economic impact of current trends to replace power plants before it is economic to do so by moving shifting capital away from applications with better risk-adjusted returns.

The United States is at a critical juncture because in the next decade the need for power supply to meet increased customer demands, replace retiring power plants, and satisfy policy targets will require fuel and

1. Oil-fired power plants account for about 4% of US capacity and 0.2% of US generation but can play a critical role in providing additional electricity when the system is under stress.

© 2014 IHS

technology decisions for at least 150 gigawatts (GW)—about 15% of the installed generating capacity in the United States. However, current trends in energy policy could push that power plant turnover percentage to as much as one-third of installed capacity by 2030. The implication is clear: power supply decisions made in the next 10–15 years will significantly shape the US generation mix for decades to come.

The results of this study indicate seven key factors that will shape US power supply diversity in the years to come:

- **Energy policy development.** US policy heavily influences the US power supply mix. Implementing an all-of-the-above energy policy requires properly internalizing the value of fuel diversity.

- **Market structure.** Market flaws distort wholesale power prices downward and result in uneconomic retirement and replacement of existing cost-effective generation resources. This issue and any market structure changes to address it will significantly shape future power plant development.

- **Energy policy discourse.** Preserving the value of fuel diversity depends on public awareness and understanding. The extent and nature of public education regarding the value of power supply diversity may strongly influence public opinion.

- **Planning alignment.** Alignment of fuel and technology choices for power generation with engineering and economic principles is critical to efficient and reliable supply. There is no single fuel or technology of choice for power generation, and all forms of power production have economic, environmental, and reliability impacts.

- **Risk assessment.** To incorporate system considerations into plant-level decisions, prudent fuel price uncertainties must be used with probabilistic approaches to decision making.

- **Flexibility.** Flexibility and exemptions in rule making and implementation allow for the balancing of costs and benefits in power supply systems and may help preserve highly valuable diversity in systemwide decisions as well as on a small but impactful individual plant scale.

- **Scope.** Including fuel price risk and additional storage and transportation infrastructure costs is crucial when evaluating reduced diversity scenarios in comparison to the cost of maintaining and expanding fuel diversity.

The Value of US Power Supply Diversity

Overview

The power business is customer driven: consumers do not want to pay more than necessary for reliable power supply, and they want some stability and predictability in their monthly power bills. Giving consumers what they want requires employing a diverse mix of fuels and technologies in power production. Employing the diverse mix of fuels and technologies available today produces lower and less volatile power prices compared to a less diverse case with no meaningful contributions from coal and nuclear power and a smaller contribution from hydroelectric power. In this less diverse scenario, called the *reduced diversity case,* wind and solar power make up one-third of installed capacity (up from about 7% in the base case) and 22.5% of generation; hydroelectric power capacity decreases from about 6.6% to 5.3% and represents 3.8% of generation; and natural gas–fired power plants account for the remaining 61.7% of installed capacity and 73.7% of generation.

The current diverse US power supply reduces US consumer power bills by over $93 billion per year compared to a reduced diversity case. In addition, the current diversified power generation mix mitigates exposure to the price fluctuations of any single fuel and, by doing so, cuts the potential variability of monthly power bills roughly in half.

Power prices influence overall economic performance. For example, since the recovery of the US economy began in the middle of 2009, manufacturing jobs in the 15 states with the lowest power prices increased by 3.3%, while in the 15 states with the highest power prices these jobs declined by 3.2%. This job impact affected the overall economic recovery. The average annual economic growth in the 15 states with the lowest industrial power prices was 0.6 percentage points higher than in the 15 states with the highest power prices.

Higher and more varied power prices can also impact international trade. In the past decade, the competitive position for US manufacturers improved thanks to lower relative energy costs, including the improving US relative price of electric power (see Figure 1). Although power prices are only one of a number of factors that influence competitive positions in the global economy, there are clear examples, such as Germany, where moving away from a cost-effective power generating mix is resulting in significant economic costs and a looming loss of competitiveness. German power prices increased rapidly over the past decade because Germany closed nuclear power plants before it was economic to do so and added too many wind and solar power resources too quickly into the generation mix. IHS estimates that Germany's net export losses

FIGURE 1

directly attributed to the electricity price differential totaled €52 billion for the six-year period from 2008 to 2013.[2]

A less diverse US power supply would make power prices higher and more varied and force a costly adjustment process for US consumers and businesses. The price increase associated with the reduced diversity case produces a serious setback to US economic activity. The value of goods and services would drop by nearly $200 billion, approximately one million fewer jobs would be supported by the US economy, and the typical household's annual disposable income would go down by over $2,100. These economic impacts take a few years to work through the economy as consumers and producers adjust to higher power prices. The eventual economic impacts are greater if current trends force the closure and replacement of power plants before it is economic to do so. Regardless of the replacement technology, it is uneconomic to close a power plant when the costs of continued operation are less than the cost of a required replacement. Premature power plant turnover imposes an additional cost burden by shifting capital away from more productive applications. A closure and replacement of all nuclear and coal-fired generating capacity in the next 10 years would involve roughly $730 billion of investment. An opportunity cost exists in deploying capital to replace productive capital rather than expanding the productive capital base.

The United States currently faces a key challenge in that many stakeholders take the current benefits of power supply diversity for granted because they inherited diversity based on fuel and technology decisions made decades ago. There is no real opposition to the idea of an all-of-the-above energy policy in power supply. Yet, a combination of factors—tightening environmental regulations, depressed wholesale power prices, and unpopular opinions of coal, oil, nuclear, and hydroelectric power plants—are currently moving the United States down a path toward a significant reduction in power supply diversity. A lack of understanding of power supply diversity means momentum will continue to move the United States toward a future generation mix without any meaningful contribution from nuclear, coal, or oil, and a diminishing contribution from hydroelectric generation.

The United States is at a critical juncture because power plant fuel and technology decisions being made today will affect the US power supply mix for decades to come. These decisions need to be grounded in engineering, economic, and risk management principles that underpin a cost-effective electric power sector. Comparing the performance of the current generation mix to results of the reduced diversity case provides key insights into the current nature and value of diversity. An assessment and quantification of the value of power supply diversity will help achieve a more cost-effective evolution of US power supply in the years ahead.

Generation diversity: A cornerstone of cost-effective power supply

If power consumers are to receive the reliable and cost-effective power supply they want, then cost-effective power production requires an alignment of power supply to power demand. Engineering, economic, and risk management assessments consistently show that an integration of fuels and technologies produces the least-cost power production mix. A cost-effective mix involves integrating nondispatchable power supply with dispatchable base-load, cycling, and peaking technologies. This cost-effective generating mix sets the metrics for cost-effective demand-side management too. Integrating cost-effective power demand management capabilities with supply options requires balancing the costs of reducing or shifting power demand with the incremental cost of increasing power supply. Appendix A reviews the principles of engineering, economics, and risk management that lead to the conclusion that cost-effective power supply requires fuel and technological diversity.

© 2014 IHS

20141023 3333 FERC PDF (Unofficial) 10/23/2014 4:11:39 PM

The underlying principles of cost-effective power supply produce five key insights:

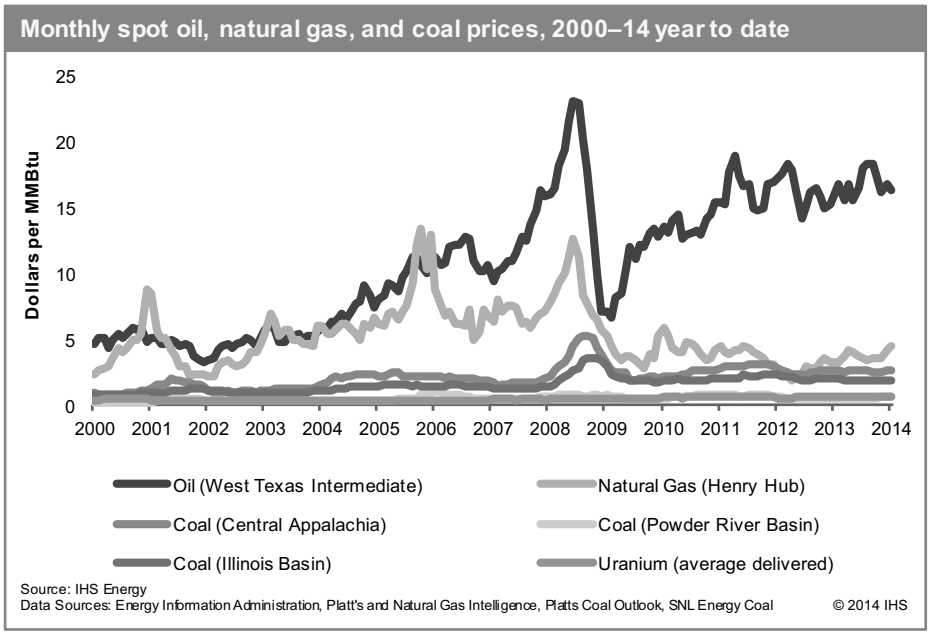
- There is no single fuel or technology of choice for power generation. Reliably and efficiently supplying consumers with the amounts of electricity they want when they want it requires a diverse generation mix.
- A cost-effective generation mix involves diversity but does not involve maximizing diversity by equalizing generation shares from all available supply options.
- A cost-effective mix of fuel and technologies for any power system is sensitive to the uncertainties surrounding the level and pattern of consumer power demands as well as the cost and performance of alternative power generating technologies and, in particular, the delivered fuel prices.
- A cost-effective generating mix will differ from one power system to the next because of differences in aggregate consumer demand patterns as well as in the cost and performance of available generating options.
- The best type of capacity to add to any generation portfolio depends on what types of capacity are already in the mix.

Power production cost fluctuations reflect inherent fuel price uncertainties

Power consumers reveal preferences for some degree of predictability and stability in their monthly power bills. These consumer preferences present a challenge on the power supply side because the costs of transforming primary energy—including natural gas, oil, coal, and uranium—into electric power is inherently risky. Experience shows that the prices of these fuel inputs to the power sector are difficult to anticipate because these prices move in multiyear cycles and fluctuate seasonally (see Figure 2). In addition, this past winter showed that dramatic price spikes occur when natural gas delivery systems are pushed to capacity (see Figure 3).

The recent volatility in the delivered price of natural gas to the US Northeast power systems demonstrates the value of fuel diversity. During this past winter, colder-than-normal weather created greater consumer demand for natural gas and electricity to heat homes and businesses. The combined impact on natural gas demand strained the capability of pipeline systems to deliver natural gas in the desired quantity and pressure. Natural gas prices soared, reflecting the market forces allocating available gas to the highest valued end uses. At some points in time, price allocation was

FIGURE 2



not enough and additional natural gas was not available at any price, even to power plants holding firm supply contracts.

As high as the natural gas price spikes reached, and as severe as the natural gas deliverability constraints were, things could have been worse. Although oil-fired power provided only 0.35% of generation in the Northeast in 2012, this slice of power supply diversity provided an important natural gas supply system relief valve. The oil-fired power plants and the dual-fueled oil- and natural gas–fired power plants were able to use liquid fuels to generate 12% of the New England power supply during the seven days starting 22 January 2014 (see Figure 4). This oil-fired generation offset the equivalent of 327,000 megawatt-hours (MWh) of natural gas–fired generation and thus relieved the natural gas delivery system of about 140 million cubic feet per day of natural gas deliveries. This fuel diversity provided the equivalent to a 6% expansion of the daily delivery capability of the existing natural gas pipeline system.

The lesson from this past winter was that a small amount of oil-fired generation in the supply mix proved to be highly valuable to the Northeast energy sector despite its production costs and emission rates. Many of these oil-fired power plants are old and relatively inefficient at converting liquid fuel to power. However, this relative inefficiency does not impose a great penalty because these power plants need to run very infrequently to provide a safety valve to natural gas deliverability. Similarly, these units have emissions rates well above those achievable with the best available technology, but the absolute amount of emissions and environmental impacts are small because their utilization rates are so low. Although the going forward costs and the environmental impacts are relatively small, the continued operation of these oil-fired power plants is at risk from tightening environmental regulations.

20141023 3333 FERC PDF (Unofficial) 10/23/2014 4:11:39 PM

Oil-fired power plants were not the only alternative to natural gas–fired generation this past winter. Coal played a major role. As the *New York Times* reported on 10 March 2014, 89% of American Electric Power Company, Inc.'s 5,573 megawatts (MW) of coal-fired power plants slated for retirement in 2015 owing to tightening environmental regulations were needed to keep the lights on during the cold snap this past winter in PJM.[3]

The critical role fuel diversity played during the recent polar vortex affected power systems that serve over 40 million US electric consumers and almost one-third of power supply. This widespread exposure to natural gas price and deliverability risks is becoming increasingly important because the share of natural gas in the US power mix continues to expand. The natural gas–fired share of power generation increased from 16% to 27% between 2000 and 2013. Twelve years ago, natural gas–fired generating capacity surpassed coal-fired capacity to represent the largest fuel share in the US installed generating mix. Currently, natural gas–fired power plants account for 40% of the US installed capacity mix.

The increasing dependence on natural gas for power generation is not an accident. The innovation of shale gas that began over a decade ago made this fuel more abundant and lowered both its actual and expected price. But the development of shale gas did not change the factors that make natural gas prices cyclical, volatile, and hard to forecast accurately.

Factors driving natural gas price dynamics include

- Recognition and adjustment lags to market conditions
- Over- and under-reactions to market developments
- Linkages to global markets through possible future liquefied natural gas (LNG) trade
- Misalignments and lags between natural gas demand trends, supply expansions, and pipeline investments
- "Black swan" events—infrequent but high-impact events such as the polar vortex

Natural gas price movements in the shale gas era illustrate the impact of recognition and adjustment lags to changing market conditions. Looking back, natural gas industry observers were slow to recognize the full commercialization potential and magnitude of the impact that shale gas would have on US natural gas supply. Although well stimulation technologies date back to the 1940s, today's shale gas technologies essentially began with the innovative efforts of George Mitchell in the Barnett resource base near Fort Worth, Texas, during the 1980s and 1990s. Mitchell Energy continued to experiment and innovate until eventually proving the economic viability of shale gas development. As a result, shale gas production expanded (see Figure 5).

Although shale gas had moved from its innovation phase to its commercialization phase, many in the oil and gas industry did not fully recognize what was happening even as US shale gas output doubled from 2002 to 2007 to reach 8% of US natural gas production. The belief that the United States was running out of natural gas persisted, and this recognition lag supported the continued investment of billions of dollars to expand LNG import facilities (see Figure 6).

3. *New York Times.* "Coal to the Rescue, But Maybe Not Next Winter." Wald, Matthew L. 10 March 2014: http://www.nytimes.com/2014/03/11/business/energy-environment/coal-to-the-rescue-this-time.html?_r=0, retrieved 12 May 2014.

© 2014 IHS

Eventually, evidence of a shale gas revolution became undeniable. However, recognition and adaptation lags continued. Productivity trends in natural gas–directed drilling rigs indicate that only about 400 gas-directed rigs are needed to keep natural gas demand and supply in balance over the long run. Yet operators in the natural gas industry did not fully anticipate this technological trend. Bullish price projections caused the US natural gas–directed rig count to rise from 690 to 1,600 rigs

FIGURE 5

© 2014 IHS

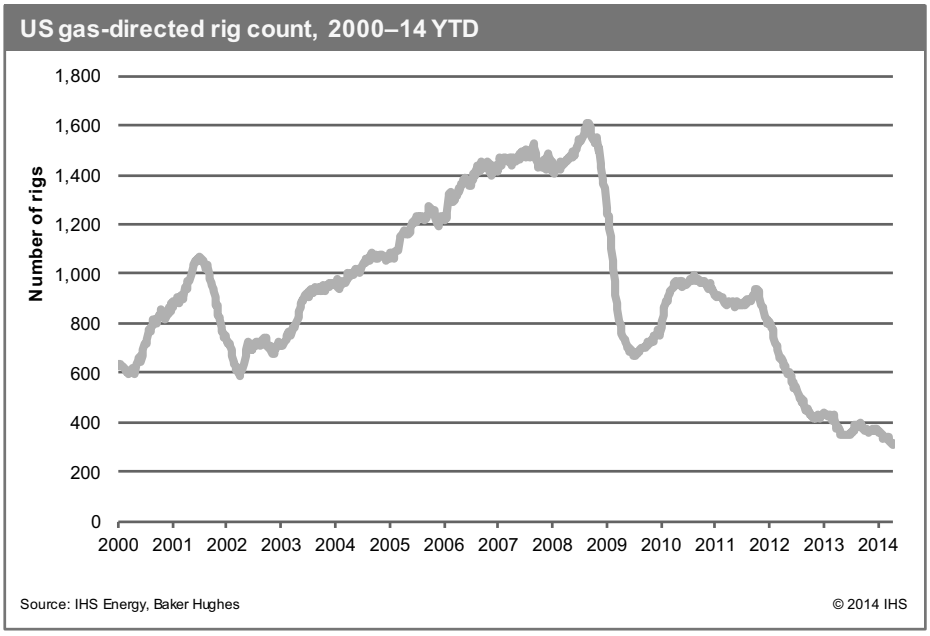
between 2002 and 2008. This level of drilling activity created a supply surplus that caused a precipitous decline of up to 85% in the Henry Hub natural gas price from 2008 to 2012. From the 2008 high count, the number of US natural gas–directed rigs dropped over fivefold to 310 by April 2014 (see Figure 7).

FIGURE 7



Natural gas investment activity also lagged market developments. During this time, the linkage between North American natural gas markets and global markets reversed from an investment hypothesis supporting an expansion of LNG *import* facilities, as shown in Figure 6, to an investment hypothesis involving the expansion of LNG *export* facilities (see Figure 8). At the same time, investment in natural gas pipelines and storage did not keep pace with the shifts in domestic demand, supply, and trade. This asymmetry created vulnerability to low frequency but high impact events, such as colder-than-normal winters that expose gas deliverability constraints and launch record-setting delivered price spikes, as happened in the Northeast in the winters of 2012/13 and 2013/14.

The Northeast delivered natural gas price spikes translated directly into dramatic power production cost run-ups. During the winter of 2013/14, natural gas prices delivered to the New York and PJM power system border hit $140 per MMBtu (at Transco Zone 6, 21 January 2014) and pushed natural gas–fired power production costs up 25-fold from typical levels and well beyond the $1,000 per MWh hourly wholesale power price cap in New York and PJM. This forced the New York Independent System Operator (NYISO) to allow exemptions to market price caps. The Federal Energy Regulatory Commission granted an emergency request to lift wholesale power price caps in PJM and New York. Lifting these price caps kept the lights on but also produced price shocks to 30% of the US power sector receiving monthly power bills in these power systems. The impact moved the 12-month electricity price index (a component of the consumer price index) in the Northeast up 12.7%—the largest 12-month jump in eight years.

The New York Mercantile Exchange (NYMEX) futures contract price strip illustrates how difficult it is to anticipate natural gas price movements. Figure 9 shows the price dynamics over the shale gas era and periodic examples of the NYMEX futures price expectations. The NYMEX future price error pattern indicates a bias toward expecting future natural gas prices to look like those of the recent past. Although these futures prices are often used as an indicator of future natural gas price movements, they have nonetheless proven to be a poor predictor.

The complex drivers of natural gas price dynamics continue to apply in the shale gas era. Prudent planning requires recognition that natural gas price movements remain hard to forecast, affected by multiyear

FIGURE 8

US lower-48 regasification facilities and filed liquefaction projects

investment cycles that lag market developments, subject to seasonality, and capable of severe short-run price volatility.

Natural gas price cycles during the shale gas era and the recent extreme volatility in natural gas prices are clear evidence that the benefits of increased natural gas use for power generation need to be balanced against the costs of natural gas's less predictable and more variable production costs and fuel availability.

The natural gas–fired generation share is second only to the coal-fired generation share. One of the primary reasons that fuel diversity is so valuable is because natural gas prices and coal prices do not move together.

Significant variation exists in the price of natural gas relative to the price of coal delivered to US power generators (see Figure 10). The dynamics of the relative price of natural gas to coal are important because

© 2014 IHS

relative prices routinely change which power plants provide the most cost-effective source of additional power supply at any point in time.

The relative prices of natural gas to coal prior to the shale gas revolution did not trigger as much cost savings from fuel substitution as the current relative prices do. From 2003 to 2007 the price of natural gas was four times higher than the price of coal on a Btu basis. Under these relative price conditions, small changes in fuel prices did not alter the position of coal-fired generation as the lower-cost resource for power generation. The shale gas revolution brought gas prices to a more competitive level and changed the traditional relative relationship between gas and coal generation. As Table 1 shows, the 2013 dispatch cost to produce electricity at the typical US natural gas–fired power plant was equivalent to the dispatch cost at the typical US coal-fired power plant with a delivered natural gas price of $3.35 per MMBtu, about 1.39 times the delivered price of coal. Current price changes move the relative price of natural gas to coal around this average equivalency level and create more generation substitution than has historically occurred.

© 2014 IHS

The average equivalency level triggers cost savings from substitution within the generation mix. Current relative prices frequently move above and below this critical relative price level. Consequently, slight movements in either coal or natural gas prices can have a big impact on which generation resource provides the most cost-effective source of generation at any given point in time.

Coal price dynamics differ from natural gas price movements. The drivers of coal price dynamics include rail and waterborne price shifts, changes in coal inventory levels, and mine closures and openings. In addition, international coal trade significantly influences some coal prices. For example, when gas prices

began to fall in 2008–12, the natural gas displacement of coal in power generation caused Appalachian coal prices also to drop. However, the coal price drop was slower and less severe than the concurrent natural gas price drop because of the offsetting increase in demand for coal exports, particularly for metallurgical coal. Linkages to global coal market prices were significant even though only about one-quarter of Appalachian coal production was involved in international trade. The implication is that as global trade expands, the influence of international trade on domestic fuel prices may strengthen.

TABLE 1

Typical generating units

	Typical coal unit	Typical CCGT unit
Size, MW	218	348
Heat rate, Btu/kWh	10,552	7,599
Fuel cost, $/MMBtu	$2.41	$4.46
Fuel cost, $/MWh	$25.43	$33.89
Variable O&M, $/MWh	$4.70	$3.50
Lbs SO_2/MWh (with wet FGD)	1.16	0
SO_2 allowance price, $/ton	70	70
Lbs NO_x/MWh	0.74	0.15
NO_x allowance price, $/ton	252	252

Nuclear fuel prices are also dynamic, and are different from fossil fuel prices in two ways (see Figure 11). Nuclear fuel cost is a relatively smaller portion of a nuclear plant's overall cost per kilowatt-hour. Also nuclear fuel prices have a different set of drivers. The primary drivers of nuclear fuel price movements include uranium prices, enrichment costs, and geopolitical changes in nuclear trade. These drivers produce price dynamics dissimilar to those of either natural gas or coal. As a result, nuclear fuel price movements are not strongly correlated to fossil fuel price movements.

Diversity: The portfolio effect

A diverse fuel and technology portfolio is a cornerstone for an effective power production risk management strategy. If prices for alternative fuels moved together, there would be little value in diversity. But relative power production costs from alternative fuels or technologies are unrelated and inherently unstable. As a result, the portfolio effect in power generation exists because fuel prices do not move together, and thus changes in one fuel price can offset changes in another. The portfolio effect of power generation fuel diversity is significant because the movements of fuel prices are so out of sync with one another.

© 2014 IHS
SI-SSA-0010-1127

The "correlation coefficient" is a statistical measure of the degree to which fuel price changes are related to each other. A correlation coefficient close to zero indicates no similarity in price movements. Correlation coefficients above 0.5 are considered strong correlations, and values above 0.9 are considered very strong correlations. Power production input fuel price changes (natural gas, coal, and nuclear) are not highly correlated and consequently create the basis for a portfolio approach to fuel price risk management (see Table 2).

TABLE 2

Delivered monthly fuel price correlations, 2000–13

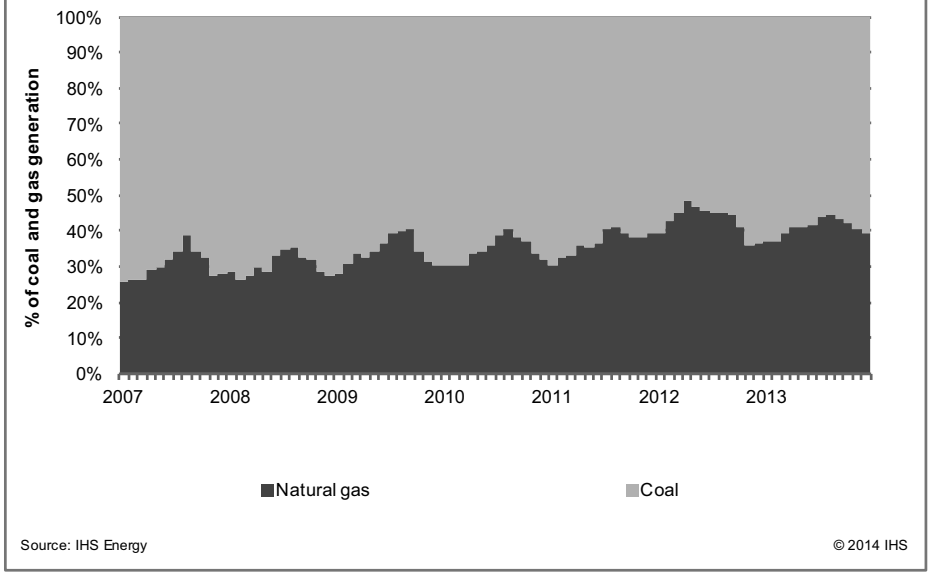
Diversity: The substitution effect

A varied portfolio mitigates power production cost risk because fuel diversity provides the flexibility to substitute one source of power for another in response to relative fuel price changes. Therefore, being able to substitute between alternative generation resources reduces the overall variation in production costs.

Substitution benefits have proven to be substantial. In the past five years, monthly generation shares for natural gas–fired generation were as high as 33% and as low as 19%. Similarly, monthly generation shares for coal-fired generation were as high as 50% and as low as 34%. The swings were driven primarily by a cost-effective alignment of fuels and technologies to consumer demand patterns and alterations of capacity utilization rates in response to changing relative fuel costs. Generation shares shifted toward natural gas–fired generation when relative prices favored natural gas and shifted toward coal-fired generation when relative prices favored coal. Figure 12 shows the recent flexibility in the utilization share tradeoffs between only coal-fired and natural gas–fired generation in the United States.

FIGURE 12

Coal and natural gas generation, 2007–13



Source: IHS Energy

© 2014 IHS

Diversity benefits differ by technology

All types of generating fuels and technologies can provide the first dimension of risk management—the *portfolio effect*. However, only some types of fuels and technologies can provide the second dimension of risk management—the *substitution effect*. Power plants need to be dispatchable to provide the substitution

effect in a diverse portfolio. As a result, the benefits of expanding installed capacity diversity by adding nondispatchable resources such as wind and solar generating technologies are less than the equivalent expansion of power capacity diversity with dispatchable power plants such as biomass, conventional fossil-fueled power plants, reservoir hydro, and nuclear power plants. Therefore, not all diversity in the capacity mix provides equal benefits.

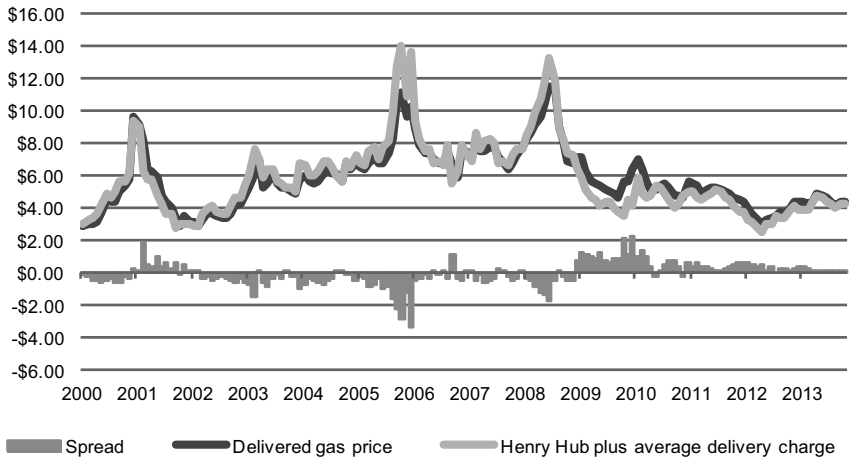
Diversity is the best available power cost risk management tool

A diverse portfolio is the best available tool for power generation cost risk management. Other risk management tools such as fuel contracts and financial derivatives complement fuel and technological diversity in power generation but fall far short of providing a cost-effective substitute for power supply diversity.

Contracts are tools available to manage power production cost risk. These tools include short-run contracts, including NYMEX futures contracts, as well as long-term contracts spanning a decade or more. Power generators have traditionally covered some portion of fuel needs with contracts to reduce the variance of delivered fuel costs. To do this, generators balance the benefits of using contracts or financial derivatives against the costs. With such assessment, only a small percentage of natural gas purchases are under long-term contracts or hedged in the futures markets. Consequently, the natural gas futures market is only liquid (has many buyers and sellers) for a few years out.

FIGURE 13

Power generation delivered gas price versus Henry Hub (plus delivery), 2000–13



Source: IHS Energy, Ventyx Velocity Suite

© 2014 IHS

The degree of risk management provided by contracts is observed in the difference between the reported delivered price of natural gas to power generators and the spot market price plus a typical delivery change. Contract prices along with spot purchases combine to determine the reported delivered price of natural gas to power generators. Delivered prices are typically about 12% higher than the Henry Hub spot price owing to transport, storage, and distribution costs, so this percentage may be used to approximate a delivery charge. Figure 13 compares the Henry Hub spot price plus this typical delivery charge to the reported delivered price of natural gas to power producers.

A comparison of the realized delivered price to the spot price plus a delivery charge shows the impact of contracting on the delivered price pattern. Natural gas contracts provided some protection from spot price highs and thus reduced some variation of natural gas prices compared to the spot market price plus transportation. Over the past 10 years, contracting reduced the monthly variation (the standard deviation) in the delivered price of natural gas to the power sector by 24% compared to the variation in the spot price

plus delivery charges at the Henry Hub. Although fuel contracts are part of a cost-effective risk management strategy, the cost/benefit trade-offs of using contracts limit the application of these tools in a cost-effective risk management strategy.

