CASE NARRATIVE / CONFORMANCE SUMMARY

Client: Arcadis **Job No** JA66701

Site: PSEG-Diesel, Salem, NJ **Report Date** 2/11/2011 10:18:54 A

On 01/21/2011, 7 Sample(s), 1 Trip Blank(s) and 1 Field Blank(s) were received at Accutest Laboratories at a temperature of 2 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA66701 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix: AQ **Batch ID:** V3B3109

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA66701-2MS, JA66701-2MSD were used as the QC samples indicated.

Matrix: AQ **Batch ID:** V3B3111

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA66594-12MS, JA66594-12MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Methyl Tert Butyl Ether are outside control limits. Outside control limits due to high level in sample relative to spike amount.

Matrix: AQ **Batch ID:** V3B3115

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA66951-1MS, JA66951-1MSD were used as the QC samples indicated.

Extractables by GCMS By Method SW846 8270C

Matrix: AQ **Batch ID:** OP47853

- All samples were extracted within the recommended method holding time.
- Sample(s) JA66701-1MS, JA66701-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Blank Spike Recovery(s) for Hexachlorocyclopentadiene are outside control limits. Outside of in house control limits.

Extractables by GCMS By Method SW846 8270C BY SIM

Matrix: AQ **Batch ID:** OP47853A

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA66701-1MS, JA66701-1MSD were used as the QC samples indicated.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover

Instrument Performance Check (BFB)

Job Number: JA66701
Account: AGMPAL Arcadis
Project: PSEG-Diesel, Salem, NJ

Sample:	V3B3115-BFB	**Injection Date:**	01/31/11
Lab File ID:	3B66718.D	**Injection Time:**	08:23
Instrument ID:	GCMS3B		

m/e	Ion Abundance Criteria	Raw Abundance	% Relative Abundance		Pass/Fail
50	15.0 - 40.0% of mass 95	20874	18.7		Pass
75	30.0 - 60.0% of mass 95	51306	46.0		Pass
95	Base peak, 100% relative abundance	111610	100.0		Pass
96	5.0 - 9.0% of mass 95	7435	6.66		Pass
173	Less than 2.0% of mass 174	0	0.00	(0.00) [a]	Pass
174	50.0 - 150.0% of mass 95	105629	94.6		Pass
175	5.0 - 9.0% of mass 174	8284	7.42	(7.84) [a]	Pass
176	95.0 - 101.0% of mass 174	104181	93.3	(98.6) [a]	Pass
177	5.0 - 9.0% of mass 176	6928	6.21	(6.65) [b]	Pass

(a) Value is % of mass 174
(b) Value is % of mass 176

This check applies to the following Samples, MS, MSD, Blanks, and Standards:

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JA68506
Site:	PSEG-Diesel, Salem, NJ	**Report Date**	3/4/2011 5:34:33 PM

On 02/18/2011, 6 Sample(s), 1 Trip Blank(s) and 2 Field Blank(s) were received at Accutest Laboratories at a temperature of 4.6 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA68506 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix: AQ **Batch ID:** V2B3591

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA68307-4MS, JA68307-4MSD were used as the QC samples indicated.

Matrix: AQ **Batch ID:** V2C3633

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA68481-8MS, JA68481-8MSD were used as the QC samples indicated.

Matrix: AQ **Batch ID:** V2C3637

- All samples were analyzed within the recommended method holding time.
- Sample(s) JA68506-4MS, JA68506-4MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Extractables by GCMS By Method SW846 8270C

Matrix: AQ **Batch ID:** OP48193

- All samples were extracted within the recommended method holding time.
- Sample(s) JA68506-1MS, JA68506-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Matrix Spike Recovery(s) for 4-Bromophenyl phenyl ether, bis(2-Ethylhexyl)phthalate, Butyl benzyl phthalate, Carbazole, Di-n-butyl phthalate, Dimethyl phthalate are outside control limits. Outside of in house control limits.
- RPD(s) for MS/MSD for 1,1'-Biphenyl, 1,2,4,5-Tetrachlorobenzene, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 2-Chloronaphthalene, 2-Methylnaphthalene, 2-Nitroaniline, 3,3'-Dichlorobenzidine, 3-Nitroaniline, 4-Bromophenyl phenyl ether, 4-Chloroaniline, 4-Chlorophenyl phenyl ether, 4-Nitroaniline, Acetophenone, Atrazine, Benzaldehyde, bis(2-Chloroethoxy)methane, bis(2-Chloroethyl)ether, bis(2-Chloroisopropyl)ether, bis(2-Ethylhexyl)phthalate, Butyl benzyl phthalate, Caprolactam, Carbazole, Di-n-butyl phthalate, Di-n-octyl phthalate, Dibenzofuran, Diethyl phthalate, Dimethyl phthalate, Hexachlorobutadiene, Hexachlorocyclopentadiene, Hexachloroethane, Isophorone, N-Nitroso-di-n-propylamine, N-Nitrosodiphenylamine, Nitrobenzene are outside control limits for sample OP48193-MSD. Analytical precision exceeds standard laboratory control limits.

Extractables by GCMS By Method SW846 8270C BY SIM

Matrix: AQ **Batch ID:** OP48193A

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA68506-1MS, JA68506-1MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Acenaphthene, Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Chrysene, Fluoranthene, Fluorene, Hexachlorobenzene, Phenanthrene, Pyrene are outside control limits. Outside of in house control limits.
- RPD(s) for MS/MSD for Acenaphthene, Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Fluorene, Hexachlorobenzene, Indeno(1,2,3-cd)pyrene, Naphthalene, Phenanthrene, Pyrene are outside control limits for sample OP48193A-MSD. Analytical precision exceeds standard laboratory control limits.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover

Accutest Laboratories Sample Receipt Summary

Accutest Job Number: JA68506 Client: Immediate Client Services Action Required: No

Date / Time Received: 2/18/2011 Delivery Method: Client Service Action Required at Login: No

Project: No. Coolers: 1 Airbill #'s:

Cooler Security	Y or N		Y or N
1. Custody Seals Present:	☑ ☐	3. COC Present:	☑ ☐
2. Custody Seals Intact:	☑ ☐	4. Smpl Dates/Time OK	☑ ☐

Cooler Temperature	Y or N
1. Temp criteria achieved:	☑ ☐
2. Cooler temp verification:	Infared gun
3. Cooler media:	Ice (bag)

Quality Control Preservatio	Y or N	N/A
1. Trip Blank present / cooler:	☑ ☐	☐
2. Trip Blank listed on COC:	☑ ☐	☐
3. Samples preserved properly:	☑ ☐	
4. VOCs headspace free:	☑ ☐	☐

Sample Integrity - Documentation	Y or N
1. Sample labels present on bottles:	☑ ☐
2. Container labeling complete:	☑ ☐
3. Sample container label / COC agree:	☑ ☐

Sample Integrity - Condition	Y or N
1. Sample recvd within HT:	☑ ☐
2. All containers accounted for:	☑ ☐
3. Condition of sample:	Intact

Sample Integrity - Instructions	Y or N	N/A
1. Analysis requested is clear:	☑ ☐	
2. Bottles received for unspecified tests	☐ ☑	
3. Sufficient volume recvd for analysis:	☑ ☐	
4. Compositing instructions clear:	☐ ☐	☑
5. Filtering instructions clear:	☐ ☐	☑

Job Change Order: JA68506_2/24/2011

Requested Date:	2/24/2011	**Received Date:**	2/18/2011
Account Name:	Arcadis	**Due Date:**	3/11/2011
Project Description:	PSEG-Diesel, Salem, NJ	**Deliverable:**	REDT2
CSR:	MM	**TAT (Days):**	13

Sample #:
JA68506-all

Change: Please change the TAT to 13 days; due 3/3/11.

Above Changes Per: Jonathan Shafer **Date:** 2/24/2011

To Client: This Change Order is confirmation of the revisions, previously discussed with the Accutest Client Service Representative.

Progress Report Approval

Re: Progress Reports – Semi-Annual Diesel Remedial Action Progress Reports - January 2010 through June 2010 & July 2010 through January 2011
Hope Creek Generating Station
Lower Alloways Creek, Salem County
SRP PI# 004157
EA ID #: SUB110001
Case # 04-08-02-2350-16
BFO File Number: 17-04-08

Dear Mr. Pantazes,

The New Jersey Department of Environmental Protection (Department) has completed review of the Progress Reports received on October 18, 2010 and November 10, 2011. The Department has determined that the Progress Reports are in compliance with the Technical Requirements for Site Remediation, N.J.A.C. 7:26E and other applicable requirements. The Department hereby approves the Progress Reports, effective the date of this letter.

Thank you for your cooperation in this matter. If you have any questions, call Linda Range at (609) 984-6606.

Sincerely,

Lynne Mitchell, Section Chief
Bureau of Southern Field Operations

A Analytical Laboratory Data Deliverables

1. Introduction

ARCADIS, on behalf of PSEG Nuclear, LLC (PSEG), has prepared this Remedial Investigation Work Plan (RIWP) for the investigation of a potential diesel-fuel discharge that occurred at the PSEG Nuclear, LLC Salem Generating Station Unit 2 (the Station) located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. **Figure 1** depicts the Station location. **Figure 2** provides the Station Layout and the location of the Unit 2 Diesel Fuel Oil system components. This work plan has been prepared in accordance with Chapter 26E - Technical Requirements for Site Remediation (Technical Requirements).

1.1 Project Background

On April 16, 2010, while completing groundwater investigation activities associated with a separate and independent investigation, PSEG personnel observed suspected diesel-related odors and staining in soil and groundwater during the opening of a temporary utility clearance, identified as TW-2 on **Figure 2**. At this time, PSEG notified the New Jersey Department of Environmental Protection (NJDEP) through its spill hotline (incident No. 10-0416-164911).

The temporary utility clearance consisted of a Schedule 40 PVC sleeve installed to an approximate depth of ten feet below ground surface (bgs) using vacuum excavation equipment. The utility clearance was installed to allow the safe advancement of direct-push borings for the collection of groundwater samples. During the advancement of the vacuum excavation, diesel fuel odors were noted and suspected petroleum hydrocarbon sheen was observed on the water once the water table was encountered. To facilitate the collection of a groundwater sample and to evaluate for the presence of separate-phase hydrocarbon (SPH) at the location of TW-2, and subsequently at the locations of TW-37 and TW-50 (see **Figure 2**), PVC well screen was installed in lieu of the solid PVC sleeve. The three locations were then identified as temporary observation point TW-2, TW-37 and TW-50. Over the next several days, the temporary observation points were evaluated for the presence of SPH and groundwater samples were collected for laboratory analysis. The details and results of these initial groundwater investigation activities are provided in Section 5.

Investigations into the source of the suspected diesel fuel revealed the presence of the following components of the Salem Unit 2 Diesel Fuel Oil System within the vicinity of TW-2:

1. Diesel fuel above ground tanks (AST);

2. Diesel fuel underground piping;

3. An emergency fill valve; and,

4. An overflow tank.

The location of these system components are identified on **Figure 2**. PSEG performed both a pressure test and a guided wave test on the underground piping and the results of the tests did not identify any integrity issues associated with the piping. Details regarding the piping integrity testing are provided in Section 5. In addition, initial soil and groundwater investigation activities were completed in association with the emergency fill valve and the overflow tank, at the three temporary observation points (TW-2, TW-37, and TW-50), and in an area that was excavated to expose the underground piping during the guided wave testing. The details and results of these investigation activities are provided in Section 5. Based on the results of these initial investigation activities, limited additional soil and groundwater investigation activities are required. Details regarding the proposed investigation activities are provided in Section 6.

1.2 Project Personnel

The primary personnel involved in the project are listed in **Table 1**. These personnel include the PSEG Project Manager, the NJDEP Case Manager, ARCADIS team members, and the project analytical laboratory (Accutest Laboratories). The PSEG Project Manager will be responsible for the overall project coordination and oversight and approval of PSEG and contractor work activities.

ARCADIS team members will be responsible for performing technical activities in accordance with the approved RIWP, supervising field subcontractors, and preparing technical reports. The ARCADIS Project Manager will be responsible for committing the necessary resources to this project, day-to-day operations, adherence to schedule, and work quality. The ARCADIS Field Team Leader will be responsible for the field implementation of the RI scope of work, and ensuring that the data collection follows the procedures outlined in the project Quality Assurance Project Plan (QAPP) provided in **Appendix A** of the RIWP for Salem Unit 1 dated January 2005. The January 2005 RIWP proposed the details of investigation activities associated with a similar diesel release at Salem Unit 1.