Using a contract to lock into volumes at fixed or indexed prices involves risks and costs. Contracting for fuel creates volume risk. A buyer of a contract is taking on an obligation to purchase a given amount of fuel, at a given price, and at a future point in time. From a power generator's perspective, the variations in aggregate power consumer demand and relative prices to alternative generating sources make predicting the amount of fuel needed at any future point in time difficult. This difficulty increases the further out in time the contracted fuel delivery date. If a buyer ends up with too much or too little fuel at a future point in time, then the buyer must sell or buy at the spot market price at that time.

Contracting for fuel creates price risk. A buyer of a fuel contract locks into a price at a future point in time. When the contract delivery date arrives, the spot market price for the fuel likely differs from the contract price. If the contract price ends up higher than the spot market price, then the contract provided price certainty but also created a fuel cost that turned out to be more expensive than the alternative of spot market purchases. Conversely, if the spot market price turns out to be above the contract price, then the buyer has realized a fuel cost savings.

Past price relationships also illustrate the potential for gains and losses from contracting for natural gas in an uncertain price environment. When the spot market price at Henry Hub increased faster than expected, volumes contracted at the previously lower expected price produced a gain. For example, in June 2008 the delivered cost of natural gas was below that of the spot market. Conversely, when natural gas prices fell faster than anticipated, volumes contracted at the previously higher expected price produced a loss. For example in June 2012, the delivered cost of natural gas was above that of the spot market purchases.

The combination of volume and price risk in fuel contracting makes buying fuel under contract a speculative activity, capable of generating gains and losses depending on how closely contract prices align with spot market prices. Therefore, cost-effective risk management requires power generators to balance the benefits of gains from contracting for fuel volumes and prices against the risk of losses.

Managing fuel price risk through contracts does not always involve the physical delivery of the fuel. In particular, a futures contract is typically settled before physical delivery takes place, and thus is referred to as a financial rather than a physical hedge to fuel price uncertainty. For example, NYMEX provides a standard contract for buyers and sellers to transact for set amounts of natural gas capable of being delivered at one of many liquid trading hubs at a certain price and a certain date in the future. Since the value of a futures contract depends on the expected future price in the spot market, these futures contracts are derivatives of the physical natural gas spot market.

The potential losses facing a fuel buyer that employs financial derivatives create a risk management cost. Sellers require that buyers set aside funds as collateral to insure that potential losses can be covered. Market regulators want these guarantees in place as well in order to manage the stability of the marketplace. Recently, as part of reforms aimed at improving the stability of the financial derivatives markets, the Dodd-Frank Act increased these collateral requirements and thus the cost of employing financial derivatives.

Outside of financial derivatives, fuel deliverability is an important consideration in evaluating power cost risk management. Currently, natural gas pipeline expansion requires long-term contracts to finance projects. Looking ahead, the fastest growing segment of US natural gas demand is the power sector and, as described earlier, this sector infrequently enters into long-term natural gas supply contracts that would finance new pipelines. Consequently, pipeline expansions are not likely to stay in sync with power generation natural gas demand trends.

© 2014 IHS

The prospect of continued periodic misalignments between natural gas deliverability and natural gas demand makes price spikes a likely feature of the future power business landscape. The nominal volume of long-term fuel contracts and the costs and benefits of entering into such contracts limit the cost-effective substitution of contracts for portfolio diversity. Therefore, maintaining or expanding fuel diversity remains a competitive alternative to natural gas infrastructure expansion.

Striking a balance between the costs and benefits of fuel contracting makes this risk management tool an important complement to a diverse generation portfolio but does not indicate that it could provide a cost-effective substitute for power supply diversity.

A starting point taken for granted

US power consumers benefit from the diverse power supply mix shown in Figure 14. Simply inheriting this diverse generation mix based on fuel and technology decisions made decades ago makes it easy for current power stakeholders to take the benefits for granted. This underappreciation of power supply diversity creates an energy policy challenge because if the value of fuel and technology diversity continues to be taken for granted, then the current political and regulatory process is not likely to properly take it into account when crafting legislation or setting regulations.

FIGURE 14

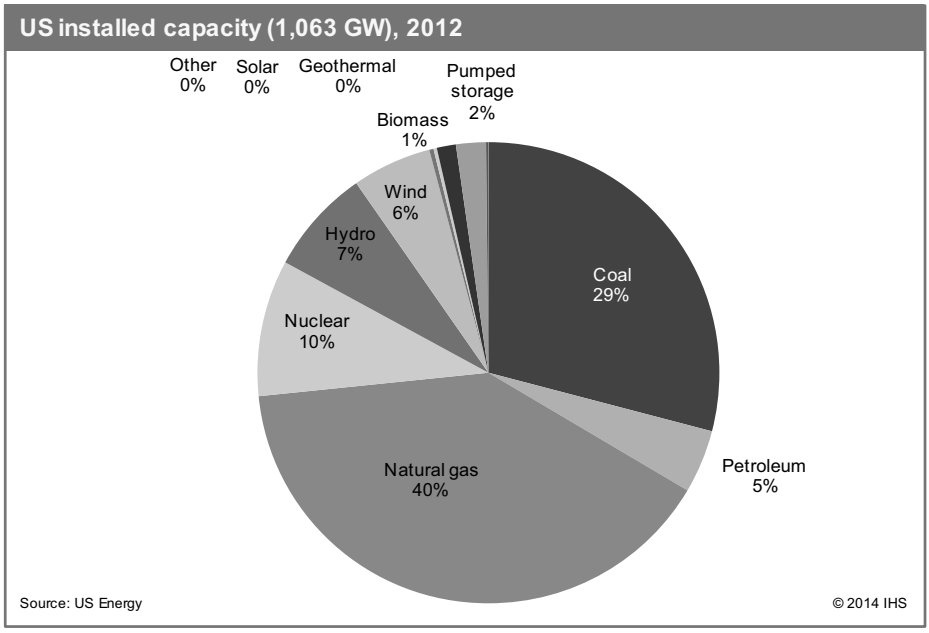

TABLE 3

The impact of fuel diversity: Power production fuel costs
(Actual versus all gas generation mix, 2000–13 YTD, cents per kWh)

	Henry Hub	All power sector fuel costs
Average	5.09	2.29
Maximum	11.02	4.20
Minimum	2.46	1.21
Standard deviation	1.63	0.55

Note: Converted the Henry Hub dollar per MMBtu price to cents per kWh using the average reported heat rate for all operating natural gas plants in the respective month.

Source: IHS Energy

As a result, the United States may move down a path toward a less diverse power supply without consumers realizing the value of power supply diversity until it is gone. For example, if the US power sector had been all natural gas–fired during the shale gas era to date, the average fuel cost for power would have been over twice as high, and month-to-month power bill variation (standard deviation) would have been three times greater (see Table 3). This estimate itself is conservative because the additional demand from power generation would have likely put significant upward pressure on gas prices.

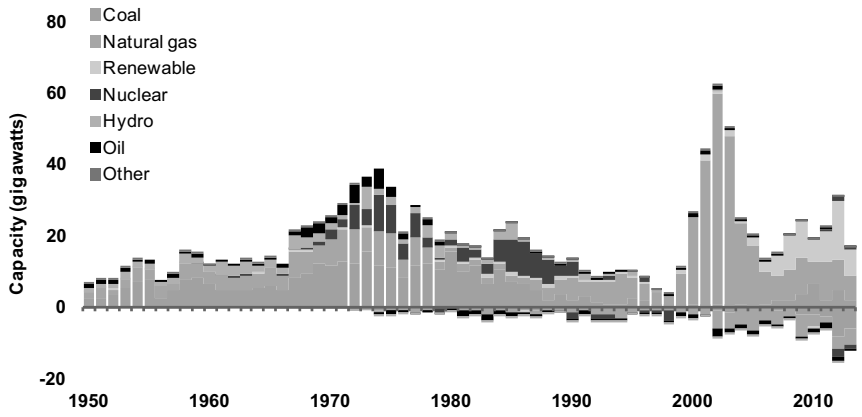
Trends in the US generation mix

The current diverse fuel and technology mix in US power supply did not come about by accident. The US generation mix evolved over many decades and reflects the fuel and technology decisions made long ago for power plants that typically operate for 30 to 50 years or more. Consequently, once a fuel and technology choice is made, the power system must live with the consequences—whatever they are—for decades.

US power supply does not evolve smoothly. The generation mix changes owing to the pace of power plant retirements, the error in forecasting power demand, price trends and other developments in the energy markets, and the impacts of public policy initiatives. All three of these factors unfold unevenly over time. The current diverse generation mix evolved from multiyear cycles of capacity additions that were typically dominated by a particular fuel and technology (see Figure 15). The swings in fuel and technology choice do not indicate a lack of appreciation for diverse power supply. Instead, they show that given the size of the existing supply base, it takes a number of years of homogenous supply additions to move the overall supply mix a small proportion. Therefore, altering the overall mix slightly required a number of years of adjustment.

FIGURE 15

US generating capacity additions and retirements, 1950–2013



Source: IHS Energy, Ventyx Velocity Suite

© 2014 IHS

The uneven historical pattern of capacity additions is important because the future pattern of retirements will tend to reflect the previous pattern of additions as similarly aged assets reach the end of their useful lives. For example, current retirements are disproportionately reducing the coal and nuclear shares in the capacity mix, reflecting the composition of power plants added in the 1960s through 1980s. Current power plant retirements are about 12,000 MW per year and are moving the annual pace of retirements in the next decade to 1.5 times the rate of the past decade.

Power plant retirements typically need to be replaced because electricity consumption continues to increase. Although power demand increases are slowing compared to historical trends and compared to the growth rate of GDP, the annual rate of change nevertheless remains positive. US power demand is expected to increase between 1.0% and 2.5% each year in the decade ahead, averaging 1.5%.

The expected pace of US power demand growth reflects a number of trends. First, US electric efficiency has been improving for over two decades. Most appliances and machinery have useful lives of many years. As technology improves, these end uses get more efficient. Therefore, overall efficiency typically increases as appliances and machinery wear out and are replaced. On the other hand, the number of electric end uses keeps expanding and the end-use penetration rates keep increasing owing to advances in digital and communication technologies that both increase capability and lower costs. These trends in existing technology turnover

and new technology adoption produce a steady rate of change in electric end-use efficiency (see Figure 16).

Underlying trends in power demand are often masked by the influences of variations in the weather and the business cycle. For example, US electric output in first quarter 2014 was over 4% greater than in the same period one year ago owing in part to the influence of the polar vortex. Therefore, trend rates need to compare power consumption increases either between points in time with similar weather conditions or on a weather-normalized basis. Similarly, power demand trends can be misleading if compared without taking the business cycle into account. Figure 17 shows the trend rate of growth in power use from the previous business cycle peak to peak and tough to trough. Overall, power consumption increased by between 0.5 and 0.6 of the rate of increase in GDP. Looking ahead, GDP is expected to increase on average 2.5% annually through 2025 and thus is likely to produce a trend rate of electric consumption of around 1.5% annually. This US power demand growth rate creates a need for about 9 GW of new power supply per year, for a total of 1,140 GW by 2025.

FIGURE 16

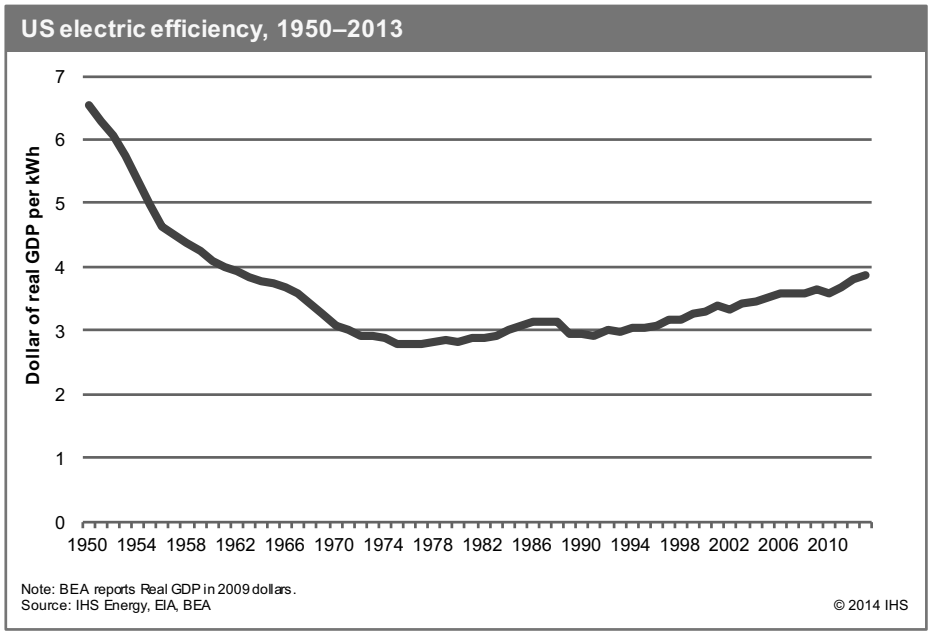


FIGURE 17

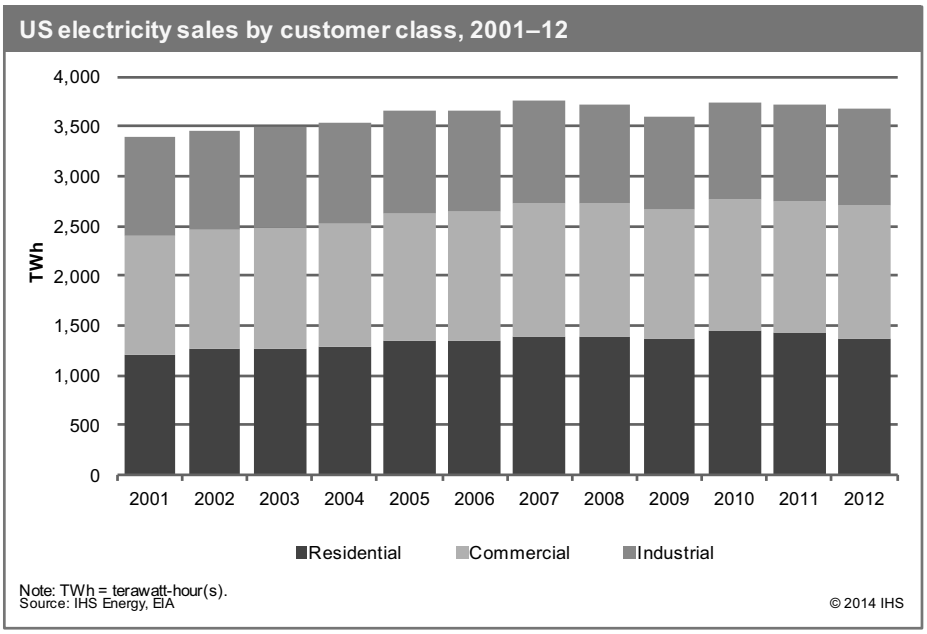


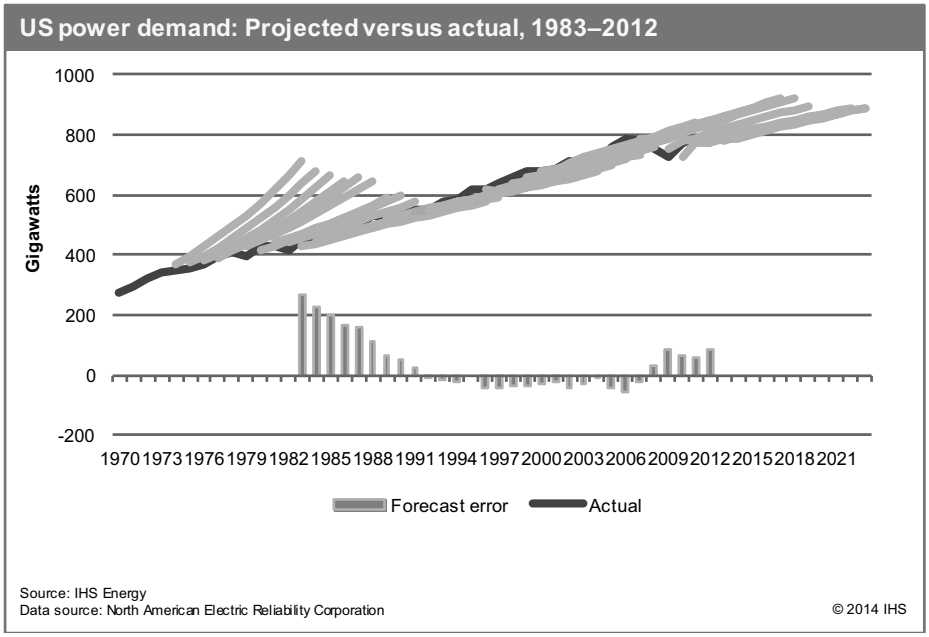
Annual power supply additions do not typically unfold simultaneously with demand increases. Historically, changes in power supply are much more pronounced than the changes in power demand. This uneven pace of change in the capacity mix reflects planning uncertainty regarding future power demand and a slow adjustment process for power supply development to forecast errors.

Future electric demand is uncertain. Figure 18 shows a sequence of power industry forecasts of future demand compared to the actual demand. The pattern of forecast errors indicates that electric demand forecasts are slow to adjust to actual conditions: overforecasts tend to be followed by overforecasts, and

© 2014 IHS
SI-SSA-0010-1133

underforecasts tend to be followed by underforecasts.

FIGURE 18



Forecasting uncertainty presents a challenge because fuel and technology decisions must be made years in advance of consumer demand to accommodate the time requirements for siting, permitting, and constructing new sources of power supply. As a result, the regional power systems are subject to momentum in power plant addition activity that results in capacity surpluses and shortages. Adjustment to forecast overestimates is slow because when a surplus becomes evident, the capital intensity of power plants creates an accumulating sunk-cost balance in the construction phase of power supply development. In this case, there is an economic incentive to finish constructing a power plant because the costs to finish are the relevant costs to balance against the benefits of completion. Conversely, if a shortage becomes evident, new peaking power plants take about a year to put into place under the best of circumstances. Consequently, the forecast error and this lagged adjustment process can produce a significant over/underinstallment of new capacity development versus need. These imbalances can require a decade or more to work off in the case of a capacity overbuild and at least a few years to shore up power supply in the case of a capacity shortage.

The pace and makeup of power plant additions are influenced by energy policies. The current installed capacity mix reflects impacts from the implementation of a number of past policy initiatives. Most importantly, 35 years ago energy security was a primary concern, and the energy policy response included the Fuel Use Act (1978) and the Public Utilities Regulatory Policy Act (1978). These policies limited the use of natural gas for power generation and encouraged utility construction of coal and nuclear generating resources as well as nonutility development of cogeneration. Public policy championed coal on energy security grounds—as a safe, reliable, domestic resource.

The influence of energy policy on power plant fuel and technology choice is dynamic. For example, as natural gas demand and supply conditions changed following the passage of the Fuel Use Act, the limits on natural gas use for power generation were eventually lifted in 1987. Whereas the Fuel Use Act banned a fuel and technology, other policy initiatives mandate power generation technologies. Energy policies designed to address the climate change challenge created renewable power portfolio requirements in 30 states (see Figure 19).

As states work to implement renewable generation portfolio standards, the complexity of power system operations becomes evident and triggers the need for renewable integration studies. These studies generally find that the costs to integrate intermittent power generation resources increase as the generation share of these resources increases. Some integration studies go so far as to identify the saturation point for wind resources based on their operational characteristics. A wind integration study commissioned by the

FIGURE 19

power system operator in New England estimated the saturation point for wind in the power system (24% generation share) as well as the additional resources that would be needed to integrate more wind resources.[4] Similarly, a wind integration study by the power system operator in California found that problems were ahead for the California power system because the number of hours when too much wind generation was being put on the grid was increasing. The study noted higher costs were ahead as well because additional resources would be needed to integrate expected additional wind resources planned to meet the renewable portfolio requirements in place.[5] Many of the impacts on the US generation mix from renewable power portfolio requirements are yet to come as higher generation or capacity share mandates become binding in many states in the next few years.

The United States is at a critical juncture because current trends in power plant retirements, demand and supply balances, and public policies are combining to accelerate change in the US generation mix, as shown in Figure 20. In 2013, increases in demand, power plant retirements, and renewable mandates resulted in around 15,800 MW of capacity additions. In the decade ahead, these increasing needs will require power supply decisions amounting to 15% of the installed generating capacity in the United States. In addition, public policies are expected to increase the share of wind and solar generation, and forthcoming regulations from the Environmental Protection Agency (EPA) regarding conventional power plant emissions as well as greenhouse gases (GHG) could significantly increase power plant retirements and accelerate changes further. Altogether, changes in US generating capacity in the next two decades could account for more than one-third of installed capacity.

Threat to power generation diversity: Complacency

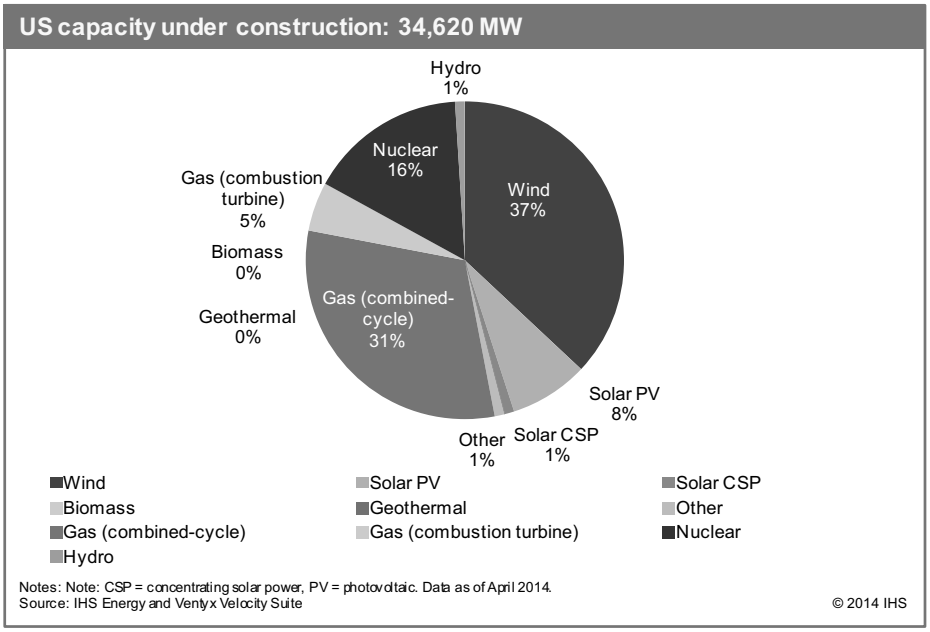
Threats to maintaining diversity in power production do not come from opposition to the idea itself, but rather from the complacency associated with simply taking diversity for granted. The familiar adage of not putting all your eggs in one basket is certainly aligned with the idea of an all-of-the-above energy policy. Four decades of experience demonstrates the conclusion that the government should not be picking fuel or technology winners, but rather should be setting up a level playing field to encourage competitive forces to move the power sector toward the most cost-effective generation mix. Nevertheless, in a striking contrast,

4. *New England Wind Integration Study* produced for ISO New England by GE Energy Applications and Systems Engineering, EnerNex Corporation, and AWS Truepower, 5 December 2010. Accessed 16 April 2014 (http://www.uwig.org/newis_es.pdf).

5. "Integration of Renewable Resources: Operational Requirements and Generation Fleet Capability at 20% RPS." California ISO, 31 August 2010, downloaded from www.caiso.com/2804/2804d036401f0.pdf.

the value of fuel diversity to the end use consumer is not internalized in current power plant decision making. A 2013 review of over eighty integrated resource plans (IRPs) found that many reference fuel diversity but only a few of them refer to it as a risk, and none of them quantify the value of fuel diversity to incorporate it into the decision process.[6] Additionally, environmental policy initiatives do not seem to accommodate diversity issues. Therefore, one power plant decision after another is revealing a de facto energy policy to move away from oil, coal, and nuclear generation and reduce hydroelectric capability, and instead build relatively low utilization wind and solar resources backed up by natural gas–fired generating units (see Figure 21).

FIGURE 21



Threat to power generation diversity: The "missing money"

Fuel diversity is threatened as well by the inability of power markets to evolve market rules and institutions to address the "missing money" problem in competitive power generator cash flows. The missing money problem in power markets is the latest manifestation of a long-standing problem in a number of industries, including railroads, airlines, and power, where competitive markets fail to balance demand and supply at market-clearing prices high enough to support the full cost of supply.

Power markets have a missing money problem because they do not have all of the necessary conditions to produce a textbook competitive marketplace. The textbook marketplace has suppliers who maximize their profits by expanding output up to the point where their short-run marginal cost (SRMC) of production equals the market-clearing price. This means that an aggregation of rival suppliers' SRMC curves produces the market supply curve. If this market supply curve intersects the market demand curve at a price too low to support the full cost of new supply (long-run marginal cost [LRMC]), then suppliers will not expand productive capacity. Instead, they will meet increases in demand by adding more variable inputs to the production process with a fixed amount of capacity. However, doing so increases SRMC, and eventually the market-clearing price rises to the point where it covers the cost of expanding productive capacity. This produces the textbook market equilibrium where demand and supply are in balance at the unique point where market-clearing prices are equal to both SRMC and LRMC.

Several characteristics of the technologies that make up a cost-effective power supply create a persistent gap between SRMCs and LRMCs as production varies. As a result, market-clearing wholesale power prices are below the level needed to support the full cost of power supply when demand and supply are in balance with the desired level of reliability.[7] Consequently, the stable textbook market equilibrium does not exist in an electric power marketplace.

20141023 3333 FERC PDF (Unofficial) 10/23/2014 4:11:39 PM

A simple example of a competitive power market made up entirely of rival wind generators illustrates the missing money problem. The cost profile of wind turbine technologies comprises nearly exclusively upfront capital costs (LRMCs). SRMCs for wind technologies equal zero because the variable input to the power production process is wind, and this input is free. In a competitive market, if wind conditions allow for power production, then rival wind generators will be willing to take any price above zero to provide some contribution to recovering the upfront capital costs. If there is adequate supply to balance demand in a competitive marketplace, then rival wind suppliers will drive the market-clearing price to zero. This is not just a theoretical example. When power system conditions create wind-on-wind competition, then zero or negative market-clearing prices (reflecting the cost of losing the production tax credit) are typically observed. Wind generating technologies are a simple and extreme example of a power generating technology with a persistent gap between SRMCs and LRMCs. But this problem exists to some degree with other power generation technologies.

This technology-based market flaw means that periodic shortage-induced price spikes are the only way for market-clearing prices to close the gap between the SRMC and LRMC. This market outcome does not work because of the inherent contradiction—periodic shortages are needed to keep demand and supply in balance.

The missing money problem threatens cost-effective power supply because when market-clearing power prices are chronically too low to support new power plants, then lower expected cash flows at existing plants cause retirements before it is economic to do so, given replacement costs. It is cost effective to retire and replace a power plant only when its cost of continued operation becomes greater than the cost of replacement. Therefore, a market-clearing power price that reflects the full cost of new power supply is the appropriate economic signal for efficient power plant closure and replacement. Consequently, when this price signal is too low, power plant turnover accelerates and moves power supply toward the reduced diversity case.

"Missing money" and premature closing of nuclear power plants

The Kewaunee nuclear plant in Wisconsin is an example of a power plant retirement due to the missing money problem. Wholesale day-ahead power prices average about $30 per MWh in the Midwest power marketplace. This market does not have a supply surplus, and recently the Midwest Independent System Operator (MISO), the institution that manages the wholesale market, announced that it expects to be 7,500 MW short of generating capacity in 2016.[8] The current market-clearing power price must almost double to send an efficient price signal that supports development of a natural gas–fired combined-cycle power plant.

The Kewaunee power plant needs much less than the cost of a new plant, about $54 per MWh, to cover the costs of continued operation. Kewaunee's installed capacity was 574 MW, and the plant demonstrated effective performance since it began operation in 1974. The plant received Nuclear Regulatory Commission approval for life extension through 2033. Nevertheless, the persistent gap between market prices and new supply costs led Dominion Energy, the power plant's owner, to the October 2012 decision to close the plant because of "low gas prices and large volumes of wind without a capacity market."

Kewaunee is not an isolated case. Other nuclear power plants such as Vermont Yankee provide similar examples. Additionally, a significant number of coal-fired power plants are retiring well before it is economic to do so. For example, First Energy retired its Hatfield's Ferry plant in Ohio on 9 October 2013. This is a large (1,700 MW) power plant with a $33 per MWh variable cost of power production.[9] The going-forward

costs involved some additional environmental retrofits, but the plant had already invested $650 million to retrofit a scrubber just four years prior to the announced retirement.

Reducing diversity and increasing risk

Proposed EPA regulations on new power plants accommodate the carbon footprint of new natural gas–fired power plants but do not accommodate the carbon footprint of any new state-of-the-art conventional coal-fired power plants that do not have carbon capture and storage (CSS). Since the cost and performance of CSS technologies remain uneconomic, the United States is now on a path to eliminating coal-fired generation in US power supply expansion. This move toward a greatly reduced role for coal in power generation may accelerate because the EPA is now developing GHG emission standards for existing power plants that could tighten emissions enough to dramatically increase coal-fired power plant retirements.

The impact of a particular fuel or technology on fuel diversity depends on overall power system conditions. As a general rule, the benefits of fuel diversity from any source typically increase as its share in the portfolio decreases. Oil-fired generation illustrated this principle when it proved indispensable in New England in keeping electricity flowing this past winter. Despite only accounting for 0.2% of US generation, it provided a critical safety valve for natural gas deliverability during the polar vortex. Yet, these oil-fired power plants are not likely to survive the tightening environmental regulations across the next decade. The implication is clear: there is a much higher cost from losing this final 0.2% of oil in the generation mix compared to the cost of losing a small percentage of oil-fired generation back in 1978, when oil accounted for 17% of the US generation mix. Losing this final 0.2% of the generation mix will be relatively expensive because the alternative to meet infrequent surges in natural gas demand involves expanding natural gas storage and pipeline capacity in a region where geological constraints make it increasingly difficult to do so.

Public opinion is a powerful factor influencing the power generation mix. The loss of coal- or oil-fired power plants in the generation mix is often ignored or dismissed because of public opinion. Coal- or oil-fired power plants are generally viewed less favorably than wind and solar resources. In particular, labeling some sources of power as “clean energy” necessarily defines other power generating sources as “dirty energy.” This distinction makes many conventional power supply sources increasingly unpopular in the political process. Yet, all sources of power supply employed to meet customer needs have an environmental impact. For example, wind and solar resources require lots of land and must be integrated with conventional grid-based power supply to provide consumers with electricity when the wind is not blowing or the sun is not shining. Therefore, integrating these “clean energy” resources into a power system to meet consumer needs produces an environmental footprint, including a GHG emission rate. The arbitrary distinctions involved in “clean energy” are evident when comparing the emissions profiles of integrated wind and solar power production to that of nuclear power production. A simplistic and misleading distinction between power supply resources is a contributing factor to the loss of fuel diversity.

Edison International provides an example of the impact of public opinion. Antinuclear political pressures in California contributed to the decision in 2013 to prematurely close its San Onofre nuclear power plant. This closure created a need for replacement power supply that is more expensive, more risky, and more carbon intensive.

The going-forward costs of continued operation of the San Onofre nuclear plant were less than the cost of replacement power. Therefore, the closure and replacement of the San Onofre power plant made California power supply more expensive in a state that already has among the highest power costs in the nation. A study released in May 2014 by the Energy Institute at Haas at the University of California Berkeley estimated that closing the San Onofre nuclear power station increased the cost of electricity by $350 million during the

© 2014 IHS

20141023 3333 PERC PBP (Unofficial) 10/23/2014 4:11:39 PM

first twelve months.[10] This was a large change in power production costs, equivalent to a 13% increase in the total generation costs for the state.

Closing San Onofre makes California power costs more risky. California imports about 30% of its electricity supply. Prior to the closure, nuclear generation provided 18.3% of California generation in 2011, and the San Onofre nuclear units accounted for nearly half of that installed nuclear capacity. The Haas study found that imports increase with system demand but not much, likely owing to transmission constraints, grid limitations, and correlated demand across states. The results imply that the loss of the San Onofre power plant was primarily made up through the use of more expensive generation, as much as 75% of which was out-of-merit generation running to supply energy as well as voltage support. The report's analysis found that up to 25% of the lost San Onofre generation could have come from increased imports of power. The substitute power increases California consumers' exposure to the risks of fossil fuel price movements as well as the risks of low hydroelectric generation due to Western Interconnection drought cycles.

Closing San Onofre makes California power production more carbon intensive. Nuclear power production does not produce carbon dioxide (CO_2) emissions. These nuclear units were a major reason that the CO_2 intensity of California power production was around 0.5 pounds (lb) per kilowatt-hour (kWh). Replacement power coming from in-state natural gas–fired power plants has associated emissions of about 0.9 lb per kWh. Replacement power coming from the rest of the Western Interconnection has associated emissions of 1.5 lb per kWh. Even additional wind and solar power sources in California with natural gas–fired power plants filling in and backing them up have a 0.7 lb per kWh emissions profile. The Haas study found that closing San Onofre caused carbon emissions to increase by an amount worth almost $320 million, in addition to the $350 million in increased electricity prices in the first year. In the big picture, California CO_2 emissions have not declined in the past decade, and the closure of the San Onofre nuclear units will negate the carbon abatement impacts of 20% of the state's current installed wind and solar power supply.

The path toward a less diverse power supply

The relative unpopularity of coal, oil, nuclear, and hydroelectric power plants (compared to renewables), combined with the missing money problem, tightening environmental regulations, and a lack of public awareness of the value of fuel diversity create the potential for the United States to move down a path toward a significant reduction in power supply diversity. Within a couple of decades, the US generation mix could have the following capacity characteristics:

- No meaningful nuclear power supply share
- No meaningful coal-fired power supply share
- No meaningful oil-fired power supply share
- Hydroelectric capacity in the United States reduced by 20%, from 6.6% to 5.3% of installed capacity
- Renewables power supply shares at operational limits in power supply mix: 5.5% solar, 27.5% wind
- Natural gas–fired generation becoming the default option for the remaining US power supply of about 61.7%

Comparing the performance of current diverse power supply to this reduced diversity case provides a basis for quantifying the current value of fuel and technology diversity in US power supply.

Quantifying the value of current power supply diversity

A number of metrics exist to compare and contrast the performance of power systems under different scenarios. Three power system performance metrics are relevant in judging the performance of alternative generation portfolios:

- SRMC of electric production (the basis for wholesale power prices)
- Average variable cost of electric production
- Production cost variability

IHS Energy chose a geographic scope for the diversity analyses at the interconnection level of US power systems. The United States has three power interconnections: Electric Reliability Council of Texas (ERCOT), Eastern, and Western. These interconnections define the bounds of the power supply network systems that coordinate the synchronous generation and delivery of alternating current electrical energy to match the profile of aggregate consumer demands in real time.

Analysis at the interconnection level is the minimum level of disaggregation needed to analyze the portfolio and substitution effects of a diverse fuel and technology generation mix. In particular, the substitution effect involves the ability to shift generation from one source of power supply to another. The degree of supply integration within an interconnection makes this possible, whereas the power transfer capability between interconnections does not. The degree of power demand and supply integration within these interconnections creates the incentive and capability to substitute lower-cost generation for higher-cost generation at any point in time. These competitive forces cause the incremental power generation cost-based wholesale power prices at various locations within each interconnection to move together. An average correlation coefficient of monthly average wholesale prices at major trading hubs within each interconnection is roughly 0.8, indicating a high degree of supply linkage within each interconnection.

IHS Energy assessed the current value of fuel diversity by using the most recently available data on the US power sector. Sufficient data were available for 2010 to 2012, given the varied reporting lags of US power system data.

IHS employed its Razor Model to simulate the interactions of demand and supply within each of these US power interconnections from 2010 to 2012. The 2010 to 2012 backcasting analysis created a base case of the current interactions between power demand and supply in US power systems. Appendix B describes the IHS Razor Model and reports the accuracy of this power system simulation tool to replicate the actual performance of these power systems. The high degree of predictive power produced by this model in the backcasting exercise establishes the credibility of using this analytical framework to quantify the impacts of more or less fuel and technology diversity. The macroeconomic impact analysis used the most recently available IHS simulation of the US economy (December 2013) as a base case.

Once this base case was in place, the Razor Model was employed to simulate an alternative case involving a less diverse generation mix. The current generation mix in each of the three interconnections—Eastern, Western, and ERCOT—were altered as follows to produce the reduced diversity case generation:

© 2014 IHS

- The nuclear generating share went to zero.
- The coal-fired electric generating share went to zero.
- The hydroelectric generation share dropped to 3.8%.
- Intermittent wind and solar generation increased its combined base case generation share of about 2% to shares approximating the operational limits—24% in the East, 45% in the West, and 23% in ERCOT—resulting in an overall wind generation share of 21.0% and a solar generation share of 1.5%.
- Natural gas–fired generation provided the remaining generation share in each power system, ranging from about 55% in the West to over 75% in the East and ERCOT, for an overall share of nearly 74%.

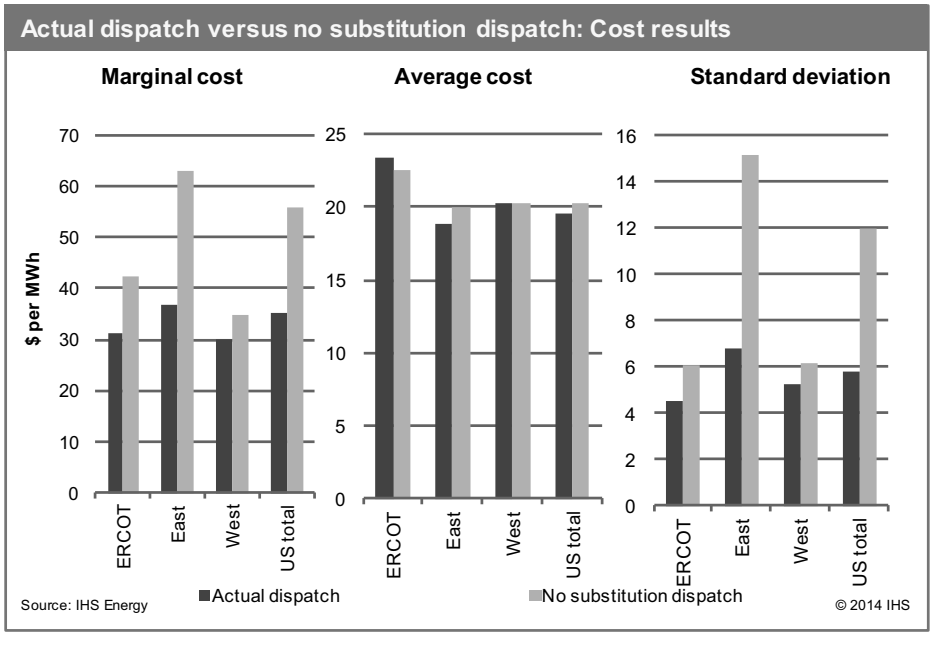
Differences between the performance metrics of the current diverse generating portfolio simulation and the reduced diversity case simulation provide an estimate for the current value of fuel diversity. The differences in the level and variance of power prices were fed through to the IHS US macroeconomic model to quantify the broader economic impacts of the higher and more varied power prices and shifts in capital deployment associated with the reduced diversity case.

Quantification of the impact of fuel diversity within the US power sector involved a two-step process. The first step quantifies the current value of the substitution effect enabled by a diverse power generating portfolio. The second step quantified the additional value created by the portfolio effect.

The value of the substitution effect

The first step alters the base case by holding relative fuel prices at the average level across 2010 to 2012. Doing this removes the opportunity to substitute back and forth between generation resources based on changes to the marginal cost of generation. This case maintains a portfolio effect but eliminates the substitution effect in power generation. The difference between this constant relative fuel price case and the base case provides an estimate of the current value of the substitution effect provided by the current diverse power generation fuel mix. The results show significantly higher fuel costs from a generation mix deprived of substitution based on fuel price changes. The substitution effects in the current diverse US power generating portfolio reduced the fuel cost for US power production by over $2.8 billion per year. In just the three years of the base case, US power consumers realized nearly $8.5 billion in fuel savings from the substitution effect. Figure 22 shows the results of this first step in the analysis for each interconnection and the United States as a whole.

FIGURE 22

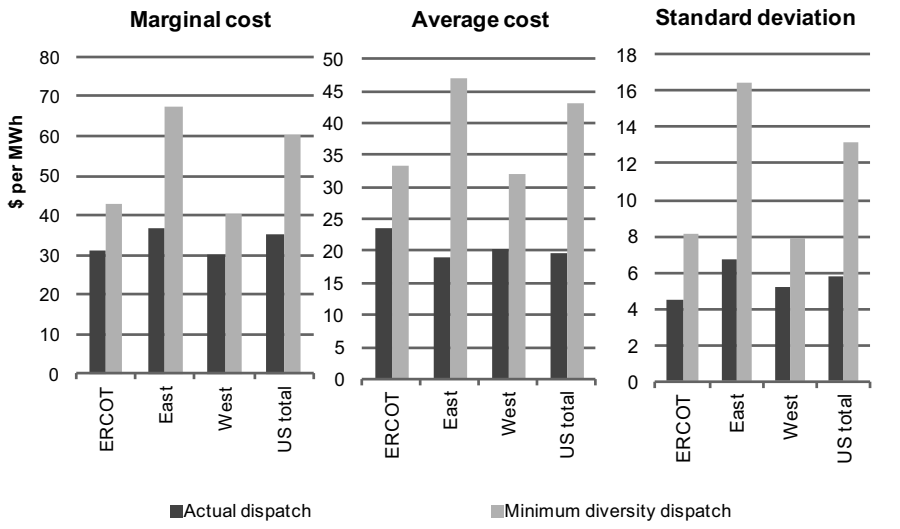


The value of the portfolio effect

The second step quantifies the portfolio value of the current generation mix. To measure this, the base case is altered by replacing the actual current generation mix with the less diverse generation mix. All else is held constant in this reduced diversity case, including the actual monthly fuel prices. Therefore, this reduced diversity simulation reduces the portfolio effect of diverse generation and allows any economic generation substitution to take place utilizing this less diverse capacity mix.

FIGURE 13

Actual dispatch versus minimum diversity dispatch: Cost results



Source: IHS Energy

© 2014 IHS

Figure 23 shows the performance metrics for each interconnection and the United States as a whole in the less diverse portfolio case compared to the base case.

The portfolio effect reduces not only costs, but also the variation in costs. This translates into a reduction in the typical monthly variation in consumers' power bills of between 25% and 30%.

The differences in average power production costs between the reduced diversity case and the current supply case indicate that fuel and technology diversity in the base case US generation mix provides power consumers with benefits of $93 billion per year. This difference between the reduced diversity case and the base case includes both the substitution and portfolio effects. Using the results of step one allows separation of these two effects, as shown in Table 4.

Figures 24 and 25 show the progression from the base case to the reduced diversity case. The results indicate that the Eastern power interconnection has the most to lose from a less diverse power supply because it faces more significant increases in cost, price, and variability in moving from the base case to the reduced diversity case. The Eastern interconnection ends up with greater variation in part because its delivered fuel costs are more varied than in Texas or the West. In addition, the natural endowments of hydroelectric power in the Western interconnection generation mix continue to mitigate some of the fuel price risk even at a reduced generation share.

In the past three years, generation supply diversity reduced US power supply costs by $93 billion per year, with the majority of the benefit coming from the portfolio effect. These estimates are conservative because they were made only across the recent past, 2010 to 2012. An evaluation over a longer period of history would show increased benefits from managing greater levels of fuel price risk.

The estimates of the current value of power supply diversity are conservative as well because they do not include the feedback effects of higher power cost variation on the cost of capital for power suppliers, as outlined in Appendix A. The analyses indicate that a power supplier with the production cost variation equal to the current US average would have a cost of capital 310 basis points lower than a power supplier

Source: IHS Energy

with the production cost variation associated with the generation mix of the reduced diversity case. Since 14% of total power costs are returned to capital, this difference accounts for 1–3% of the overall cost of electricity. This cost-of-capital effect can have a magnified impact on overall costs if more capital has to be deployed with an acceleration of power plant closures and replacements from the pace that reflects underlying economics.

The cost of accelerating change in the generation mix

Current trends in public policies and flawed power market outcomes can trigger power plant retirements before the end of a power plant's economic life. When this happens, the closure creates cost impacts beyond the level and volatility of power production costs because it requires shifting capital away from a productive alternative use and toward a replacement power plant investment.

All existing power plants are economic to close and replace at some point in the future. The economic life of a power plant ends when the expected costs of continued operation exceed the cost of replacement. When

© 2014 IHS

this happens, the most cost-effective replacement power resource depends on the current capacity mix and what type of addition creates the greatest overall benefit—including the impact on the total cost of power and the management of power production cost risk.

Figure 26 shows the current distribution of the net present value (NPV) of the going-forward costs for the existing US coal-fired generation fleet on a cents per MWh basis in relation to the levelized NPV of replacement power on a per MWh basis.

As the distribution of coal-fired power plant going-forward costs indicates, there is a significant difference between the going-forward costs and the replacement costs for the majority of plants. As a result, a substantial cost exists to accelerate the turnover of coal-fired power plants in the capacity mix. For example, closing coal-fired power plants and replacing them as quickly as possible with natural gas–fired power plants would impose a turnover cost of around $500 billion.

Figure 27 shows the going-forward costs of the existing US nuclear power plant fleet. As with the coal units, there is currently a high cost associated with premature closure. As a point of comparison, closing all existing nuclear power plants and replacing them as quickly as possible with natural gas–fired power plants would impose a turnover cost of around $230 billion. Unlike the coal fleet, where a nominal amount of older capacity has a going-forward cost that exceeds the expected levelized cost of replacement, none of the US nuclear capacity is currently more expensive than the lowest of projected replacement costs.

Closing a power plant and replacing it before its time means incurring additional capital costs. The average depreciation rate of capital in the United States is 8.3%. This implies that the average economic life of a

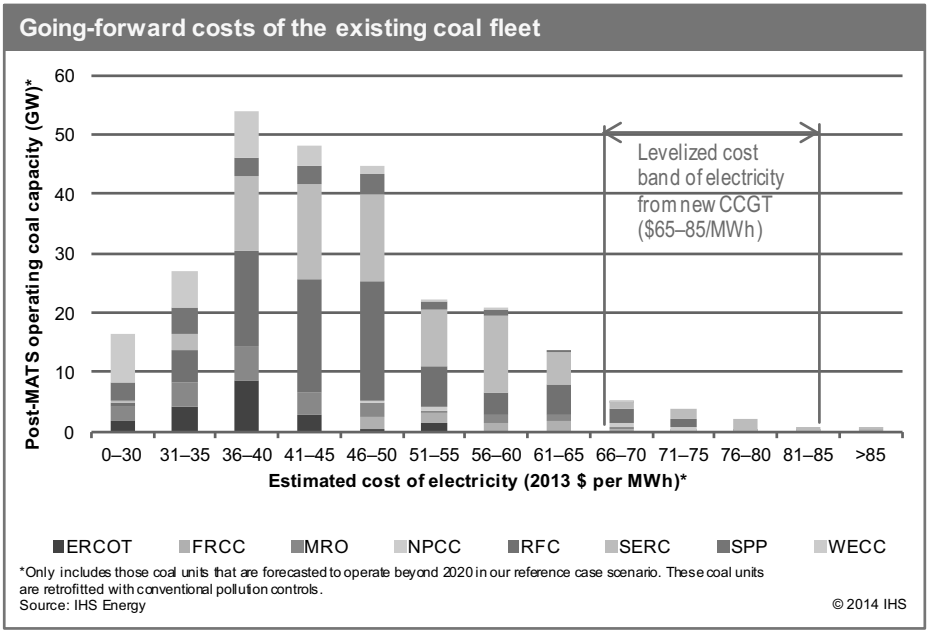
SI-SSA-0010-1145

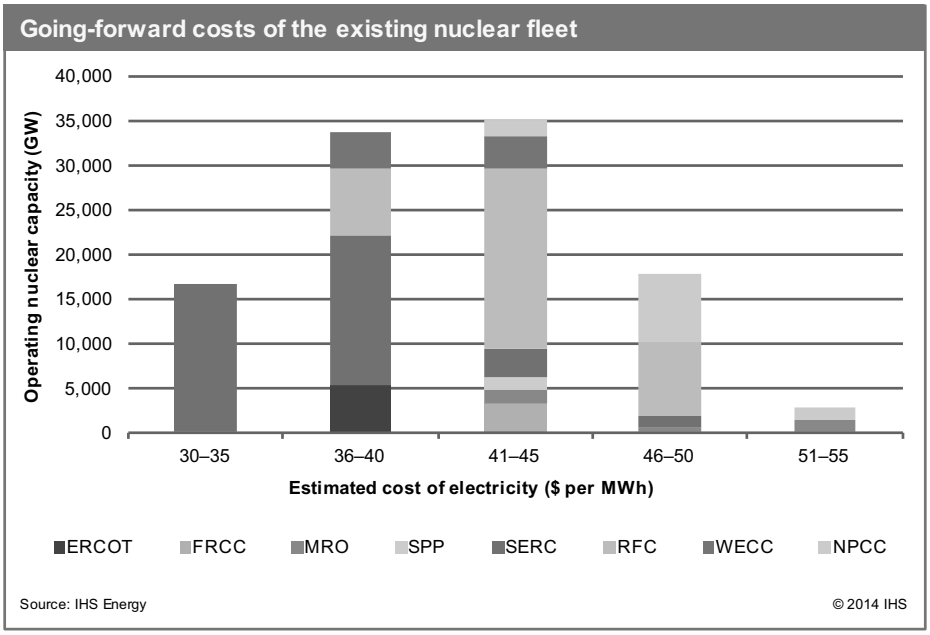
capital investment in the United States economy is 12 years. Altering the amount of capital deployed in the US economy by $1 in Year 1 results in an equivalent impact on GDP as deploying a steady stream of about $0.15 of capital for each of the 12 years of economic life. This annual levelized cost approximates the value of the marginal product of capital. Therefore, each dollar of capital deployed to replace a power plant that retires prematurely imposes an opportunity cost equal to the value of the marginal productivity of capital in each year.

FIGURE 16



Economywide impacts

FIGURE 17



In addition to the $93 billion in lost savings from the portfolio and substitution effects, depending upon the pace of premature closures, there is a cost to the economy of diverting capital from other productive uses. The power price increases associated with the reduced diversity case would profoundly affect the US economy. The reduced diversity case shows a 75% increase in average wholesale power prices compared to the base case. IHS Economics conducted simulations using its US Macroeconomic Model to assess the potential impact of the change in the level and variance of power prices between the base case and the reduced diversity case. The latest IHS base line macroeconomic outlook in December 2013 provides a basis for evaluating the impacts of an electricity price shock due to a reduced diversity case for power supply. Subjecting the current US economy to such a power price increase would trigger economic disruptions, some lasting over a multiyear time frame. As a result, it would take several years for most of these disruptions to dissipate. To capture most of these effects, power price changes were evaluated over the period spanning the past two and the next three years to approximate effects of a power price change to the current state of the economy. Wholesale power price increases were modeled by increasing the

Producer Price Index for electricity by 75% in the macroeconometric model; consumers were affected by the resulting higher prices for retail electricity and other goods and services.

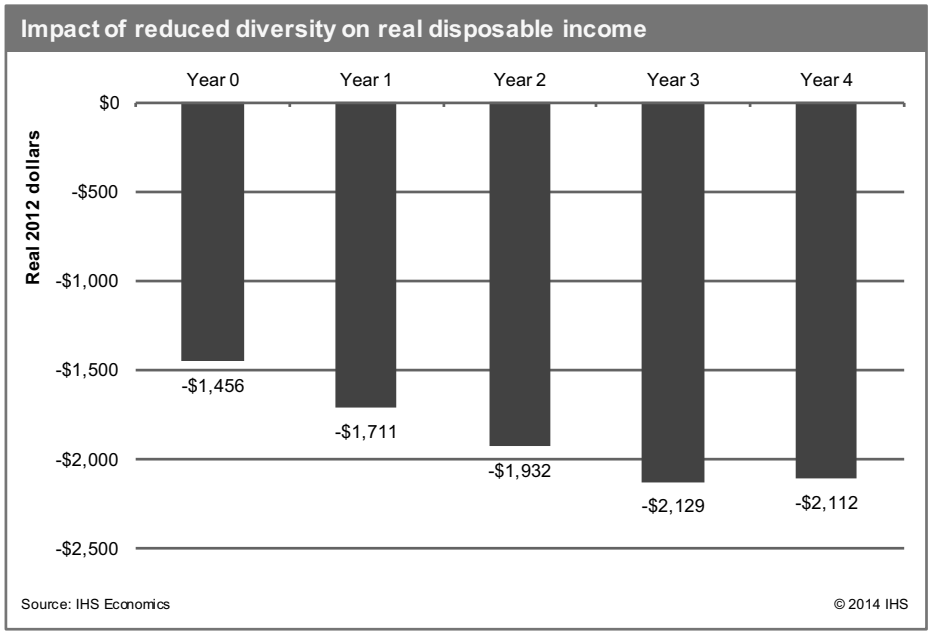
Economic impacts of the power supply reduced diversity case are quantified as deviations from the IHS macroeconomic baseline simulations of the US economy. The major impacts within the three years after the power price change would include

- A drop in real disposable income per household of about $2,100
- A reduction of 1,100,000 jobs
- A decline in real GDP of 1.2%

Consumers will bear the brunt of the impact of higher power prices. The higher price of electricity would trigger a reduction in power use in the longer run (10 or more years out) of around 10%. Yet even with such dramatic reductions in consumption, the typical power bill in the United States would increase from around $65 to $72 per month.

Not only will consumers face higher electric bills, but some portion of increases in manufacturers' costs ultimately will be passed on to consumers through higher prices for goods and services. Faced with lower purchasing power, consumers will scale back on discretionary purchases because expected real disposable income per household is lower by over $2,100 three years after the electric price increase (see Figure 28). Unlike other economic indicators (such as real GDP) that converge toward equilibrium after a few years, real disposable income per household does not recover, even if the simulations are extended out 25 years. This indicates that the price increases will have a longer-term negative effect on disposable income and power consumption levels.

FIGURE 18



Businesses will face the dual challenge of higher operational costs coupled with decreased demand for their products and services. Industrial production will decline, on average, by about 1% through Year 4. This will lead to fewer jobs (i.e., a combination of current jobs that are eliminated and future jobs that are never created) within a couple of years relative to the IHS baseline forecast, as shown in Figure 29, with the largest impact appearing in Year 2, with 1,100,000 fewer jobs than the IHS baseline level.

© 2014 IHS
SI-SSA-0010-1147

Impact on GDP

The US economy is a complex adaptive system that seeks to absorb shocks (e.g., increases in prices) and converge toward a long-term state of equilibrium. Although the simulations conducted for this study do not project that the US economy will fall into a recession because of power price increases, it is informative to gauge the underperformance of the US economy under the reduced diversity case. In essence, the higher power prices resulting from the reduced diversity conditions cause negative economic impacts equivalent to a mild recession relative to the forgone potential GDP of the baseline. The economic impacts of the reduced diversity case set back GDP by $198 billion, or 1.2% in Year 1 (see Figure 30). This deviation from the baseline GDP is a drop that is equivalent to about half of the average decline in GDP in US recessions since the Great Depression. However, the impacts on key components of GDP such as personal consumption and business investment will differ.

FIGURE 19

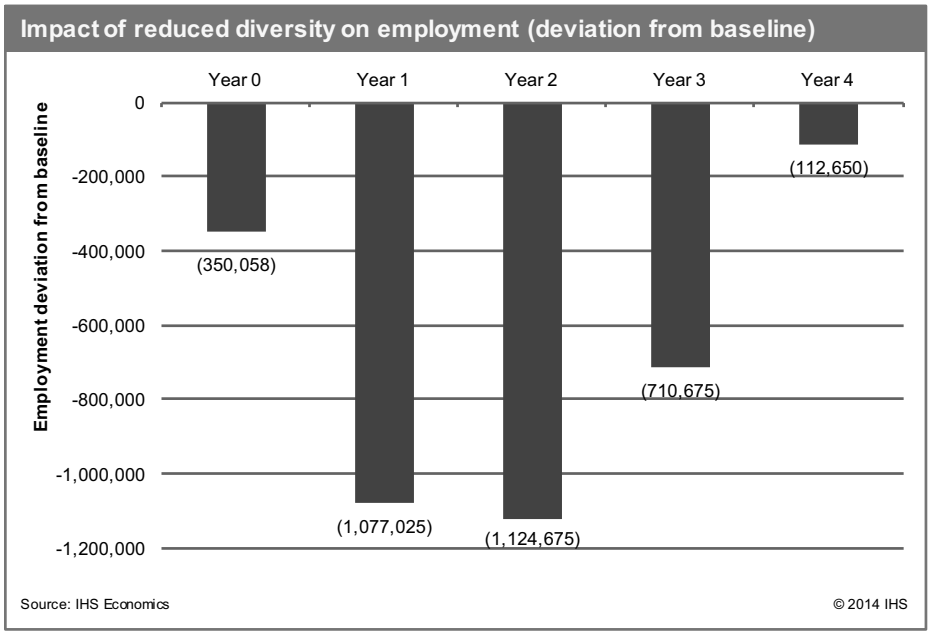


FIGURE 10

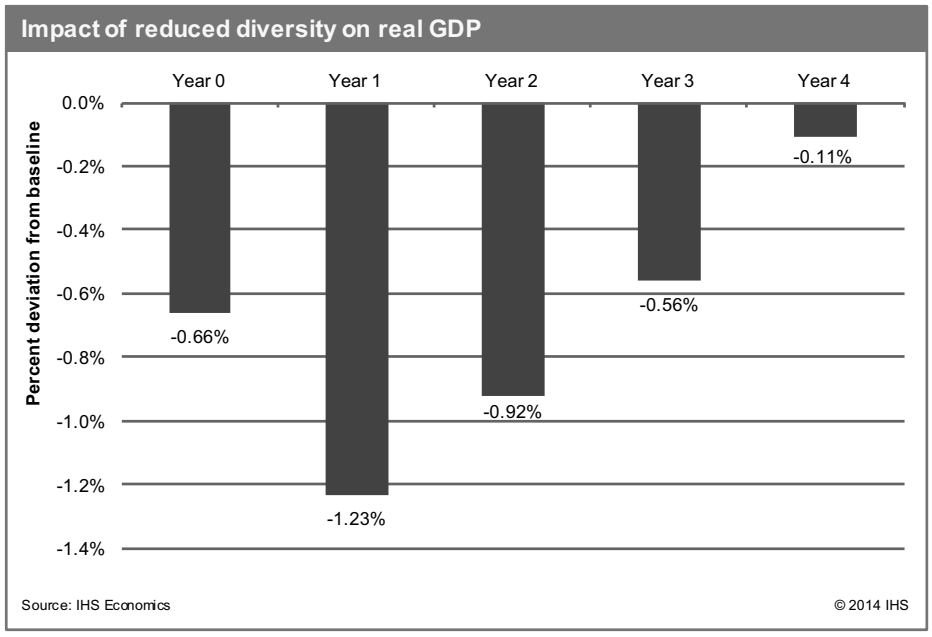


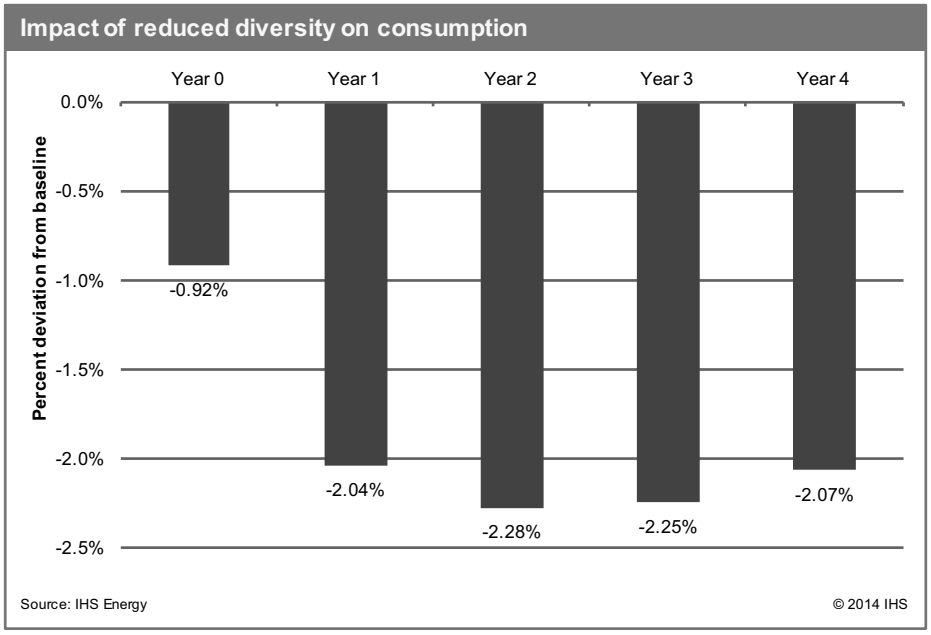
Consumption

Analyzing personal consumption provides insights on the changes to consumer purchasing behavior under the scenario conditions. Consumption, which accounts for approximately two-thirds of US GDP, remains lower over the period with each of its three subcomponents—durable goods, nondurable goods, and services—displaying a different response to the reduced power supply scenario conditions. In contrast with overall GDP, consumer spending shows little recovery by Year 4, as shown in Figure 31. This is due to continued higher prices for goods and services and decreased household disposable income. About 57% of the decline will occur in purchases of services, where household operations including spending on electricity will have a significant impact.