Accutest Laboratories (Accutest) (certification No. 12129) will be utilized for the project and is a New Jersey-certified laboratory for performing routine environmental and chemical analyses. The laboratory is responsible for providing analytical services, including

laboratory quality assurance and quality control (QA/QC). Additionally, Atlantic Product Services, Inc. (Atlantic) will be utilized for specialty laboratory services including dye and fingerprint analysis in the event that this analysis is warranted.

1.3 Work Plan Organization

This RIWP contains nine sections, including this introduction:

- **Section 2**, provides an overview of the operating history of the Station and the regulation of its operations;
- **Section 3** provides a detailed description of the Station including topography, surface water features, climate, soil, geology and hydrogeology, and a detailed description of previous investigation activities;
- **Section 4** provides details regarding the facility construction and the influence on local geology and hydrogeology;
- **Section 5** provides the details and results of initial investigation activities designed to identify potentials sources of the suspected diesel contamination and to characterize soil and groundwater quality;
- **Section 6** presents proposed investigation activities designed to delineate the extent of soil and groundwater contamination;
- **Section 7** presents information regarding the proposed receptor evaluation;
- **Section 8** presents details regarding the project schedule and required reporting; and,
- **Section 9** provides reports and publications referenced during the preparation of the RIWP.

2. Station History

The following sections provide relevant site information regarding the facility's operating history and a review of applicable regulations relating to operations at the Station.

2.1 Operating History

PSEG Nuclear LLC operates and is part owner of the Salem Generating Station located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. PSEG Nuclear LLC (57.41%) and Excelon (42.59%) jointly own the Salem Generating Station. The Salem Generating Station is situated adjacent to the Hope Creek Generating Station, also located on Artificial Island. Both the Salem and Hope Creek Generating Stations (the Stations) are located on the eastern bank of the Delaware River. The Salem Generating Station encompasses an approximate 26-acre portion of Artificial Island.

The Salem Generating Station is composed of two nuclear generating units (Units 1 and 2) and one distillate oil fueled combustion turbine unit (Unit 3). Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectively. The combustion turbine unit commenced operations in 1972. The nuclear generating units operate as base load units and the combustion turbine unit operates as a peaking unit. The Salem Generating Station has a combined generating capacity of approximately 2,400 MW. Over its operational life, the Salem Generating Station has experienced no significant changes in its operation.

2.2 Regulatory Review

Regulatory oversight for the Salem Generating Station, and other nuclear generating stations, is provided by both federal and state agencies. These agencies ensure that the stations are designed, constructed, licensed and operate in a matter that maximizes the safe containment and management of radioactive materials. These agencies also ensure that sufficient funding mechanisms have been established, are adequately funded, and will be available to decommission the nuclear generating stations at the end of their life cycle.

On the federal and state levels, the United States Nuclear Regulatory Commission (USNRC) and the New Jersey Department of Environmental Protection Bureau of Nuclear Engineering (NJDEP-BNE) conduct licensing and oversight of the Station. Oversight by the NJDEP-BNE and USNRC includes periodic inspections and conducting environmental radiological monitoring.

3. Station Description

The following sections provide information regarding the setting of the Salem Generating Station, including land use, the environmental setting, precipitation and drainage, local geology and local hydrogeology.

3.1 Land Use

PSEG Nuclear LLC owns and/or controls an approximately 740-acre area of Artificial Island that is situated adjacent to and surrounds the Salem and Hope Creek Generating Stations. This area contains administrative and support facilities used by the Stations, the Hope Creek Switch Yard, the Salem Switch Yard, and undeveloped vacant land. With the exception of the Salem Generating Stations (Units 1 through 3) and the Salem Switchyard, the remaining acreage is considered to be the Hope Creek Generating Station.

The zoning classification for the Salem Generating Station is industrial. The land adjacent to the Salem Generating Station is zoned for industrial and residential or agricultural use.

3.2 Environmental Setting

The Salem Generating Station is located on a portion of Artificial Island that borders the Delaware Estuary. The Estuary, in the location of the Salem Generating Station, is a tidal, brackish river, located in an area designated as Zone 5 by the Delaware River Basin Commission.

The United States Army Corps of Engineers, beginning in the early twentieth century, created Artificial Island by depositing hydraulic dredging spoils within a diked area established around a natural sand bar that projected into the Delaware River. Prior to construction of the Salem Generating Station, the property was vacant, undeveloped, low-lying land.

3.3 Topography and Station Drainage

The topography at the Salem Generating Station is relatively flat with limited local relief. Topographic contours for the Station are included on **Figure 3**. Stormwater is managed in accordance with the Salem Generating Station New Jersey Pollution Discharge Elimination System (NJPDES) permit and Stormwater Pollution Prevention Plan. Stormwater is collected in storm drains and routed to the Delaware River for discharge. Stormwater from the major petroleum storage handling areas is routed to the oil/water separator prior to discharge.

3.4 Climate and Precipitation

Salem County is located in southwestern New Jersey. The county's climate is considered to be humid and temperate, as the climate in this county is readily influenced by its proximity to the Delaware Bay. Coastal storms are not uncommon in this region and can

produce high winds and heavy rainfall, which can cause wind damage and flooding in low-lying areas.

Wind direction in this region is dependent upon the season; during the summer, winds are typically from the southwest while during the winter winds are commonly from the northwest. Temperatures vary by season and the maximum expected high temperature for a given year is 96 degrees Fahrenheit, while the minimum expected yearly low temperature is minus 2 degrees Fahrenheit. The average annual precipitation total is 39.9 inches.

3.5 Regional Geology

The Station is located in the Atlantic Coastal Plain Physiographic Province. This area is characterized by relatively flat to gently undulating terrain, underlain by unconsolidated sediments that increase in thickness to the southeast. These sediments range in age from Holocene to Cretaceous (0 to 146 million years old), are primarily comprised of clay, silt, sand, and gravel, and are generally classified as continental, coastal, or marine in nature. Published geologic mapping indicates that the basement rock beneath these sediments (in the area of the Station) is metamorphic schist of the Wissahickon Formation, which is Pre-Cambrian in age (570 to 900 million years old).

The unconsolidated overburden at the Salem and Hope Creek Generating Stations consists of approximately 25 to 40 feet of dredge spoils, engineered fill material (cofferdam), tidal marsh deposits and riverbed deposits. The engineered fill, composed mainly of silt, silty clay, sand, and gravel, replaced the dredge spoils within the cofferdam during the construction of the Station. Due to the composition and nature of the engineered fill, the hydraulic conductivity of this material is expected to be very low, thus limiting the extent and rate of groundwater movement. Below the engineered fill there is an approximate five-foot layer of tidal marsh deposits consisting of silty peat and organic silt and meadow mat. The tidal marsh deposits are semi-confining. Beneath the tidal marsh deposits are approximately ten feet of discontinuous Quaternary Age riverbed deposits consisting of sand and gravel. The engineered fill, the tidal marsh deposits and the riverbed deposits, combine to form the water table aquifer (see Section 3.6). Beneath the surface water aquifer, in order of increasing depth, are the following geologic formations:

Clay, Confining Unit – Beneath the shallow, riverbed and other deposits is a clay, confining unit that separates the shallow unit from the deeper Vincentown Formation. Conflicting geologic reports suggest that the clay, confining unit is either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits (USGS 1979 and 1999). Previous investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

Vincentown Formation – The Vincentown Formation occurs from a depth of approximately 55 feet bgs to a depth of 135 feet bgs and consists of a competent, greenish-gray, fine to medium sand with some silt, shell fragments, feldspar and glauconite.

Hornerstown Formation – The Hornerstown Formation is a highly glauconitic, clayey, dark green sand that contains small percentages of quartz grains and apatite pellets. The Hornerstown Formation unconformably overlies the Navesink Formation and is unconformably overlain by the Vincentown Formation. The Hornerstown Formation occurs from approximately 135 to 145 feet bgs.

Navesink Formation – The Navesink Formation is characteristically a glauconitic sand with varying amounts of silt and clay. It is brown or dark green to blue-black and has a shell bed at its base. The upper part of the formation is less glauconitic, more clayey, more micaceous, and lighter in color. The Navesink Formation conformably overlies the Mount Laurel Sand (USGS 1969). The contact with the overlying Hornerstown Formation is gradational. The Navesink Formation is encountered from approximately 145 to 170 feet bgs.

Mount Laurel-Wenonah Formation – The Mount Laurel-Wenonah Formation consists of a clayey, medium-grained sand with some gravel, feldspar and glauconite. In the vicinity of the Station, the Mount Laurel-Wenonah Formation is approximately 100 feet thick and occurs from 170 to 270 feet bgs.

Beneath the Mount Laurel-Wenonah Formation, more than 1,000 feet of Upper Cretaceous sediments overlie the crystalline bedrock. The Upper Cretaceous sediments include in descending order: the Marshalltown Formation (gray, fine sand); the Englishtown Formation (yellow-brown, fine sand); the Woodbury Clay (dark gray, stiff, silty clay); the Merchantville Formation (dark green clay); the Magothy Formation (coarse to fine silt with little fine sand); and the Raritan and Potomac Formations (interbedded sand, gravelly sand and clay).

3.6 Regional Hydrogeology

There are four primary water bearing formations (aquifers) underlying the Station: 1) the shallow, water table aquifer; 2) the Vincentown Formation; 3) the Mount Laurel-Wenonah Formations; and, 4) the Potomac-Raritan-Magothy Formations. The shallow, water-bearing unit, which consists of the dredge spoils, engineered fill, tidal marsh deposits and the discontinuous Quaternary riverbed deposits, occurs between approximately 10 to 40 feet bgs. In general, the dredge spoils, engineered fill and tidal marsh deposits are characterized by low permeability. Occasional lenses of sand within the dredge spoils may

contain perched water within a few feet of the ground surface. The groundwater in the water table aquifer is generally brackish, with flow to the southeast and a gradient of approximately 0.007 feet/feet.

A clay confining unit, identified as either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits, separates the shallow water-bearing unit from the deeper Vincentown Formation. As stated previously, investigations conducted at the facility indicate that the clay confining unit is laterally extensive beneath the Station.

The Vincentown Formation, which occurs from approximately 55 to 135 feet bgs, is a semi-confined to confined aquifer under artesian conditions. Groundwater in the Vincentown Formation generally flows from north to south with a gradient of approximately 0.003 feet/feet. Regionally, the Vincentown Formation is a water-producing aquifer, which supplies potable water to domestic wells in Salem County. Groundwater in the aquifer is moderately hard with high iron content. Saltwater-intrusions occur near the Delaware River, where water quality is brackish and non-potable.

The Hornerstown and Navesink confining units separate the Vincentown Formation from the Mount Laurel-Wenonah Formations. The Mount Laurel-Wenonah Formations occur from approximately 135 to 170 feet bgs. The Station has two potable and fire-water supply wells screened in this formation.

The deepest of the water bearing formations is the Potomac-Raritan-Magothy Formation. In Salem County, the Potomac-Raritan-Magothy Formation occurs at depths in excess of 500 feet bgs. This is the primary water producing aquifer for New Jersey. Four potable and fire-water supply wells at the Station are screened in the Potomac-Raritan-Magothy Formation at depths ranging from 800 to 1,100 feet bgs. The Potomac-Raritan-Magothy Formation is bounded by the Merchantville Formation above and below by the Wissahickon Schist basement rock. The crystalline basement rock of the Wissahickon Schist is not considered a productive aquifer and only locally transmits water from secondary porosity (i.e., fractures and faults).

4. Facility Construction and Local Geology and Hydrogeology

The construction of the Salem Generating Station has caused significant changes to the local geology and hydrogeology. Within the footprint of the cofferdam surrounding Units 1 and 2 (see **Figure 2**) the majority of original Artificial Island materials were removed to a depth of 70 feet bgs. The following sections, which contain information presented in a Remedial Investigation Report (RIR) previously prepared for a separate investigation conducted at the Station (ARCADIS 2004), describe the conditions at Artificial Island prior

to the construction of the Station and detail how the construction of the Station has altered the local geology.

4.1 Pre-Facility Construction

The Station is located on the southern tip of what was once a natural sand bar projecting into the Delaware River. The area between the sand bar and the mainland had been used as a dredge spoil deposit area. In 1899, a timber sheetpile wall was installed around the perimeter of the sand bar. Over the next 50 or so years the area was used as a spoil deposit area for material collected during the dredging of the Delaware River. Riprap was added to the perimeter when the timbers began to degrade. The area landward of Artificial Island has remained a tidal marsh.