20141023 3333 FERC PDF (Unofficial) 10/23/2014 4:11:39 PM

In the early years, lower spending on durable goods (appliances, furniture, consumer electronics, etc.) will account for about 33% of the decline, before moderating to 25% in the longer term. This indicates that consumers, faced with less disposable income, will simply delay purchases in the early years. The US macro simulations also predict moderate delays in housing starts and light vehicle sales, ostensibly due to consumers trying to minimize their spending.

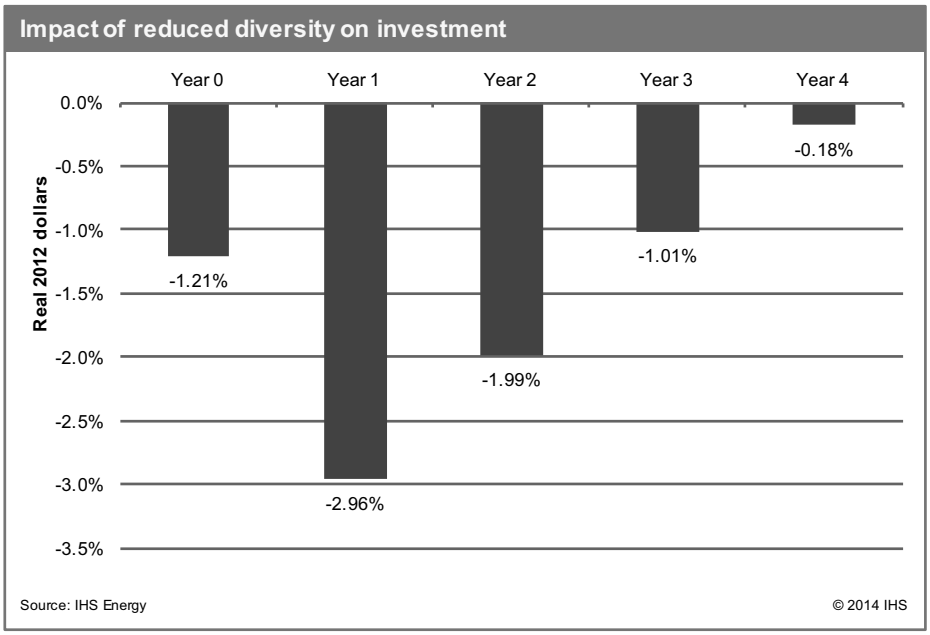
FIGURE 21



Investment

Following an initial setback relative to the baseline, investment will recover by the end of the forecast horizon. Nonresidential investment will initially be characterized by delays in equipment and software purchases, which will moderate a few years after the electric price shock. Spending on residential structures will remain negative relative to the baseline over the four years, as shown in Figure 32. The net effect in overall investment is a recovery as the economy rebounds back to a long-run equilibrium.

FIGURE 12



In the longer term, if current trends cause the reduced diversity case to materialize within the next decade, then the premature closure and replacement of existing power plants would shift billions of dollars of capital from alternative deployments in the US economy.

Conclusions

Consumers want a cost-effective generation mix. Obtaining one on the regulated and public power side of the industry involves employing an integrated resource planning process that properly incorporates

© 2014 IHS

20171025 3333 FERC PDF (Unofficial) 10/25/2017 4:11:39 PM

cost-effective risk management. Obtaining such a mix on the competitive side of the power business involves employing time-differentiated market-clearing prices for energy and capacity commodities that can provide efficient economic signals. The linkage between risk and cost of capital can internalize cost-effective risk management into competitive power business strategies. Regardless of industry structure, a diverse generation mix is the desired outcome of cost-effective power system planning and operation.

The results of this study indicate seven key factors that will shape US power supply diversity in the years to come:

- **Energy policy development.** US policy heavily influences the US power supply mix. Implementing an all-of-the-above energy policy requires properly internalizing the value of fuel diversity.

- **Market structure.** Market flaws distort wholesale power prices downward and result in uneconomic retirement and replacement of existing cost-effective generation resources. This issue and any market structure changes to address it will significantly shape future power plant development.

- **Energy policy discourse.** Preserving the value of fuel diversity depends on public awareness and understanding. The extent and nature of public education regarding the value of power supply diversity may strongly influence public opinion.

- **Planning alignment.** Alignment of fuel and technology choices for power generation with engineering and economic principles is critical to efficient and reliable supply. There is no single fuel or technology of choice for power generation, and all forms of power production have economic, environmental, and reliability impacts.

- **Risk assessment.** To incorporate system considerations into plant-level decisions, prudent fuel price uncertainties must be used with probabilistic approaches to decision making.

- **Flexibility.** Flexibility and exemptions in rule making and implementation allow for the balancing of costs and benefits in power supply systems and may help preserve highly valuable diversity in systemwide decisions as well as on a small but impactful individual plant scale.

- **Scope.** Including fuel price risk and additional storage and transportation infrastructure costs is crucial when evaluating reduced diversity scenarios in comparison to the cost of maintaining and expanding fuel diversity.

Appendix A: Cost-effective electric generating mix

The objective of power supply is to provide reliable, efficient, and environmentally responsible electric production to meet the aggregate power needs of consumers at various points in time. Consumers determine how much electricity they want at any point in time, and since the power grid physically connects consumers, it aggregates individual consumer demands into a power system demand pattern that varies considerably from hour to hour. For example, Figure A-1 shows the hourly aggregate demand for electricity in ERCOT.

In order to reliably meet aggregate power demands, enough generating capacity needs to be installed and available to meet demand at any point in time. The overall need for installed capacity is determined by the peak demand and a desired reserve margin. A 15% reserve margin is a typical planning target to insure reliable power supply.

The chronological hourly power demands plus the required reserve margin allow the construction of a unitized load duration curve (see Figure A-2). The unitized load duration curve orders hourly electric demands from highest to lowest and unitizes the hourly loads by expressing the values on the y-axis as a percentage of the maximum (peak) demand plus the desired reserve margin. The x-axis shows the percentage of the year that load is at or above the declining levels of aggregate demand.

This unitized load duration curve has a load factor—the ratio of average load to peak load—of 0.60. Although load duration curve shapes vary from one power system to another, this load factor and unitized load duration curve shape is a reasonable approximation of a typical pattern of electric

FIGURE A-1

demand in a US power system. The objective of any power system would be to match its demand pattern with cost-effective power supply.

There are a number of alternative technologies available to produce electricity. These power supply alternatives have different operating characteristics. Most importantly, some power generating technologies can produce electricity on demand that aligns with the pattern of consumer demand through time, while others cannot. For example, solar PV panels can only provide electric output during hours of sunlight and thus cannot meet aggregate demand during the night. In contrast, thermal generation such as coal and natural gas can ramp up and down or turn on and off to match output with customer demand. Technologies such as coal and natural gas are considered dispatchable, while technologies such as solar and wind are considered nondispatchable. A number of combinations of technologies can together provide electric output that matches the pattern of consumer needs.

The lowest-cost generating technologies that can meet the highest increases in demand are peaking technologies such as combustion turbines (CTs). CTs are the most economical technology to meet loads that occur for only a small amount of time. These technologies can start-up quickly and change output flexibly to meet the relatively infrequent hours of highest power demand. They are economic even though they are not the best available technology for efficiently transforming fuel into electricity. CTs have relatively low upfront capital costs and thus present a trade-off with more efficient but higher capital cost generating technology alternatives. Since these resources are expected to be used so infrequently, the additional cost of more efficient power generation is not justified by fuel savings, given their expected low utilization rates.

Cycling technologies are most economical to follow changes in power demand across most hours. Consequently, utilization rates can be high enough to generate enough fuel savings to cover the additional capital cost of these technologies over a peaking technology. These intermediate technologies provide flexible operation along with efficient conversion of fuel into power. A natural gas–fired combined-cycle gas turbine (CCGT) is one technology that is suitable and frequently used for this role.

Base-load technologies are the lowest-cost power supply sources to meet power demand across most hours. These technologies are cost-effective because they allow the trading of some flexibility in varying output for the lower operating costs associated with high utilization rates. These technologies include nuclear power plants, coal-fired power plants, and reservoir hydroelectric power supply resources.

Nondispatchable power resources include technologies such as run-of-the-river hydroelectric, wind, and solar power supplies. These technologies produce power when external conditions allow—river flows, wind speeds, and solar insolation levels. Variations in electric output from these resources reflect changes in these external conditions rather than changes initiated by the generator or system operator to follow shifts in power consumer needs. Some of these resources can be economic in a generation mix if the value of the fuel they displace and their net dependable capacity are enough to cover their total cost. However, since nondispatchable production profiles do not align with changes in consumer demands, there are limits to how much of these resources can be cost-effectively incorporated into a power supply mix.

Alternative power generating technologies also have different operating costs. Typical cost profiles for alternative power technologies are shown in Table A-1. Both nuclear and supercritical pulverized coal (SCPC) technologies are based on steam turbines, whereby superheated steam spins a turbine; in coal's case, supercritical refers to the high-pressure phase of steam where heat transfer and therefore the turbine itself is most efficient. Natural gas CTs are akin to jet engines, where the burning fuel's exhaust spins the turbine. A CCGT combines both of these technologies, first spinning a CT with exhaust and then using that exhaust to create steam which spins a second turbine.

TABLE A-1

Typical cost profiles for alternative power technologies

	CCGT	SCPC	Nuclear	CT
Capital cost (US$ per kW)	1,350	3,480	7,130	790
Variable O&M cost (US$ per MWh)	3.5	4.7	1.6	4.8
First year fixed O&M cost (US$ per kW-yr)	13	39	107	9
Property tax and insurance (US$ per kW-yr)	13	36	78	8
Fuel price (US$ per MMBtu)	4.55	2.6	0.7	4.55
Heat rate (Btu per kWh)	6,750	8,300	9,800	10,000
CO_2 emission rate (lbs per kWh)	0.8	1.73	0	1.18

Total capital cost figures include owner's costs: development/permitting, land acquisition, construction general and administrative, financing, interest during construction, etc.

Source: IHS Energy

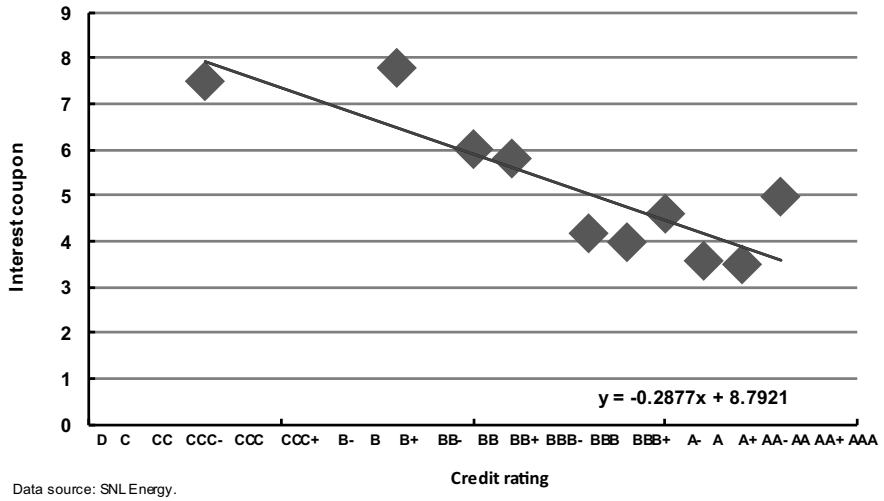
Power production technologies tend to be capital intensive; the cost of capital is an important determinant of overall costs. The cost of capital is made up of two components: a risk-free rate of return and a risk premium. Short-term US government bond interest rates are considered an approximation of the risk-free cost of capital. Currently, short-term US government bond interest rates are running at 0.1%. In order to attract capital to more risky investments, the return to capital needs to be greater. For example, the average cost of new debt to the US investor-owned power industry is around 4.5%.[11] This indicates an average risk premium of 4.4%.

Power generating technologies have different risk profiles. For example, the fluctuations in natural gas prices and demand levels create uncertainty in plant utilization and the level of operating costs and revenues. This makes future net income uncertain. Greater variation in net income makes the risk of covering debt obligations greater. In addition, more uncertain operating cost profiles add costs by imposing higher working capital requirements.

Risk profiles are important because they affect the cost of capital for power generation projects. If a project is seen as more risky, investors demand a higher return for their investment in the project, which can have a significant impact on the overall project cost.

FIGURE A-3

2010 shareholder-owned utilities senior debt offerings average interest coupon versus credit rating



Data source: SNL Energy.

© 2014 IHS

Credit agencies provide risk assessments and credit ratings to reflect these differences. Credit ratings reflect the perceived risk of earning a return on, and a return of, capital deployments. As Figure A-3 shows, the higher credit ratings associated with less risky investments have a lower risk premium, and conversely lower credit ratings associated with more risky investments have a higher risk premium.

Lower credit ratings result from higher variations in net

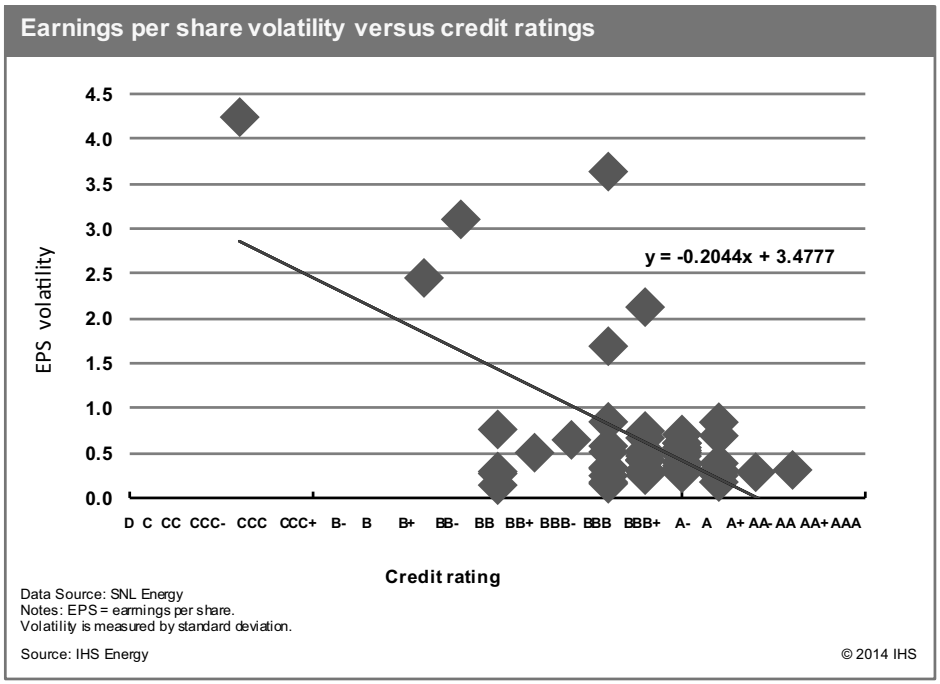
income, as shown in Figure A-4.

FIGURE A-4



Sometimes the cost of capital is directly related to the power plant when project financing is used. In other cases, power companies raise capital at the corporate level with a capital cost that reflects the overall company risk profile rather than just the power plant risk profile. Utilities typically have diverse power supply portfolios, whereas merchant generators tend to be much less diverse—typically almost entirely natural gas-fired. As a result of the different supply mixes and associated risk profiles, utilities and merchant generators have different costs of capital. This difference in the cost of capital provides an approximation of the difference in risk premium.

Overall, the cost of capital for merchant generators is higher than that for utilities broadly. While the power industry has an average cost of debt of roughly 4.5%, merchant generators with significant natural gas holdings tend to have a cost of debt of around 8%. As many of these firms have gone through bankruptcies in the past, this number may be lower than the cost of debt these firms had prior to restructuring.[12] The implied risk premium of a merchant generator to a utility is 3.5%, which is similar to the cost of capital analysis results discussed in the body of the report, where the reduced diversity case generator was calculated to have a cost of capital 310 basis points (3.1%) higher than that of the current US power sector as a whole.

Merchant generators with majority natural gas holdings have higher costs of capital because of the increased earnings volatility and risk of an all natural gas portfolio. In contrast, a generator with a more diverse portfolio needing to secure financing for the same type of plant would have costs of capital more in line with the industry as a whole. This can have a significant impact on the overall cost of the plant. This is not due specifically to the properties of natural gas as a fuel, but rather to the diversity of generating resources available. If a merchant generator were to have an exclusively coal-fired generating fleet or an exclusively nuclear generating fleet, its cost of capital would also increase owing to the higher uncertainty in generation cash flows.

The expected annual power supply costs can be calculated over the expected life of a power plant once the cost of capital is set and combined with the cost and operating profile data. These power costs are uneven through time for a given utilization rate. Therefore, an uneven cost stream can be expressed as a levelized cost by finding a constant cost in each year that has the same present value as the uneven cost stream. The discount rate used to determine this present value is based on the typical cost of capital for the power

12. Based on analysis of the "Competitive" business strategy group, defined by IHS as businesses with generation portfolios that are over 70% nonutility, based on asset value and revenue. Cost of debt based on coupon rates of outstanding debt as of May 2014.

industry as a whole. Dividing the levelized cost by the output of the power plant at a given utilization rate produces a levelized cost of energy (LCOE) for a given technology at a given utilization rate (see Figure A-5).

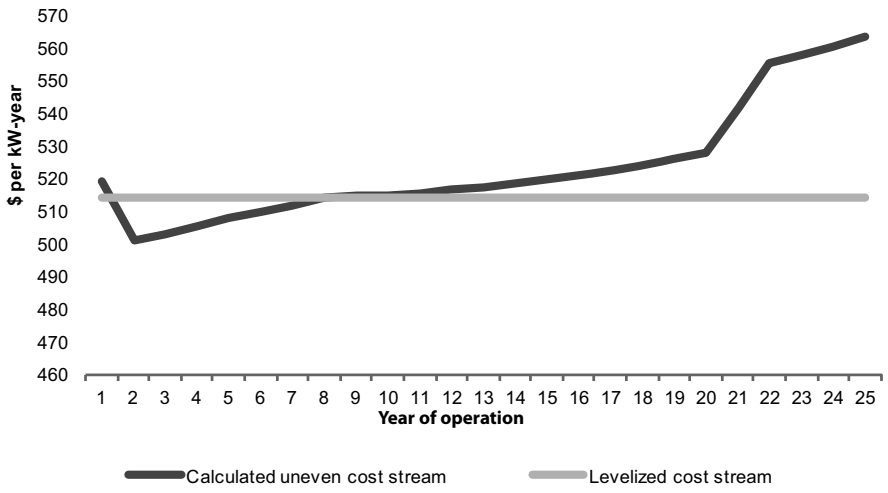
A levelized cost stream makes it possible to compare production costs at different expected utilization rates. A lower utilization rate forces spreading fixed costs over fewer units of output and thus produces higher levelized costs (see Figure A-6).

Figure A-7 adds the LCOE of a CT. Since the LCOE of the CT is lower than that of the CCGT at high utilization rates, adding CTs shows the point at which the savings for a CCGT's greater efficiency in fuel use are enough to offset the lower fixed costs of a CT.

There is a utilization rate at which a CCGT is cheaper to run than a CT. Below a utilization rate of roughly 35%, a CT is more economical. At higher utilization rates, the CCGT is more economical. When referring back to the load duration curve, it can be calculated that a generation mix that is 37% CT and 63% CCGT would produce a least-cost outcome. This can be demonstrated by comparing the LCOE graph with the load duration curve: the intersection point of CT and CCGT LCOEs occurs at the same time percentage on the LCOE graph at which 63% load occurs on the load duration curve (see Figure A-8).

FIGURE A-5

Cost stream comparisons—CCGT, 85% utilization rate



Source: IHS Energy

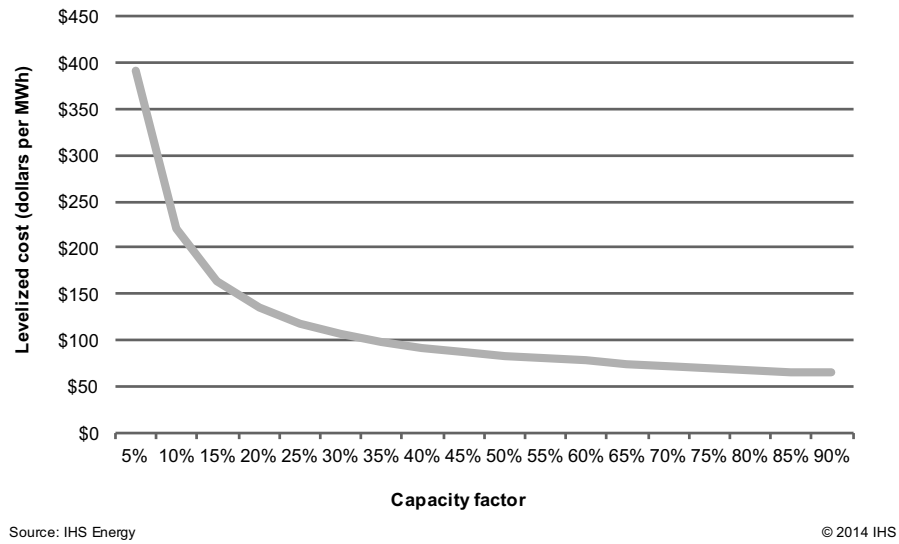
FIGURE A-6

LCOE of CCGT generation



Source: IHS Energy

© 2014 IHS

The levelized cost of production for each technology can be determined by finding the average load (and corresponding utilization rate) for the segment of the load duration curve (LDC) that corresponds to each technology (in this example, the two segments that are created by splitting the curve at the 35% mark). Loads that occur less than 35% of the time will be considered peak loads, so the average cost of meeting

© 2014 IHS
SI-SSA-0010-1155

a peak load will be equivalent to the cost of a CT operating at a 17.5% utilization rate, the average of the peak loads. Cycling loads will be defined as loads occurring between 35% to 80% of the time, with base loads occurring more than 80% of the time. As the CCGT is covering both cycling and base loads in this example, the average cost of meeting theses loads with a CCGT will be equivalent to the levelized cost of a CCGT at a 57.5% utilization rate. A weighted average of the costs of each technology is then equivalent to an average cost of production for the power system. For this generation mix, the levelized cost of production is equal to 9.6 cents per kWh.

The generating options also can be expanded to include fuels besides natural gas. Stand-alone coal and stand-alone nuclear are not lower cost than stand-alone gas, as shown in Figure A-9, and all have a high-risk premium associated with the lack of diversity. However, when combined as part of a generation mix, the cost of capital will be lower owing to the more diverse (and therefore less risky) expected cash flow.

Based on the LDC, in this example base-load generation was modeled at 52.5% of capacity and was composed of equal parts gas, coal, and nuclear capacity. This combination of fuels and technology produces a diverse portfolio that can reduce risk and measurably lower the risk premium in the cost of capital. The point at which a CCGT becomes cheaper than a CT changes slightly from the previous example owing to the change in cost of capital, but the result is similar, with a 30% utilization rate the critical point and 36% CT capacity the most economical. Cycling loads with utilization

rates between 30% and 80% can be covered by CCGTs, equaling 11.5% of capacity. The levelized cost of production for this more diverse portfolio is equal to 9.3 cents per kWh. Even though coal and nuclear have higher levelized costs than gas, all else being equal, the reduced cost of capital is more than enough to offset the increased costs of generation. The implication is that a least-cost mix to meet a pattern of demand is a diverse mix of fuels and technologies.

If the power system has a renewables mandate, this can be incorporated as well. Solar PV has a levelized cost of 14.2 cents per kWh, given a 4.5% cost of capital. If solar made up 10% of generating capacity, the load duration curve for the remaining dispatchable resources would change, as shown in Figure A-10. Using hourly solar irradiation data from a favorable location to determine solar output, the peak load of the power system does not change, as there is less than full solar insulation in the hour when demand peaks.[13] The load factor for this new curve is 0.58, a small decrease from the original curve. A lower load factor typically means that larger loads occur less often, so more peaking capacity is necessary.

FIGURE A-9

Levelized cost curves of generating resources

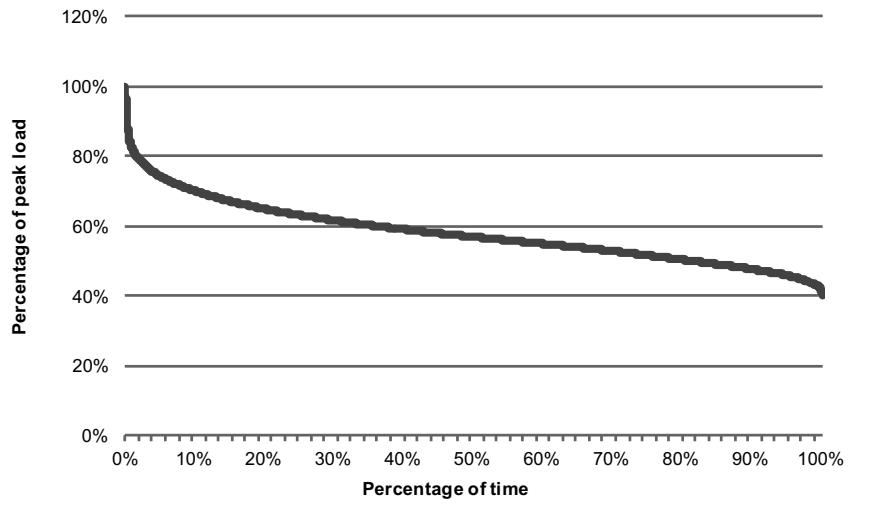
FIGURE A-10

Load duration curve, after solar additions



Source: IHS Energy
Data Source: Ventyx Velocity Suite, National Renewable Energy Laboratory

© 2014 IHS

The needed dispatchable resources can be recalculated using the new curve, integrating the solar generation. The new curve increases the amount of peaking resources needed, but otherwise changes only very slightly. After solar is added, the total cost is 10.8 cents per kWh. Since the output pattern of solar doesn't match the demand pattern for the power system, adding solar does not significantly decrease the amount of capacity needed.

Conclusion

- There is no single fuel or technology of choice for power generation. Reliably and efficiently supplying consumers with the amounts of electricity that they want, when they want it, requires a diverse generation mix.

- A cost-effective generation mix involves diversity but does not involve maximizing diversity by equalizing generation shares from all available supply options.

- The cost-effective mix of fuel and technologies for any power system is sensitive to the uncertainties surrounding the level and pattern of consumer power demands as well as expectations regarding the cost and performance of alternative power generating technologies and, in particular, the expectations for delivered fuel prices.

- The cost-effective generating mix will differ from one power system to the next because of differences in aggregate consumer demand patterns as well as the cost and performance of available generating options.

- The best type of capacity to add to any generation portfolio depends on what types of capacity are already in the mix.

Appendix B: IHS Power System Razor Model overview

Design

The IHS Power System Razor (Razor) Model was developed to simulate the balancing of power system demand and supply. The model design provides flexibility to define analyses' frequency and resolution in line with available data and the analytical requirements of the research investigation.

For this assessment of the value of fuel diversity, the following analytical choices were selected:

- **Analysis time frame**—Backcasting 2010 to 2012
- **Analysis frequency**—Weekly balancing of demand and supply
- **Geographic scope**—US continental power interconnections—Western, Eastern, and ERCOT
- **Demand input data**—Estimates of weekly interconnection aggregate consumer energy demand plus losses
- **Fuel and technology types**—Five separate dispatchable supply alternatives: nuclear, coal steam, natural gas CCGT, gas CT, and oil CT
- **Supply input data by type**—Monthly installed capacity, monthly delivered fuel prices, monthly variable operations and maintenance (O&M), heat rate as a function of utilization
- **Load modifiers**—Wind, solar, hydroelectric, net interchange, peaking generation levels, and weekly patterns

Demand

The Razor Model enables the input of historical demand for backcasting analyses as well as the projection of demand for forward-looking scenarios. In both cases, the Razor Model evaluates demand in a region as a single aggregate power system load.

For backcasting analyses, the model relies upon estimates of actual demand by interconnection. For forward-looking simulations, Razor incorporates a US state-level cross-sectional, regression-based demand model for each of the three customer classes—residential, commercial, and industrial. Power system composite state indexes drive base year demand levels by customer class into the future.