4.2 Facility Construction

The construction of the Station has resulted in significant changes to the local geology. It was necessary to remove and rework much of the soil in the area of the Station in order to facilitate construction. For the purposes of this report, the description of the facility construction is limited to the area within the cofferdam; however, it should be noted that the local geology beyond the limits of the cofferdam was also significantly modified. The extent of the cofferdam is shown on **Figure 2**.

The cellular cofferdam, which encircled the excavation for all the Class I structures (e.g., containment, fuel handling, and auxiliary buildings), was constructed of interlocking sheet piling driven from an approximate depth of 23 feet below existing grade (approximately 77 feet plant datum [PD] or -12.92 feet above mean sea level [amsl NAVD 1988]). The cofferdam consists of 24 circular cells, approximately 60.5 feet in diameter with connecting arcs, that were advanced from this depth to approximately 10 feet into the Vincentown Formation to an elevation of 17 feet PD (-72.92 feet amsl). The cofferdam sections are of two different heights, 50 feet and 60 feet. The elevation of the top of the cofferdam is 77 feet PD (-12.92 feet amsl) on the north, south and west sides. The elevation of the eastern side is 67 feet PD (-22.92 feet amsl) providing access and a foundation for the return circulating water pipes and associated thrust block.

The inside area of the cofferdam sections were excavated to elevation 27 feet PD (-62.92 feet amsl). A vertical steel wall was added inside each individual cofferdam section to divide the sections approximately in half. The inner half of the individual cofferdam sections, or the section facing the building foundations, was then filled to the top with lean concrete. The area contained by the entire cofferdam structure was then excavated to the Vincentown Formation for placement of a lean concrete mat that served as the foundation for the

construction of the structures within the cofferdam. During this stage of the excavation, qualified personnel visually inspected the bottom of the excavation to verify that the excavation had reached the top of the Vincentown Formation prior to placing any lean concrete.

Prior to the completion of the excavation, at approximately elevation 45 feet PD (-44.92 feet amsl), 15 exploratory borings were drilled through the remaining Kirkwood Formation and into the underlying Vincentown to verify the depth to the formation. These additional borings showed no measurable differences from the study borings. Based on a review of available documents, the top of the Vincentown Formation in the area of the cofferdam ranges between 27 and 30 feet PD (-62.92 to –65.92 feet amsl).

When the surface of the Vincentown Formation was reached, the area was cleared of loose soil and lean concrete was poured directly onto the exposed Vincentown Formation. Because the latter stages of the excavation were performed in freezing temperatures, a layer of material was left in place to insulate the Vincentown Formation until the concrete was ready to pour. In cases where the top of the Vincentown Formation did freeze prior to pouring of the concrete, the frozen soils were excavated or thawed prior to starting the pour. The station construction drawings indicate that the base of the first lean concrete pour was at 30 feet PD (-59.92).

The cofferdam serves as a basin in which the Class I structures were constructed. Prior to construction of the primary structures, a lean concrete mat ranging in thickness from 5 to 50 feet was placed on top of the Vincentown Formation for support of the structures. Following placement of the lean concrete, the Auxiliary Building, Fuel Handling Buildings and Reactor Containment Buildings were constructed. The remainder of the excavation within the cofferdam was then backfilled with structural fill meeting the design specifications of the Station.

4.3 Local Geology and Hydrogeology

The soils removed from within the cofferdam were not used to backfill the completed structure because the hydraulically placed fill and other riverbed deposits underlying Artificial Island did not meet the building design specifications for the Station. Therefore, it was necessary to import construction or structural fill to build the facility. The structural fill was placed between and around the Auxiliary Building, Fuel Handling Buildings, Units 1 and 2, portions of the cofferdam, above the return circulating water pipes, and from the top of the clay, confining-unit to the land surface in the portions of the area between the cofferdam and the circulating water discharge pipes.

SII-SSA-0014-004151

The structural fill used at the station was obtained from a number of sources in New Jersey and Delaware. One fill source used in the area of this investigation was the Hinchner Pit. While the location of the borrow source was not identified, the material was described as yellowish-brown fine to medium sand with a trace of silt and clay.

Details of groundwater investigation activities historically completed at the facility indicate that groundwater elevations in the shallow, water-bearing unit within the limits of the cofferdam are generally higher than those outside the limits of the cofferdam. This is expected considering permeability differences that exist between the structural fill within the limits of the cofferdam and the hydraulic fill beyond the limits of the cofferdam, which result in a groundwater mound. Due to the mound, groundwater flows radially outward from the cofferdam. The observed mounding effect dissipates quickly. A groundwater elevation contour map for the shallow, water-bearing unit is presented on **Figure 3**. Beyond the limits of the cofferdam, groundwater flow is generally from the center of the island (northeast of the Salem Generating Station) towards the Delaware River.

5. Initial Investigation Activities

The following sections provide details regarding initial investigation activities completed at the Facility. These investigation activities included the following:

- Unit 2 Diesel Fuel System component inventory;
- SPH evaluation;
- Underground piping evaluation;
- Soil Sampling; and
- Groundwater Sampling.

Prior to initiating investigation activities, PSEG inventoried the Salem Unit 2 Diesel Fuel System components in the vicinity of utility clearance location TW-2 to identify potential sources of the suspected release. Temporary Observation Points TW-2, TW-37, and TW-50 were gauged using an oil/water interface probe to determine if SPH had accumulated. Subsequently, each of the diesel system components identified during the inventory were evaluated as potential sources of the suspected diesel observed at TW-2 through pressure and guided wave testing (underground piping) and soil sampling (emergency fill valve and overflow tank). To confirm the observed sheen was diesel fuel, a dye and fingerprint analysis was conducted. Additionally, groundwater samples were collected from Temporary

Observation Points TW-2, TW-37, and TW-50 to evaluate for the presence of dissolved phase constituents. The following sections include details and results of these investigation activities.

5.1 Separate-Phase Product Evaluation

Groundwater in the vicinity of utility clearance TW-2 was observed to be approximately 3-feet below ground surface (bgs). To identify if SPH existed on top of the water table, a 4-inch slotted PVC casing was installed into the temporary utility clearance TW-2 which extended to approximately 10 feet bgs. Two additional locations (TW-37 and TW-50) adjacent to TW-2 were also fitted with slotted PVC casing. The locations were then identified as temporary observation points TW-2, TW-37 and TW-50. **Figure 4** shows the location of the temporary observation points. All three points were periodically monitored for the presence of SPH with an oil-water interface probe. To identify if SPH was present between monitoring periods (and to capture any mobile SPH), a hydrophobic absorbent sock was placed in temporary observation point TW-2. During monitoring events, the absorbent sock was inspected for the accumulation of SPH.

On May 27, 2010, while excavating soil west of the Fuel Handling Building in preparation for the pressure and guided wave test (see Section 5.4), a SPH sheen was observed on the groundwater within the excavation. A sample of the groundwater that had accumulated within the excavation with an apparent sheen was collected for diesel fuel dye testing and fingerprint analysis. **Figure 2** shows the location of excavation No. 2 and the location of the soil sample FHB.

During the course of initial investigation activities, measurable SPH was not observed within the temporary observation points, nor did the absorbent sock accumulate any observable SPH. Additionally, monitoring of excavation No. 2 confirmed no additional SPH accumulated in the excavation. Analytical results from the dye analysis indicated that no dye was detected in the sheen sample. Results from fingerprint analysis confirmed the material most closely resembles weathered diesel fuel. **Appendix A** contains the laboratory analytical deliverable.

5.2 Salem Unit 2 Diesel Fuel System Inventory

A review of Salem Unit 2 Diesel System components identified four potential sources of the suspected diesel release in the vicinity of temporary utility location TW-2. **Figure 2** identifies these components which include: diesel fuel ASTs, an emergency fill valve, an above ground overflow tank and underground diesel supply piping.

The Salem Unit 2 Emergency Diesel Generator Fuel System is supplied by two 30,000 gallon ASTs located within the Auxiliary Building. The associated emergency fill valve and overflow tank are both above ground features located along the exterior wall of the Auxiliary Building. The emergency fill valve is used to fill the diesel fuel 30,000 gallon ASTs in the event the standard fill supply through the underground piping is not available. The overflow tank is an approximately 55 gallon drum and is utilized as containment for diesel fuel if the Salem Unit 2 Diesel Fuel ASTs are overfilled. The underground diesel fuel oil supply pipe in the area inspected is an approximately 4-inch carbon steel pipe which supplies fuel from the Salem Unit 20,000 barrel Fuel Oil storage tank.

Each of the Salem Unit 2 Diesel Fuel System components was investigated to identify if it was potentially the source of the release. Visual observation of the Salem Unit 2 30,000 gallon Diesel Fuel ASTs confirmed the tanks were not leaking and the secondary containment contained no apparent staining, eliminating the ASTs as potential sources. The remaining part of this section describes the investigative techniques used to characterize the remaining parts of the Salem Unit 2 Diesel Fuel System and the extent of the impacts.

5.3 Pressure Testing and Guided Wave Testing

The underground piping identified in **Figure 2** supplies diesel fuel from the Salem 20,000 barrel Fuel Oil storage tank to various loads including the Salem Units 1 and 2 Diesel Fuel 30,000 gallon ASTs, located within the Auxiliary Building, the service water furnaces and the circulating water boiler. PSEG performed a pressure test and guided wave test, to investigate the integrity of the underground piping in the vicinity of the Auxiliary Building and Unit 2 Fuel Handling Building.

Pressure testing is conducted by isolating a section of pipe and pressurizing the section. If the pipe fails to hold a positive pressure, then the pipe is known to contain a leak. This test is utilized to confirm if larger integrity concerns (i.e. a break in the pipe) are present. Guided wave testing uses low frequency ultrasound waves to identify metal loss from the pipe walls. Guided wave testing is utilized to identify smaller integrity concerns (i.e. pin holes or fractures).

In late May and early June 2010, PSEG conducted pressure testing and guided wave testing of the underground diesel system supply pipe, respectively. Results of both tests confirmed the integrity of the pipe. As such, no additional investigation of the underground diesel fuel supply pipe is proposed.

5.4 Soil Sampling

On May 4, 2010, ARCADIS advanced five soil borings to investigate soil adjacent to the emergency fill valve (EFV-W and EFV-N) and overflow tank (OFT-W, OFT-N and OFT-E). **Figure 4** shows the location of the soil boring. ARCADIS collected discrete interval soil samples from 0.0 to 0.5 feet bgs and 2.0 to 2.5 feet bgs to characterize soil in the vicinity of these potential source features. To accommodate site specific health and safety practices, a vacuum excavator was used to advance the borings prior to collecting the sample. Samples were collected using a decontaminated hand trowel and transferred directly to laboratory supplied glassware. In addition, ARCADIS collected a soil sample for TPHC analysis and 2-methylnaphthalene and naphthalene contingent analysis from immediately above the water table in excavation No. 2.

In accordance with analytical requirements for diesel fuel contained within Table 2-1 of the Technical Requirements for Site Remediation (TRSR) and the *Protocol for Addressing Extractable Hydrocarbons* (NJDEP 2010), soil samples were analyzed for TPHC via method NJDEP OQA-QAM-025. In addition, ARCADIS collected soil samples from each of the discrete intervals for contingency semi-volatile organic compound (SVOC) analysis (naphthalene and 2-methylnaphthalene if TPHC analytical results exceed 1,000 mg/kg).

Sample collection, packaging, and shipment were conducted in accordance with the NJDEP Field Sampling and Procedures Manual dated August 2005. Samples were cooled to approximately 4°C, and submitted under chain-of-custody protocols to Accutest Laboratories, Inc., a New Jersey certified laboratory for analysis on an expedited (72-hour) turn-around-time.

Analytical data presented in **Table 2** indicate one (OFT-E[0-0.5]) out of 10 samples exceeded the NJDEP soil remediation standard (SRS) for TPHC of 5,100 milligrams per kilogram (mg/kg), with a concentration of 5,510 mg/kg. Five results exceeded the contingency threshold screening criterion of 1,000 mg/kg. As such, contingency sample analyses was conducted on the highest two TPHC concentration samples (OFT-E[0-0.5] and OFT-N[0-0.5]). **Table 2** presents the analytical results for 2-methylnaphthalene and naphthalene, which did not indicate concentrations above the method detection limits. **Appendix A** contains the full analytical data deliverable in New Jersey Reduced format.

Figure 4 illustrates the sample locations and analytical data collected during the initial soil investigation. TPHC concentrations exceeded NJDEP SRS in sample OFT-E at a depth of 0.0 - 0.5 feet bgs. This exceedence was delineated vertically by a sample collected from the same boring at 2.0 – 2.5 feet bgs. This exceedence was delineated horizontally by the building wall to the south, and north and west by samples OFT-N and OFT-W, respectively.

These samples were collected at the same depth as the exceedence. Interpretation of the analytical results (decreasing concentrations with depth) confirms shallow impacts associated with a surface release. As such, PSEG proposes additional sample collection to horizontally delineate TPHC impacts in soil to the east and northeast.

5.5 Groundwater Sampling

On May 5, 2010, ARCADIS collected grab groundwater samples from temporary observation points TW-2, TW-37 and TW-50 to characterize the shallow water quality. Groundwater samples to be analyzed for TPHC were collected using laboratory-decontaminated disposable Teflon® bailers. ARCADIS transferred the samples directly from the bailers to decontaminated sample bottles supplied by Accutest.

Table 3 presents the analytical results for TPHC in groundwater samples collected from temporary observation points screened across the shallow water table. TPHC was detected in samples at concentrations ranging from 1.84 mg/L (TW-50) to 372 mg/L (TW-2). Currently there is not a Groundwater Quality Criteria (GWQC) concentration available for TPHC. However, these concentrations signify limited impacts. To further evaluate the groundwater quality within the source area, PSEG proposes installing two monitoring wells and collecting groundwater samples for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). **Figure 7** illustrates the locations of the proposed monitoring wells. One monitoring well is proposed adjacent to soil boring OFT-E and the other in the vicinity of excavation No. 2.

6. Remedial Investigation Work Plan

The following are the objectives of the remedial investigation activities proposed in this RIWP:

- Characterize the horizontal extent of diesel-related constituents in soil;
- Evaluate for the presence of SPH(as defined in *Guidance for LNAPL Free Product Initial Recovery and Interim Remedial Measures* [NJDEP 2010]) and delineate its extent, if necessary;
- Characterize dissolved-phase diesel-related constituents in shallow groundwater within the release area; and

- Determine the need for further action.

The following activities were designed to achieve these primary objectives.

6.1 Soil Investigation

In accordance with New Jersey Administrative Code (N.J.A.C.) TRSR section 7.26E-4.1(a), PSEG proposes to advance two soil borings (Borings OFT-E+5 and OFT-NE) to investigate the horizontal extent of diesel-related constituents in soil. **Figure 6** identifies location of the proposed borings.

6.1.1 Collection of Soil Samples

Soil samples will be collected to horizontally delineate TPHC impacts identified in soil sample OFT-E (0.0 – 0.5) to the east and northeast. Soil boring OFT-E+5 and OFT-NE will be located 5 feet to the east and northeast of boring OFT-E, respectively. Sample locations (OFT-E+5 and OFT-NE) will be identified by measuring from known stationary objects.

Following the removal of asphalt cover, a surface soil sample will be collected using a hand auger or equivalent device from 0.0 – 0.5 feet bgs. Soil retrieved from each boring will be visually examined by an ARCADIS geologist and field screened using a photoionization detector (PID). Soil will be described according to the Unified Soil Classification System (USCS). Soil descriptions will also include notes of other visual or olfactory observations related to diesel impacts. Relevant information collected during the advancement of soil borings will be recorded in the field book, including lithology, PID readings, and other visual observations. **Table 4** summarizes locations, depths, analysis and method for soil samples collected during RI activities.

6.1.2 Soil Sample Analysis

In accordance with NJDEP's November 12, 2009 *Protocol for Addressing Extractable Petroleum Hydrocarbon*, samples will be analyzed for TPHC via either NJDEP OQA-QAM-025 on an accelerated (1-week) turnaround time. In the event that analysis results exceed 1,000 mg/kg, 25 percent of these samples will be analyzed for naphthalene and 2-methylnaphthalene. ARCADIS will collect one blind duplicate sample and in accordance with the NJDEP Field Sampling Procedures Manual (FSPM), ARCADIS will collect one field blank and one trip blank; however, the Trip Blank will only be analyzed if the contingent naphthalene and 2-methylnaphthalene sample is released for analysis.

SII-SSA-0014-004157

6.2 Groundwater Investigation

PSEG proposes to install two monitoring wells (Well CC and Well CD) to evaluate for the presence of SPH, and characterize dissolved-phase constituents in groundwater. **Figure 7**shows the location of the proposed wells.

Monitoring well CC will be installed adjacent to where a sheen was observed in excavation No. 2. Monitoring well CD will be installed at a location where previous activities have identified TPHC concentrations exceeding NJDEP SRS of 5,100 mg/kg.

The collection of free-phase product measurements and the analysis of groundwater samples from the monitoring wells will provide data regarding the presence of SPH and dissolved-phase diesel fuel constituents in groundwater. Water-level measurements collected from monitoring wells will be evaluated to confirm the direction of groundwater flow within the area of investigation.

If field observations identify measurable thicknesses of SPH in the monitoring wells, interim product recovery efforts will be initiated and NJDEP case manager will be notified.

6.2.1 Monitoring Well Installation

Prior to commencing monitoring well installation activities, a utility locator service will identify underground utilities in the vicinity of proposed monitoring wells using ground penetrating radar (GPR) instruments. Additionally, to accommodate site specific health and safety best practices, PSEG proposes to advance the boring using vacuum excavation techniques to 10 feet bgs. The Borehole will be opened to a minimum 8 inch diameter to accommodate NJDEP regulated monitoring well annulus. Descriptions of the overburden materials, including physical characteristics, PID readings, visual evidence of staining, and odors, will be made by the ARCADIS geologist and logged in the field book.

Monitoring wells will be screened across the first water-bearing unit encountered at a depth of approximately 3 feet bgs. The monitoring wells will be constructed of 4-inch-diameter flush-joint threaded PVC risers with an 8.5-foot-length of 0.02-inch PVC well screen. A washed silica sand pack will be placed between the well string and the formation to the top of the well screen followed by a 6-inch layer of fine sand (#00) as a seal. A neat cement grout will be installed in the remaining annular space to lock the well in place. Each monitoring well will be completed as a flush-mounted well with a protective steel casing and locking well cap. **Table 5** summarizes the depth, diameter, and construction details of the wells to be installed during the RI activities.

A New Jersey licensed driller will provide oversight of installation activities to ensure monitoring wells are installed in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001.

Upon completion, each monitoring well will be properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the formation. The monitoring wells will be developed via the block and surge and overpumping method. Well development will continue until the discharge is free of turbidity.

All monitoring wells will be surveyed by a New Jersey licensed surveyor and Form B provided. Top of casing elevation will be established to within 0.01-foot relative to the 1988 North American Vertical Datum (NAVD 88). The location of each monitoring well will be established to within 0.1-foot relative to the 1983 North American Horizontal Datum (NAD 83).

6.2.2 Groundwater Sampling

Following installation, monitoring wells will be sampled to characterize water quality within the source area. The following sections provide details regarding these activities.

6.2.2.1 Water-Level and Separate-Phase Product Measurements

Prior to the collection of groundwater samples from the wells, depth-to-water and separate-phase product thickness measurements will be collected using an electronic oil/water interface probe. The measurement data will be used along with the surveyed top of casing elevation data to calculate groundwater elevations for the wells. The groundwater elevation data will be analyzed to assess groundwater flow conditions at the Station. The separate-phase product measurements will be used to delineate the extent of product on the water table. Water-level and product measurement collection procedures are addressed in the QAPP included in the RIWP for Salem Unit 1 (ARCADIS 2005).

6.2.2.2 Collection of Groundwater Samples

Following the installation and development of the wells, two-rounds of groundwater samples will be collected. The first round of groundwater sampling will be completed a minimum of two weeks following the well installation activities. Groundwater samples will only be collected from the wells that do not indicate a measurable thickness (i.e., greater than 0.01 feet) of separate-phase product. The second round of groundwater sampling will be completed one month following the initial round.

SII-SSA-0014-004159

Due to the sensitive nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples will be collected utilizing the low-flow sampling methodology. Sample collection procedures, as well as quality control/quality assurance (QA/QC) sampling requirements, are outlined in the QAPP included in the RIWP for Salem Unit 1 (ARCADIS 2005).

6.2.2.3 Groundwater Sample Analysis

In accordance with analytical requirements for diesel fuel contained within Table 2-1 of the TRSR groundwater samples will be analyzed for volatile organic compounds plus library search (VOC+10) and semi-volatile organic compounds plus library search (SVOC+15).

6.3 Data Reduction and Analysis

Following completion of the RI field activities, field and analytical data will be reduced and evaluated to: 1) identify data gaps; 2) present a clear and concise summary of the investigation results; 3) provide recommendations for further investigation and remediation, if necessary. The reduction and evaluation of the field and analytical data will involve the activities described in the following sections.

6.3.1 Geographic Information System

ARCADIS will use the EQuIS data management system to manage environmental data collected during the RI. EQuIS is a comprehensive geo-environmental data management database, designed to store analytical test data and related data obtained during environmental site investigations, routine site monitoring, and hazardous waste remediation projects. EQuIS can be used for report and chart generation and is integrated with multiple statistical, numerical modeling and data visualization tools.

Analytical data generated will be in the form of electronic data deliverables (EDD) from the analytical laboratory. Quality assurance/quality control (QA/QC) data will be entered as necessary to comply with regulatory requirements. The electronic database will not be subjected to a formal data validation process; however, the data will be reviewed for completeness and if data gaps are identified, they will be reported for discussion of how to address them.

6.3.2 Compile and Review Groundwater Analytical Data

As discussed in Section 6.3.1, the EQuIS data management system will be used to compile and manage groundwater analytical data collected at the Station. These data will be summarized and presented in table format and posted on figures as appropriate.

Historical groundwater analytical results for the monitoring wells will be evaluated to determine groundwater analytical trends for the wells.

6.4 Iterative Investigation Objective Process

As stated previously, following completion of the RI, data will be evaluated to: 1) identify data gaps; 2) present a clear and concise summary of the investigation results; 3) provide recommendations for further investigation and remediation, if necessary. Addenda to this RIWP will be prepared, accordingly, to address further investigation.

7. Receptor Evaluation

PSEG proposes to perform a receptor evaluation in accordance with the requirements specified in N.J.A.C. TRSR 7:26E1.15 through 1.19 and submit the results with the RIR.

8. Schedule and Reporting

PSEG would like to expedite the review process to ensure all regulatory deadlines are met. Therefore, PSEG proposes to arrange a meeting with NJDEP case manager to review the proposed work plan prior to initiating field activities.

Following completion of the RI, data will be evaluated to determine if additional investigation activities are necessary to characterize soil and groundwater conditions at the Station. A RIR will be prepared to present a comprehensive overview of investigation activities performed to date, and recommendations regarding future activities. A tentative schedule has been prepared that highlights some of the key project deliverables and the timeframes for their submittal as set forth in the Site Remediation Reform Act, N.J.S.A. 58:10C-1 et seq. The schedule is provided as **Figure 8**.

SCALE: 1"=10'

INVESTIGATION DETAILS:

ANALYTICAL RESULTS INDICATE DETECTED CONCENTRATIONS OF TPHC ARE BELOW NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION SOIL REMEDIATION STANDARDS FOR ALL SAMPLES EXCEPT OFT–E(0.0–0.5). THIS SAMPLE WAS VERTICALLY DELINEATED THROUGH SAMPLE OFT–E(2.0–2.5) AND HORIZONTALLY DELINEATED TO THE NORTH AND WEST THROUGH OFT–N AND OFT–W, RESPECTIVELY. PSEG PROPOSES TO ADVANCE TWO BORINGS (OFT–E+5 AND OFT–NE) AND COLLECT SOIL SAMPLES FROM THE 0.0–0.5 FEET INTERVAL AND ANALYZE FOR TPHC, TO COMPLETE DELINEATION.

INSPECTIONS OF QUALITY

TK / VESSEL/ UNIT :	**SUBMITTED SAMPLE FHD(GW)**	APS FILE # :	**79131**
TERMINAL NAME :	**ARCADIS**	LAB # :	**7501**
CITY, STATE :	**NEWTOWN, PA**	DATE SAMPLED :	**5/27/2010**
PRODUCT :	**OIL/WATER MIXTURE**	DATE TESTING COMPLETED :	**6/10/2010**

ON OIL/WATER MIXTURE FROM SUBMITTED SAMPLE FHD(GW)
THE FOLLOWING ANALYTICAL RESULTS WERE OBTAINED

METHOD No.	TESTS	UNITS	RESULTS
DT-100	DYE CONCENTRATION	PPM / PPTB	**0.0 / 0.0**

A GC Fingerprint was run on the sample and the fingerprint matches Diesel Fuel #2 (No. 2 Fuel Oil) and appears to be weathered. The sample did not match Ultra Low Sulfur Diesel, Diesel Fuel #6 or Hydraulic Oil.