Load modifiers

Utilization of some power supply resources is independent of SRMC–based dispatch dynamics. Some power supply is determined by out-of-merit-order utilization, normal production patterns, or external conditions—such as solar insolation levels, water flows, and wind patterns. These power supply resources are treated as load modifiers.

© 2014 IHS

Net load

Net load is the difference between power system aggregate electric output needs and the aggregate supply from load modifiers. It is the amount of generation that must be supplied by dispatchable power supply resources.

Calibration of the inputs determining net load is possible using data reporting the aggregate output of dispatchable power sources.

Fuel- and technology-specific supply curves

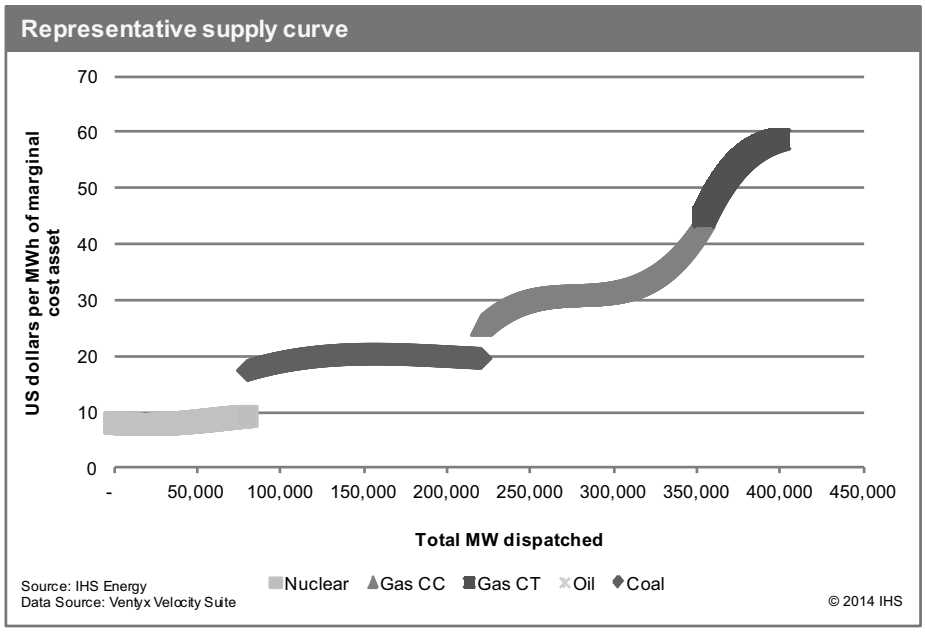
Supply curves are constructed for each fuel and technology type. The supply curve for each dispatchable power supply type reflects the SRMCs of the capacity across the possible range of utilization rates. Applying availability factors to installed capacity produces estimates of net dependable (firm, derated) capacity by fuel and technology type.

Each cost curve incorporates heat rate as a function of utilization rate.[14] *Heat rate* describes the efficiency of a thermal power plant in its conversion of fuel into electricity. Heat rate is measured by the amount of heat (in Btu) required each hour to produce 1 kWh of electricity, or most frequently shown as MMBtu per MWh. The higher the heat rate, the more fuel required to produce a given unit of electricity. This level of efficiency is determined primarily by the fuel type and plant design. Outliers are pruned from data to give a sample of heat rates most representative of the range of operational plants by fuel and technology type.[15]

Dispatch fuel costs are the product of the heat rate and the delivered fuel cost. Total dispatch costs involve adding variable operations and maintenance (VOM, or O&M) costs to the dispatch fuel costs. These O&M costs include environmental allowance costs.

The power system aggregate supply curve is the horizontal summation of the supply curves for all fuel and technology types. Figure B-1 illustrates the construction of the aggregate power system supply curve. The supply curve shows the SRMC at each megawatt dispatch level and the associated marginal resource.

FIGURE B-1



Balancing power system aggregate demand and supply

The Razor Model balances aggregate power system demand and supply by intersecting the demand and supply curves. At the intersection point, power supply equals demand; supply by type involves equilibrating the dispatch costs of available alternative sources of supply.

14. Power plant data sourced from Ventyx Velocity Suite.

15. Outliers are defined as plants with an average heat rate higher than the maximum observed fully loaded heat rate.

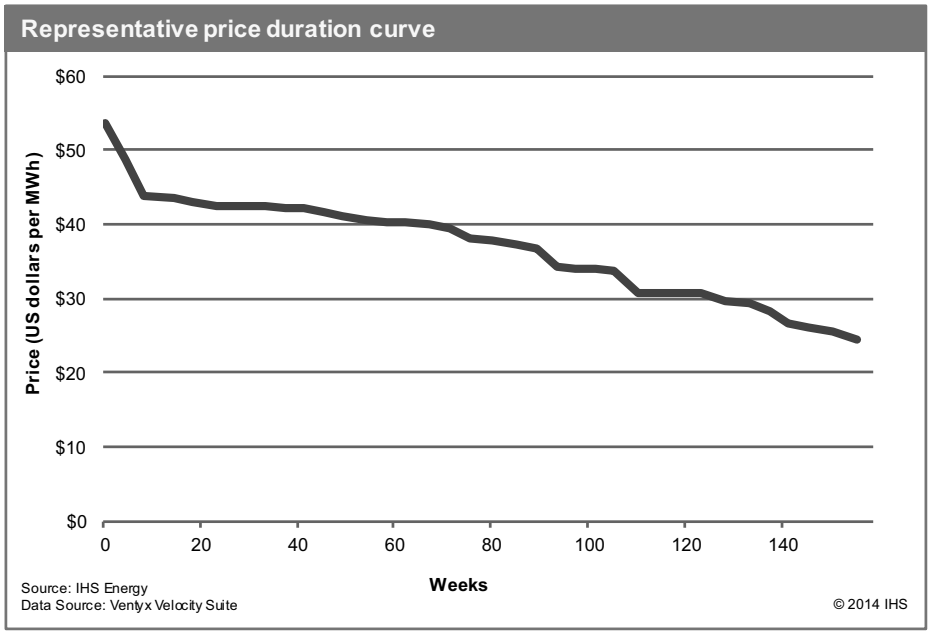
This power system–wide marginal cost of production is the basis for the wholesale power price level that clears an energy market.

The Razor Model results in the following outputs:

- **Power system SRMC/wholesale price**
- **Generation by fuel and technology type**
- **Average variable cost of production.** The average variable cost is calculated at each dispatch increment by taking the total cost at that generation level divided by the total megawatt dispatch.
- **Price duration curve.** The price duration curve illustrated in Figure B-2 provides an example of wholesale power price distribution across the weeks from 2010 through 2012.

Calibration

FIGURE B-2



The predictive power of the Razor Model for portfolio and substitution analysis is revealed by comparing the estimated values of the backcasting simulations to the actual outcomes in 2010–12.

The Razor Model backcasting results provide a comparison of the estimated and actual wholesale power prices. The average difference in the marginal cost varied between (3.8%) and +2.3% by interconnection region. A comparison of the average rather than marginal cost of power production also indicated a close correspondence. The average difference between the estimate and the actual average cost of power production varied between (4.7%) and (0.1%) by interconnection region. Table B-1 shows the assessment of the predictive power of the Razor Model for these two metrics across all three interconnections in the 2010 to 2012 weekly backcasting exercise.

TABLE B-1

IHS power system Razor Model analysis

	East	West	ERCOT
Average wholesale power price difference	2.3	0.3	-3.8
Average production cost difference	-0.2	-4.7	-0.1

Note: Differences reflect deviation averaged over backcasting period. Production cost difference reflects average of five power sources: Coal, gas combined-cycle, gas combustion turbine, nuclear, and oil.

v.	)	
PJM Interconnection, L.L.C.,	)	
Respondent.	)	

REPLY COMMENTS OF THE PSEG COMPANIES

Pursuant to Rule 213 of the Federal Energy Regulatory Commission's ("Commission") Rules of Practice and Procedure,[1] the PSEG Companies submit this reply to comments submitted concerning the proposed changes to PJM Interconnection, L.L.C.'s ("PJM") Open Access Transmission Tariff ("Tariff") described in the June 29, 2018 Order Rejecting Proposed Tariff Revisions, Granting In Part and Denying In Part Complaint, and Instituting Proceeding Under Section 206 of the Federal Power Act ("Order").[2]

This proceeding was established to consider the Commission's proposal to modify the PJM Tariff to: (1) expand the MOPR to cover new and existing resources that receive out-of-market payments with few or no exceptions; and (2) allow resources receiving out-of-market

[1] 18 C.F.R. §§ 385.212, 385.214 (2018).

[2] *PJM Interconnection, L.L.C.,* 163 FERC ¶ 61,236 (2018).

support to choose to be removed from the PJM capacity market, along with a commensurate amount of load, for some period of time ("FRR-Alternative").

The PSEG Companies continue to maintain that PJM's current capacity construct is just and reasonable and therefore does not require modification.[3] As described below, the PSEG Companies respectfully request that if the Commission determines changes are required, it approve the expanded Minimum Offer Price Rule ("Expanded MOPR") with little or no exceptions, along with either an approach aligned with PJM's Resource Carve-Out Option ("RCO"),[4] proposal or consider an alternate version of PJM's Proposed Extended RCO alternative as discussed below. The PSEG Companies stress that it is critical that the features we recommend below are incorporated in any approved changes to PJM's Tariff. In its initial comments, the PSEG Companies proposed an FRR-Alternative mechanism that is generally aligned with PJM's RCO option.[5] As such, the PSEG Companies support most aspects of PJM's RCO option, but propose modifications to ensure just and reasonable capacity market outcomes. It is particularly important that the RCO mechanism is structured to recognize all capacity that exists in the market and does not create an unnecessary oversupply situation that will lead to perpetually suppressed energy market prices and inefficient market signals to suppliers.

The PSEG Companies initial comments generally supported the Commission's proposal given our foundational belief that PJM should continue to manage a market construct that both

[3] *See* The PSEG Companies Request for Rehearing, Docket No. EL18-178-000, *et al*., (submitted July 30, 2018) ("PSEG Rehearing Request") (discussing the PSEG Companies' position on why the current tariff was improperly found to be unjust and unreasonable).

[4] Initial Submission of PJM Interconnection, L.L.C., Docket No. EL16-49-000, *et al*. (filed October 2, 2018) ("PJM Comments").

[5] *See* Comments of the PSEG Companies, Docket No. EL16-49-000, *et al*. (filed October 2, 2018) ("PSEG Comments").

accommodates legitimate state public policy initiatives[6] and honors the physical nature of the locational capacity market.[7] In its comments, PJM provides a mostly workable approach. However, there are a number of elements in PJM's proposal that should either be modified or rejected. These elements include the numerous exemptions to the MOPR and the capacity repricing mechanism ("Extended RCO"). Moreover, while the PSEG Companies disagree with the PJM's Extended RCO re-pricing proposal, if the Commission deems it just and reasonable, we offer an alternative that retains many of its elements, but request that the Commission adopt it with design elements identified below in order to ensure that the auction produces just and reasonable outcomes.

Therefore, we respectfully request that the Commission issue an order that supports the PSEG Companies' FRR-Alternative approach or a modified version of the PJM RCO approach should it still determine that changes are necessary to the MOPR construct. These are the alternatives that provide appropriate pricing for both load and resources, are fair across all Regional Transmission Organization ("RTO") participants and achieve the accommodative approach described in the Commission's Order.

I. COMMENTS

(a) The Commission Should Support PJM's RCO Option With Modifications Consistent With The PSEG Companies' Proposal

The PSEG Companies generally support PJM's proposed RCO clearing mechanism, but request that the Commission reject certain aspects of PJM's proposal to better align it with the PSEG Companies' suggestions. Specifically, the Commission was clear and many respondents

[6] For example, New Jersey's Zero Emissions Certificate ("ZEC") and other renewable energy programs designed to achieve the State's environmental goals.

[7] PSEG Comments at pp. 4-7.

have stated their strong support for a MOPR with few or no exceptions.[8] The PJM proposal falls well short of that bar, and with its broad exceptions, could easily be seen as unduly discriminatory by targeting specific asset classes or certain state activities, while accommodating those same actions in other places. The PSEG Companies do not support such an approach as proposed and have therefore provided suggestions to improve the PJM Extended RCO proposal if the Commission should determine a repricing mechanism is acceptable. The PSEG Companies believes PJM has provided a workable roadmap for the Commission to follow. We further emphasize that the PJM proposal does not have to be implemented in its entirety. The proposal includes several elements that should be approved by the Commission while other elements should be rejected.

PJM's RCO proposal – submitted in response to the Commission's guidance – remains riddled with exemptions that have little to no basis in either economics or policy and would likely have a material impact on market outcomes. The PSEG Companies reiterate our position that only materiality thresholds are appropriate as exceptions to applying the MOPR.[9] Several self-supply entities have submitted comments highlighting differences in their business models to rationalize exemptions from the Expanded MOPR. None of these commenters, however, provide a legitimate basis for differentiating between these business models and the goals of states that have chosen to select and compensate specific generation resources to achieve policy objectives. The Expanded MOPR construct should apply to all generation receiving material

[8] Initial Brief of Eastern Generation, LLC, Docket No. EL16-49-000, *et al.,* at pp. 10-12 (filed Oct. 1, 2018); Initial Brief of Exelon Corporation, Docket No. EL16-49-000, *et al.,* (filed Oct. 2, 2018); Initial Brief of the PJM Power Providers Group, Docket No. EL16-49-000, *et al*., at p. 10 (filed October 2, 2018); Initial Brief of The Electric Power Supply Association, Docket No. EL16-49-000, *et al*., at pp. 6-8 (filed Oct. 2, 2018).

[9] *See* Comments of the PSEG Companies, Docket No. EL16-49-000, *et al*., at p. 6 (filed October 2, 2018) (agreeing with PJM's proposed 1% of revenue value threshold, and suggested a 1 MW size threshold).

out-of-market support and the RCO option should serve as the accommodation mechanism for all entities looking to self-select generation resources.

Several commenters highlighted the locational difficulties that would be created if both resources and load were removed from the clearing algorithm. Specifically, Mr. Keech in his testimony outlined several of the problems that would be encountered.[10] The clearing algorithm proposed by PJM directly addresses those concerns and most importantly, aligns with the PSEG Companies' recommendation that there be a requirement that carved-out resources achieve the same reliability standard (i.e., reserve margin) as the market.[11]

A careful review of PJM's RCO approach reveals that there are aspects of the PJM design that may be superior to the PSEG Companies' suggested approach. Specifically, PJM's proposals for bidding and settlement offer a simpler solution than those proposed by the PSEG Companies and may better facilitate implementation of the RCO mechanism. PJM would require that the RCO resources offer into the market at zero. In contrast, the PSEG Companies suggested that the RCO resources establish their own economic offer. The PSEG Companies offered this suggestion believing that a resource may wish to get out of an obligation to either avoid capacity performance risk or pursue retirement. After further consideration of the PJM proposal, these options exist and the risks can be effectively managed within the normal process. Therefore, the PSEG Companies support the PJM recommendation that resources that elect the RCO option offer into the market at zero.

(b) <u>The RCO Option Must Provide States With Sufficient Flexibility to Pursue Their Policy Goals</u>

[10] *See* PJM Comments, Attached Affidavit of Adam J. Keech on Behalf of PJM Interconnection, L.L.C.

[11] PSEG Comments at pp. 8-9.

A second aspect of PJM's proposal that warrants consideration is PJM's suggested approach to settling loads associated with a state supported RCO election. The PSEG Companies argued that states could designate specific customers or categories of customers such as default service load that would be matched with the RCO resources. PJM takes a different approach. Under PJM's approach a capacity resource that elects the RCO option will be matched with a portion of the total state load.[12] PJM explains that:

> "[T]he financial settlement (which begins in the Delivery Year, three years after the auction has cleared) can assess charges and remit revenues according to the auction clearing rules (a pro-rata credit across all load in the state) *or impose the rate on load in different manner as may be proposed by the state*. The actual mechanics of this settlement can be facilitated by PJM Settlement as a billing agent, should the state so wish."[13]

The PSEG Companies support this statement. It is critical that states be allowed to determine how capacity allocations to load should occur. This allows states with different wholesale / retail models to determine the mechanism that will best support its constituency. This choice is also aligned with the PSEG Companies initial comments and further emphasizes a key point made in those comments: that what PJM refers to as the Resource Carve-Out offset, should be allocated to the affected load. In PJM's proposal, where the full state has its capacity obligation reduced by the RCO resource election, allocating the credit back on a load — ratio share to all LSEs is appropriate. However, if a state elects to have the RCO resource election impact only a subset of its loads (such as default service or specific rate-classes), the credit should only be allocated back to those impacted loads.

[12] PJM Comments at p. 61.

[13] *Id.*, at p. 59 (emphasis added).

But the pro forma tariff provisions that allow for deviations from the default pro-rata allocation of credits to load for Resource Carve-Out offset resources requires that the Commission accept or approve deviations from the default allocation mechanism under Federal Power Act ("FPA") Sections 205 or 206. The PSEG Companies do not perceive the need for FPA approval simply in order to identify which customers that the state wishes to receive the credits. The tariff should be modified to allow a state agency to identify to PJM which load serving entities serving load within that state should receive the Resource Carve-Out offset. This is consistent with the practice under the currently-effective FRR mechanism that allows states to determine how the *entirety* of a state's capacity obligation is met.

The situation faced by New Jersey in implementing the recently enacted Zero Emission Certificate ("ZEC") Act designed to preserve environmental and fuel diversity/resiliency attributes of nuclear generation serving the state illustrates this point. New Jersey is a retail open-access state but a sizable share of New Jersey's load is still served by "provider of last resort" service known as "Basic Generation Service" ("BGS"). The state's electric distribution companies are responsible for obtaining electricity supplies needed for BGS load which are procured thought a yearly state-wide auction. The successful auction winners each become Load Serving Entities ("LSEs") for an undivided portion of the BGS load. Although no decisions have been reached nor has a formal process been convened by the New Jersey Board of Public Utilities, the potential for using BGS to facilitate implementation the RCO mechanism is currently being discussed. If BGS were to be used for this purpose, PJM's proposed default would be problematic because it would allocate credits to all the LSEs not just the LSEs serving BGS load.

For example, New Jersey's total capacity procurement obligation is about 17,600 MWs of which somewhat more than half consists of BGS load – approximately 10,600 MWs. If the BPU awards ZECs to nuclear generators with 3,000 MWs of capacity which units then seek to become RCO resources, the BGS suppliers would need to be credited with the entire Resource Carve-Out offset of 3,000 MWs. If the 3,000 MW credit were allocated to all LSEs serving the state, *i.e.*, both BGS and Third Party Suppliers ("TPS"), almost half of the 3,000 MW Resource Carve-Out offset would be conferred on the TPS companies that are not responsible for paying for the resources. Moreover, there is no reason why it should be necessary to seek Commission approval under circumstances, such as these, in which the allocation of the Resource Carve-Out offset associated with the RCO resources conforms to a state's normal procurement practices.

(c) <u>If the Commission Decides Not To Accept PJM's Extended RCO, It Should Adopt the PSEG Companies' Repricing Alternative Instead</u>

The PSEG Companies do not support the Extended RCO proposal offered by PJM for several reasons. First, it presumes that state actions to address their resource mix result in market outcomes that are not just and reasonable. In the carve-out proposal, these actions are effectively removed from the market and priced separately through a bilateral action – an approach that achieves reasonable outcomes as the remaining resources and balance of the load clear. Second, PJM takes the step of removing the RCO resources from the second clearing mechanism without removing the corresponding load. Putting the market "out of balance" in this regard is guaranteed to lead to higher prices. PJM also offers no reason why these resources should be removed from the market as opposed to being represented at a competitive price. The methodology then goes on to establish a "competitive" price, and offers to pay resources that have no obligation to the market an "uplift" payment simply because they would have been

economic. This assumption is without foundation and lacks any economic basis. For all of these reasons, the construct proposed would not result in appropriate market outcomes and would increase consumer charges with no benefits.

Recognizing these drawbacks, the PSEG Companies understand that the idea of creating a competitive generation proxy price may receive some consideration. We therefore offer several modifications to the PJM Extended RCO approach that address several of the deficiencies in the PJM design.

i. Modifications To The PJM Extended RCO Proposal are Necessary

The most simplistic approach to repricing is closer to what PJM provided originally. All units would participate in round one of the auction, the commitment phase, with all resources providing their competitive offer.

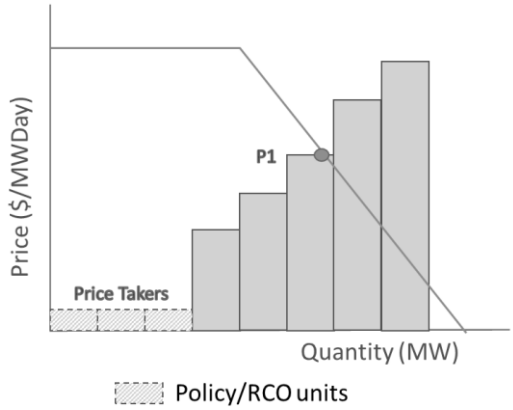

Figure 1. Commitment round, and how the market would work under current rules – Policy resources are entered as price takers.

To achieve a just and reasonable price in the second round, all resources must be included in the pricing round, where all load is being represented. The RCO resources can be offered at their MOPR price level, which will have already been found to reflect a "competitive" rate.

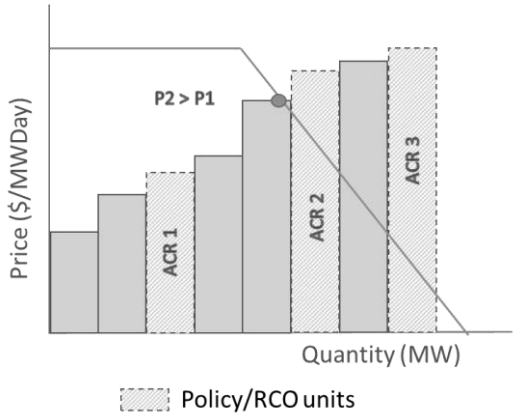

Figure 2. A better alternative for repricing. Policy resources are entered at their ACR's, which limits the price increase in the pricing round.

Excluding these resources would result in unnecessary and excessive costs to ratepayers[14] while sending false price signals to the remainder of the market.

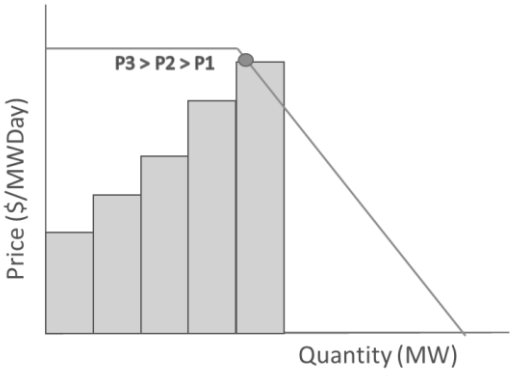

Figure 3. PJM's proposal for the pricing round. Policy resources are removed entirely. All load remains. Result is prices rise to a high level, possibly all the way to the market cap depending on the number of policy resources electing RCO and shape of the supply curve.

Once the price is determined, it will only be paid to the merchant generators. Therefore, generators receiving a material subsidy would not be eligible for a market payment unless their mitigated offers cleared in the pricing round.

[14] Should the Commission adopt a strong MOPR with few or no exceptions, the amount of resources that would be removed from the market rather than re-priced would be significant and would cause certain PJM zones to clear at the top (horizontal portion) of the demand curve.

The other adjustment that must be addressed is the unnecessary payment proposed to resources that did not receive an obligation in the commitment round, but had offers at or below the clearing price in the pricing run. These resources have no performance obligations or commitments to the market and should therefore not receive any payment. This payment only represents another layer of costs that are being unnecessarily placed on consumers.

ii. The PSEG Companies Offer Additional Changes To The PJM Extended RCO Proposal

Building off of the last proposal we would offer another alternative that adjusts settlement and payments for the resources that did not have a commitment but were economic in the pricing run.

The PSEG Companies note that recognizing appropriate obligations through the capacity markets is required to maintain the balance and integrity of the energy markets, and that the Commission should take all steps necessary to ensure energy price signals are appropriate. The market design ultimately adopted by the Commission should minimize the uneconomic retention and speculative rent seeking behavior that would most certainly accompany a mechanism which pays resources that do not receive a commitment in round one, but are inframarginal in round two ("Inframarginal Resources"). To achieve this, we believe the Commission should make any payments, such as those proposed by PJM, optional to the Inframarginal Resources. Should the Inframarginal Resources elect to receive the payment, they would also be obligated to submit a binding retirement notification and forfeit their Capacity Interconnection Rights. This payment will be a "severance payment" for resources that the auction determines are not needed to meet reliability requirements, but completely at the resources' discretion. This is consistent with the

successful, voluntary nature of the PJM markets and works to maintain appropriate resource balances going forward.

In settlement, ratepayers should not have to pay more than the total dollars determined by multiplying the clearing price times the quantity based on the point at which the supply curve intersects the Variable Resource Requirement ("VRR") curve in the pricing round along with any make whole payments as is required in the current construct. This estimates the amount that ratepayers would pay in a market with no subsidies. This pool of dollars would be used to compensate resources clearing the market in round one and, if the Commission determines it is appropriate that the units electing binding retirement.

The PSEG Companies believe that paying all merchant resources receiving a capacity obligation in the first round plus Inframarginal Resources electing the severance payment option from the "pool of dollars," which would necessitate a final settled clearing price between the round 1 and round 2 clearing prices is appropriate for two reasons. First, all remaining resources will benefit from retiring excess supply in both the energy and capacity markets. Second, state supported resources have always been a factor in capacity markets. Capacity markets, since their inception, have always included subsidized resources and prices have settled accordingly. Merchant generators have never had an expectation that they would be participating in a "pure" market devoid of any subsidized resources. PJM's Extended RCO proposal would create a windfall for merchant resources because it would completely remove supported resources from the market. The PSEG Companies' repricing alternative seeks a middle ground, where much of the price suppression is removed and load pays no more than they would in a market without subsidies.

iii. The Commission Should Adopt the PSEG Companies Proposed FRR-Alternative Mechanics

The Commission should adopt the following design elements. All load in PJM should continue to be represented in the VRR curve. Moreover, all resources should continue to be represented in the supply curve as follows: (a) merchant resources should be represented at their chosen price either at or below their applicable offer cap; (b) resources receiving support payment, but that are not electing the RCO option should be represented at their mitigated or MOPR offer level; and (c) resources receiving support payments and electing the RCO option should be offered in the supply curve as price takers. Resources should have the option to elect the "severance payment" option at this point and allowed to indicate whether they would agree to a binding retirement in exchange for a payment in the event they do not clear first round but eventually become Inframarginal Resources.

(1) PJM administers the first round of the auction to establish which resources will receive a capacity commitment.

(2) Resources receiving support payments are removed from the supply curve and reentered at their MOPR price.

(3) PJM administers the pricing round of the auction. The point at which the supply curve intersects the VRR curve is used to create a funding pool by multiplying the price times the quantity at the point of intersection. This applies to the RTO and any Locational Deliverability Areas ("LDA") that separate from the RTO. Additionally, Inframarginal Resources that elected the binding retirement option and did not receive a commitment are identified as "Severance Payment Eligible" ("SPE").

(4) An iterative settlement process is then initiated where:

a. The initial revenue requirement is determined by multiplying the round two clearing price by the round one capacity obligations ("Obligation Requirement") and adding the total SPE revenue requirement, which is determined by subtracting the round two clearing price for each SPE by each SPE's bid price multiplied by its unforced capacity ("SPE Requirement").

b. If the Obligation Requirement plus SPE Requirement exceeds the funding pool – which we believe it will initially due to the slope of the VRR curve – the capacity price is lowered by $0.01 to determine the Adjusted Capacity Payment Price ("ACPP").

c. If an Inframarginal Resource's offer price drops below the ACPP, it is no longer considered inframarginal and is removed from the settlement round and not eligible for a severance payment.

d. The first three steps are repeated, substituting the ACPP for the round two price in the first step until the revenue requirement no longer exceeds the funding pool.

(d) <u>The Commission Should Reject Requests to Implement a CASPR-like Mechanism</u>

The Commission should reject requests by commenters to implement a mechanism similar to ISO New England Inc.'s ("ISO-NE") Competitive Auctions with Sponsored Resources ("CASPR")[15] mechanism. Initially, the CASPR structure was designed to fit the unique circumstances of ISO-NE and does not translate well to the PJM structure. Specifically, it was

[15] Comments of Vistra Energy Corp. and Dynegy Marketing and Trade, LLC, Docket Nos. EL16-49-000, *et al*., at pp. 3, 6-7 (filed October 2, 2018); Initial Arguments of Starwood Energy Group Global, L.L.C., Docket Nos. EL16-49-000, *et al*., at pp. 12-15 (filed October 2, 2018).

designed to accommodate the efficient entry of new resources that do not have existing capacity supply obligations. While the issues underlying the need for the CASPR design are present in PJM, the primary concern in PJM is the retention of existing resources to meet legitimate state public policy objectives.

Unlike the ISO-NE situation, the existing PJM units have already satisfied all necessary requirements to be capacity resources and therefore do not need to buy their way into the markets to become existing resources. Forcing these resources into a substitution auction, where they may or may not get an obligation, is an inefficient methodology to try to establish a competitive price and is likely to thwart state efforts rather than accommodate them.

Moreover, the price established in the first round of the CASPR design is similar to the price that would be established under a repricing mechanism that values subsidized resources at their mitigated levels during the auction step that determines the clearing price. Under this approach, existing resources would have to pay a second time to obtain the status that they already hold, with this "one-time tax" ultimately born by consumers. Unlike PJM's proposal, this approach would not provide the states with the option to satisfy load obligations with the resources that they selected to achieve their desired public policy objectives, so it serves only as a penalty. Given the voluntary nature of the proposed substitution auctions, there is no guarantee that there will be enough resources available and willing to retire to satisfy the objectives of a state. Under these conditions, states may end up supporting the resource mix they choose as well as being forced to procure other resources through the primary auction above and beyond their load and reserve requirements. This approach has the potential to significantly overburden customers in states that pursue or already have secured resources consistent with their jurisdictional rights.

(e) The Commission Should Reject Caps and Other Limitations that Would Thwart the Accommodative Approach Described in the Commission's Order

The Commission's Order recognized the rights of states to support a particular resource mix in order to achieve public policy objectives. Some states have legitimately pursued renewable portfolio standards to attract a specific resource profile while other states have enacted legislation that provides for ZECs in order to achieve environmental objectives. The Commission's Order clearly recognizes and attempts to accommodate these programs by offering a carve-out mechanism to mitigate the impacts of these activities on the markets.

A number of commenters raised concerns that there will be a "rush to the door" by states as they try to protect their favored resources. We believe that states are cognizant of the many benefits they have received from the markets through the years. The creation of an accommodative approach that allows those states to satisfy their objectives will not lead to states undoing markets, rather it can serve as a bridge to a broader objective of reflecting the attributes states are pursuing in those markets. To address these unfounded concerns, LS Power proposed caps and limitations on the amount of state supported resources that should be eligible for a carve-out.[16] The adoption of such provisions would be both arbitrary and unnecessary. LS Power's analysis for determining "a reasonable cap" highlights how arbitrary it would be to determine the appropriate limitation on the number of resources that can be carved-out.[17] Further, even if a state has chosen to provide bilateral payments to resources that offset 100% of their load, no legal basis has been identified to deny them that right.

[16] Initial Brief of LS Power Associates, L.P., Docket Nos. EL16-49-000, *et al*., at pp. 14-19 (filed October 2, 2018).

[17] *Id*., at pp. 16-17.

(f) PJM Should Clarify that Units Receiving Actionable Subsidies Subsequent To The "Self-Certification" Date 150 Days Prior to a Base Residual Auction Are Not Subject to the MOPR

PJM's pro forma tariff specifies that units receiving an Actionable Subsidy must "certify [to PJM] whether or not such Capacity Resource is a Capacity Resource with Actionable Subsidy" 150 days prior to the commencement of a Base Residual Auction ("BRA").[18] The Tariff further states that a resource will retain its status as a Capacity Resource with Actionable Subsidy "unless and until the Capacity Market Seller provides notification of a change in such status or the Office of the Interconnection removes such status . . . ."[19] An additional tariff provision in the same tariff section that addresses the retention of status by a Capacity Resource with Actionable Subsidy provides that "[a]ll Capacity Market Sellers shall have an ongoing obligation to provide notification of any change in status."[20]

Analyzed in context, the PSEG Companies understand the referenced tariff provision requiring Capacity Market Sellers "to provide notification of any change in status" as applicable to situations in which a Capacity Resource with Actionable Subsidy loses its subsidy during the 150 day period prior to a BRA. But they do not read the provision as being applicable to situations in which Capacity Resource that did not have an Actionable Subsidy obtains one during the 150 day period after supplying it self-certification. Stated otherwise, as the PSEG Companies understand the intent of the tariff provision, a Capacity Resource that lacks an Actionable Subsidy at 150 days prior to a BRA but obtains an Actionable Subsidy during the

[18] *See* pro forma Tariff, Attachment DD, section 5.14(h)(iii)(A).

[19] *See* pro forma Tariff, Attachment DD, section 5.14(h)(iii)(B).

[20] *Id.*

ensuing 150 day period retains its status as a Capacity Resource *without* an Actionable Subsidy for the relevant BRA. The Commission should direct PJM to clarify this understanding.

A contrary reading would place Capacity Resources that have not qualified for subsidies by 150 days prior to a BRA, but receive them later in an untenable position. In addition, it would interfere with the ability of the RCO construct to adequately accommodate state policies. If a Capacity Resource that obtained an Actionable Subsidy in close proximity to the BRA, *i.e.*, within the 150 day period, becomes subject to the MOPR as a result, it would lack adequate time as an RCO resource to make necessary arrangements for alternate capacity payment mechanisms. The ability of the state to further the public policy goals associated with the subsidy would thus be thwarted if the affected unit were forced to bid at the MOPR reference price and was unable to clear the market. A "bright-line" standard for units to determine if they will be subject to the MOPR – such as PJM apparently intends – needs to be incorporated into the tariff in order for the Expanded MOPR/RCO construct to be workable. The 150 day cut-off for units to self-certify their status creates a reasonable and defensible standard.[21]

[21] *See Emily's List v. FEC,* 581 F.3d 1, 22 n. 20 (D.C.Cir.2009) ("Agencies generally do not violate the [Administrative Procedures Act's] deferential arbitrary-and-capricious standard when they employ bright-lines rules for reasons of administrative convenience, so long as those rules fall within a zone of reasonableness and are reasonably explained.").

20181106-5235 FERC PDF (Unofficial) 11/6/2018 4:47:28 PM

II. CONCLUSION

If the Commission continues to deem it necessary to adopt the proposal contained in its June 29th Order, the PSEG Companies request that the Commission adopt the Expanded MOPR and PJM's RCO option with the recommended modifications. The PSEG Companies also request that the Commission acknowledge that a transition year may be necessary to accommodate states as the Commission pursues solutions that will facilitate full and appropriate participation in the upcoming RPM auction.

Respectfully submitted,

PSEG Power LLC

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

REPLY COMMENTS OF THE PSEG COMPANIES

The PSEG Companies[1] submit these reply comments concerning the Secretary of the United States Department of Energy's ("Secretary") proposed rule ("DOE Proposal")[2] for final action by the Federal Energy Regulatory Commission ("Commission") and in response to the Commission's October 2, 2017 notice inviting comments.[3] As previously explained,[4] the PSEG Companies support the immediate implementation of the DOE Proposal as an interim measure to prevent the premature retirement of fuel-secure baseload units until a permanent market-based solution is developed through the RTO/ISO stakeholder processes.

The PSEG Companies' reply comments include a proposal for a streamlined interim mechanism that could be implemented by the Commission without an onerous administrative burden. The streamlined cost-of-service approach described below and in the attached affidavit of Alan R. Lovinger is intended to counter claims that it would be too onerous for the Commission to direct and thereafter implement a cost-of-service

[1] The PSEG Companies are comprised of Public Service Electric and Gas Company ("PSE&G"), PSEG Power LLC ("PSEG Power") and PSEG Energy Resources & Trade LLC ("PSEG ER&T").

[2] *Grid Resiliency Pricing Rule*, Notice of Proposed Rulemaking, *82 Fed. Reg. 46,940* (October 10, 2017) ("DOE Proposal").

[3] *Grid Reliability and Resilience Pricing,* Notice Inviting Comments, Docket No. RM18-1-000 (October 2, 2017).

[4] *See generally*, Comments of the PSEG Companies, Grid Reliability and Resilience Pricing, Docket No. RM18-1-000 (submitted October 23, 2017) ("PSEG Initial Comments").

20171107-5273 FERC PDF (Unofficial) 11/7/2017 4:52:04 PM

approach. In his testimony, Mr. Lovinger describes a simplified methodology that could be used to set just and reasonable cost-of-service rates through formula rates for eligible baseload generating units.[5] Given the urgent need to preserve fuel-secure baseload resources, we respectfully request that the Commission direct the RTOs/ISOs to modify their tariffs to include an interim mechanism such as the one Mr. Lovinger describes.

In sum, these reply comments show that:

(1) The Commission could implement a streamlined interim cost-of-service mechanism that would result in just and reasonable rates such as the one described by Mr. Lovinger without creating an onerous administrative burden;

(2) Implementing the DOE Proposal as an interim solution will not compromise competitive markets and will provide a lifeline that will prevent economic fuel-secure baseload resources from prematurely retiring while a market-based solution could be developed;

(3) An interim cost-of-service mechanism would be upheld by the courts since it would not be unduly discriminatory, it is in the public interest and certain resources would suffer irreparable harm without it;

(4) Maintaining fuel diversity and fuel security in the generation portfolio through the preservation of nuclear generation is necessary given the national security issues at stake;

(5) Certain RTO/ISO initiatives such as capacity performance and pay-for-performance do not address grid resiliency; and

SI-SSA-0010-1192

(6) There is widespread support for Commission action on the outstanding price formation reforms – namely, fast-start pricing[6] and uplift allocation and market transparency[7] reforms – and PJM's proposed energy price formation reform.[8]

I. REPLY COMMENTS

A. The Commission Must Assume a Leadership Role and Promptly Address the Risk of Imminent Retirements of Fuel-Secure Baseload Resources

The PSEG Companies showed in their Initial Comments that there was a compelling need for immediate Commission action to address the risk of imminent retirements of fuel-secure resources. Some commentators have contended, however, that there is not a need for immediate action.[9] Most of these commenters make claims along the lines that system reliability is being adequately met by existing resources and that, to the extent that retirements are occurring, new gas and renewable resources are replacing them. Notably, the RTOs/ISOs believe that there is not currently a problem and that they can judge how to address any future action held under their own time tables. But taking

such a wait and see approach would be perilous. The Commission needs to take a leadership role and take decisive action now.

For example, PJM points to a study it released earlier in which it "assessed future likely and plausible generation mix portfolios on their ability to provide certain essential reliability services . . . ."[10] Those "likely and plausible generation mix portfolios" include portfolios in which nuclear generation was as low as 4.5% and coal generation was as low as 8.6%. A finding of the report, moreover, is that PJM could reliably operate its system with as much as 86% natural gas fired generation.[11] While PJM also claims that on-going stakeholder processes are reviewing broader concepts of resiliency, the main focus of these activities is on real-time "operating procedures" such as conservative operations during periods of pipeline contingencies. In sum, it is clear that PJM does not at present perceive a need to preserve the existing fuel diversity of its fleet to meet typical reliability criteria, the processes in which it is currently engaged to address resiliency issues are at best in a fledging state and when (and if) it does address the make-up of the resource mix, a significant portion of the fuel diversity on the PJM system will have already been lost.[12] Like many respondents, these conclusions cloud the issue at hand by mixing traditional RTO reliability concepts with the idea of resiliency. The existing system could likely be planned to achieve the modeled reliability on a single fuel, but

[10] Initial Comments of PJM Interconnection, L.L.C. On the United States Department of Energy Proposed Rule, Grid Reliability and Resilience Pricing, Docket No. RM18-1-000 at 15 (submitted October 23, 2017) ("PJM Comments").

[11] *See* PJM Comments (citing PJM's Evolving Resource Mix and System Reliability (dated March 30, 2017)), available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx).

[12] PJM has presented its "resilience roadmap" to stakeholders, which provides a proposed timeline that indicates that PJM does not intend to take any action to address resilience concerns in the near-term, available at: http://www.pjm.com/~/media/committees-groups/committees/oc/20170606/20170606-item-18-resilience-roadmap.ashx.

nobody would contend that is a resilient system. Our markets are fortunate to have a broad, diverse set of assets today, but as was pointed out, this status is changing quickly and the Commission needs to take the leadership role now.

The Independent Market Monitor for PJM ("IMM") also contends that imminent action by the Commission is not needed.[13] The IMM references its 2017 Quarterly State of the Market Report for PJM ("State of the Market Report") to support the claim that three quarters of nuclear plants are recovering their "going forward" costs.[14] The State of the Market Report identifies operating costs for nuclear plants of $25.83 per MWh for single unit sites and $18.73 per MWh for multi-unit sites and uses these figures as "avoidable costs."[15] Using this data, the IMM draws the conclusion that only about one-quarter of the nuclear units in PJM failed to recover their "avoidable costs" in the past year. In fact, however, these "avoidable cost" values are not realistic estimates of the true costs of operating a nuclear plant. The figures identified by the IMM for avoidable costs come from the Nuclear Energy Institute's ("NEI") 2017 Whitepaper.[16] The following table from the NEI Whitepaper compares the costs between single units and multi-units.

[13] IMM Comments at 2.

[14] Monitoring Analytics, LLC, 2017 Quarterly State of the Market Report for PJM, May 11, 2017, available at: http://www.monitoringanalytics.com/reports/PJM_State_of_the_Market/2017/2017q1-som-pjm.pdf.

[15] IMM Comments at 18 (footnote omitted).

[16] Nuclear Energy Institute, Nuclear Costs in Context, August 2017 ("NEI Whitepaper"), available at: https://www.nei.org/CorporateSite/media/filefolder/Policy/Papers/Nuclear-Costs-in-Context.pdf?ext=.pdf. In fact, although the IMM Comments cite to this report as the source for the operating costs data in its comments, as shown in the chart reproduced below, the NEI operating cost value for single site nuclear plants is actually $25.95 /MWh and not $25.83 /MWh.

2016 Cost Summary ($/MWh)

Category	Number of Plants / Sites	Fuel	Capital	Operating	Total Operating (Fuel + Operating)	Total Generating (Fuel + Capital + Operating)
All U.S.	60*	6.76	6.74	20.43	27.19	33.93
Plant Size						
Single-Unit	25	6.77	8.67	25.95	32.72	41.39
Multi-Unit	35	6.75	6.15	18.73	25.48	31.63
Operator						
Single	12	7.18	8.19	21.20	28.38	36.57
Fleet	48	6.63	6.32	20.21	26.84	33.16

**Costs exclude shutdown plants.*
Source: Electric Utility Cost Group (EUCG)

The IMM values thus include only the "operating" costs in its avoidable cost recovery calculations and exclude fuel and capital costs. When those costs are included, the actual cost of running a nuclear plant is approximately 65% - 75% higher. It is not optional (avoidable) to choose not to continue refueling if a plant is to be kept in operation. Likewise, it is not optional to choose not to invest in ongoing capital for a nuclear plant most of which is driven by regulatory, security and safety requirements. These costs must be included when considering whether a nuclear plant is financially viable. It would be both unrealistic and financially irresponsible for an entity not to consider these costs. The IMM's analysis, accordingly, should be rejected. In fact, as shown by the PSEG Companies in another proceeding in which the IMM provided a similar analysis, when adjustments are made to determine a more realistic "avoidable

cost" based on NEI data, *at least three quarters of nuclear plants in PJM did not cover 100 percent of their going forward costs*.[17]

Comments like the ISO/RTO's and the IMM's should not deter the Commission from taking steps to address the urgent issues presented. In particular, the Commission must not shy away from its statutory duties to protect national interests. While the RTOs/ISOs certainly have a role to play, and regional differences should be considered, it is important that the Commission exercise its independent judgment and act before there is additional erosion of fuel diversity in the country's fuel supply portfolio.

B. There Is An Immediate and Urgent Need For the Commission to Take Action

Many commenters who claimed that the DOE Proposal has not been shown to be justified appear to have failed to understand the problem identified. The main issue identified in the DOE Proposal was the risk to the electric grid posed by the loss of generating plants with sufficient quantities of on-site fuel so as to be resilient to disruptions of fuel deliveries – particularly deliveries effectuated by natural gas pipelines. As stated in the DOE Proposal, the purpose of preserving resources with 90-days of on-site fuel is to retain the capacity to "withstand major fuel supply disruptions."[18] Quoting the North American Electric Reliability Corporation ("NERC"), the DOE Proposal states that "[m]any months of on-site fuel allow these units to be operated in a manner

independent of the supply chain disruptions."[19] The Commission should not get distracted from these clearly defined concerns.

First, contentions that the Commission cannot act without the ability to precisely measure the risk addressed or the benefit gained[20] ignore the inherent nature of high impact, low probability events. As the PSEG Companies showed in their initial comments, the risk of an event such as a major prolonged disruption of gas supply obtained from the interstate pipeline system is not amenable to a cost-benefit analysis.[21] A prolonged widespread pipeline disruption is statistically unlikely but, if such an event did occur, clearly would have devastating impacts unless alternate fuel-secure baseload sources were available. In the end, the value of having a fuel diverse generating fleet with meaningful quantities of fuel-secure resources is very real and of critical importance but cannot be precisely determined. Telling the Commission that it cannot act or should not act until a probability-weighted cost-benefit analysis is complete is tantamount to telling the Commission not to act at all.

Second, the fact that preserving fuel-secure generation resources would not address every potential resiliency issue presented is irrelevant. It is correct that nuclear

[20] *See, e.g.*, PJM Comments at 20 ("[T]he next steps for PJM and its stakeholders include defining metrics for resilience . . . ."); Joint Industry Comments Opposing The DOE Proposal, Docket No. RM18-1-000 at 20 (filed October 23, 2017), Attachment A, "Evaluation of the DOE's Proposed Grid Resiliency Pricing Rule," dated October 23, 2017, prepared by The Brattle Group at 10-11, 48-52 ("Brattle Group Evaluation") ("[T]he benefits of resiliency and on-site fuel assurance have not been sufficiently defined or quantified . . . .) (Brattle Group proposes "metric and methods [for analyzing grid resilience that] would . . . permit the examination of economic tradeoffs of such adjustments in a cost-benefit study" and endorses a seven-step "Resilience Analysis Process."); Comments of The American Public Power Association on Proposed Rule, Docket No. RM18-1-000 at 2 (filed October 23, 2017) (stating that "the NOPR does not clearly define what it means by resilience in this context or explain how resilience should be measured.")

[21] PSEG Initial Comments at 13, 29.

and coal generations have certain vulnerabilities and that most loss-of-load events relate to the distribution system.[22] However, that is the point of fuel diversity: avoiding exposure to *single* mode failure risk in recognition of the fact that all technologies have some vulnerabilities. Moreover, the fact there may be other issues to address in order to promote resiliency besides preserving fuel-secure resources does not preclude the Commission from addressing the immediate problem before it.[23]

Ultimately, objections of this ilk are merely distractions from the issue identified in the DOE Proposal: It is clear that our electric grid would be more robust to potentially devastating disruptions of the gas supply system if we preserve a reasonable level of fuel-secure resources as part of the generation fleet and the Commission does not need precise "metrics" to determine that is true. Given the undeniable erosion that has occurred in the fuel-secure baseload resources to date and which threatens to continue absent positive action to prevent it, the Commission has compelling grounds upon which to take immediate action in order to address this looming risk.

[22] *See e.g.,* PJM Comments at 11 (quoting DOE Staff Report noting that, during the Polar Vortex, "[m]any coal plants could not operate due to conveyor belts and coal piles freezing."); APPA Comments, at 10 ("[C]oal and nuclear plants can face challenges of their own during extreme weather events."); Comments By Amory B. C. Competitive Markets Will Not Be Compromised by an Interim Cost-of-Service Payment Mechanism

1. The DOE NOPR Will Correct Market Distortions

A number of parties contend that the DOE Proposal would have substantial negative impacts on competitive markets.[24] These arguments fail to recognize that in order for the competitive markets to continue producing efficient outcomes, they must evolve to align with public policy objectives. To this point, the PSEG Companies agree that, to date, the competitive markets have produced "tangible benefits for American consumers and the American economy."[25] However, time has revealed that the competitive markets are not operating in an efficient manner, resulting in the loss of fuel diversity and fuel security. As a consequence, consumers are now exposed to a greater risk of catastrophic losses due to low probability, high impact events. As Dr. Makovich explained, the lack of harmony between market operations and public policies such as those mandating renewable technologies are creating market distortions that are preventing the wholesale electricity market from generating the right price signals.[26] Dr. Makovich states that:

> As a result, the distorted market price signals do not shape a cost effective supply portfolio. In particular, public policies that mandate and subsidize intermittent renewable technologies are neither fuel nor technology neutral policy approaches and therefore result in inefficient market outcomes whenever mandates of subsidized intermittent renewables result in a greater wind and solar generation shares than are cost effective. In organized

[25] EPSA Comments at 19.

[26] Makovich Affidavit at 4.

> electricity markets, this inefficient market outcome suppresses wholesale electric energy prices. This is an "imposed" missing money problem for competitive generators."[27]

The market distortions described by Dr. Makovich are heavily impacting baseload generators and causing their premature retirement. This is resulting in a trend where the resiliency in the U.S. supply portfolio is eroding to the point that immediate action must be taken to stop additional premature retirements of fuel-secure baseload resources. Currently, these resources are relying on revenue streams from markets that many commenters agree are flawed and must be fixed.[28] Thus, the best solution to resolve the issues that are causing the current market distortions would be to develop a market-based solution that would value "external" costs such as those associated with the loss of fuel diversity and fuel security that the current market construct completely ignores.

Under a market-design that takes account of "external costs," fuel-secure baseload generation would be highly valued. More specifically, in a properly designed market that values resiliency, fuel diversity, fuel security and carbon abatement, nuclear baseload generation would receive higher revenues. Therefore, nuclear resources, if valued properly, would be economic. According to Dr. Makovich "an economic argument exists to support public policies that provide support to these nuclear resources through compensation for resilience attributes that these resources provide to the power supply portfolio and move the current distorted market outcome toward the results in an effective competitive marketplace."[29] Accordingly, economic fuel-secure baseload resources such as nuclear should not be forced to succumb to early retirements simply

[27] *Id.*

[28] EPSA Comments at 2; ELCON Comments at 6, 11.

[29] Makovich Affidavit at 6.

because the current competitive markets are distorted and the process to determine a market-based solution to fix these distortions may require a significant amount of time.

Therefore, it is appropriate to provide a lifeline to fuel-secure baseload resources through the interim cost-of-service mechanism proposed in this filing. This will prevent the retirement of valuable resources until they can be properly valued through a market-based solution.

2. Competition In Energy Markets Can Be Preserved by Requiring Units That Receive Cost-of-Service Payments to Bid at The Level of Their Marginal Costs and Consistently with Their Approved Operational Parameters

Some commenters contend that making cost-of-service payments to plants that qualify under the DOE Proposal will result in those plants engaging in behavior in the energy market that will have deleterious impacts on efficient price formation. They contend, in particular, that units receiving cost-of-service payments will increase their run-times beyond what would occur in a competitive market and thus cause price suppression. While the extent of the issue presented is not clear, the PSEG Companies submit that any such concerns can be addressed by specifying bidding procedures for the day-ahead and real-time energy markets. Specifically, units receiving cost-of-service payments should be required to submit energy market bids at their marginal costs and consistently with unit operating parameters approved by the ISO/RTO or market monitor in the region.

It is extremely well-settled that marginal cost bids in the energy market are consistent with bidding behavior expected in a competitive market. As stated by the Commission for PJM:

> Under PJM's LMP pricing system, all generators that lack market power have an incentive to submit bids at their marginal costs, because any price above marginal cost will generate sufficient revenue to cover the unit's operating costs and contribute to the recovery of the unit's fixed costs. This is the same incentive that exists in a competitive market, where competitors are expected to produce at the point where prices exceed their short-run marginal costs.[30]

In PJM, FERC also followed this practice in connection with Reliability Must Run ("RMR") agreements. Thus, in *PSEG Energy Resources & Trading, LLC,* the Commission noted that "the [RMR] tariff [ultimately approved] provides that PSEG will not delist the units as capacity resources and that each unit will be bid into the day-ahead and the real time PJM Energy Exchange Markets at rates equal to their cost-based bids as determined by PJM."[31]

In *NYISO,* the Commission affirmed that "in a competitive market, a generator lacking market power would be expected to submit bids . . . at a level that . . . would be expected to cover the generator's marginal costs."[32] The Commission also found its expectation of marginal cost bidding in the energy market was "consistent with precedent" and independent of concerns about how fixed costs would be recovered.[33]

In CAISO, the Commission explained that "marginal cost pricing generally reflects the prices that would be bid into an auction by generators in a competitive

[30] *PJM Interconnection, LLC*, 110 FERC ¶ 61,053 P 25 (2005).

[32] *N.Y. Indep. Sys. Operator, Inc.*, 131 FERC ¶ 61,169 P 73 (2010), *reh'g denied*, 139 FERC ¶ 61,001 (2012).

[33] *N.Y. Indep. Sys. Operator, Inc.,* 139 FERC ¶ 61,001 PP 42-44 (finding that concerns about fixed cost recovery should be addressed by means other than "bids [that] significantly exceed a bid expected in a competitive market [] that is, at marginal cost.").

market."[34] The Commission has affirmed this concept again and again in CAISO, most recently in January 2017.[35] Similarly, in ISO-NE, the Commission approved a mitigation plan because it was a "reasonable means of obtaining a rough estimate of competitive bids (which would ordinarily reflect the bidder's marginal cost)."[36] Further, in connection with an RMR filing, the Commission stated that "[u]nder RMR agreements, generators submit stipulated marginal operating cost bids and receive a cost-based revenue guarantee that is offset by energy market revenues earned."[37]

Requiring units receiving cost-of-service payments to bid at their marginal costs is thus an appropriate measure to assure that energy markets remain competitive. In addition, in some regions, such as PJM, marginal-cost bids already are routinely calculated by all market participants and submitted to the RTO as reference prices. However, even when that is not the case, they are reasonably calculable under a methodology such as the one used by PJM and the bids could be verified by RTO/ISO staff if deemed necessary.

In addition, units receiving cost-of-service payments should be required to submit energy market bids consistent with their approved operating parameters such as start-up times, ramp rates and minimum run times. This requirement will also help assure efficient price formation outcomes.[38]

D. An Interim Cost-of-Service Measure Is Not Discriminatory and is Consistent with the Public Interest

A number of parties contend that the DOE Proposal should be rejected on the grounds that it provides "discriminatory compensation in favor of a preferred set of generation resources," specifically, for certain coal and nuclear resources located within RTOs and ISOs with energy and capacity markets.[39] However, "discrimination" is not prohibited by the Federal Power Act; only when discrimination is "undue" does it run afoul of the statute. These critics fail to acknowledge that the DOE Proposal is intended to address the risk to the electric grid and to the citizens of our country as the generation supplier portfolio becomes overly reliant on a single fuel source. The DOE Proposal, therefore, correctly focuses on the resources that are being most heavily impacted by the deficiencies in the current competitive market design even though they supply valuable resiliency attributes. Discrimination among resource types is fully justified given the problem being addressed in this matter. Unless the Commission takes immediate steps through an interim measure to prevent fuel-secure baseload resources from prematurely retiring, those resources and the public they serve will suffer irreparable harm.

As discussed in the PSEG Initial Comments, there is Commission-precedent supporting a temporary program (i.e., the Winter Reliability Program) that allowed only a limited set of resources to participate on the grounds that the program was needed to address urgent circumstances until a long-term solution could be developed.[40] Moreover, the discretion of agencies to establish appropriate relief through interim rules while they

[39] Joint Industry Comments Opposing the DOE Proposal, Grid Reliability and Resilience Pricing, Docket No. RM18-1-000 at 1, 5 (submitted October 23, 2017) ("Joint Industry Comments"); ExxonMobil Comments at 1-2; P3 Comments at 7-9.

[40] PSEG Initial Comments at 15-16.

are engaged with stakeholders in a rulemaking has been upheld by the courts, particularly where there has been a demonstration of irreparable harm.[41] In *Mid-Tex Elec. Co-op., Inc. v. FERC*, 822 F.2d 1123 (D.C. Cir. 1987), the U.S. Court of Appeals for the D.C. Circuit ("D.C. Circuit") upheld the Commission's authority to put in place an interim rule without notice or comment procedures while the Commission evaluated a permanent solution, noting that it was "necessary or proper to provide a regulation prior to completing its full consideration."[42] The D.C. Circuit found that the "irremedial financial consequences" supported allowing the interim rule to remain.[43] *Id.* This is precisely the remedy we believe is appropriate here

In a separate case, *Arizona Elec. Power Co-op., Inc. v. FERC*, 631 F.2d 802 (D.C. Cir. 1980, the D.C. Circuit explained that in fashioning a remedy, the Commission has an obligation to consider the general public interest. The *Arizona Elec. Power* case concerned temporary measures that the Commission approved in order to address gas shortages in the winter months and ensure that customers in California received adequate supplies of gas. The D. C. Circuit applied a highly deferential standard in evaluating whether the Commission's actions were appropriate and explained that "it is not the role of the courts to second guess the Commission's judgment because we think we could

[41] *Rural Cellular Ass'n v. FCC*, 588 F.3d 1095, 1105 (D.C. Cir. 2009) (In upholding the temporary regulation, the Court emphasized the "irreparable harm to the [universal service fund] and the telecommunications markets generally that might result from waiting until comprehensive reform, which is often complex and difficult to achieve, was adopted. Courts, including this one, have deferred to the Commission's decisions to enact interim rules based on its predictive judgment that such rules were necessary to preserve universal service").

[42] *Id.* at 1131-32. After the D.C. Circuit vacated portions of a Commission rule and remanded an issue concerning a utility's ability to include a portion of its construction work-in-progress ("CWIP") costs in rate base, the Commission promulgated an interim rule that did "not change the substance of the general provision of the [vacated] CWIP rule." *Id.* at 1124.

[43] *Id.*

devise a better solution than that which the agency has adopted so long as the agency's determination has a rational basis."[44]

Under the theories applied in these cases, it is clear that an interim cost-of-service solution as suggested by the PSEG Companies would be upheld by the courts as an appropriate remedy to address the urgent issues facing at risk fuel-secure baseload resources. First, preserving fuel-secure baseload resources is in the public interest. Specifically, maintaining fuel diversity and fuel security in the nation's electric grid is a matter of national security. As Mr. Carl explains in his attached affidavit, nuclear power plants are well-equipped to withstand new threats to our power plants.[45] Nuclear plants are already hardened against risks and have been designed to ensure safety and security. In addition, the erosion of resiliency in the electric grid increases the likelihood that consumers would be exposed to high impact, low frequency events.[46] As Dr. Makovich's Affidavit demonstrates, the loss of nuclear units would significantly increase costs to consumers.[47] Second, without an interim measure, there is a strong likelihood that fuel-secure baseload resources would prematurely retire and, in many cases, be unable to reopen. In these circumstances, both fuel-secure baseload resources and consumers would sustain irreparable harm. Finally, as the courts have made clear, the Commission

[45] Reply Comments of the PSEG Companies, Attachment A, Affidavit of Jeremy C. Carl, Grid Reliability and Resilience Pricing at 9-11, Docket No. RM18-1-000 (submitted November 7, 2017) ("Carl Affidavit").