GC-FID METHOD 310.13	GC FINGER PRINT		
	ULTRA LOW SULFUR DIESEL	MG/L	**ND**
	DIESEL FUEL #6	MG/L	**ND**
	DIESEL FUEL #2	MG/L	**158.0 ***
	HYDRAULIC OIL	MG/L	**ND**

* NOTE: THE DIESEL FUEL #2 PRESENT IN THE SAMPLE APPEARS TO BE WEATHERED.
THE DILUTION FACTOR IS 1.
ND = NOT DETECTED.

Soil samples reported on a dry weight basis unless otherwise indicated on result page.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JA45964
Site:	PSE&G Diesel Unit 2, Salem, NJ	**Report Date**	5/26/2010 10:21:15 A

On 05/06/2010, 11 Sample(s), 0 Trip Blank(s) and 1 Field Blank(s) were received at Accutest Laboratories at a temperature of 4.2 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA45964 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Extractables by GCMS By Method SW846 8270C

Matrix: AQ **Batch ID:** OP43568

- Sample(s) JA46345-1MS, JA46345-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- JA45964-12R: Sample extracted outside the holding time per client's request.

Matrix: SO **Batch ID:** OP43560

- All samples were extracted within the recommended method holding time.
- Sample(s) JA46369-2MS, JA46369-2MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Extractables by GC By Method OQA-QAM-025

Matrix: AQ	Batch ID: OP43411

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA45640-2MS, JA45640-2MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Total PHC are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for Total PHC are outside control limits.
- OP43411-MS for Tetracosane-d50: Outside control limits due to matrix interference.
- OP43411-MSD for Tetracosane-d50: Outside control limits due to matrix interference.
- OP43411-MSD for Chlorobenzene: Outside control limits due to matrix interference.
- OP43411-MS for Chlorobenzene: Outside control limits due to matrix interference.

Matrix: SO	Batch ID: OP43484

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA45964-3MS, JA45964-3MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Total PHC are outside control limits. Outside control limits due to high level in sample relative to spike amount.
- JA45964-3 for o-Terphenyl: Outside control limits due to matrix interference and dilution.
- OP43484-MSD for o-Terphenyl: Outside control limits due to matrix interference and dilution.
- OP43484-MSD for Chlorobenzene: Outside control limits due to matrix interference and dilution.
- JA45964-7 for o-Terphenyl: Outside control limits due to matrix interference.
- OP43484-MS for o-Terphenyl: Outside control limits due to matrix interference and dilution.
- OP43484-MS for Chlorobenzene: Outside control limits due to matrix interference and dilution.

Wet Chemistry By Method SM18 2540G

Matrix: SO	Batch ID: GN37211

- The data for SM18 2540G meets quality control requirements.

Matrix: SO	Batch ID: GN37212

- The data for SM18 2540G meets quality control requirements.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JA46106
Site:	PSE&G Diesel Unit 2, Salem, NJ	**Report Date**	5/25/2010 4:03:31 PM

On 05/07/2010, 3 Sample(s), 0 Trip Blank(s) and 1 Field Blank(s) were received at Accutest Laboratories at a temperature of 4.8 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA46106 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Extractables by GC By Method OQA-QAM-025

Matrix AQ **Batch ID:** OP43411

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA45640-2MS, JA45640-2MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Total PHC are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for Total PHC are outside control limits. Probable cause due to matrix interference.
- Sample(s) JA46106-3, OP43411-MS, OP43411-MSD have surrogates outside control limits. Probable cause due to matrix interference.
- JA46106-3: Diluted due to high concentration of target compound and matrix interference.
- JA46106-3 for Tetracosane-d50: Outside control limits due to dilution.
- JA46106-3 for o-Terphenyl: Outside control limits due to dilution.
- JA46106-3 for Chlorobenzene: Outside control limits due to dilution.
- OP43411-MSD for Tetracosane-d50: Outside control limits due to matrix interference.
- OP43411-MSD for Chlorobenzene: Outside control limits due to matrix interference.
- OP43411-MS for Tetracosane-d50: Outside control limits due to matrix interference.
- OP43411-MS for Chlorobenzene: Outside control limits due to matrix interference.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover

SII-SSA-0014-004208

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JA47682
Site:	PSE&G Diesel Unit 2, Salem, NJ	**Report Date**	6/9/2010 2:22:00 PM

On 05/28/2010, 1 Sample(s), 0 Trip Blank(s) and 0 Field Blank(s) were received at Accutest Laboratories at a temperature of 4 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA47682 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Extractables by GC By Method OQA-QAM-025

Matrix SO	**Batch ID:** OP43822

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA47682-1MS, JA47682-1MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Total PHC are outside control limits. Outside control limits due to high level in sample relative to spike amount.
- RPD(s) for MSD for Total PHC are outside control limits for sample OP43822-MSD. Outside control limits due to high level in sample relative to spike amount.

Wet Chemistry By Method SM18 2540G

Matrix SO	**Batch ID:** GN38122

- The data for SM18 2540G meets quality control requirements.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover

Dear Ms. Linda Range:

ARCADIS, on behalf of PSEG Nuclear, LLC (PSEG), is submitting a revised Figure 7 – Proposed Monitoring Well Locations, attached, from the July 12, 2010 Salem Unit 2 Remedial Investigation Work Plan. In response to our meeting on August 25, 2010 the attached figure was updated to incorporate comments that were received during the meeting. Monitoring well CC is being installed down-gradient of the former excavation number 2. Monitoring well CD is being installed at a location that total petroleum hydrocarbon (TPH) concentrations exceeded the New Jersey Soil Remediation Standards. Monitoring well CE is being installed along the diesel fuel line, north of the former excavation number 2. Monitoring well CF is being installed near a temporary observation point (36). These wells are proposed to be installed in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001.

Monitoring wells will be screened across the first water-bearing unit encountered at a depth of approximately 4 feet bgs. The monitoring wells will be constructed of 4-inch-diameter flush-joint threaded PVC risers with an 7-foot-length of 0.02-inch PVC well screen. A washed silica sand pack will be placed between the well string and the formation to the top of the well screen followed by a 6-inch layer of fine sand (#00) as a seal. A neat cement grout will be installed in the remaining annular space to lock the well in place. Each monitoring well will be completed as a flush-mounted well with a protective steel casing and locking well cap

Upon completion, each monitoring well will be properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the

formation. The monitoring wells will be developed via the block and surge and overpumping method. Well development will continue until the discharge is free of turbidity.

All monitoring wells will be surveyed by a New Jersey licensed surveyor and Form B provided. Top of casing elevation will be established to within 0.01-foot relative to the 1988 North American Vertical Datum (NAVD 88). The location of each monitoring well will be established to within 0.1-foot relative to the 1983 North American Horizontal Datum (NAD 83).

Sincerely,

Bradley Pierce

E Groundwater Sampling Logs

1. Introduction

ARCADIS, on behalf of PSEG Nuclear, LLC (PSEG), has prepared this Remedial Investigation Report (RIR) for the investigation of a potential diesel-fuel discharge that occurred at the PSEG Salem Generating Station Unit 2 (the Station) located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. **Figure 1** depicts the Station location. **Figure 2** provides the Station Layout and the location of the Unit 2 Diesel Fuel Oil system components. This report has been prepared in accordance with Chapter 26E - Technical Requirements for Site Remediation (Technical Requirements).

1.1 Project Background

On April 16, 2010, while completing groundwater investigation activities associated with a separate and independent investigation, PSEG personnel observed suspected diesel-related odors and staining in soil and groundwater during the opening of a temporary utility clearance, identified as TW-2 on **Figure 2**. At this time, PSEG notified the New Jersey Department of Environmental Protection (NJDEP) through its spill hotline (incident No. 10-0416-164911).

The temporary utility clearance consisted of a Schedule 40 polyvinyl chloride (PVC) sleeve installed to an approximate depth of 10-feet below ground surface (bgs) using vacuum excavation equipment. The utility clearance was installed to allow the safe advancement of direct-push borings for the collection of groundwater samples. During the advancement of the vacuum excavation, diesel fuel odors were noted and suspected petroleum hydrocarbon sheen was observed on the water once the water table was encountered. To facilitate the collection of a groundwater sample and to evaluate the presence of separate-phase hydrocarbon (SPH) at the location of TW-2, and subsequently at the locations of TW-37 and TW-50 (see **Figure 2**), PVC well screen was installed in lieu of the solid PVC sleeve. The three locations were then identified as temporary observation point TW-2, TW-37 and TW-50. Over the next several days, the temporary observation points were evaluated for the presence of SPH and groundwater samples were collected for laboratory analysis. The details and results of these initial groundwater investigation activities are provided in Section 5.

Investigations into the source of the suspected diesel fuel revealed the presence of the following components of the Salem Unit 2 Diesel Fuel Oil System within the vicinity of TW-2:

1. Diesel fuel above ground storage tanks (AST);

2. Diesel fuel underground piping;

3. An emergency fill valve; and;

4. An overflow tank.

The location of these system components are identified on **Figure 2**. PSEG performed both a pressure test and a guided wave test on the underground piping and the results of the tests did not identify any integrity issues associated with the piping. Details regarding the piping integrity testing are provided in Section 5. In addition, initial soil and groundwater investigation activities were completed in association with the emergency fill valve and the overflow tank, at the three temporary observation points (TW-2, TW-37, and TW-50), and in an area that was excavated to expose the underground piping during the guided wave testing. The details and results of these investigation activities were provided in the July 12, 2010 Site Investigation Report (SIR)/ Remedial Investigation Workplan (RIWP) and are summarized in Section 5. Based on the results of these initial investigation activities, additional soil and groundwater investigation activities were conducted in accordance with SIR/RIWP as amended in a letter dated October 28, 2010 and verbally agreed upon in meeting with NJDEP on August 25, 2010. Details regarding the remedial investigation activities are provided in Section 6.

1.2 Project Personnel

The primary personnel involved in the project are listed in **Table 1**. These personnel include the PSEG Project Manager, the NJDEP Case Manager, ARCADIS team members, and the project analytical laboratory (Accutest Laboratories). The PSEG Project Manager is responsible for the overall project coordination and oversight and approval of PSEG and contractor work activities.

ARCADIS team members are responsible for performing technical activities in accordance with the approved RIWP, supervising field subcontractors, and preparing technical reports. The ARCADIS Project Manager is responsible for committing the necessary resources to this project, day-to-day operations, adherence to schedule, and work quality. The ARCADIS Field Team Leader is responsible for the field implementation of the Remedial Investigation (RI) scope of work, and ensuring that the data collection followed the procedures outlined in the project Quality Assurance

Project Plan (QAPP) provided in the RIWP for Salem Unit 1 dated January 2005 (Appendix A). The January 2005 RIWP proposed the details of investigation activities associated with a similar diesel release at Salem Unit 1.

Accutest Laboratories (Accutest) (certification No. 12129) was utilized for the project and is a New Jersey-certified laboratory for performing routine environmental and chemical analyses. The laboratory is responsible for providing analytical services, including laboratory quality assurance and quality control (QA/QC). Additionally, Atlantic Product Services, Inc. (Atlantic) was utilized for specialty laboratory services including dye and fingerprint analysis.

1.3 Report Organization

This RIR contains nine sections, including this introduction:

- **Section 2**, provides an overview of the operating history of the Station and the regulation of its operations;
- **Section 3** provides a detailed description of the Station including topography, surface water features, climate, soil, geology and hydrogeology, and a detailed description of previous investigation activities;
- **Section 4** provides details regarding the facility construction and the influence on local geology and hydrogeology;
- **Section 5** provides the details and results of initial investigation activities designed to identify potentials sources of the suspected diesel contamination and to characterize soil and groundwater quality;
- **Section 6** presents results of investigation activities designed to delineate the extent of soil and groundwater contamination;
- **Section 7** presents information regarding the submittal of the receptor evaluation;
- **Section 8** presents details regarding the project schedule and required reporting; and,
- **Section 9** provides reports and publications referenced during the preparation of the RIR.

2. Station History

The following sections provide relevant site information regarding the facility's operating history and a review of applicable regulations relating to operations at the Station.

2.1 Operating History

PSEG Nuclear LLC operates and is part owner of the Salem Generating Station located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. PSEG Nuclear LLC (57.41%) and Exelon (42.59%) jointly own the Salem Generating Station. The Salem Generating Station is situated adjacent to the Hope Creek Generating Station, also located on Artificial Island. Both the Salem and Hope Creek Generating Stations (the Stations) are located on the eastern bank of the Delaware River. The Salem Generating Station encompasses an approximate 26-acre portion of Artificial Island.