[46] Dr. Makovich analyzed the outcome if the 2014 Polar Vortex took place under today's PJM electric supply portfolio. He calculated the cost of such an outage to be around $1.2 billion. *See* PSEG Initial Comments at 8-9 (citing Makovich Affidavit at 11). Dr. Makovich further determined that if the 2014 Polar Vortex took place and plants in PJM now being evaluated for premature closure – Perry and Davis Besse – were no longer available, the expected cost of the Polar Vortex-induced outage would be around $3.7 billion. *Id.*

[47] Makovich Affidavit at 16-17.

has broad remedial powers to fashion appropriate remedies, particularly where there is an urgent need to protect consumers.[48]

E. Maintaining Diversity and Fuel Security in the Generation Portfolio Through the Preservation of Nuclear Generation is Needed for National Security

The DOE Proposal emphasizes the important role that grid resiliency plays in our national security and the welfare of American citizens. It specifically states that: "[o]ur economy, government and national defense all depend on electricity. Therefore, ensuring a reliable and resilient electric supply and corresponding supply chain are vital to national security."[49] However, as Dr. Makovich explains, the distortions in the current markets designs are heavily impacting fuel-secure baseload resources and leading to their premature retirement. As discussed in his attached affidavit, Mr. Carl also believes that today's "highly regulated market" has been manipulated in ways that "have been profoundly damaging to nuclear's competitiveness."[50] Mr. Carl further explains that:

> Perhaps the biggest unmeasured value of nuclear is its contribution to our national security. It cannot be stressed enough that unlike any other form of energy, the nuclear enterprise has fundamental non-energy related security attributes that justify additional support in the market.[51]

Moreover, nuclear plants have the ability to maintain more on-site fuel than any other form of energy, which is particularly valuable in the event of a long-term emergency situation or an interruption to fuel supplies to other generators. Nuclear resources have

[48] *See Niagara Mohawk Power Corp. v. FPC*, 379 F.2d 153, 159 (D.C.Cir.1967).

[49] DOE Proposal at 2.

[50] Carl Affidavit at 8.

[51] *Id.*

also been designed to withstand many of the new types of threats to power plants such as cyber security attacks or terrorism.

The decline in the United States' nuclear technology capabilities due to a lack of domestic plant manufacturing also impacts the advantages and leverage we have previously enjoyed in the area of non-proliferation. Mr. Carl explains that the:

> United States has lost several bids on nuclear power projects in the Middle East to Russia, in no small part because of our degraded capacity in this area. The closure of additional nuclear plants degrades our already fragile capabilities while empowering geopolitical rivals such as Russia and China.[52]

Mr. Carl notes that as the nuclear capability in the United States declines the rest of the world continues to invest in nuclear generation, particularly China, where nuclear power generation has almost tripled in the last decade.[53]

Mr. Carl explains that even though nuclear power plants' technology is distinct in many ways from nuclear weapons, you cannot divorce the two when it comes to our national security interests. The reactors that power our nuclear navy – almost 100 submarines and aircraft carriers – run on technology virtually identical to that powering our civilian reactors. Therefore, "[l]osing the technology and operating experience through the atrophy of our domestic nuclear-power sector would mean a profound loss of capability in our military."[54] Given the important role nuclear generation plays in our national security and the resiliency of the electric system, Mr. Carl believes that "[p]utting these units at risk because of short-run market signals and the failure of [the RTO/ISO] markets to adequately value all of the units' attributes is a deficiency that

[52] *Id.* at 12.

[53] *Id.*

[54] *Id.* at 15.

requires immediate attention and action."[55] Finally, Mr. Carl notes that the DOE Proposal provides an opportunity for the federal government to address and preserve the fundamental role that a robust nuclear energy sector has in meeting national security imperatives.[56]

F. Initiatives Such as Capacity Performance and Pay-For-Performance Do Not Sufficiently Address Resiliency Issues

Some commenters contend that the actions identified in the DOE NOPR are not needed because RTOs/ISOs already have mechanisms in place to address resiliency concerns. They point to the "Capacity Performance" mechanism in PJM and the "Pay-For-Performance" mechanism in ISO-NE as examples. These comments, however, miss the mark: the issues identified in the DOE Proposal are different than the intended scope of the existing RTO/ISO programs.

The concern targeted by the DOE Proposal was never intended to be addressed and is not addressed by programs such as PJM's "Capacity Performance" initiative or ISO-NE's "Pay-for-Performance" initiative. These programs have had an impact on incentivizing actions to make generators more resilient to short-term emergencies, including upgrades to gas-fired generators to withstand short-term disruptions in gas deliveries. In particular, they have driven improvements that increase system resilience to certain extreme weather events. But they do not address the risk of extended emergencies affecting fuel deliveries identified in the DOE Proposal, particularly of gas pipeline deliveries. As noted by the Commission in approving the PJM Capacity Performance mechanism, PJM characterized its initiative as an alternative to

[55] *Id.*

[56] *Id.* at 9.

"establishing prescriptive eligibility requirements such as delineating acceptable fuel transportation arrangements, storage requirements for dual fuel capable units, or weatherization requirements."[57] Enhancements of this type, however, will not address the problem that the DOE Proposal is seeking to remedy.

The reference to "acceptable fuel transportation arrangements" is primarily directed to the firmness of gas delivery supplies.[58] The existence of firm pipeline delivery arrangements will not assure gas deliveries, however, when the pipeline is physically impaired from operating. As shown in our initial comments, pipeline repairs and testing can take months to complete.[59] Moreover, some of the most notable contingencies that the DOE Proposal is designed to address – such as a pipeline explosion or terrorist attack – would likely excuse performance under the *force majeure* provision of firm service tariffs maintained by the pipelines. Similarly, events that could disrupt the availability of gas supplies – such as regulatory action restricting fracking – would be expected to excuse performance under gas supply arrangements pursuant to the *force majeure* or "change of law" provisions of those agreements. Incentives designed to cause gas-fired generators to enter into more firm supply arrangements therefore do not obviate the need for the NOPR Proposal.

Similarly, the incentives supplied by Capacity Performance intended to promote investments in "dual-fuel capable units" will only address short-term emergencies. As

[57] *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208 P 51 (2015).

[58] *See PJM Interconnection, L.L.C., et al*, 151 FERC ¶ 61,208 P 46 (2015) (Commission noting that "current tariff does not allow sellers to include in their sell offers costs attributable to means of securing reliable fuel, such as natural gas firm transportation arrangements . . . . PJM asserts that the deficiencies in its existing rules, in this regard, will only be exacerbated if they remain in effect as additional natural gas-fired resources come on line.").

[59] PSEG Initial Comments at 9-10, 17-18.

explicitly required in the original Capacity Performance mechanism initially proposed by PJM "[a] generator must have on-site fuel (or dual-fuel backup capability) for at least 16 hours of continuous operation per day for three consecutive days at an output equal to its quantity of committed Installed Capacity."[60] While an on-site three day fuel source would be adequate to address some types of emergencies, it would not be sufficient to ensure operations over an extended gas supply disruption of the type that the DOE Proposal is designed to address. Finally, improvements in "weatherization" of individual generating plants clearly could not address many types of long-term fuel disruptions and, in particular, could not address the vulnerabilities of the interstate pipeline system or gas production areas.

Capacity Performance and Pay-For-Performance also fall short of addressing the concern identified in the DOE NOPR because they do not address the national security aspects of resiliency. As discussed elsewhere in the PSEG Companies' comments, a diverse portfolio of generating resources including, in particular, nuclear generation makes a significant contribution to our national security. The incentives created by the Capacity Performance and Pay-for-Performance programs do not, however, foster investments to achieve that goal. The DOE Proposal, in contrast, provides an opportunity to recognize the value of this aspect of a fuel diverse generating portfolio.

G. Streamlined Cost-of-Service Mechanism

Certain commentators have claimed that the adoption of a cost-of-service rate mechanism such as set forth in the DOE Proposal would impose an onerous

[60] PJM Staff Proposal, PJM Capacity Performance Proposal, August 20, 2014, available at: http://www.pjm.com/~/media/committees-groups/committees/elc/20140822/20140822-pjm-capacity-performance-proposal.ashx.

administrative burden on the Commission.[61] The PSEG Companies submit that these allegations are greatly overstated. They appear to assume that virtually every coal and nuclear plant in the regions covered by the organized markets would be eligible for cost-of-service payments, which is not realistic.[62] Moreover, the Commission could adopt streamlined procedures for setting cost-of-service rates that would greatly reduce the administrative burden and yet still yield rates consistent with the FPA's just and reasonable standard. The adoption of a streamlined approach would be particularly appropriate under the PSEG Companies' proposal for interim cost-of-service rates until a market-based approach for valuing resiliency can be developed.

The PSEG Companies have retained a consultant – Mr. Alan R. Lovinger – with extensive experience in cost-of-service rate proceedings before the Commission to develop a streamlined procedure that could be used to set rates for nuclear and coal units that are eligible for payments under the DOE Proposal. Mr. Lovinger's affidavit is included as an exhibit to our comments. As explained by Mr. Lovinger, the "mechanism described will maintain FERC's cost-based and original cost principles" but will "resolve up-front those rate issues that require . . . time consuming efforts to resolve and often cause protracted litigation."[63] Mr. Lovinger proposes that applicants would submit standardized data in a "template format includ[ing]: the cost of return on equity and debt as well as the makeup of an appropriate capitalization structure, depreciation and amortization expense, allocation of overhead, and the eligible plant investment included

[61] Brattle Group Evaluation at 25 (stating that "we anticipate that more than 300 generating units would likely be eligible and [setting rates] would require extensive FERC Staff review ….").

[62] *See, e.g.*, Comments of American Electric Power Company, Inc., Docket No. RM18-1-00 at 6 (submitted October 23, 2017) ("Many coal units do not store 90 days of coal, or even have the capability to store that much coal due to space constraints and safety concerns.").

[63] Lovinger Affidavit at 2.

in rate base."[64] The streamlined methodologies recommended by Mr. Lovinger "have been widely used in various electric and gas transmission rate proceedings before the Commission, thereby establishing precedents in such venues."[65] He further notes that his "proposals . . . should streamline both the applicants' rate filings and the resolution of those filings at FERC."[66] He also suggests that "the template currently used by the Commission to set formula rates for transmission providers may be a useful foundation, both in structure and instructions, for creating a NOPR template."[67]

Mr. Lovinger's proposal recognizes the reality that most, if not all, of the plants that would be eligible for cost-of-service payments under the DOE Proposal were at some point in time transferred from traditional utilities to merchant generating companies. In most cases, the original costs of constructing the plants 30 or 40 years ago are fully depreciated or have been written down. He thus recommends two elements for the cost-of-service determination to adequately capture costs and operational risks: (1) a typical (but streamlined) cost-of-service determination based on the current costs of operating the plant, plus the recovery of the cost of capital, including a return of equity, determined from a rate base consisting of plant additions made after the plant was transferred from a traditional utility;[68] and (2) a management fee based on a fraction of the original cost in order to reflect the operational risks associated with owning and managing the transferred facilities plus account for any rate base that may not have been fully recovered

[64] *Id.* at 2-3.

[65] *Id.* at 3.

[66] *Id.*

[67] *Id.*

[68] *Id.* at 3-4.

subsequent to the asset transfer.[69] Mr. Lovinger identifies specific approaches consistent with Commission precedent that could be applied in a mechanical manner for determining capital structure, return on equity, accumulated depreciation, accumulated deferred income taxes, allocations of operating and maintenance costs, depreciation expenses and other elements used in a cost of service calculation.

Because the template approach would provide a means for applicants to mechanically populate a pre-approved formula for determining a units' cost of service, the resultant rate would automatically satisfy the just and reasonable standard upon the Commission's determination that the template was complete. The template filing thus would be for information purposes only but could be challenged by intervenors under FPA Section 206. This approach would be fully consistent with Commission precedent.

For example, in *Public Utilities Comm'n of State of California v. FERC*, 254 F.3d 250 (D.C. Cir. 2001) the Court upheld a formula rate for RMR payments under the CAISO tariff. The Court rejected claims that RMR contracts whose costs would be passed through to non-jurisdictional entities had to be filed under FPA Section 205. As explained there, "[w]hen the Commission accepts a formula rate as a filed rate, it grants waiver of the filing and notice requirements of [§ 205] [, and] [t]he utility's rates, then, can change repeatedly, without notice to the Commission, *provided* those changes are

[69] *Id.* at 4-6; *See, e.g., High Island Offshore Sys., L.L.C.*, 110 FERC ¶ 61,043 PP 107, 115 (2005) (Commission approving management fee for fully depreciated assets equal to the overall rate of return of 9.60 percent multiplied by 10 percent of the modified average rate base which the Commission determined was adequate "to compensate HIOS' owners for the risks of continuing to operate the pipeline."), *remanded on other grounds, Petal Gas Storage, L.L.C. v. FERC*, 496 F.3d 695 (D.C. Cir. 2007); *Tarpon Transmission Co.*, 57 FERC ¶ 61,371 at 62,239-41 (1991) (Commission approving management fee for fully depreciated assets by applying the pretax cost of capital to 10 percent of the pipeline's historical average rate base "to compensate Tarpon's owners for the risks of continuing to operate the pipeline and to provide an incentive for efficient operations."). A fee of this type would appropriately reflect operational risks associated with elements of gross plant whose costs are not reflected in the current rate base.

consistent with the formula."[70] Indeed, as observed by the Court "[i]t can hardly be doubted at this late date [in 2001] that the Commission need not confine rates to specific, absolute numbers but may approve a tariff containing a rate 'formula' or a rate 'rule'...."[71] Finally, the Court noted that "[i]n approving formula rates, the Commission has relied on § 206 as a mechanism to ensure that the rates are just and reasonable, and its reliance on § 206 has survived judicial scrutiny."[72]

As the Commission itself has explained "with formula rates, the specific formula itself is the rate, not the particular components of the formula."[73] Further, *Transwestern Pipeline Co. v. FERC*, 897 F.2d 570 (D.C. Cir. 1990), confirms that the Commission's express adoption of a formula, indicating when it will take effect, provides sufficient notice of the rate to ratepayers, notwithstanding the lack of numerical specificity until the components of the formula are added.[74] Because the elements of the cost-of-service rate as proposed by Mr. Lovinger could be calculated in a mechanical fashion, the formula rate approach would be appropriate here until a market-based mechanism for valuing resiliency is developed.

H. There Is Widespread Support for the Commission to Continue Its Energy Price Formation Efforts

The PSEG Companies are encouraged that there appears to be widespread support among the commenters in this proceeding for the Commission to continue pushing

[70] 254 F.3d at 254 (internal punctuation and citations omitted).

[71] *Id.* (citations omitted).

[72] *Id.* at 257 (internal punctuation and citations omitted).

[73] *Ocean State Power II*, 69 FERC ¶ 61,146 at 61,544 (1994)

[74] *Transwestern*, 897 F.2d at 578 (discussing *Electrical District No. 1 v. FERC*, 774 F.2d 490 (D.C. Cir. 1985))

forward with efforts to improve energy price formation.[75] The PSEG Companies, therefore, reiterate their request here for the Commission to finalize the pending price formation reforms (*i.e.,* uplift cost allocation and transparency and fast-start pricing reforms)[76] and to issue a directive to PJM for the submittal of its proposal to allow marginal units to set price at any point in their operating range so that it can be evaluated. Our position is supported by PJM's Comments. Specifically, PJM states that there are particular price formation reforms that are eligible for "prompt remedy" in the PJM region.[77] PJM further explains that it "has not yet adopted the level of reforms as other regions with respect to fast-start pricing. Other regions have already experienced the benefit of more flexible pricing methods whereas PJM has yet to make similar enhancements."[78] Therefore, because "PJM does not have many units that meet the FERC definition of 'fast-start' the universe of resources that can qualify as "fast-start" should be broadened in PJM to account for the composition of PJM's fleet."[79] Dr. Hogan also supports PJM's enhanced price formation proposal "to reform the existing pricing model in order to ensure that the incremental cost of serving load is reflected in LMP to the fullest extent possible, uplift is reduced and incentives are maintained."[80] According to Dr. Hogan, "PJM's proposal to implement integer relaxation is a beneficial and

[75] ELCON Comments at 6, 11; Comments of Edison Electric Institute, Grid Reliability and Resiliency Pricing, Docket No. RM18-1-000 at 4-5(submitted October 23, 2017); Comments of the PJM Power Providers Group, Grid Reliability and Resiliency Pricing, Docket No. RM18-1-000 at 9-14 (submitted October 23, 2017); Comments of Exelon Corporation, Grid Reliability and Resiliency Pricing, Docket No. RM18-1-000 at 6, 9-22 (submitted October 23, 2017).

[76] *See supra* at n.6&7.

[77] PJM Comments at 39.

[78] *Id.* at 40.

[79] *Id.* at 40-41.

[80] PJM Comments, Appendix B, Letter to Stu Bresler from William Hogan, at 1.

essential first step toward solving the bigger issue of a more comprehensive enhancement of energy and reserve price formation."[81]

Given that the PJM Comments have explained in detail the issues that need to be addressed – "circumstances where prices could fail to reflect all elements relevant to sending the right market signals"[82] – and Dr. Hogan has explained that PJM's proposal is an appropriate step to addressing needed price formation reforms in the PJM market, the Commission should direct PJM to submit its energy price reform proposal without delay so that it can be fully evaluated by the Commission.

Further, both PJM and the IMM raised several other critical areas of reform that were aligned with the PSEG Initial Comments. Specifically, refinements to the scarcity pricing mechanism and enhanced reserve modeling are critical components to the efficient functioning of the markets. Therefore, we believe that the Commission should direct reforms in these areas.[83]

II. CONCLUSION

The PSEG Companies believe that the DOE Proposal has brought to the forefront important concerns regarding the resilience of the Nation's electric grid that require immediate action. We are encouraged by the industry's engagement in this proceeding and believe that a permanent market-based solution could be developed through each region's stakeholder processes. However, the Commission is very aware of the timing issues associated with gaining consensus and implementing a complex set of solutions, even ones that appear to have the broad support. Therefore, we reiterate that the prudent

[81] *Id.* at 3.

[82] PJM Comments at 45.

[83] PSEG Initial Comment at 28.

and proper course of action is to implement the DOE Proposal immediately as an interim solution before further damage is done to the resilience of the electric grid. This should be accompanied by an order directing the RTOs/ISOs to investigate issues unique to their regions, develop viable market-based solutions and submit those solutions to the Commission by a specific date for full evaluation.

Respectfully submitted,

Kenneth R. Carretta

AFFIDAVIT OF JEREMY C. CARL

20171107-5273 FERC PDF (Unofficial) 11/7/2017 4:52:04 PM

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

AFFIDAVIT OF
JEREMY C. CARL

My name is Jeremy C. Carl and I am a research fellow at the Hoover Institution ("Hoover") at Stanford University.

In my role at Hoover, I am the Executive Director of the Shultz-Stephenson Task Force on Energy Policy at Stanford University, and Co-Executive Director of the Hacking for Defense Program's new energy initiative at Stanford. As such, I have direct experience with both energy policy and how it relates to our security and the environment. I have a B.A. from Yale University, a Master in Public Administration from the Kennedy School of Government at Harvard University, focusing on energy policy, and did further graduate work in energy policy at Stanford University.

I have written extensively about grid reliability and resiliency, and have published a number of papers advocating for reform of state and national electricity policy.

I provide this affidavit in support of the PSEG Companies' reply comments in this proceeding on the Secretary of the Department of Energy's Notice of Proposed Rulemaking ("NOPR") for final action by the Federal Energy Regulatory Commission ("FERC" or "Commission").

The purpose of this affidavit is to address issues raised in this proceeding concerning resiliency and the need for federal policymakers to take affirmative action on

this NOPR. Specifically, I will describe how nuclear units affect grid reliability and resilience, U.S. security and economic growth, and non-proliferation interests.

I. THE CURRENT ENVIRONMENT FOR NUCLEAR

There are currently four primary factors driving the decline of the existing nuclear fleet, which I have at times referred to as the "four horsemen of the apocalypse." These four factors facing America's nuclear power sector in the current regulatory environment are:

1. Naturally and artificially depressed wholesale electricity prices in deregulated states.
2. A failure in our markets to recognize and value the unique attributes nuclear resources provide.
3. A trend of higher nuclear generation costs in older, smaller nuclear power plants and in nuclear plants requiring major refurbishment or upgrades. This trend is exacerbated by a period of general operational and regulatory cost increases that have affected all plants.
4. Increasingly effective antinuclear advocacy efforts by both those who dislike nuclear power and those who see nuclear power as competition for their own favored forms of power generation.

It is important to note that the current pressure on our nuclear fleet is largely a result of being squeezed like a vice on one side by fossil fuel plants whose emissions are not factored into their pricing, and subsidized renewables, which reflect the subsidies in their market offers. This has led to negative prices in a significant number of hours (and very low prices in others), distorting the economics for baseload resources such as nuclear units.

II. THE VALUE OF NUCLEAR IN TODAY'S GRID AND WHY THE CURRENT MARKET UNDERVALUES IT

In the remainder of this affidavit, I will explain the critical aspects of maintaining nuclear power as a vital part of our electric grid. The security and resilience aspects include:

1) The new evolving threats facing the system today, particularly terrorism and cyber-security.
2) The ways in which current nuclear unit retirements (America has lost 5 nuclear plants since 2013 and have just 61 plants remaining representing 99 reactors) are negatively impacting overall system resilience and increasing our risk exposure to extreme events.

A. RECENT NUCLEAR POWER PLANT CLOSURES[1]

- Crystal River 3 (Florida), decommissioning began in 2013 *Reactor had been licensed to 2016.*
- Fort Calhoun (Nebraska), 2016 - *Reactor had been licensed to 2033.*

- Quad Cities Generating Station 2 (Illinois), 2018: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2032.
- R. E. Ginna Nuclear Power Plant (New York), 2017: Proposed by utility owner, but near-term closure risk averted through adoption of a state subsidy program. Licensed to 2029.

3) The reliability, on site fuel-storage and the fact that nuclear facilities are already significantly hardened against both physical and cyber threats.

4) The critical role the U.S. leadership and nuclear fleet plays in non-proliferation.

[4] *Id.*

5) The importance of civilian nuclear for America's military leadership.

Economic factors will also be discussed, including:

1) The importance of nuclear power in workforce development.
2) The importance of the civilian nuclear supply chain for both civilian and military matters.
3) The importance of maintaining strong diverse electric generation assets with different sources of power. America needs an actual portfolio strategy for its electricity system, not simply a myopic focus on short-term cost-minimization.

III. THE CRITICAL ROLE OF NUCLEAR POWER TODAY

Nuclear energy provides critical capabilities associated with a resilient and secure electric grid. First, it provides the necessary baseload power that is reliable and available when needed.

As we continue to add more and more renewables and other intermittent sources of energy to the grid, the importance of having a supply that is always on is more important than ever.[5] These intermittent forms of power generation make up increasingly large parts of the grid and cannot always be relied upon to reliably meet system demand. The aggressive deployment of these intermittent resources leads to increased costs for the electricity system as a whole, both in terms of requiring greater transmission capacity to transmit from the generation asset to the load source and more complicated computerization and forecasting to keep up with non-dispatchable assets. In addition, as more of these intermittent sources come on to the grid, it will require the deployment of

[5] Jeffery St. John, *The California Duck Curve Is Real, and Bigger Than Expected*, Greentech Media, November 3, 2016, available at: https://www.greentechmedia.com/articles/read/the-california-duck-curve-is-real-and-bigger-than-expected#gs.VpC0WFE.

more expensive long-term storage solutions, such as batteries. As a result of all of these factors, California, which has arguably been the most aggressive state on renewable energy, has electricity costs that are more than 60% higher than the national average despite record low natural gas prices. (Natural gas makes up almost half of California's power generation.).[6]

In contrast, nuclear power has been a model of predictability. The capacity factor of nuclear power plants in 2016 was a record 92.5%,[7] light years above other low-emission alternatives such as Hydro (38.0%), Solar PV (27%) and wind (34.7%) or even fossil generation such as combined cycle gas (56%) and coal (52.7%) [8] Nuclear Power is indeed "used and useful" in America's electricity generation mix.

IV. NUCLEAR PORTFOLIO ECONOMICS

The recent nuclear unit retirements are negatively impacting overall system resilience and increasing our exposure (unnecessarily) to extreme events.[9] When the California San Onofre plant shutdown, the resulting need to contract with other generation resources led to a $350 million increase in direct customer costs as well as an increase in emissions and a need to build out extensive infrastructure at a multi-billion-

[8] United States Energy Information Agency, *Capacity Factors for Utility Scale Generators Primarily Using Fossil Fuels*, January 2013-August 2017, Electric Power Monthly, available at: https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_6_07_a.

[9] A report by the APS Panel on Public Affairs*, Integrating Renewable Electricity on the Grid,* American Physical Society, available at: https://www.aps.org/policy/reports/popa-reports/upload/integratingelec.pdf.

dollar cost to maintain reliability.[10] In the wake of the shutdown of San Onofre, the California Independent System Operator, Inc. ("California ISO") acknowledged that "reliability has become a more pronounced concern."[11]

With low natural gas prices, the U.S. generation mix is migrating toward gas resources as the primary source of generation capability, and we cannot lose sight of the fact that there can be disruptions that could halt the natural gas revolution in its tracks. The growth in gas production is almost entirely dependent on hydraulic fracturing ("fracking"); yet fracking is under unprecedented attack in numerous states. If these attacks[12] succeed or an issue such as unexpected environmental impacts arises with the technology, we could see tremendous price spikes (akin to what we observed in 2007 thru 2009) and decreases in gas production. Declining yields could also unexpectedly thwart the fracking revolution, stressing the importance of not making all of our energy bets on one source.[13] Even if those price spikes are mitigated in short order, the damage to consumers will have been done.

In less than a decade, the Northeast markets have seen coal production decline from over 30% of our output to 11%. Nuclear, has seen small declines with the retirement of Vermont Yankee, but those declines could increase dramatically if more at risk units are lost. Natural gas has filled the gap, increasing from 23% of the generation

[11] California ISO, *Grid Resiliency*, available at: http://publications.caiso.com/StateOfTheGrid2014/GridResiliency.htm.

[12] Current concerns raised by fracking opponents focus on surrounding seismicity or groundwater pollution.

[13] Mason Inman, *Natural Gas: The Fracking Fallacy*, Nature, December 3, 2014, available at: https://www.nature.com/news/natural-gas-the-fracking-fallacy-1.16430.

mix to 43%. As these trends continue, overall diversity declines, and as PJM has noted in its own reports this leads to potential resiliency risks.[14]

Many argue this is so-called free-market principles at work. As an aggressive free-market proponent who has been aligned with some of the strongest pro-market forces and Congressmen in American politics, this argument garners natural sympathy. But, and this is a critical point all-too-little understood by the public, the U.S. electricity system is not a free market – it has never been a free market, and frankly it has no reasonably foreseeable prospects of becoming a free market.

It is, for better or for worse, a highly regulated market that has been manipulated for many years in ways that have been profoundly damaging to nuclear energy's competitiveness. Yet despite these challenges, nuclear still provides one-fifth of all electricity in the U.S. and creates far more emission-free energy than any other technology, including the solar and wind that capture environmentalist plaudits and journalists headlines.

V. NUCLEAR ENERGY AND NATIONAL SECURITY

Perhaps the biggest unmeasured value of nuclear power is its contribution to our national security. It cannot be stressed enough that unlike any other form of energy, the nuclear enterprise has fundamental non-energy related security attributes that justify additional support in the market. Furthermore this national security assessment is not a partisan issue. As a report by the Energy Futures Initiative (a non-partisan energy think tank founded by former Secretary of Energy Ernest Moniz), notes: "The national security

[14] PJM Interconnection, L.L.C., *PJM's Evolving Resource Mix and System Reliability*, March 30, 2017, available at: http://www.pjm.com/~/media/library/reports-notices/special-reports/20170330-pjms-evolving-resource-mix-and-system-reliability.ashx.

imperatives of nuclear energy, however, are not addressed in state rate-making. This is understandable: national security policy is inherently Federal in nature. As such, the fundamental role of a robust nuclear energy sector in meeting national security imperatives must, in reality, be addressed by the Federal government."[15] Given FERC's rulemaking power, it is ideally situated to do just that.

Nuclear plants are able to keep more fuel on site than any other form of energy, due to nuclear fuel's high energy density.[16] Nuclear energy generation is incredibly space efficient with a fuel pellet the size of a pencil eraser providing as much electricity as 17,000 cubic feet of natural gas, 1,780 pounds of coal or 149 gallons of oil.[17] This could be particularly useful in the event of an interruption to fuel supplies to other generators. In a long-term emergency situation, transporting the necessary amount of nuclear fuel to power a reactor for years could be achieved with relative ease, even in a situation where roads and other transportation networks might be badly degraded. Overall fuel also averages just 31% of total plant costs for operation as opposed to 80-90% of coal and natural gas, making nuclear power much less prone to vacillations in fuel prices.

There are several new threats that potentially menace our power plants and the grid today – from terrorism to cyber threats. In San Jose, CA in 2013 a single non-hardened substation sustained millions of dollars of damage from a sniper attack in 2013

[17] *Id.*

when multiple gunmen opened fire on the transformers using high-powered rifles. As was noted by the ranking member of the House Energy and Commerce Subcommittee at the time who called the attack "... an unprecedented and sophisticated attack ... Communications were disrupted. The attack inflicted substantial damage. It took weeks to replace the damaged parts. Under slightly different conditions, there could have been serious power outages or worse."[18] Nuclear power plants, with their already high-levels of surveillance and security, are much less vulnerable to these types of attacks.

Nuclear has an advantage in this world because nuclear power plants are already hardened against risks and have been designed with safety and security (physical and cyber) in mind from the ground up.

One need only scan the government documents to find a wealth of information on steps nuclear plants have taken to reduce the risk from electromagnetic pulse ("EMP") attacks or the numerous recent publications and books specifically devoted to emergency planning for nuclear power plants and/or hardening their components for cyber or EMP attacks.[19] U.S. nuclear units are similarly resistant to extreme climatic events. When Hurricane Andrew had a direct hit of Florida's Turkey Point Nuclear Plant as a category 5 hurricane with wind gusts up to 175 MPH in 1992, there was no damage to the plant's critical systems.[20] Other forms of electricity generation are simply not hardened and

secured to nearly the same degree. With increasing concerns arising every day about foreign powers hacking into the U.S. electric grid, the hardened security around America's nuclear power plants is critical. In the U.S. nuclear industry, safety and security are a core part of the design and building process in a far more direct and substantive way than they are for any other type of resource.