The Salem Generating Station is composed of two nuclear generating units (Units 1 and 2) and one distillate oil fueled combustion turbine unit (Unit 3). Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectively. The combustion turbine unit commenced operations in 1972. The nuclear generating units operate as base load units and the combustion turbine unit operates as a peaking unit. The Salem Generating Station has a combined generating capacity of approximately 2,400 MW. Over its operational life, the Salem Generating Station has experienced no significant changes in its operation.

2.2 Regulatory Review

Regulatory oversight for the Salem Generating Station, and other nuclear generating stations, is provided by both federal and state agencies. These agencies ensure that the stations are designed, constructed, licensed and operate in a matter that maximizes the safe containment and management of radioactive materials. These agencies also ensure that sufficient funding mechanisms have been established, are adequately funded, and will be available to decommission the nuclear generating stations at the end of their life cycle.

On the federal and state levels, the United States Nuclear Regulatory Commission (USNRC) and the New Jersey Department of Environmental Protection Bureau of Nuclear Engineering (NJDEP-BNE) conduct licensing and oversight of the Station.

Oversight by the NJDEP-BNE and USNRC includes periodic inspections and conducting environmental radiological monitoring.

3. Station Description

The following sections provide information regarding the setting of the Station, including land use, the environmental setting, precipitation and drainage, local geology and local hydrogeology.

3.1 Land Use

PSEG owns and/or controls an approximately 740-acre area of Artificial Island that is situated adjacent to and surrounds the Salem and Hope Creek Generating Stations. This area contains administrative and support facilities used by the Stations, the Hope Creek Switch Yard, the Salem Switch Yard, and undeveloped vacant land. With the exception of the Salem Generating Stations (Units 1 through 3) and the Salem Switchyard, the remaining acreage is considered to be the Hope Creek Generating Station.

The zoning classification for the Station is industrial. The land adjacent to the Station is zoned for industrial and residential or agricultural use.

3.2 Environmental Setting

The Station is located on a portion of Artificial Island that borders the Delaware Estuary. The Estuary, in the location of the Station, is a tidal, brackish river, located in an area designated as Zone 5 by the Delaware River Basin Commission.

The United States Army Corps of Engineers, beginning in the early twentieth century, created Artificial Island by depositing hydraulic dredging spoils within a diked area established around a natural sand bar that projected into the Delaware River. Prior to construction of the Station, the property was vacant, undeveloped, low-lying land.

3.3 Topography and Station Drainage

The topography at the Station is relatively flat with limited local relief. Topographic contours for the Station are included on **Figure 2**. Stormwater is managed in accordance with the Station New Jersey Pollution Discharge Elimination System (NJPDES) permit and Stormwater Pollution Prevention Plan. Stormwater is collected in

storm drains and routed to the Delaware River for discharge. Stormwater from the major petroleum storage handling areas is routed to the oil/water separator (OWS) prior to discharge.

3.4 Climate and Precipitation

Salem County is located in southwestern New Jersey. The county's climate is considered to be humid and temperate, as the climate in this county is readily influenced by its proximity to the Delaware Bay. Coastal storms are not uncommon in this region and can produce high winds and heavy rainfall, which can cause wind damage and flooding in low-lying areas.

Wind direction in this region is dependent upon the season; during the summer, winds are typically from the southwest while during the winter winds are commonly from the northwest. Temperatures vary by season and the maximum expected high temperature for a given year is 96 degrees Fahrenheit, while the minimum expected yearly low temperature is minus 2 degrees Fahrenheit. The average annual precipitation total is 39.9 inches.

3.5 Regional Geology

The Station is located in the Atlantic Coastal Plain Physiographic Province. This area is characterized by relatively flat to gently undulating terrain, underlain by unconsolidated sediments that increase in thickness to the southeast. These sediments range in age from Holocene to Cretaceous (0 to 146 million years old), are primarily comprised of clay, silt, sand, and gravel, and are generally classified as continental, coastal, or marine in nature. Published geologic mapping indicates that the basement rock beneath these sediments (in the area of the Station) is metamorphic schist of the Wissahickon Formation, which is Pre-Cambrian in age (570 to 900 million years old).

The unconsolidated overburden at the Stations consists of approximately 25 to 40 feet of dredge spoils, engineered fill material (cofferdam), tidal marsh deposits and riverbed deposits. The engineered fill, composed mainly of silt, silty clay, sand, and gravel, replaced the dredge spoils within the cofferdam during the construction of the Station. Due to the composition and nature of the engineered fill, the hydraulic conductivity of this material is expected to be very low, thus limiting the extent and rate of groundwater movement. Below the engineered fill there is an approximate five-foot layer of tidal marsh deposits consisting of silty peat and organic silt and meadow mat. The tidal marsh deposits are semi-confining. Beneath the tidal marsh deposits are

approximately ten feet of discontinuous Quaternary Age riverbed deposits consisting of sand and gravel. The engineered fill, the tidal marsh deposits and the riverbed deposits, combine to form the water table aquifer (see Section 3.6). Beneath the surface water aquifer, in order of increasing depth, are the following geologic formations:

Clay, Confining Unit – Beneath the shallow, riverbed and other deposits is a clay confining unit that separates the shallow unit from the deeper Vincentown Formation. Conflicting geologic reports suggest that the clay confining unit is either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits (USGS 1979 and 1999). Previous investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

Vincentown Formation – The Vincentown Formation occurs from a depth of approximately 55 feet bgs to a depth of 135 feet bgs and consists of a competent, greenish-gray, fine to medium sand with some silt, shell fragments, feldspar and glauconite.

Hornerstown Formation – The Hornerstown Formation is a highly glauconitic, clayey, dark green sand that contains small percentages of quartz grains and apatite pellets. The Hornerstown Formation unconformably overlies the Navesink Formation and is unconformably overlain by the Vincentown Formation. The Hornerstown Formation occurs from approximately 135 to 145 feet bgs.

Navesink Formation – The Navesink Formation is characteristically a glauconitic sand with varying amounts of silt and clay. It is brown or dark green to blue-black and has a shell bed at its base. The upper part of the formation is less glauconitic, more clayey, more micaceous, and lighter in color. The Navesink Formation conformably overlies the Mount Laurel Sand (USGS 1969). The contact with the overlying Hornerstown Formation is gradational. The Navesink Formation is encountered from approximately 145 to 170 feet bgs.

Mount Laurel-Wenonah Formation – The Mount Laurel-Wenonah Formation consists of a clayey, medium-grained sand with some gravel, feldspar and glauconite. In the vicinity of the Station, the Mount Laurel-Wenonah Formation is approximately 100 feet thick and occurs from 170 to 270 feet bgs.

Beneath the Mount Laurel-Wenonah Formation, more than 1,000 feet of Upper Cretaceous sediments overlie the crystalline bedrock. The Upper Cretaceous

sediments include in descending order: the Marshalltown Formation (gray, fine sand); the Englishtown Formation (yellow-brown, fine sand); the Woodbury Clay (dark gray, stiff, silty clay); the Merchantville Formation (dark green clay); the Magothy Formation (coarse to fine silt with little fine sand); and the Raritan and Potomac Formations (interbedded sand, gravelly sand and clay).

3.6 Regional Hydrogeology

There are four primary water bearing formations (aquifers) underlying the Station: 1) the shallow, water table aquifer; 2) the Vincentown Formation; 3) the Mount Laurel-Wenonah Formations; and, 4) the Potomac-Raritan-Magothy Formations. The shallow, water-bearing unit, which consists of the dredge spoils, engineered fill, tidal marsh deposits and the discontinuous Quaternary riverbed deposits, occurs between approximately 10 to 40 feet bgs. In general, the dredge spoils, engineered fill and tidal marsh deposits are characterized by low permeability. Occasional lenses of sand within the dredge spoils may contain perched water within a few feet of the ground surface. The groundwater in the water table aquifer is generally brackish, with flow to the southeast and a gradient of approximately 0.007 feet/feet.

A clay confining unit, identified as either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits, separates the shallow water-bearing unit from the deeper Vincentown Formation. As stated previously, investigations conducted at the facility indicate that the clay confining unit is laterally extensive beneath the Station.

The Vincentown Formation, which occurs from approximately 55 to 135 feet bgs, is a semi-confined to confined aquifer under artesian conditions. Groundwater in the Vincentown Formation generally flows from north to south with a gradient of approximately 0.003 feet/feet. Regionally, the Vincentown Formation is a water-producing aquifer, which supplies potable water to domestic wells in Salem County. Groundwater in the aquifer is moderately hard with high iron content. Saltwater-intrusions occur near the Delaware River, where water quality is brackish and non-potable.

The Hornerstown and Navesink confining units separate the Vincentown Formation from the Mount Laurel-Wenonah Formations. The Mount Laurel-Wenonah Formations occur from approximately 135 to 170 feet bgs. The Station has two potable and fire-water supply wells screened in this formation.

The deepest of the water bearing formations is the Potomac-Raritan-Magothy Formation. In Salem County, the Potomac-Raritan-Magothy Formation occurs at depths in excess of 500 feet bgs. This is the primary water producing aquifer for New Jersey. Four potable and fire-water supply wells at the Station are screened in the Potomac-Raritan-Magothy Formation at depths ranging from 800 to 1,100 feet bgs. The Potomac-Raritan-Magothy Formation is bounded by the Merchantville Formation above and below by the Wissahickon Schist basement rock. The crystalline basement rock of the Wissahickon Schist is not considered a productive aquifer and only locally transmits water from secondary porosity (i.e., fractures and faults).

4. Facility Construction and Local Geology and Hydrogeology

The construction of the Station has caused significant changes to the local geology and hydrogeology. Within the footprint of the cofferdam surrounding Units 1 and 2 (see **Figure 2**) the majority of original Artificial Island materials were removed to a depth of 70 feet bgs. The following sections, which contain information presented in a Remedial Investigation Report (RIR) previously prepared for a separate investigation conducted at the Station (ARCADIS 2004), describe the conditions at Artificial Island prior to the construction of the Station and detail how the construction of the Station has altered the local geology.

4.1 Pre-Facility Construction

The Station is located on the southern tip of what was once a natural sand bar projecting into the Delaware River. The area between the sand bar and the mainland had been used as a dredge spoil deposit area. In 1899, a timber sheet pile wall was installed around the perimeter of the sand bar. Over the next 50 or so years the area was used as a spoil deposit area for material collected during the dredging of the Delaware River. Riprap was added to the perimeter when the timbers began to degrade. The area landward of Artificial Island has remained a tidal marsh.

4.2 Facility Construction

The construction of the Station has resulted in significant changes to the local geology. It was necessary to remove and rework much of the soil in the area of the Station in order to facilitate construction. For the purposes of this report, the description of the facility construction is limited to the area within the cofferdam; however, it should be noted that the local geology beyond the limits of the cofferdam was also significantly modified. The extent of the cofferdam is shown on **Figure 2**.

The cellular cofferdam, which encircled the excavation for all the Class I structures (e.g., containment, fuel handling, and auxiliary buildings), was constructed of interlocking sheet piling driven from an approximate depth of 23 feet below existing grade (approximately 77 feet plant datum [PD] or -12.92 feet above mean sea level [amsl NAVD 1988]). The cofferdam consists of 24 circular cells, approximately 60.5 feet in diameter with connecting arcs, that were advanced from this depth to approximately 10 feet into the Vincentown Formation to an elevation of 17 feet PD (-72.92 feet amsl). The cofferdam sections are of two different heights, 50 feet and 60 feet. The elevation of the top of the cofferdam is 77 feet PD (-12.92 feet amsl) on the north, south and west sides. The elevation of the eastern side is 67 feet PD (-22.92 feet amsl) providing access and a foundation for the return circulating water pipes and associated thrust block.

The inside area of the cofferdam sections were excavated to elevation 27 feet PD (-62.92 feet amsl). A vertical steel wall was added inside each individual cofferdam section to divide the sections approximately in half. The inner half of the individual cofferdam sections, or the section facing the building foundations, was then filled to the top with lean concrete. The area contained by the entire cofferdam structure was then excavated to the Vincentown Formation for placement of a lean concrete mat that served as the foundation for the construction of the structures within the cofferdam. During this stage of the excavation, qualified personnel visually inspected the bottom of the excavation to verify that the excavation had reached the top of the Vincentown Formation prior to placing any lean concrete.