VI. THE COUNTRY'S NUCLEAR TECHNOLOGY CAPABILITY IMPACTS NON-PROLFERATION EFFORTS

One of the primary areas in which America gains major strategic advantages from the civilian nuclear enterprise—advantages that are not currently accounted for in market prices - occurs in the area of non-proliferation. The U.S. has long been a leader in enforcing non-proliferation norms, as first enunciated by President Dwight Eisenhower in his Atoms for Peace initiative. We have used our leadership in nuclear technology non-proliferation to sign so-called "123" agreements with countries wishing to use civilian nuclear technology which had very strong proliferation safeguards.

These initiatives can have great value to the countries that sign them. For example, when India signed its 123 agreement with President George W. Bush in 2008, it represented the most serious lobbying the Indian government had done on any issue in the US and was described as the cornerstone of the new relationship between the U.S. and India. India was willing to expend these efforts and commit to a much stricter regime under IAEA supervision, in no small part because India's government highly valued the U.S. nuclear technologies we could bring to the table. Without a serious ongoing effort in civilian nuclear technology, these anti-proliferation efforts on the military side would not have been possible. The deal was described by the Council on Foreign Relations as a "watershed in U.S.-India relations and introduces a new aspect

to international nonproliferation efforts."[21] A similar gold-standard 123 Agreement was signed with the United Arab Emirates in December of 2009. Again, U.S. technological leadership in the nuclear arena was used to leverage a strong nonproliferation agreement in a sensitive part of the word.[22]

As our nuclear technology capability has weakened due to a lack of domestic plant manufacture (we have not completed a greenfield nuclear power plant in three decades) so has our leverage in this area, with challenges coming from countries that may have very different views on non-proliferation than we do. Recently the United States has lost several bids on nuclear power projects in the Middle East to Russia, in no small part because of our degraded capacity in this area. The closure of additional nuclear plants degrades our already fragile capabilities while empowering geopolitical rivals such as Russia and China.

Whether or not the U.S. is in the nuclear game, the rest of the world continues to play it, particularly in China where nuclear power generation has almost tripled in the last decade. There are over 400 GW of installed nuclear capacity in more than 31 countries, with more being added every year. There were 58 reactors in 15 countries with a capacity of almost 57 GW under construction as of 2016.[23]

VII. PRESERVING NUCLEAR IS AN IMPORTANT TO THE COUNTRY'S NATIONAL SECURITY INTERESTS

In addition to our work in non-proliferation, the civilian nuclear enterprise dramatically strengthens our military capability as well, another nuclear attribute that is not priced into the market. This is most visibly seen in our Nuclear Navy, which is indubitably the world's most capable. America has almost 100 nuclear-powered vessels, consisting of aircraft carriers and submarines. We have accumulated almost 6200 reactor years of service without a single nuclear accident.[24]

For decades, the United States has gained a strategic advantage from its use of nuclear-powered ships that can deploy longer and more effectively than conventionally powered craft. The importance of fuel choice on capability has a rich history, most notably when Winston Churchill turned the British Navy from coal to oil for many of the same reasons the United States would move its key assets to nuclear. If America does not maintain a nuclear power capability domestically it is difficult to imagine that we will be able to maintain a nuclear navy at the same level of capability we have had historically. This would be a substantial degradation of our ability to project U.S. power.

One example of this degraded capability has been seen in our procurement processes for highly-enriched uranium to fuel both domestic and military reactors. Historically, the entire supply chain for highly enriched uranium has been legally mandated to be of U.S. origin. However, due to the decline of our nuclear capability, the

[24] "Nuclear Powered-Ships," *World Nuclear Association*, Updated October 2017, available at: http://www.world-nuclear.org/information-library/non-power-nuclear-applications/transport/nuclear-powered-ships.aspx.

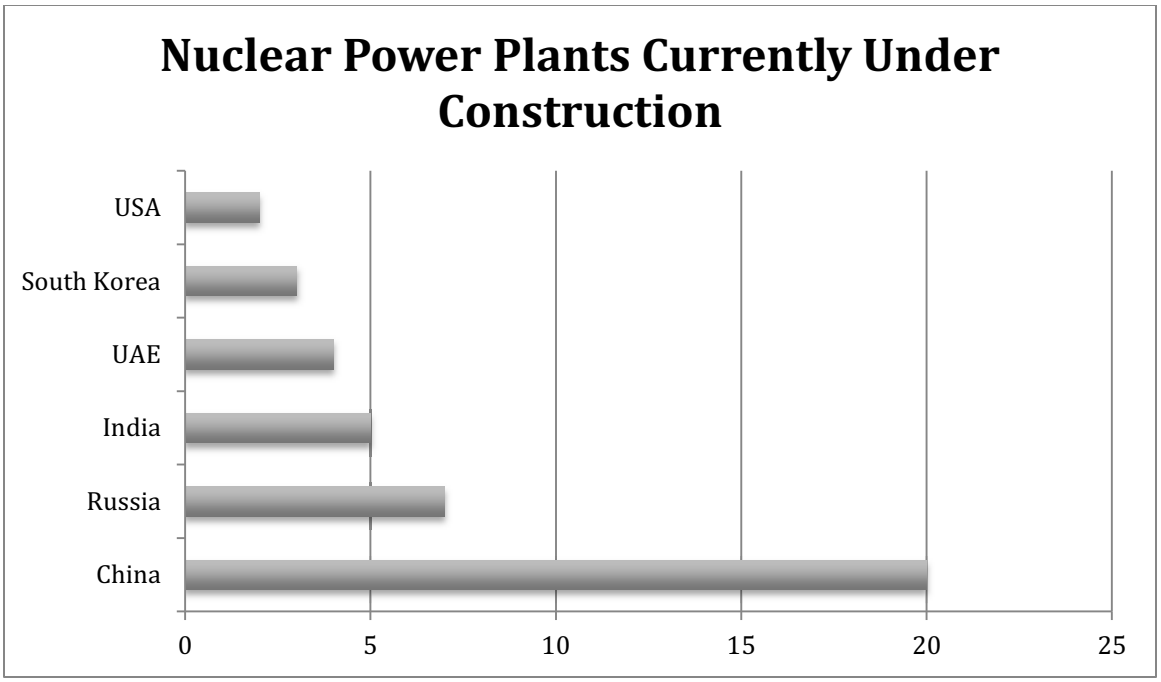
country no longer maintains all aspects of this process domestically, and other nations have gained production advantages over us."[25]

Our nuclear weapons stockpile, and its critical nature for deterring threats such as we are seeing in North Korea, is also hostage to the degradation of America's civilian nuclear capability. The stockpile requires a constant source of Tritium that must also be from U.S. origin reactors using domestically produced LEU reactor fuel. Our lack of an enrichment facility using solely U.S. origin technology represents a substantial impediment to our security in this area. As a result we find ourselves relying on Europe for the supply of this fuel at a time in which Europe's commitment to the nuclear enterprise has become questionable.

Our nuclear technology capability has profound impacts on America's national security. The failure of a new nuclear build in South Carolina and cost overrun issues in Georgia are further indications that the U.S. has lost control of its own nuclear destiny. Without a course correction we will see the future of nuclear power determined by China and Russia, who continue to move aggressively in this arena. China will complete five new nuclear power plants in this year alone.[26]

[25] Energy Futures Initiative, Inc., *The U.S. Nuclear Enterprise: A Key National Security Enabler*, August 2017, available at: https://static1.squarespace.com/static/58ec123cb3db2bd94e057628/t/5992f7e0bf629ad8f9d575ec/1502803938248/EFI+Nuclear+Report+FINAL+08.2017.pdf.

[26] Source: *World Nuclear Association*



The dangers of this situation should be obvious: While nuclear power plants are in many ways a quite distinct technology from nuclear weapons, the capabilities used in domestic enrichment for civilian nuclear power plants can also be used to create nuclear weapons. This fact has been at the core of much of our conflict with Iran and North Korea over their "civilian" nuclear programs. The U.S. has traditionally used its leadership in the supply of nuclear technologies to make it very difficult for nuclear-power-plant operators to proliferate the technology. Are the Chinese and Russians likely to share our interests in this? We need only look to Pyongyang and Pakistan to find out.

In addition to the critical role of nuclear energy in U.S. national security, the reactors that power our nuclear navy – almost 100 submarines and aircraft carriers – run on technology that is virtually identical to the technology powering our civilian reactors. In fact, domestic nuclear power originally grew from these naval programs. Losing the technology and operating experience through the atrophy of our domestic nuclear-power sector would mean a profound loss of capability in our military.

Although these aspects of nuclear retention are tangential to the energy markets, the importance of these resources both to the resilience of the electric system and our overall national interest must be considered in any decision. Putting these units at risk because of short-run market signals and the failure of our markets to adequately value all of the units' attributes is a deficiency that requires immediate attention and action.

VIII. SUPPLY CHAIN AND WORKFORCE DEVELOPMENT

More than 700 companies in 44 states contribute to the U.S. nuclear supply chain and this supply chain is increasingly missing links because of the lack of support for a robust domestic nuclear industry. While nuclear weapons and nuclear power are two quite distinct technologies, there are many suppliers who create specialized solutions for both markets. Without the support of the civilian nuclear fleet our weapons supply chain may also suffer badly, with consequent damage to our nuclear deterrent.

As a result of the uncertainties about our nuclear future, America's number of nuclear engineers being trained sank to less than 25% of what it was at its peak. Although rebounding impressively during the short lived nuclear renaissance created by the Energy Policy Act of 2005, the numbers remain well below peak levels reached in the 1970s.[27]

The closure of a nuclear power plant can often have a dramatic effect on local workforces. When Vermont Yankee closed more than 500 people lost their well-paying jobs that were 2.5 times the average for a worker in the region. The total economic impact within seven years of the plants closing was projected to be 1,100 jobs lost with

[27] Oak Ridge Institute for Science and Education, 2016 Nuclear Engineering Enrollments and Degrees Survey, 2016, available at: https://orise.orau.gov/stem/workforce-studies/nuclear-engineering-enrollments.html.

almost a half billion in economic activity. Nuclear plants also tend to be in more rural areas and the loss of economic activity in these areas from a shutdown is therefore more profound.

There is also the additional important issue of outlet jobs for the U.S. Navy's nuclear technicians. Without a civilian nuclear workforce for these trained nuclear engineers to "graduate" into upon leaving naval service, the U.S. Navy's ability to attract top candidates to work in the nuclear navy may badly lag.

IX. CONCLUSION

The Nuclear enterprise is a vital part of America's electricity infrastructure, that, unique among major forms of generation, provide substantial national security, resilience and reliability and environmental attributes, all of which are either poorly valued by the marketplace or not valued at all. In many cases, local power companies and public utility commissions are poorly positioned to be able to properly value these attributes, which bring benefits far beyond those that accrue to local ratepayers. Furthermore, nuclear energy's lack of price correlation with other forms of electricity generation and its lack of dependence on spot fuel prices make it an ideal component of a broad electricity-generation portfolio.

Given the varied attributes that nuclear energy brings, FERC is absolutely justified in pursuing policies to ensure that the nuclear fleet and our broader civilian nuclear enterprise, will not be irreparably damaged by a myopic focus on short-term cost-minimization.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

AFFIDAVIT OF
ALAN R. LOVINGER

My name is Alan R. Lovinger. I am a Vice President of Brown, Williams, Moorhead & Quinn, Inc. ("BWMQ"). My business address is 1155 Fifteenth Street, N.W., Suite 1004, Washington, D.C. 20005. I have been employed by the firm since March 1, 1998. BWMQ is a leading energy-consulting firm that has been providing advice and assistance to clients for over thirty years. BWMQ provides comprehensive energy related services on business and regulatory matters to over one hundred clients, including independent power producers, natural gas and oil pipelines, electric transmission providers, local distribution companies, energy producers, energy trade associations, pipeline shippers, and federal and state agencies. I graduated from Bryant University in 1965 with a B.S. Degree in Business Management. In 1965, I enrolled in an MBA program at Texas Tech University majoring in Accounting. Prior to joining BWMQ, I was employed by the Federal Energy Regulatory Commission ("FERC" or "Commission") as a Senior Accountant. I was employed by FERC for twenty-five years, from 1966 to the end of 1969, and from 1976 to 1998. My work at FERC was primarily related to cost-of-service issues with an emphasis on income tax matters, gas storage accounting, allocation of shared services, and rate base matters. I provided accounting and tax advice on the rate treatment of storage gas in rate proceedings and participated in

proceedings involving the determination of purchased gas costs in purchased gas adjustment matters. I also represented the Commission in dealings with the Internal Revenue Service on income tax issues that arose in various rate proceedings and assisted the Commission on rulemakings on various cost-of-service matters such as tax normalization, cash working capital, and Post-Retirement Benefits Other than Pensions. Between 1970 and 1976, I was employed by the Internal Revenue Service as an Internal Revenue Agent.

During my employment at FERC and BWMQ, I performed hundreds of cost-of-service studies and provided expert testimony using FERC precedent to support these studies. As an employee of BWMQ, I perform cost-of-service studies for coal generating plants in Reliability-Must-Run ("RMR") rate proceedings where the operator was unable to perform the required reliability required by the grid under market rates. I also perform cost-of-service studies for coal generators supporting compensation for generating reactive power for the grid.

I have been requested by the PSEG Companies to develop a simplified methodology that could be used to set just and reasonable ("J&R") cost-of-service rates for a defined class of eligible resources in connection with the DOE NOPR. The process outlined below sets forth a template approach that could be used to set a J&R cost-of-service in a streamlined manner that could be used to meet the requirements of DOE's NOPR.

The mechanism described will maintain FERC's cost-based and original cost principles to achieve this goal. The primary objective is to resolve up-front those rate issues that are present in rates filings that require applicants, FERC staff and intervenors

time-consuming efforts to resolve and often cause protracted litigation. The issues that can be resolved easily in a template format include: the cost-of-return on equity and debt as well as the makeup of an appropriate capitalization, depreciation and amortization expense, allocation of overhead, and the eligible plant investment included in rate base. The mechanisms proposed here to resolve these issues have been widely used in various electric and gas transmission rate proceedings before the Commission, thereby establishing precedents in such venues. The proposals listed below should streamline both the applicants' rate filings and the resolution of those filings at FERC. It is important to note that cost-of-service recoveries should be net of market revenues so that units do not over-recover their costs. If the Commission finds that the use of a template is appropriate for filing the cost-of-service payment, then the template currently used by the Commission to set formula rates for transmission providers may be a useful foundation, both in structure and instructions, for creating a NOPR template. The descriptions of those issues to be streamlined in a template structure are as follows:

1. **Rate Base** – Rate base will be computed using the Commission's original cost principles. For applicants that are the original owners of the generation facility, the composition of their rate base will be computed using traditional FERC precedent. For the unit owners that are not the original owners and such change in ownership resulted in the facilities to be operated under a market-based authority, the applicant's rate base can be composed of all documented capitalized plant additions made after the change in the original ownership that ended FERC cost-of-service regulation. The coal-fired and nuclear power generators that are likely to file for a cost-of-service payment are those originally placed into service

under the ownership of traditional FERC-regulated utilities. These utilities were required to file an annual Form No. 1 at FERC. The last FERC Form No. 1 filed can form the base to which subsequent additions and retirements can be added. Many of these generating facilities have changed hands at purchase prices that are different from original cost. Use of a purchase price in determining rate base should be allowed only to the extent it is equal to or lesser than original cost. For those allowable plant additions, the applicant will be required to compute appropriate accumulated depreciation and accumulated deferred income taxes ("ADIT") through the starting date authorizing a cost-of-service payment. Unless the applicant has recorded the appropriate ADIT on its books, ADIT should be computed using all applicable federal income elections including bonus depreciation and book recorded depreciation rates. Applicant should also be allowed to include working capital, cash working capital[1] and prepaid expenses using FERC rate case precedent including, but not limited to, the use of a thirteen-month average. Applicant should also be permitted to include general and intangible plant, net of accumulated depreciation and amortization computed through the date prior to the authorization of a cost-of-service payment. General and intangible plant would include only those assets that are both physically located at the plant and whose cost is recorded on the books of the generating plant.

2. **Management Fee** – Because a majority of the coal- and nuclear-fired generators likely to apply for cost-of-service were placed into service in and around the

[1] FERC's precedent in electric rate cases is to permit one-eighth of annual accrued operating and administrative costs to be included in rate base.

1960s and 1970s, many could be fully depreciated, taking into effect FERC's authorized depreciation rates and the significant length of time these facilities have been in service. Since there remains significant operating risk borne by the owners and operators of these fully-depreciated facilities (under FERC precedent), the cost-of-service payment would provide an alternate method of compensating the owners for incurring this significant risk. The Commission has previously addressed the issue of a fully depreciated gas pipeline system and acknowledged that such utilities are entitled to compensation for undertaking the risk of continued operation of the utility service. To provide the necessary incentive for undertaking the risk of ownership and operation of these units, the Commission found that the owners are entitled to a management fee. The mechanism for such a management fee is based on FERC precedent which can be found in FERC gas pipeline decisions.[2] The formula can be simply stated as an average of the pipeline's rate base over its depreciable life multiplied by a factor of ten percent. The product of this computation is then multiplied by the allowed pretax return[3] determined in the rate proceeding to arrive at the allowable management fee. The formula presented in the cited cases is based on

[2] *See, e.g., High Island Offshore Sys., L.L.C.*, 110 FERC ¶ 61,043 PP 107, 115 (2005) (Commission approving management fee for fully depreciated assets equal to the overall rate of return of 9.60 percent multiplied by 10 percent of the modified average rate base which the Commission determined was adequate "to compensate HIOS' owners for the risks of continuing to operate the pipeline."), *remanded on other grounds, Petal Gas Storage, L.L.C. v. FERC*, 496 F.3d 695 (D.C. Cir. 2007); *Tarpon Transmission Co.*, 57 FERC ¶ 61,371 at 62,239-41 (1991) (Commission approving management fee for fully depreciated assets by applying the pretax cost of capital to 10 percent of the pipeline's historical average rate base "to compensate Tarpon's owners for the risks of continuing to operate the pipeline and to provide an incentive for efficient operations.").

[3] A pretax return is the amount earned by a generating unit before income taxes and debt interest payments. A generating unit's after-tax return on equity is grossed up to reflect its income taxes. The formula to calculate a pretax rate of return can be presented as: *pretax rate of return = (debt percentage * debt rate) + (equity percentage * equity rate) * (1 + Composite Tax Rate / (1 – Composite Tax Rate)).*

multiplying the original cost of the plant by five percent (a ten percent rate multiplied by an average of the depreciated plant converts to a five percent rate of the total plant) and multiplying the allowed plant number by a pretax return to arrive at the allowed management fee.[4] Page 402 of the original utility unit owners' Form No. 1 during their ownership contains the original cost plant data. From this Form No. 1 data, the current unit owners can calculate an appropriate management fee simply by multiplying the original cost of the generating units by five percent and multiplying the allowable original plant investment by the pretax return. Ascertaining the allowable pretax components will be discussed below. The management fee accordingly once computed should be directly included as a cost element in the cost-of-service payment. This management fee structure would provide some means of compensation for the operating risk associated with the asset.

3. **Return and Capitalization** – For reactive rate case filings made at FERC, the Commission permits the use of a proxy to establish a reasonable return on equity, cost of debt and capital structure. The proxy used is that of a transmission owner that is interconnected to the generating unit. The Commission found that it is reasonable to use the cost of capital and the capitalization of the transmission owner with which each facility is interconnected as a proxy. Such capital cost was fully investigated either in a transmission rate proceeding or in an annual formula rate filing and was either accepted by the Commission and the parties to the proceeding in settlement or through litigation. For those unit owners that are

[4] This abbreviated computation is appropriate because the necessary information to calculate an average rate base is not available. The use of rate base, instead of the plant investment, in the orders makes the computation more complex than it needs to be.

not connected to a transmission owner that files annual formula rates, the capital structure and debt and equity returns can be used from the transmission owner's last approved FERC rate case.

4. **Fuel and Variable Costs** – As in the Commission's RMR rate proceedings, units receiving cost-of-service payments should be required to bid into the energy markets for the recovery of fuel and applicable variable costs. Assuming that the energy bidding procedures should be largely unchanged, the cost-of-service payment will only consist of operating costs other than fuel and fuel-related variable costs such as water, ammonia or other consumables. The instructions in the template should make it clear that any variable costs recoverable in the energy bidding process should be excluded from the proposed cost-of-service payment to eliminate the possibility of a double recovery of such costs.

5. **Operating Cost Recovery** – Applicants should be entitled to recover all direct and indirect operating costs not already recoverable in their energy bid price. For such recovery of operating costs, the Applicant must provide in its rate filing complete income and balance sheet statements supporting the twelve-month period ("test period") used in the template cost-of-service. These statements can be either an "audited" financial statement or a financial statement review.[5] The Income Statement should provide the necessary detail itemizing the various direct

[5] An audit is an objective examination and evaluation of the financial statements of an organization to make sure that the records are a fair and accurate representation of the transactions they claim to represent. It includes an evaluation of the internal controls of the organization, detail tests of the accounting records through examination of source documents and verifying that the information in the report footnotes is accurate. A financial statement review is a service under which the accountant obtains limited assurance that there are no material modifications that need to be made to an entity's financial statements for them to be in conformity with the applicable financial reporting framework. This work would include inquiries of management, analytical procedures, comparisons to industry benchmarks and review of documentation only to the extent considered necessary.

cost categories that accrued during the test period. No test period adjustments should be permitted. Due to the operating capabilities of turbine generators, periodic costly overhauls (outages) are required and nuclear generators take periodic fuel outages. To normalize the cost effect of these major cost incurrences, Applicants would be required to include a level of overhaul costs in the cost-of-service representing a twelve-month average cost. Thus, if an Applicant incurs in the test period an overhaul cost that is incurred every twenty-four months only one-half of the expenditure ("normalized costs") would be permitted in the test period. Nuclear fuel outages would be treated in a similar manner. Likewise, if the Applicant has zero overhaul cost in the test period, the Applicant will be entitled to a normalized cost adjustment. Administrative and General ("A&G") expense incurred on the generating unit's behalf that can be directly assigned will be permitted in the cost-of-service payment. For A&G costs that cannot be directly assigned, such costs can be allocated to the generating unit if it can be determined that such cost is incurred on behalf of the generator unit, providing such allocations are performed using the Commission's preferred labor allocator. A labor ratio is the product of all the operating labor cost of the consolidated group as the denominator and the Applicant's labor costs as the numerator. Thus, all non-assignable overhead either at a parent or division, or similar cost centers, can be assigned to the Applicant based on the computed labor allocator. Although the attached financial statements will not be in accordance with FERC's Uniform System of Accounts ("USofA"), the cost

categories should be generally consistent with the cost categories prescribed by FERC's USofA.

6. **Depreciation Expense** – Depreciation expense recoverable in the cost-of-service payment should only include plant investment that satisfies the Commission's original cost principles and such plant items that are included in the computation of rate base. Depreciation expense should be computed based on the applicable depreciation rates for the subject plant additions. The sum of the calculated depreciation expense for the eligible plant additions will be included in the computation of the cost-of-service payment. Applicant should also be permitted to recover depreciation and amortization of general and intangible plant directly associated with the generating unit.

7. **Taxes Other Than Income Taxes** – State and local taxes that are attributable directly to the generator should be allowed in the cost-of-service payment, assuming they are included in the attached financial statements and are consistent with Generally Accepted Accounting Principles. Employment taxes that are not included in labor loading costs should likewise be allowed.

Re: Docket Nos. RM05-15-000; RM94-14

Enclosed please find our annual Federal Energy Regulatory Commission (FERC) financial report as produced by our trustee, The Northern Trust Company. The Exelon Generation Company, LLC units are reported as follows:

those formerly owned by Commonwealth Edison Company (Braidwood 1 & 2, Byron 1 & 2, Dresden 1, 2 & 3, LaSalle 1& 2, and Quad Cities 1 & 2) – the reports are consolidated for the Tax Qualified and Non-Tax Qualified Trusts;

those formerly owned by PECO Energy Company (Limerick 1 & 2, Salem 1 & 2, and Peach Bottom 1, 2 & 3) - the reports are consolidated for the Tax Qualified and Non-Tax Qualified Trusts; and

those formerly owned by AmerGen Energy Company, LLC the reports are provided separately for each of the three units (TMI, Oyster Creek and Clinton) and the reports are consolidated for Tax Qualified and Non-Tax Qualified Trusts.

In 2013, there were no decommissioning expenses paid out of any Exelon units and only the legacy PECO units received rate payer contributions.

Please note that the Northern Trust reports reflect a zero opening balance for the legacy PECO and AmerGen units due to the trustee transition on January 1st, 2013 from BNY Mellon to Northern Trust. To address this issue, the ending balances from 2012 reports produced by the prior trustee, BNY Mellon, are included in our filing for these units.

There has not been an opinion expressed on any of the attached reports by an independent public accountant, therefore none is enclosed.

If you have any questions, please contact me at (312) 394-3956.

Sincerely,

Brian E. Andersen

Brian E. Andersen

Notice of Change in Status of the Exelon MBR Entities

Dear Secretary Bose:

Pursuant to the requirements of section 35.42 of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[1] the above-captioned affiliates of Exelon Corporation ("Exelon") with market-based rate authority (the "Exelon MBR Entities") submit this notice of change in status to inform the Commission of certain new affiliations with entities that own or will own generation facilities.[2]

On May 13, 2014, Constellation Solar Georgia, LLC ("Constellation Solar Georgia"), an indirect wholly owned subsidiary of Exelon, began the operation of a 0.8 MW (net) solar-powered generation facility located in Sparta, Georgia. The facility is a qualifying facility ("QF") under the Public Utility Regulatory Policies Act of 1978[3] and is interconnected to Georgia Power Company's ("Georgia Power") transmission system within the Southern Company Services, Inc. ("SOCO") balancing authority area ("BAA"). Constellation Solar Georgia sells the output of its facility to Georgia Power Company under a power purchase agreement.

In addition, on June 6, 2014 two indirect wholly owned subsidiaries of Exelon, Beebe 1B Renewable Energy, LLC ("Beebe 1B") and Fourmile Wind Energy, LLC ("Fourmile") filed with the Commission applications for market-based rate authority in Docket Nos. ER14-2144-000 and ER14-2145-000, respectively. Beebe 1B is developing and will own and operate an approximately 50.4 MW (nameplate) wind-powered electric generation facility located in Gratiot County, Michigan and interconnected to the transmission system owned by Michigan Electric Transmission Company, LLC and operated by the Midcontinent Independent System Operator, Inc. ("MISO"). Beebe 1B is an exempt wholesale generator ("EWG") under the Public Utility Holding Company Act of 2005[4] and will sell the output of its facility under separate long-term contracts to the Lansing Board of Water and Light and the Michigan Public Power Agency. Fourmile is developing and will own and operate an approximately 40 MW (nameplate) wind-powered electric generation facility located in

[1] 18 C.F.R. § 35.42 (2013).

[2] The Exelon MBR Entities have attached an updated asset appendix in the format set forth in Appendix B to 18 C.F.R. Part 35, Subpart H that reflects the new affiliations.

[3] *See* the notice of self-certification of QF status filed on May 2, 2014 by Fresh Air Energy VI, LLC in Docket No. QF14-505-000 and the notice of self-recertification of QF status filed on May 13, 2014 by Constellation Solar Georgia. Effective May 7, 2014, Fresh Air Energy VI, LLC changed its name to Constellation Solar Georgia.

[4] *See* the notice of self-certification of EWG status filed on June 3, 2014 by Beebe 1B in Docket No. EG14-60-000.

Garrett County, Maryland and interconnected to the transmission system owned by The Potomac Edison Company and operated by the PJM Interconnection, L.L.C. ("PJM"). Fourmile will file a Form 556 to certify its facility as a QF prior to its commercial operation date and will sell the output of its facility into PJM's market. Both Beebe 1B and Fourmile expect to begin sales of test power from their respective facilities on September 1, 2014 and to begin commercial operations in the fall of 2014.

The affiliations reported herein do not raise any horizontal or vertical market power concerns. Constellation Solar Georgia owns only a *de minimis* (0.8 MW) amount of generation and therefore has no material impact on the ability of any of the Exelon MBR Entities to exercise horizontal market power in the SOCO BAA. In addition, Beebe 1B's and Fourmile's applications for market-based rate authority demonstrate that they pass the pivotal supplier and market share screens for MISO and PJM, respectively. Therefore, the affiliations reported herein do not raise any horizontal market power concerns. With respect to vertical market power, neither Constellation Solar Georgia nor Beebe 1B or Fourmile owns or controls any transmission facilities, except for limited interconnection facilities required to connect individual generating facilities to the transmission grid, or any inputs to electric power production, as defined in section 35.36 of the Commission's regulations.[5] Therefore the affiliations reported herein do not raise any vertical market power concerns.

For the reasons set forth above, the Exelon MBR Entities' affiliations with Constellation Solar Georgia, Beebe 1B, and Fourmile do not materially change the facts and circumstances that the Commission relied upon in granting the Exelon MBR Entities market-based rate authority. Nor do the new affiliations raise any horizontal or vertical market power concerns with respect to the Exelon MBR Entities. Therefore, the Exelon MBR Entities respectfully request that the Commission accept for filing this notice of change in status and find that no further inquiry is necessary.

Respectfully submitted,

/s/ Vincenzo Franco

1 Unless otherwise indicated, generation capacity ratings (megawatts) are based on the summer seasonal ratings.

2 Facilities solely in the region administered by the Electric Reliability Council of Texas ("ERCOT") are not included herein.

3 MBR authority was not obtained for this entity, because it is a qualifying facility with a capacity of less than 20 MW *(see* 18 C.F.R. § 292.601(c)(1)).

4 The capacity rating for this entity is based on its nameplate capacity.

5 MBR authority was not obtained for this entity, because it is a qualifying facility that sells power pursuant to a PURPA contract or pursuant to a contract executed on or before March 17, 2006 *(see* 18 C.F.R. § 292.601(c)(1)).

6 ExGen has a tolling agreement for 795 MW from Green Country.

7 This generation rating reflects the full plant rating, not just Exelon's ownership share.

8 This row pertains to one or more behind-the-meter facilities that sell entirely at retail and therefore do not participate in the wholesale market.