Prior to the completion of the excavation, at approximately elevation 45 feet PD (-44.92 feet amsl), 15 exploratory borings were drilled through the remaining Kirkwood Formation and into the underlying Vincentown to verify the depth to the formation. These additional borings showed no measurable differences from the study borings. Based on a review of available documents, the top of the Vincentown Formation in the area of the cofferdam ranges between 27 and 30 feet PD (-62.92 to –65.92 feet amsl).

When the surface of the Vincentown Formation was reached, the area was cleared of loose soil and lean concrete was poured directly onto the exposed Vincentown Formation. Because the latter stages of the excavation were performed in freezing temperatures, a layer of material was left in place to insulate the Vincentown Formation until the concrete was ready to pour. In cases where the top of the Vincentown Formation did freeze prior to pouring of the concrete, the frozen soils were excavated or thawed prior to starting the pour. The station construction drawings indicate that the base of the first lean concrete pour was at 30 feet PD (-59.92).

The cofferdam serves as a basin in which the Class I structures were constructed. Prior to construction of the primary structures, a lean concrete mat ranging in thickness from 5 to 50 feet was placed on top of the Vincentown Formation for support of the structures. Following placement of the lean concrete, the Auxiliary Building, Fuel Handling Buildings and Reactor Containment Buildings were constructed. The remainder of the excavation within the cofferdam was then backfilled with structural fill meeting the design specifications of the Station.

4.3 Local Geology and Hydrogeology

The soils removed from within the cofferdam were not used to backfill the completed structure because the hydraulically placed fill and other riverbed deposits underlying Artificial Island did not meet the building design specifications for the Station. Therefore, it was necessary to import construction or structural fill to build the facility. The structural fill was placed between and around the Auxiliary Building, Fuel Handling Buildings, Units 1 and 2, portions of the cofferdam, above the return circulating water pipes, and from the top of the clay, confining-unit to the land surface in the portions of the area between the cofferdam and the circulating water discharge pipes.

The structural fill used at the station was obtained from a number of sources in New Jersey and Delaware. One fill source used in the area of this investigation was the Hinchner Pit. While the location of the borrow source was not identified, the material was described as yellowish-brown fine to medium sand with a trace of silt and clay.

Details of groundwater investigation activities historically completed at the facility indicate that groundwater elevations in the shallow, water-bearing unit within the limits of the cofferdam are generally higher than those outside the limits of the cofferdam. This is expected considering permeability differences that exist between the structural fill within the limits of the cofferdam and the hydraulic fill beyond the limits of the cofferdam, which result in a groundwater mound. Due to the mound, groundwater flows radially outward from the cofferdam. The observed mounding effect dissipates quickly. A groundwater elevation contour map for the shallow, water-bearing unit is presented on **Figure 3**. Beyond the limits of the cofferdam, groundwater flow is generally from the center of the island (northeast of the Salem Generating Station) towards the Delaware River.

5. Initial Investigation Activities

The following sections provide details regarding initial investigation activities completed at the Station and submitted with the SIR/RIWP. These investigation activities included the following:

- Unit 2 Diesel Fuel System component inventory;
- SPH evaluation;
- Underground piping evaluation;
- Soil Sampling; and
- Groundwater Sampling.

Prior to initiating investigation activities, PSEG inventoried the Salem Unit 2 Diesel Fuel System components in the vicinity of utility clearance location TW-2 to identify potential sources of the suspected release. Temporary Observation Points TW-2, TW-37, and TW-50 were gauged using an oil/water interface probe to determine if SPH had accumulated. Subsequently, each of the diesel system components identified during the inventory were evaluated as potential sources of the suspected diesel observed at TW-2 through pressure and guided wave testing (underground piping) and soil sampling (emergency fill valve and overflow tank). To confirm the observed sheen was diesel fuel, a dye and fingerprint analysis was conducted. Additionally, groundwater samples were collected from Temporary Observation Points TW-2, TW-37, and TW-50 to evaluate for the presence of dissolved phase constituents. The following sections include details and results of these initial investigation activities.

5.1 Separate-Phase Product Evaluation

Groundwater in the vicinity of utility clearance TW-2 was observed to be approximately 3-feet below ground surface (bgs). To identify if SPH existed on top of the water table, a 4-inch slotted PVC casing was installed into the temporary utility clearance TW-2 which extended to approximately 10 feet bgs. Two additional locations (TW-37 and TW-50) adjacent to TW-2 were also fitted with slotted PVC casing. The locations were then identified as temporary observation points TW-2, TW-37 and TW-50 (**Figure 2**). All three points were periodically monitored for the presence of SPH with an oil-water interface probe. To identify if SPH was present between monitoring periods (and to

capture any mobile SPH), a hydrophobic absorbent sock was placed in temporary observation point TW-2. During monitoring events, the absorbent sock was inspected for the accumulation of SPH.

On May 27, 2010, while excavating soil west of the Fuel Handling Building (FHB) in preparation for the pressure and guided wave test (see Section 5.4), a SPH sheen was observed on the groundwater within the excavation. A sample of the groundwater that had accumulated within the excavation with an apparent sheen was collected for diesel fuel dye testing and fingerprint analysis.

During the course of initial investigation activities, measurable SPH was not observed within the temporary observation points, nor did the absorbent sock accumulate any observable SPH. Additionally, monitoring of excavation No. 2 confirmed no additional SPH accumulated in the excavation. Analytical results from the dye analysis indicated that no dye was detected in the sheen sample. Results from fingerprint analysis confirmed the material most closely resembles weathered diesel fuel. The laboratory analytical data deliverable was provided as an appendix in the RIWP (Appendix A).

5.2 Salem Unit 2 Diesel Fuel System Inventory

A review of Salem Unit 2 Diesel System components identified four potential sources of the suspected diesel release in the vicinity of temporary utility location TW-2. **Figure 2** identifies these components which include: diesel fuel ASTs, an emergency fill valve, an above ground overflow tank and underground diesel supply piping.

The Salem Unit 2 Emergency Diesel Generator Fuel System is supplied by two 30,000 gallon ASTs located within the Auxiliary Building. The associated emergency fill valve and overflow tank are both above ground features located along the exterior wall of the Auxiliary Building. The emergency fill valve is used to fill the diesel fuel 30,000 gallon ASTs in the event the standard fill supply through the underground piping is not available. The overflow tank is an approximately 55 gallon drum and is utilized as containment for diesel fuel if the Salem Unit 2 Diesel Fuel ASTs are overfilled. The underground diesel fuel oil supply pipe in the area inspected is an approximately 4-inch diameter carbon steel pipe which supplies fuel from the Salem Unit 20,000 barrel Fuel Oil storage tank.

Each of the Salem Unit 2 Diesel Fuel System components was investigated to identify if it was potentially the source of the release. Visual observation of the Salem Unit 2 30,000 gallon Diesel Fuel ASTs confirmed the tanks were not leaking and the

secondary containment contained no apparent staining, eliminating the ASTs as potential sources. The remaining part of this section describes the investigative techniques used to characterize the remaining parts of the Salem Unit 2 Diesel Fuel System and the extent of the impacts.

5.3 Pressure Testing and Guided Wave Testing

The underground piping identified in **Figure 2** supplies diesel fuel from the Salem 20,000 barrel Fuel Oil storage tank to various loads including the Salem Units 1 and 2 Diesel Fuel 30,000 gallon ASTs, located within the Auxiliary Building, the service water furnaces and the circulating water boiler. PSEG performed a pressure test and guided wave test, to investigate the integrity of the underground piping in the vicinity of the Auxiliary Building and Unit 2 Fuel Handling Building.

Pressure testing is conducted by isolating a section of pipe and pressurizing the section. If the pipe fails to hold a positive pressure, then the pipe is known to contain a leak. This test is utilized to confirm if larger integrity concerns (i.e. a break in the pipe) are present. Guided wave testing uses low frequency ultrasound waves to identify metal loss from the pipe walls. Guided wave testing is utilized to identify smaller integrity concerns (i.e. pin holes or fractures).

In late May and early June 2010, PSEG conducted pressure testing and guided wave testing of the underground diesel system supply pipe, respectively. Results of both tests confirmed the integrity of the pipe. As such, no additional investigation of the underground diesel fuel supply pipe was proposed.

5.4 Soil Sampling

On May 4, 2010, ARCADIS advanced five soil borings, **Appendix D**, to investigate soil adjacent to the emergency fill valve (EFV-W and EFV-N) and overflow tank (OFT-W, OFT-N and OFT-E). ARCADIS collected discrete interval soil samples from 0.0 to 0.5 feet bgs and 2.0 to 2.5 feet bgs to characterize soil in the vicinity of these potential source features. To accommodate site specific health and safety practices, a vacuum excavator was used to advance the borings prior to collecting the sample. Samples were collected using a decontaminated hand trowel and transferred directly to laboratory supplied glassware. In addition, ARCADIS collected a soil sample for total petroleum hydrocarbons (TPHC) analysis and 2-methylnaphthalene and naphthalene contingent analyses from immediately above the water table in excavation No. 2.

In accordance with analytical requirements for diesel fuel contained within Table 2-1 of the Technical Requirements for Site Remediation (TRSR) and the *Protocol for Addressing Extractable Hydrocarbons* (NJDEP 2010), soil samples were analyzed for TPHC via method NJDEP OQA-QAM-025. In addition, ARCADIS collected soil samples from each of the discrete intervals for contingency semi-volatile organic compound (SVOC) analysis (naphthalene and 2-methylnaphthalene if TPHC analytical results exceeded 1,000 mg/kg).

Sample collection, packaging, and shipment were conducted in accordance with the NJDEP Field Sampling and Procedures Manual dated August 2005. Samples were cooled to approximately 4°C, and submitted under chain-of-custody protocols to Accutest Laboratories, Inc., a New Jersey certified laboratory for analysis on an expedited (72-hour) turn-around-time.

Analytical data presented in **Table 2** indicate one (OFT-E[0-0.5]) out of 10 samples exceeded the NJDEP soil remediation standard (SRS) for TPHC of 5,100 milligrams per kilogram (mg/kg), with a concentration of 5,510 mg/kg. Five results exceeded the contingency threshold screening criterion of 1,000 mg/kg. As such, contingency sample analyses was conducted on the highest two TPHC concentration samples (OFT-E[0-0.5] and OFT-N[0-0.5]). **Table 2** presents the analytical results for 2-methylnaphthalene and naphthalene, which did not indicate concentrations above the method detection limits.

Figure 4 illustrates the sample locations and analytical data collected during the initial soil investigation. TPHC concentrations exceeded the NJDEP SRS in sample OFT-E at a depth of 0.0 - 0.5 feet bgs. This exceedence was delineated vertically by a sample collected from the same boring at 2.0 – 2.5 feet bgs. This exceedence was delineated horizontally by the building wall to the south, and north and west by samples OFT-N and OFT-W, respectively. These samples were collected at the same depth as the exceedence. Interpretation of the analytical results (decreasing concentrations with depth) confirms shallow impacts associated with a surface release. As such, PSEG proposed additional sample collection to horizontally delineate TPHC impacts in soil to the east and northeast in the SIR/RIWP.

5.5 Groundwater Sampling

On May 5, 2010, ARCADIS collected grab groundwater samples from temporary observation points TW-2, TW-37 and TW-50 to characterize the shallow water quality. Groundwater samples to be analyzed for TPHC were collected using laboratory-

decontaminated disposable Teflon® bailers. ARCADIS transferred the samples directly from the bailers to decontaminated sample bottles supplied by Accutest.

The analytical results for TPHC in groundwater samples collected from the temporary observation points (TW-2, TW-37 and TW-50) screened across the shallow water table are summarized in **Table 3**. TPHC was detected in samples at concentrations ranging from 1.84 milligrams per liter (mg/L) in TW-50 to 372 mg/L in TW-2. Currently there is no groundwater quality criterion (GWQC) available for TPHC. However, these concentrations signify limited impacts.

To further evaluate groundwater quality within the source area, PSEG proposed the installation of two monitoring wells and subsequent collection of groundwater samples for analysis of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). One monitoring well (MW-CD) was proposed adjacent to soil boring OFT-E and the other (MW-CC) in the vicinity of excavation No. 2. On August 25, 2010, ARCADIS, on behalf of PSEG, met with representatives of the NJDEP to discuss the proposed RIWP. At the request of the NJDEP, two addtional monitoring wells were added to the work plan to further delineate groundwater impacts; one well (MW-CE) was proposed along the diesel fuel line north of the former excavation No. 2 and one well (MW-CF) was proposed proximal to temporary observation point TW-37. Documentation of the August 2010 NJDEP meeting is provided in **Appendix A**.

6. Remedial Investigation Results

The following objectives of the remedial investigation were proposed in the July 2010 RIWP:

- Characterize the horizontal extent of diesel-related constituents in soil;
- Evaluate for the presence of SPH (as defined in *Guidance for LNAPL Free Product Initial Recovery and Interim Remedial Measures* [NJDEP 2010]) and delineate its extent, if necessary;
- Characterize dissolved-phase diesel-related constituents in shallow groundwater within the release area; and
- Determine the need for further action.

The following sections provide details regarding the remdial investigation activities completed at the Station. These investigation activities, designed to achieve the primary objectives listed above, include the following:

- Advancement of two soil boring to north and east of OFT-E, and;
- Install four monitoring wells for groundwater sampling and separate phase product evaluation.

6.1 Soil Investigation

In accordance with New Jersey Administrative Code (N.J.A.C.) TRSR section 7.26E-4.1(a), PSEG advanced two soil borings (OFT-E+5 and OFT-NE) to investigate the horizontal extent of diesel-related constituents in soil. **Figure 4** illustrates the locations of the soil borings.

6.1.1 Collection of Soil Samples

Soil samples were collected to horizontally delineate TPHC impacts identified in soil sample OFT-E (0.0 – 0.5) to the east and northeast. Soil boring OFT-E+5 and OFT-NE are located 5 feet to the east and northeast of boring OFT-E, respectively. Sample locations (OFT-E+5 and OFT-NE) were identified by measuring from known stationary objects.

Following the removal of asphalt cover, a surface soil sample was collected using a hand auger or equivalent device from 0.0 – 0.5 feet bgs. Soil retrieved from each boring was visually examined by an ARCADIS geologist and field screened using a photoionization detector (PID). Soil was described according to the Unified Soil Classification System (USCS). Soil descriptions also include notes of other visual or olfactory observations related to diesel impacts. Relevant information collected during the advancement of soil borings was recorded in the field book, including lithology, PID readings, and other visual observations. Soil boring logs are presented in **Appendix D**.

6.1.2 Soil Sample Analysis and results

In accordance with NJDEP's August 9, 2010 *Protocol for Addressing Extractable Petroleum Hydrocarbons*, samples were analyzed for extractable petroleum hydrocarbons (EPH) via NJDEP EPH Method Revision 3 on an accelerated (1-week)

turnaround time. ARCADIS collected one blind duplicate sample and in accordance with the NJDEP field sampling procedures manual (FSPM), ARCADIS collected one field blank and one trip blank.

Both soil samples OFT-E+5 and OFT-NE had concentrations of EPH below the standard of 5,100, 536 and 1,350 mg/kg respectively. Analytical results of these indicate that soil delineation is complete.

A summary of the soil analytical results is provided in **Table 2** and illustrated on **Figure 4**. The full analytical data deliverable in New Jersey Reduced format is provided in **Appendix B**.

6.2 Groundwater Investigation

In November 2010, PSEG installed four monitoring wells (Well CC, CD, CE and CF) to evaluate for the presence of SPH, and characterize dissolved-phase constituents in groundwater. **Figure 5** shows the locations of the monitoring wells.

Monitoring well CC was installed adjacent to where a sheen was observed in excavation No. 2. Monitoring well CD was installed at a location where previous activities have identified TPHC concentrations exceeding NJDEP SRS of 5,100 mg/kg. Monitoring well CE was installed along the diesel fuel line, north of the former excavation number 2. Monitoring well CF was installed near temporary observation point (37).

6.2.1 Monitoring Well Installation

Prior to commencing monitoring well installation activities, a utility locator service identified underground utilities in the vicinity of proposed monitoring wells using ground penetrating radar (GPR) instruments. Additionally, to accommodate site specific health and safety best practices, PSEG advanced the boring using vacuum excavation techniques to 10 feet bgs. The Borehole was opened to a minimum 8 inch diameter to accommodate NJDEP regulated monitoring well annulus. Descriptions of the overburden materials, including physical characteristics, PID readings, visual evidence of staining, and odors, were recorded by the ARCADIS geologist and logged in the field book and presented in **Appendix D**. During well installation no staining was observed on the soil and there were no PID readings above background concentrations in the soil. No evidence of separate phase product was identified during well installation.

Monitoring wells were screened across the first water-bearing unit encountered at a depth of approximately 3 feet bgs. The monitoring wells were constructed of 4-inch-diameter flush-joint threaded PVC risers with an 8.0-foot-length of 0.02-inch PVC V-wire wrap well screen. A washed silica sand pack was placed between the well string and the formation to the top of the well screen followed by a 6-inch layer of fine sand (#00) as a seal. A neat cement grout was installed in the remaining annular space to lock the well in place. Each monitoring well was completed as a flush-mounted well with a protective steel casing and locking well cap. Details of the well construction can be found on **Table 5**.

A New Jersey licensed driller provided oversight of installation activities to ensure monitoring wells were installed in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001.

Upon completion, each monitoring well was properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the formation. The monitoring wells were developed via the block and surge and over-pumping method. Well development continued until the discharge was free of turbidity to the extent practical.

All monitoring wells were surveyed by a New Jersey licensed surveyor and the Form B for each well is provided in **Appendix C**. Top of casing elevation were established to within 0.01-foot relative to the 1988 North American Vertical Datum (NAVD 88). The location of each monitoring well was established to within 0.1-foot relative to the 1983 North American Horizontal Datum (NAD 83).

6.2.2 Groundwater Sampling

Following installation, monitoring wells were sampled to characterize water quality within the source area. The following sections provide details regarding these activities.

6.2.2.1 Water-Level and Separate-Phase Product Measurements

Prior to the collection of groundwater samples from the wells (see Section 6.2.2.2), depth-to-water and separate-phase product thickness measurements were collected using an electronic oil/water interface probe. The measurement data was used along with the surveyed top of casing elevation data to calculate groundwater elevations for the wells, **Table 3**. The groundwater elevation data was analyzed to assess

groundwater flow conditions at the Station. **Table 3** shows that during both gauging events separate-phase product was not detected.

6.2.2.2 Collection of Groundwater Samples

Following the installation and development of the wells, two-rounds of groundwater samples were collected. The first round of groundwater sampling was conducted in December 2010 and January 2011. The second round of groundwater sampling was completed in February 2011, approximately one month following the initial round.

Due to the sensitive nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples were collected utilizing low-flow sampling methodology. Sample collection procedures, as well as QA/QC sampling requirements, are outlined in the QAPP included in the RIWP for Salem Unit 1 (ARCADIS 2005).

6.2.2.3 Groundwater Sample Analysis and results

In accordance with analytical requirements for diesel fuel contained within Table 2-1 of the TRSR groundwater samples were analyzed for volatile organic compounds plus library search (VOC+10) and semi-volatile organic compounds plus library search (SVOC+15). ARCADIS collected one blind duplicate sample per groundwater sampling event and in accordance with the NJDEP field sampling procedures manual (FSPM), ARCADIS collected field blanks and trip blanks.

The groundwater sampling results, from both events,did not indicate concentrations of constituents of concern above the groundwater quality standards. The groundwater analytical results are summarized in **Tables 4A** and **4B**. Based on the results, no further groundwater investigation is proposed.

7. Receptor Evaluation

PSEG performed a receptor evaluation in accordance with the requirements specified in N.J.A.C. TRSR 7:26E1.15 through 1.19. The receptor evaluation report was submitted to the NJDEP on February 28, 2011. The receptor evaluation concluded that while there are environmentally sensitive areas near the project area, none are located within the project area.

8. Conclusions and Next Steps

Based on the results of investigation activities completed to date in association with incident No. 10-0416-164911, no additional soil and/or groundwater investigation is warranted. PSEG will prepare and submit a Remedial Action Workplan (RAWP) to address the TPH impacts in soil. The RAWP will be submitted August 2011..

Notes:
GWQC = New Jersey Groundwater Quality Criteria for Class IIA aquifers
µg/L = micrograms per liter (equivalent to parts per billion)
Bold value indicates concentration was detected above the method detection limit.
Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U = The compound was not detected at the indicated concentration.
J = Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero; concentration given is an approximate value.

Notes:
GWQC = New Jersey Groundwater Quality Criteria for Class IIA aquifers
µg/L = micrograms per liter (equivalent to parts per billion)
Bold value indicates concentration was detected above the method detection limit.
Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U = The compound was not detected at the indicated concentration.
J = Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero; concentration given is an approximate value.

Dear Ms. Linda Range:

ARCADIS, on behalf of PSEG Nuclear, LLC (PSEG), is submitting a revised Figure 7 – Proposed Monitoring Well Locations, attached, from the July 12, 2010 Salem Unit 2 Remedial Investigation Work Plan. In response to our meeting on August 25, 2010 the attached figure was updated to incorporate comments that were received during the meeting. Monitoring well CC is being installed down-gradient of the former excavation number 2. Monitoring well CD is being installed at a location that total petroleum hydrocarbon (TPH) concentrations exceeded the New Jersey Soil Remediation Standards. Monitoring well CE is being installed along the diesel fuel line, north of the former excavation number 2. Monitoring well CF is being installed near a temporary observation point (36). These wells are proposed to be installed in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001.

Monitoring wells will be screened across the first water-bearing unit encountered at a depth of approximately 4 feet bgs. The monitoring wells will be constructed of 4-inch-diameter flush-joint threaded PVC risers with an 7-foot-length of 0.02-inch PVC well screen. A washed silica sand pack will be placed between the well string and the formation to the top of the well screen followed by a 6-inch layer of fine sand (#00) as a seal. A neat cement grout will be installed in the remaining annular space to lock the well in place. Each monitoring well will be completed as a flush-mounted well with a protective steel casing and locking well cap

Upon completion, each monitoring well will be properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the

formation. The monitoring wells will be developed via the block and surge and overpumping method. Well development will continue until the discharge is free of turbidity.

All monitoring wells will be surveyed by a New Jersey licensed surveyor and Form B provided. Top of casing elevation will be established to within 0.01-foot relative to the 1988 North American Vertical Datum (NAVD 88). The location of each monitoring well will be established to within 0.1-foot relative to the 1983 North American Horizontal Datum (NAD 83).

Sincerely,

Bradley Pierce

SCALE: 1"=10'

INVESTIGATION DETAILS:

PSEG PROPOSES TO INSTALL FOUR 4-INCH MONITORING WELLS SCREENED ACROSS THE WATER TABLE. MONITORING WELL MW-CC WILL BE INSTALLED DOWNGRADIENT OF WHERE A SHEEN WAS OBSERVED AND MONITORING WELL MW-CD WILL BE INSTALLED WHERE AN EXCEEDANCE OF TPHC NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION SOIL REMEDIATION STANDARDS WAS DETECTED. MONITORING WELL MW-CE WILL BE INSTALLED ALONG THE DIESEL FUEL PIPELINE. MONITORING WELL MW-CF WILL BE INSTALLED WHERE A SHEEN WAS OBSERVED. GROUNDWATER SAMPLES WILL BE COLLECTED AND ANALYZED FOR VOCs AND SVOCs.

Soil samples reported on a dry weight basis unless otherwise indicated on result page.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client: Arcadis **Job No:** JA61582

Site: PSEG-Diesel, Salem, NJ **Report Date** 12/12/2010 10:10:59 A

On 11/12/2010, 3 Sample(s), 0 Trip Blank(s) and 1 Field Blank(s) were received at Accutest Laboratories at a temperature of 6 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA61582 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Extractables by GCMS By Method SW846 8270C

Matrix: SO **Batch ID:** OP46916

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA61651-1MS, JA61651-1MSD were used as the QC samples indicated.

Extractables by GC By Method NJDEP EPH

Matrix: AQ **Batch ID:** OP46776

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA61635-2MS, JA61635-2MSD, JA61635-3DUP were used as the QC samples indicated.
- Matrix Spike Recovery(s) for EPH (C9-C28), Total EPH (C9-C40) are outside control limits. Outside control limits due to high level in sample relative to spike amount.

Matrix: SO **Batch ID:** OP46762

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA61561-8DUP, JA61582-2MS, JA61582-2MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for EPH (>C28-C40) are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for EPH (>C28-C40) are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Recovery(s) for EPH (C9-C28), Total EPH (C9-C40) are outside control limits. Outside control limits due to high level in sample relative to spike amount.
- RPD(s) for MSD for EPH (>C28-C40) are outside control limits for sample OP46762-MSD. Probable cause due to sample homogeneity.

Wet Chemistry By Method SM18 2540G

Matrix: SO **Batch ID:** GN44749

- The data for SM18 2540G meets quality control requirements.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover
