To Whom it May Concern:

Arcadis U.S., Inc. on behalf of PSEG Nuclear, LLC (PSEG) herby transmits this Remedial Investigation Report for activities performed at PSEG Salem Generating Station. This report summarizes the soil and groundwater remedial investigation activities performed as part of the NJDEP Case Nos. 04-08-02-2350-16 and 10-04-16-1649-11.

Should you have any questions, or require additional information, please contact Helen Gregory at 856-339-1341 or the Licensed Site Remediation Professional on record, Gregory Albright at 609-366-9067.

Sincerely,

Arcadis U.S., Inc.

Glenn Palmer
Senior Scientist

Site Remediation Program

COVER/CERTIFICATION FORM

(Submit with Remedial Phase Report, Receptor Evaluation, and CEA Forms)

Date Stamp
(For Department use only)

SECTION A. SITE INFORMATION

Site Name: Salem Generating Station

AKAs: PSEG Nuclear

Street Address: PO Box 236

Municipality: Hancocks Bridge (*Township, Borough or City*)

County: Salem Zip Code: 08038

Program Interest (PI) Number(s): 004156

Case Tracking Number(s) for this submission: 04-08-02-2350-16 and 10-0416-1649-11

Date Remediation Initiated Pursuant to N.J.A.C. 7:26C-2: 08/02/2004

State Plane Coordinates for a central location at the site: Easting: 199,503 Northing: 230,881

List current Municipal Block and Lot Numbers of the Site:

Block # 26	Lot #(s) 4.01	Block #	Lot #(s)
Block #	Lot #(s)	Block #	Lot #(s)
Block #	Lot #(s)	Block #	Lot #(s)
Block #	Lot #(s)	Block #	Lot #(s)

SECTION B. SUBMISSION STATUS

1. Indicate how the Electronic Data Deliverable (EDD) for this submission is being provided to the NJDEP:
   - ☒ Via Email at srpedd@dep.state.nj.us (attach NJDEP confirmation email); or
   - ☐ CD (attach to this submission)
   - ☐ Not Applicable – No EDD
2. Complete the following Submission and Permit Status Table:

Remedial Phase Documents	N/A	Included in this Submission	Previously Submitted	Date of Submission	Date of Revised Submission	Date of Previous NJDEP Approval	Date of Document Withdrawal
Preliminary Assessment Report	☐	☐	☒	01/28/2005			
Site Investigation Report	☐	☐	☒	01/28/2005			
Remedial Investigation Report	☐	☒	☐	06/03/2005			
Remedial Action Work Plan	☐	☐	☒	06/03/2005			
Remedial Action Report	☒	☐	☐				
Response Action Outcome	☒	☐	☐				
Other Submissions							
Alternative Soil Remediation Standard and/or Screening level Application Form	☒	☐	☐				
Case Inventory Document		☒

SECTION C. SITE USE

Current Site Use: (*check all that apply*)

- ☒ Industrial
- ☐ Residential
- ☐ Commercial
- ☐ School or child care
- ☐ Agricultural
- ☐ Park or recreational use
- ☐ Vacant
- ☐ Government
- ☐ Other: _____

Intended Future Site Use, if known: (*check all that apply*)

- ☒ Industrial
- ☐ Residential
- ☐ Commercial
- ☐ School or child care
- ☐ Park or recreational use
- ☐ Vacant
- ☐ Government
- ☐ Future site use unknown
- ☐ Other: _____

SECTION D. CASE TYPE: (*check all that apply*)

- ☐ Administrative Consent Order (ACO)
- ☐ Brownfield Development Area (BDA)
- ☐ Child Care Facility
- ☐ Chrome Site (Chromate chemical production waste)
- ☐ Coal Gas
- ☐ Due Diligence with RAO
- ☐ Hazardous Discharge Remediation Fund (HDSRF) Grant/Loan
- ☐ ISRA
- ☐ Landfill (SRP subject only)
- ☐ Regulated Underground Storage Tank (UST)
- ☐ Remediation Agreement (RA)/Remediation Certification
- ☐ School Development Authority (SDA)
- ☐ School facility
- ☐ Spill Act Defense – Government Entity
- ☒ Spill Act Discharge
- ☐ UST Grant/Loan
- ☐ Other: _____

Federal Case (*check all that apply*)

☐ RCRA GPRA 2020 ☐ CERCLA/NPL ☐ USDOD ☐ USDOE

1. Is the party conducting remediation a government entity? ..... ☐ Yes ☒ No

If "Yes," check one: ☐ Federal ☐ State ☐ Municipal ☐ County

SECTION E. PUBLIC FUNDS

Did the remediation utilize public funds? ..... ☐ Yes ☒ No

If "Yes," check applicable:

- ☐ UST Grant
- ☐ HDSRF Grant
- ☐ Spill Fund
- ☐ UST Loan
- ☐ HDSRF Loan
- ☐ Schools Development Authority
- ☐ Brownfield Reimbursement Program
- ☐ Landfill Reimbursement Program
- ☐ Environmental Infrastructure Trust

SECTION F. PERSON RESPONSIBLE FOR CONDUCTING THE REMEDIATION INFORMATION AND CERTIFICATION

Full Legal Name of the Person Responsible for Conducting the Remediation: PSEG Nuclear, LLC

Representative First Name: David Representative Last Name: Mannai

Title: Senior Director Regulatory Operations

Phone Number: (856) 339-2061 Ext: Fax:

Mailing Address: Alloway Creek Neck Rd.

City/Town: Hancocks Bridge State: NJ Zip Code: 08038

Email Address: David.Mannai@pseg.com

This certification shall be signed by the person responsible for conducting the remediation who is submitting this notification in accordance with Administrative Requirements for the Remediation of Contaminated Sites rule at N.J.A.C. 7:26C-1.5(a).

I certify under penalty of law that I have personally examined and am familiar with the information submitted herein, including all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, to the best of my knowledge, I believe that the submitted information is true, accurate and complete. I am aware that there are significant civil penalties for knowingly submitting false, inaccurate or incomplete information and that I am committing a crime of the fourth degree if I make a written false statement which I do not believe to be true. I am also aware that if I knowingly direct or authorize the violation of any statute, I am personally liable for the penalties.

Signature: Date: 8/14/17

Name/Title: David Mannai/Sr. Dir. Regulatory Operations

For CEA Submissions:

☒ Check this box if the person above is also the property owner of the site or their representative. If this person is not the site property owner, please ensure the site property owner's name and address is in the first line of the table in Section E.2 of the Classification Exception Area / Well Restriction Area (CEA/WRA) Fact Sheet Form.

SECTION G. LICENSED SITE REMEDIATION PROFESSIONAL INFORMATION AND STATEMENT

LSRP ID Number: 585761

First Name: Gregory Last Name: Albright

Phone Number: (609) 366-9067 Ext: Fax: (609) 860-8007

Mailing Address: 6033 Long Breach Boulevard

City/Town: Long Beach Township State: NJ Zip Code: 08008-3738

Email Address: gregory.albright@arcadis-us.com

This statement shall be signed by the LSRP who is submitting this notification in accordance with section 14 of P.L.2009 c.60 (N.J.S.A. 58:10C-14), and paragraphs (1) and (2) of subsection b. of section 30 of P.L.2009 c.60 (N.J.S.A. 58:10B=1.3b(1) and (2)).

I certify that I am a Licensed Site Remediation Professional authorized pursuant to N.J.S.A. 58:10C to conduct business in New Jersey. As the Licensed Site Remediation Professional of record for this remediation, I:

[SELECT ONE OR BOTH OF THE FOLLOWING AS APPLICABLE]:

☐ *directly oversaw and supervised all of the referenced remediation, and\or*

☒ *personally reviewed and accepted all of the referenced remediation presented herein.*

I believe that the information contained herein, and including all attached documents, is true, accurate and complete.

It is my independent professional judgment and opinion that the remediation conducted at this site, as reflected in this submission to the Department, conforms to, and is consistent with, the remediation requirements in N.J.S.A. 58:10C-14.

My conduct and decisions in this matter were made upon the exercise of reasonable care and diligence, and by applying the knowledge and skill ordinarily exercised by licensed site remediation professionals practicing in good standing, in accordance with N.J.S.A. 58:10C-16, in the State of New Jersey at the time I performed these professional services.

I am aware pursuant to N.J.S.A. 58:10C-17 that for purposely, knowingly or recklessly submitting false statement, representation or certification in any document or information submitted to the board or Department, etc., that there are significant civil, administrative and criminal penalties, including license revocation or suspension, fines and being punished by imprisonment for conviction of a crime of the third degree.

LSRP Signature: Date: August 16, 2017

LSRP Name/Title: Gregory R. Albright / Principal Geologist

Company Name: Arcadis U.S., Inc.

Completed forms should be sent to:

AOC ID	AOC Type	AOC Description	Confirmed Contamination	AOC Status	Status Date	Incident #	DEP AOC Number	Contaminated Media	Contaminants of Concern	Additional Contaminants of Concern	Additional Contaminants of Concern	Applicable Remediation Standard	Exposure Route	Additional Exposure Route	RA Type	Additional RA Type	Additional RA Type	Was an Order of Magnitude Evaluation Conducted?	Activity
Unit 1 Diesel Release	Storage tank and appurtenance - Piping, above/below ground pump station, sump/pit	Area includes piping that supplies diesel from bulk storage tanks to diesel/generator storage tanks	Yes	RAR	2/6/2006	04-08-02-2350-16		Ground Water	VO	BN		Remediation Standards	Ground Water		LNAPL skimming				On August 2, 2004, site workers observed a diesel odor in a catch basin. Source investigation focused on underground piping that supplies diesel from bulk storage tanks to diesel/generator tanks. In January 2005, an RIWP was submitted to NJDEP. A Site Investigation Report was submitted in January 2005. A Remedial Investigation Report and interim RAR submitted in June 2005. In February 2006, PSEG submits a Remedial Action Report. On March 24, 2008, NJDEP approves semi-annually groundwater monitoring. On June 21, 2010, NJDEP issues a NOD to PSEG requiring installation of a shallow well near Well AI for further delineation. In December 2010, PSEG installs Well CG, no SPH detected.
Unit 2 Diesel Release	Storage tank and appurtenance - Piping, above/below ground pump station, sump/pit	Area includes a historical release caused by overflow from a bulk storage AST system	Yes	RAW	9/9/2011	10-04-16-1649-11		Soil	TPHC			Remediation Standards	Ingestion/Dermal						On April 16, 2010. diesel odors and staining are observed in a soil boring during a independent investigation. On July 12, 2010, PSEG submitts Site Investigation / Remedial Investigation Workplan. On May 17, 2011, PSEG submitted a Remedial Investigation Report. On September 9, 2011 a Remedial Action Workplan was submitted showing the excavation area around the TPHC impacts and indicating groundwater monitoring next to the soil impacts will continue until remedial action is completed. DEP approved both the RIR and the RAWP in a letter dated December 16, 2011.
Sodium Hypochlorite Release	Other areas of concern - Discolored area or spill area	A release of approximately 1,000 gallons of water containing sodium hypochlorite was release into the waters of the State.	No	RAO-A (Unrestricted Use)	4/25/2017	12-05-16-2210-44		None	Not Applicable			Remediation Standards							As discussed in the Preliminary Assessment / Site Investigation Report, no further action is required based on the surface water investigation results which show that either constituents were not detected or they were detected at concentratoins less than NJDEP Surface Water Ecological Screening Criteria. On April 25, 2017, the LSRP issued a RAO-A (unrestricted use) for the AOC indicating no impacts persist.
Ammonia in Groundwater	Other areas of concern - Open area away from production operations	Ammonia was detected in groundwater within an excavation at concentrations greater than NJDEP GWQC.	Yes	RAO-A (Unrestricted Use)	4/25/2017	12-07-11-1157-10		Ground Water	Other			Remediation Standards	Ground Water		No Remedial Action				As discussed in the Preliminary Assessment / Site Investigation Report, ammonia, total dissolved solids, and sodium were detected at concentrations greater than NJDEP GWQS. Additional groundwater investigation was conducted as part of a remedial investigation. The results presented in the RIR show the source of the COCs is naturally occuring background conditions. On April 25, 2017, the LSRP issued a RAO-A (unrestricted use) for the AOC indicating the COCs are associated with background conditions.
Vegetable Oil Release Area	Environmental media - Media Surface water	One pint of hydro safe hydraulic (vegetable) oil was released from the Circulating Water Intake Structure trash rakes into the Delaware River.	No	No Sampling Trigger	4/14/2015	14-04-16-0922-51		None	Not Applicable			Remediation Standards							As discussed in the Preliminary Assessment / Site Investigation Report, a leak occurred from a trash rake hydraulic hose located within circulating water intake structure. The leak released approximately one pint of vegetable based oil into the Delaware River. Sampling was not performed based on the emulsification and breakdown of the oil. The report recommended no additional investigation is required. On April 14, 2015, the site's LSRP (Gregory Albright) submitted the PA/SIR to the NJDEP via email following a conversation with NJDEP who instructed him that the NJDEP closed out the case. The NJDEP instructed PSEG that no further action is required for this AOC.

1 INTRODUCTION

Arcadis U.S., Inc. (Arcadis), on behalf of PSEG Nuclear, LLC (PSEG), prepared this *Remedial Investigation Report* (RIR) to present the results of remedial investigation (RI) activities in association with the release of diesel fuel at the PSEG Salem Generating Station (SGS) Unit 1 (Incident No. 04-08-02-2350-16) and potential diesel fuel discharge at SGS Unit 2 (Incident No. 10-0416-1649-11). SGS and Hope Creek Generating Station (HCGS) (collectively, the Station) are located on Artificial Island in Hancocks Bridge, Salem County, New Jersey (**Figure 1**). The investigation areas are shown on **Figure 2**.

The remedial investigation for the SGS Unit 1 release (Incident No. 04-08-02-2350-16) was conducted in accordance with the Remedial Investigation Work Plan (RIWP) that was submitted to the New Jersey Department of Environmental Protection (NJDEP) in January 2005 (Arcadis 2005a) and the remedial investigation for the SGS Unit 2 potential release (Incident No. 10-0416-1649-11) was conducted in accordance with the Site Investigation Report (SIR)/Remedial Investigation Workplan (RIWP; Arcadis 2010) that was submitted to NJDEP in July 2010. The scope of work outlined in the RIWPs was designed to investigate the extent of diesel fuel constituents in the shallow, water-bearing unit at the SGS.

Results of the RI activities performed under the guidance and oversight of NJDEP (Case Manager, Linda Range) are summarized in this report. Details of these investigations were previously submitted to NJDEP. Relevant case history for SGS Unit 1 and Unit 2 is provided in **Appendices A** and **B**, respectively. NJDEP either conditionally approved the reports (March 14, 2006 NJDEP letter to PSEG) or approved the reports without comment (December 16, 2011 NJDEP approval letter). PSEG subsequently corrected all deficiencies without further comment from NJDEP (December 16, 2011 NJDEP approval letter), however, NJDEP administrative records do not accurately reflect the RIR was completed. Furthermore, NJDEP approved the SGS Unit 1 interim remedial measures (March 14, 2006 NJDEP letter to PSEG) and the SGS Unit 2 Remedial Action Work Plan (RAWP) (December 16, 2011 NJDEP approval letter). Additional detail on the case history (document submissions and approvals) is provided is Sections 1.1.1 and 1.1.2. On June 9, 2017 as directed by Raymond Strassler of NJDEP, PSEG developed this comprehensive RIR to document past activities so that the RIR recorded is administratively complete. Based on results of previous investigations, sufficient data has been collected to determine the extent of constituents of concern (COCs) in soil and groundwater. Additionally, with the submission of the RIR, PSEG satisfies the requirement to complete a remedial investigation for these cases.

The RI activities were performed in compliance with the NJDEP's Site Remediation Program's (SRP) requirements established in the Administrative Requirements for Remediation of Contaminated Sites (ARRCS) (N.J.A.C. 7:26C), the Technical Requirements for Site Remediation (TRSR) (N.J.A.C. 7:26E) and the NJDEP's *Field Sampling Procedures Manual* last updated in April 2011. Arcadis' activities have been conducted under the supervision of a Licensed Site Remediation Professional (LSRP), Mr. Gregory Albright, P.G. (LSRP License No. 585761) of Arcadis, since being retained in 2012. This report has been prepared in accordance with N.J.A.C. 7:26E (NJDEP 2012).

Pursuant to the requirements of N.J.A.C. 7:26E (NJDEP 2012), the Cover/Certification Form and a Case Inventory Document (CID) are included at the front of the RIR. A copy of the Cover Form is provided in **Appendix C** also. The Receptor Evaluation Form is included in **Appendix D**.

1.1 Project Background

1.1.1 SGS Unit 1

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the stormwater collection system just to the south of the SGS Unit 1 Fuel Handling Building. Investigation of the catch basin, which is identified as "Catch Basin 27" on **Figure 2**, revealed the presence of a red-dyed diesel fuel (the red-dye is more typical of a recent release of diesel fuel). At the time, PSEG notified the NJDEP through its spill hotline (Incident No. 10-0416-1649-11).

To prevent the migration of diesel fuel within the stormwater collection system, the storm drains upstream and downstream of Catch Basin 27 were temporarily blocked to isolate the affected section of piping. Further, a cover was placed over Catch Basin 27 to prevent rain water from entering. Investigations of the remainder of the stormwater system indicated that the diesel fuel had not migrated beyond Catch Basin 27, no diesel fuel was released to the Delaware River, and the diesel fuel in the catch basin was removed.

Investigations into the source of the diesel fuel focused on the underground piping adjacent to Catch Basin 27 that supplies diesel fuel from the bulk storage tanks to diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers. The location of the underground piping is shown on **Figure 2**. PSEG performed a pressure test on this underground piping. The results revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. To pinpoint the location of the leak along this 300-foot section of piping, PSEG subcontracted Praxair Services, Inc. to perform a "Tracer Tight" gas analysis. The results of this test showed that the location of the leak was directly adjacent to Catch Basin 27. The results of the Tracer Tight gas analysis indicated that there were no other leaks along the 300-foot section of piping.

Excavation in the area of the leaking underground piping was initiated on August 23, 2004 by PSEG with the support of Clean Harbors, Inc. to repair the piping. During the excavation process, residual diesel fuel was observed on soil excavated from below the piping (approximately six feet below ground surface (bgs)). Soil excavated from the piping area was stockpiled by PSEG pending waste characterization. Following characterization, the soil was disposed of by Clean Harbors. Separate-phase hydrocarbons (SPH) was observed on standing water within the excavation. Prior to backfilling, approximately 150 gallons of diesel fuel were recovered from the excavation.

In November 2004, PSEG initiated remedial investigation and interim product recovery actions. In accordance with the scope of work presented within the RIWP (Arcadis 2005a), soil borings were advanced at locations downgradient of the source area to delineate the horizontal extent of diesel related COCs in soil. The soil borings were converted to monitoring/product recovery wells to facilitate the collection of groundwater samples and for the recovery of SPH, if present. Interim remedial actions completed to date in this area include the installation of a Spill Buster® Product Recovery System, a passive product skimmer, and the use of absorbent socks. In June 2005, PSEG submitted *Salem Unit 1 Remedial Investigation/Interim Remedial Action Report* (RIR/IRAR; Arcadis 2005b) to document the investigation findings and an update on the interim remedial action. The RIR/IRAR was conditionally approved by NJDEP, contingent with a well installation south of well AY. The requested well was installed and the well installation details were summarized in a Remedial Action Progress Report (RAPR)

submitted in February 2007 (Arcadis 2007). In the March 24, 2008 letter from the NJDEP to PSEG, NJDEP approves the February 2007 RAPR. On June 21, 2010, NJDEP issues a Notice of Deficiency requiring the installation of a well near well AI to delineate SPH. August 25, 2010 PSEG and NJDEP participate in a technical meeting to discuss the project status and path forward. In November 2011, PSEG submits a RAPR (Arcadis 2011a) including a summary of the installation of well CG. On December 16, 2011, NJDEP issues an approval of the November 2011 RAPR. No further indication of additional investigation or remedial action was mentioned from NJDEP. A summary of the RI activities, showing where delineation is achieved, are presented in Section 3.2.

1.1.2 SGS Unit 2

On April 16, 2010, while completing groundwater investigation activities associated with a separate and independent investigation, PSEG personnel observed suspected diesel-related odors and staining in soil and groundwater during the opening of a temporary utility clearance, identified as TW-2 on **Figure 2**. At this time, PSEG notified the NJDEP through its spill hotline (incident No. 10-0416-1649-11).

The temporary utility clearance consisted of a Schedule 40 PVC sleeve installed to an approximate depth of 10 feet bgs using vacuum excavation equipment. The utility clearance was installed to allow the safe advancement of direct-push borings for the collection of groundwater samples. During the advancement of the vacuum excavation, diesel fuel odors were noted and suspected petroleum hydrocarbon sheen was observed on the water once the water table was encountered. To facilitate the collection of a groundwater sample and to evaluate the presence of SPH at the location of TW-2, and subsequently at the locations of TW-37 and TW-50 (see **Figure 2**), PVC well screen was installed in lieu of the solid PVC sleeve. The three locations were then identified as temporary observation point TW-2, TW-37, and TW-50. Over the next several days, the temporary observation points were evaluated for the presence of SPH and groundwater samples were collected for laboratory analysis. The details and results of these initial groundwater investigation activities are provided in Section 3.

Investigations into the source of the suspected diesel fuel revealed the presence of the following components of the SGS Unit 2 Diesel Fuel Oil System within the vicinity of TW-2:

1. Diesel fuel above ground storage tanks (AST);
2. Diesel fuel underground piping;
3. An emergency fill valve; and;
4. An overflow tank.

The locations of these system components are identified on **Figure 2,** except for the Diesel fuel AST, which is located immediately south of the investigation area inside the Auxiliary Building. PSEG performed both a pressure test and a guided wave test on the underground piping and the results of the tests did not identify any integrity issues associated with the piping. In addition, initial soil and groundwater investigation activities were completed in association with the emergency fill valve and the overflow tank, at the three temporary observation points (TW-2, TW-37, and TW-50), and in an area that was excavated to expose the underground piping during the guided wave testing. The details and results of these investigation activities were provided in the July 12, 2010 SIR/RIWP (Arcadis 2010). Based on the results of the investigation activities, additional soil and groundwater investigation activities were conducted in accordance with SIR/RIWP as amended in a letter dated October 28, 2010 and verbally agreed upon in meeting with NJDEP on August 25, 2010. On May 17, 2011 and September 9, 2011,

PSEG submitted the SGS Unit 2 RIR and RAWP, respectively. On December 16, 2011, NJDEP approved both of these documents stating “The Department has determined that the submittals are in compliance with the TRSR, N.J.A.C. 7:26E and other applicable requirements.” A summary of the RI activities, showing where delineation is achieved, are presented in Section 3.3.

1.2 Report Purpose

The purpose of this RIR is to present the results of soil and groundwater investigation activities related to both SGS Units 1 and 2 investigations.

Samples were collected during the RI to determine the extent of constituents in soil and groundwater. The RI consisted of advancing soil borings, installing groundwater monitoring wells, and collecting groundwater samples.

This report presents relevant background information, the Station’s physical setting, a general profile of the investigation execution and results, and the RI findings and conclusions.

1.3 Report Organization

This RIR is organized as follows:

Section 2 – **Site Background**. This section provides an overview of the operating history of the Station, present a description of the Station, including climate and precipitation, regional and station specific geology, hydrogeology, topography and station drainage, surrounding site use, and information captured in the NJDEP-required receptor evaluation and ecological evaluation.

Section 3 – **Summary of Remedial Investigation**. This section presents the applicable regulatory requirements, the details and results of the remedial investigation activities which included groundwater sampling and soil sampling.

Section 4 – **Data Usability**. This section presents the details related to the data usability.

Section 5 – **Classification Exception Area (CEA).** This section provides information regarding the proposed CEA, including the fate and transport, timeframe of the CEA, and the horizontal and vertical extent.

Section 6 – **Regulatory Timeframe.** This section provides a summary of the regulatory timeframe for the station specific investigations.

Section 7 – **Conclusion**. This section summarizes the results of the remedial investigation activities and presents the nature and extent of COCs at the Station.

Section 8 – **References**. This section lists the references cited in this RIR.

2 SITE BACKGROUND

The following sections provide relevant information regarding the Station's operating history, physical setting, receptor evaluation, and ecological evaluation.

2.1 Operating History

PSEG operates two nuclear generating stations on an approximately 740-acre area of Artificial Island located in Hancocks Bridge, Lower Alloways Creek Township, Salem County, New Jersey: SGS and HCGS. Both SGS and HCGS are located on the eastern bank of the Delaware River. The Salem Generating Station encompasses an approximate 26-acre portion of Artificial Island.

SGS is composed of two nuclear generating units (Units 1 and 2). Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectively. The nuclear generating units operate as base load units with a combined generating capacity of approximately 2,400 mega-watts electric (MWe). Over its operational life, SGS has experienced no significant changes in its operation.

2.2 Physical Setting

The following sections provide information regarding the setting of the Station, including climate and precipitation, regional and station specific geology, hydrogeology, topography and station drainage, and surrounding site use.

2.2.1 Climate and Precipitation

The Station is located in the Southwest Climate Zone of New Jersey. In this zone, winds from the south bring high humidity and moderate temperatures, while proximity to the Delaware Bay moderates temperature extremes. Temperatures vary by season. The maximum expected high temperature for a given year is 100 degrees Fahrenheit (°F), while the minimum expected low temperature is -2°F.

Near the Station, summer temperatures, humidity, and precipitation are influenced by several water bodies (Delaware River, Delaware Bay, and Atlantic Ocean). As described below, summer winds are primarily from the south/southwest, which allows for considerable precipitation, frequently including local thunderstorms. During late summer and autumn seasons, hurricane-induced weather patterns occasionally cause heavy rainfall at the Station. Although the facilities have contingency plans that are implemented in preparation for the sustained high winds and heavy precipitation associated with hurricane-induced weather patterns, winds seldom reach hurricane force in this area.

Regional winter temperatures are influenced and moderated by the Appalachian Mountains to the west as well as by the nearby water bodies. Winter storms can produce heavy snowfalls in this region. Considered together, the information presented above indicates that the regional climate is considered to be humid, temperate, and influenced by its proximity to the Delaware Bay.

Wind direction data collected from several nearby sources were used to define a general wind profile for the Station. In general, the wind direction at this location is from the northwest during the autumn, winter, and spring months and generally from the south during the summer months. The historical maximum

average wind speed (recorded in 1987) for the Station is 41 miles per hour. The average annual precipitation total is generally in the range of 40 inches.

2.2.2 Geology

The Station is located in the Atlantic Coastal Plain Physiographic Province. This area is characterized by relatively flat to gently undulating terrain, underlain by unconsolidated sediments that increase in thickness to the southeast. These sediments range in age from Holocene to Cretaceous (0 to 146 million years old); primarily comprise clay, silt, sand, and gravel; and are generally classified as continental, coastal, or marine in nature. Published geologic mapping indicates that the basement rock beneath these sediments (in the area of the SGS) is metamorphic schist of the Wissahickon Formation, which is Pre-Cambrian in age (570 to 900 million years old) (United States Geological Survey [USGS] 1999).

Beginning in the early twentieth century, the U.S. Army Corps of Engineers (USACE) created the land where the Station is located. Artificial Island was created by depositing hydraulic dredge spoils (hydraulic fill) from the shipping channel in the Delaware River Estuary in to a diked area established around a natural sand bar in the estuary. The Station is located on that portion of Artificial Island that borders the Delaware River Estuary. This fill consists of a layer of soft gray to black organic-rich clays and silts.

The unconsolidated overburden at the Station consists of approximately 25 feet of dredge spoils (hydraulic fill), engineered fill material, tidal marsh deposits, and riverbed deposits. Structural (engineered) fill material was placed on Artificial Island to provide a more stable base than the dredge spoil material to enable construction of the generating units (Arcadis 2006b). Due the length of time and volume required for construction, different sources of fill were used for SGS and HCGS (Dames & Moore June 20, 1972).

The construction of Station facilities required the excavation of dredge spoils in areas requiring structural support. The more recently constructed station (HCGS) used fine sand with a density compacted to 98 percent of an established proctor to replace the dredge spoils. At SGS fine sand was used, with a density compacted to 98 percent of an established proctor to replace the dredge spoils present at land surface in areas requiring structural support for key operational areas; however, in non-essential areas, a 95 percent compacted material was used (Dames & Moore August 28, 1968). Additionally, much of the material (in non-key areas) at SGS has a higher gravel content than the 98 percent compacted material. Structural fill material was encountered in several of the borings located closest to facility buildings. Where encountered, it was typically less than 12 feet thick. The hydraulic conductivity of this material is low, based on the data collected during well installation activities, the composition, and compaction of the engineered fill. As such, the ability of this material to transmit a significant quantity of groundwater is low (Arcadis 2006a).

The engineered fill, tidal marsh deposits, and riverbed deposits combine to form the shallow, water-bearing unit. Beneath the engineered fill and dredge spoil material, in order of increasing depth, are the following geologic formations (USGS 1999):

- *Riverbed Deposits*. Overlying the erosional surface of the confining unit are Quaternary-age riverbed deposits that represent native conditions present in the period before the USACE designated Artificial Island as a Dredge Spoil Area. Direct-push soil borings advanced during pre-facility construction proved that, in the immediate station vicinity, these sediments consist of gray to light brown, medium-

grained, medium-dense sand, with a trace of fine gravel in places. Note that during construction of the Station, the riverbed deposits were removed from the footprint of structures built to be resistant to seismic events.

The riverbed deposits range in thickness from 15 feet thick at well BP (where the sands have filled paleo-channels) to 2 feet thick at well BR. The riverbed deposits are either not present or very thin (several inches) in locations where the underlying confining unit exhibits topographic highs. The riverbed deposits represent the shallowest saturated unit having appreciable hydraulic conductivity in the shallow subsurface at the Station and, where of sufficient thickness, transmit the greatest volume of shallow groundwater beneath and around the containment areas. The thickness and topography of the riverbed deposits are described in prior reports (Arcadis 2004, 2006a, 2006b).

- *Confining Unit*. The confining unit near the SGS consists of dark gray clay with some silt and layers of fine-grained micaceous quartz sand, and is approximately 15 feet thick. The confining unit occurs from approximately 40 to 55 feet bgs (USGS 1999).
- *Basal Sands*. The basal sand is a fine to medium micaceous sand with varying silt content that coarsens with depth. The unit is approximately 15 feet thick. This unit occurs from approximately 55 to 70 bgs (USGS 1999).
- *Vincentown Formation*. The Vincentown Formation occurs from approximately 70 to 135 feet bgs and consists of a competent, greenish-gray, fine to medium sand with some silt, shell fragments, feldspar, and glauconite (USGS 1999).
- *Hornerstown Formation*. The Hornerstown Formation is a highly glauconitic, clayey, with dark green sand that contains small percentages of quartz grains and apatite pellets. The Hornerstown Formation unconformably overlies the Navesink Formation and is unconformably overlain by the Vincentown Formation. The Hornerstown Formation occurs from approximately 135 to 145 feet bgs (USGS 1999).
- *Navesink Formation*. The Navesink Formation is characteristically a glauconitic sand with varying amounts of silt and clay. It is brown or dark green to blue-black and has a shell bed at its base. The upper part of the formation is less glauconitic, more clayey, more micaceous, and lighter in color. The Navesink Formation conformably overlies the Mount Laurel Sand. The contact with the overlying Hornerstown Formation is gradational. The Navesink Formation is encountered from approximately 145 to 170 feet bgs (USGS 1999).
- *Mount Laurel-Wenonah Formation*. The Mount Laurel-Wenonah Formation consists of a clayey, medium-grained sand with some gravel, feldspar, and glauconite. Near the SGS, the Mount Laurel-Wenonah Formation is approximately 100 feet thick and occurs from 170 to 270 feet bgs (USGS 1999).

Beneath the Mount Laurel-Wenonah Formation, more than 1,000 feet of Upper Cretaceous sediments overlie the crystalline bedrock. The Upper Cretaceous sediments include, in descending order: Marshalltown Formation (gray, fine sand); Englishtown Formation (yellow-brown, fine sand); Woodbury Clay (dark gray, stiff, silty clay); Merchantville Formation (dark green clay); Magothy Formation (coarse to fine silt with little fine sand); and Raritan and Potomac formations (interbedded sand, gravelly sand, and clay) (USGS 1999). **Figure 3** provides a regional cross section depicting these geologic units.

2.2.3 Hydrogeology

Four primary water-bearing zones underlay the Station, the shallow water-bearing unit and three aquifers: 1) Vincentown Formation, 2) Mount Laurel-Wenonah Formation, and 3) Potomac-Raritan-Magothy Formations. The physical characteristics and some hydrogeological characteristics of the aquifers are discussed in previous sections of this report. The shallow water-bearing zone is the primary zone of concern regarding this investigation. This unit consists of dredge spoils, engineered fill, tidal marsh deposits, and discontinuous quaternary riverbed deposits and is present between approximately 10 to 40 feet bgs. In general, the dredge spoils, engineered fill, and tidal marsh deposits are characterized by high porosity and low permeability. Occasional lenses of sand within the dredge spoils may contain perched water within a few feet of the ground surface. Groundwater in the shallow water-bearing zone is generally brackish, with flow generally to the southwest and a gradient of approximately 0.007 foot per foot.

2.2.3.1 Groundwater Elevations

Groundwater elevations across the Station generally range between 1 and 7 feet above mean sea level (amsl); however, the Station's many surface and subsurface features influence groundwater elevations on a local level. An example of this influence is observed when comparing groundwater elevations inside and outside the cofferdam structure at SGS. The cofferdam was constructed prior to building SGS and remains in place. The cofferdam, made of concrete and steel, inhibits the horizontal flow of groundwater within and around it. When groundwater levels are elevated, groundwater may flow radially in all directions over the top of the structure (e.g., overflowing bathtub effect). But when water levels are lower, the flow directions may be more limited as a result of the subsurface structures. In general, the subsurface structures (concrete and steel) may result in higher groundwater elevations within the cofferdam than those observed outside the feature.

2.2.3.2 Groundwater Use

As described above, several geologic formations beneath Artificial Island contain transmissive units and are capable of supplying a useable quantity of water. The shallow, water-bearing unit within the shallow and manmade geologic units beneath the Station is not suitable for potable or non-potable purposes because groundwater is marginally transmissive and of poor water quality. As such, the shallow, water-bearing unit is not used as a water source or anticipated to become a usable water source. The Vincentown Formation supplies potable water to domestic wells located upgradient in eastern Salem County, where groundwater in the aquifer is moderately hard with high iron content. Saltwater intrusion into the aquifer occurs along the Delaware River Estuary in western Salem County, thus rendering water quality brackish and non-potable. In general, groundwater in the Vincentown Formation beneath the Station has relatively high concentrations of chloride and therefore is not adequate for use as a potable water supply. Moreover, no public water supply wells or private wells in the general Station vicinity (within 3.5 miles) are completed in the Vincentown Formation.

The Mount Laurel-Wenonah aquifer occurs from approximately 170 to 270 feet bgs. SGS has emergency fire-water supply wells screened in this formation.

The deepest of the water-bearing formations near the Station is the Potomac-Raritan-Magothy (PRM) Formation, which is bounded by the Merchantville Formation above and by the Wissahickon Schist

basement rock below. The crystalline basement rock of the Wissahickon Schist is not considered an aquifer, because it transmits water only locally due to secondary porosity (i.e., fractures and faults). In Salem County, the PRM Formation occurs at depths in excess of 500 feet bgs. This is the primary water-producing aquifer for southern New Jersey. Station water supply wells are screened in the PRM at depths ranging from 800 to 1,100 feet bgs. No off-site public water supply wells or private wells are located within 1 mile of the Station.

2.2.4 Topography

The topography at the Station is relatively flat. Topographic contours for the Station are included on **Figure 2**. Stormwater is managed in accordance with the SGS's New Jersey Pollution Discharge Elimination System (NJPDES) permit (NJPDES Permit NJ0005622) and Stormwater Pollution Prevention Plan. Stormwater is collected in storm drains and routed to the Delaware River for discharge. Stormwater from the major petroleum storage and handling areas is routed to the oil/water separators prior to discharge.

2.2.5 Surrounding Site Use

PSEG owns and/or controls an approximately 740-acre area of Artificial Island that includes SGS and HCGS (**Figure 4**). This area contains SGS, HCGS, and administrative and support facilities used by both SGS and HCGS, including the Salem and Hope Creek Switch Yards, administrative support buildings, and 367 acres of uncommitted, undeveloped land. The zoning classification for generating facilities is industrial. The land adjacent to generating facilities is zoned as wetlands.

The Station is located on a portion of Artificial Island that borders the Delaware Estuary. The Delaware Estuary, in the location of the Station, is a tidal, brackish river, located in an area designated as Zone 5 by the Delaware River Basin Commission (DRBC). The entire area of Artificial Island is within the Delaware River's estuarine zone and is defined by the DRBC as a "tidally influenced interface between fresh water and salt water." The salinity line, as tracked by DRBC and presented in the 2008 State of the Basin Report (DRBC 2008) hovers around the Pennsylvania-Delaware state line.

Beginning in the early twentieth century, the USACE created Artificial Island by depositing hydraulic dredging spoils within a diked area established around a natural sand bar that projected into the Delaware River. Prior to construction of the Station, the property was vacant, undeveloped, low-lying land.

2.3 Receptor Evaluation

PSEG performed a receptor evaluation in accordance with the requirements specified in N.J.A.C. TRSR 7:26E1.15 through 1.19. An initial receptor evaluation was submitted in 2011. An updated receptor evaluation for the Site is included as **Appendix D**. The receptor evaluation concluded that while there are environmentally sensitive areas near the project area, none are located within the project area, and delineation is completed prior to impacting soil or groundwater encroaching on the environmentally sensitive areas. The following sections present the results of the current receptor evaluation:

2.3.1 On-Site and Surrounding Properties Use

The Station is located on a 740-acre parcel adjacent to a brackish reach of the Delaware River. The Station is bounded to the south and west by the Delaware River, to the north by a USAC dredge spoils area, and to the east by undeveloped land. Land surrounding the Station is zoned for industrial, residential, and agricultural uses. However, there are no homes located within several miles of the Station. As shown on **Figure D-1 (Appendix D)**, no natural heritage priority sites are located within one-half mile of the Station.

As part of the evaluation of environmentally sensitive areas, the NJDEP GIS database was searched. The following data layers were downloaded for land within approximately one-half mile of the Station:

- Coastal centers
- Hydrography
- Natural Heritage priority sites
- Lakes
- 1995/97 Land use/land cover
- Linear wetlands
- Streams
- Wetlands

Environmentally sensitive areas located within and adjacent to the Station were characterized during a visual reconnaissance conducted on April 26, 2005. Environmentally sensitive areas identified within the Station property boundary using Geographic Information System (GIS) information downloaded from NJDEP include forests, surface water and wetlands as shown on **Figure D-1** (**Appendix D**). Environmentally sensitive areas located within 200 feet of the Station property boundary include the Delaware River, the associated riparian buffer along the river, forest, and wetlands.

2.3.2 Groundwater Use

Several geologic formations beneath Artificial Island contain transmissive units and are capable of supplying a useable quantity of water. The shallow, water-bearing unit within the shallow and manmade geologic units beneath the Station is not suitable for potable or non-potable purposes because groundwater is marginally transmissive and of poor water quality (high salinity and total dissolved solids). Several hundred feet of overburden exists between the shallow, water bearing zone and the aquifers that the Station's potable wells are screened. As such, potable well sampling is not warranted. The location of the Station's potable wells is shown on **Figure D-2** (**Appendix D**).

2.3.3 Vapor Intrusion

Structural as-built drawings indicate the concrete foundation of the facility extends to a depth of approximately 35-feet bgs compared the SPH being present at 4-feet bgs. Therefore, SPH and groundwater are not present beneath the buildings adjacent to the measurable SPH and vapors have nowhere to accumulate. Additionally, the use of the SGS Auxiliary Building required the construction to

include excessively thick concrete construction. Based on the construction of the generating station structures, the nature of the contaminants (diesel) and absence of shallow groundwater or SPH under the buildings, a vapor intrusion investigation is not warranted for the site.

2.3.4 Ecological Evaluation

In accordance with N.J.A.C. 7:26E-3.11, a baseline ecological evaluation was performed to identify the following: 1) constituents of potential environmental concern in soil and groundwater; 2) environmentally sensitive areas; and, 3) potential contaminant migration pathways. The results of the baseline ecological evaluation, which were presented in Appendix G of the SGS Unit 1 RIR (Arcadis 2006c) and are included in **Appendix A**, concluded that no further ecological evaluation is warranted.

3 SUMMARY OF REMEDIAL INVESTIGATION ACTIVITIES

The following sections provide summary of the RI activities completed at the Station and the analytical results.

3.1 Remedial Goals

This RI was performed using NJDEP's March 4, 2014 Groundwater Quality Criteria for Class IIA aquifers (GWQC) (N.J.A.C. 7:9C) and soil remediation standards (N.J.A.C. 7:26D) as the applicable remediation goals. Consistent with NJDEP guidance, total petroleum hydrocarbon (TPHC) concentrations for #2 fuel oil are equivalent to extractable petroleum hydrocarbon (EPH) values.

3.2 SGS Unit 1

The results of SGS Unit 1 RI field activities are documented in SGS Unit 1 RIR (Arcadis 2005b), February 2007 Remedial Action Progress Report (RAPR; Arcadis 2007), and November 2011 RAPR (Arcadis 2011a). These activities and conclusions were ultimately approved by NJDEP in letters dated, March 14, 2006, March 24, 2008, and December 16, 2011. Since initial site characterization activities began in 2004, PSEG has implemented a groundwater monitoring program. Prior to the implementation of the LSRP program, groundwater monitoring results were documented and submitted the NJDEP in RAPRs. Subsequently, the LSRP reviews the results and RAPRs are kept on file. The following sections provide a summary of the results of the RI investigation activities and the current groundwater quality conditions. Specific details of the investigation activities and NJDEP correspondence are provided in **Appendix A**.

3.2.1 Investigation Activities

As presented in the RIWP (Arcadis 2005a), the remedial investigation conducted in association with the diesel release had the following four primary goals: 1) to characterize the vertical and horizontal extent of diesel-related constituents in soil; 2) to determine if SPH was present on the water table and to what extent; 3) to characterize the extent of dissolved-phase diesel-related constituents in groundwater downgradient of the release area; and, 4) to determine the need for further action. The scope of work developed to achieve these objectives included the advancement of four soil borings at various locations downgradient of the source of the diesel release for collecting soil samples, the installation of eight monitoring wells (well AU, well AV, well AW, well AY, well AZ, well BV, and well CG), and the monitoring of water/SPH levels and the collection of groundwater samples from six monitoring wells (well AV, well AY, well AZ, well BV, and well CG). The cross section view for the investigation area is presented on **Figures 5** and **6**.

3.2.1.1 Soil

On November 8 and 9, 2004, PSEG advanced four soil borings (D-2 through D-5) for the collection of soil samples. The locations of the soil borings relative to the source of the diesel release are identified on **Figure 7**. Due to the presence of diesel-fuel oil, soil samples were not collected from the source area soil

boring (D-1). Prior to initiating soil sampling activities, a water level measurement was obtained from well X, located adjacent to the northwest corner of the Fuel Handling Building (see **Figure 8**) to determine the appropriate depth for sample collection. Soil samples were obtained from the borings at a depth of six inches above the water table as measured in well X. A second sample was obtained from soil boring D-4 to evaluate the vertical distribution of diesel related COCs in soil.

Due to the extensive, facility-critical infrastructure within the area of investigation, both the boring locations and advancement methods were limited. Soil borings D-2 through D-5, advanced at accessible locations beyond the source area of the diesel release to the south and west, were advanced using vacuum excavation equipment to ensure that, if encountered, subsurface infrastructure would not be damaged. Soil samples were obtained from each boring ahead of the vacuum excavation using a hand auger. The soil samples were submitted for laboratory analysis of TPHC. In accordance with the then current TRSR (N.J.A.C. 7:26E-2.1(d)), soil samples were also placed on hold for volatile organic compounds (VOCs) analysis pending the TPHC results. Based on the results of the TPHC analysis (**Figure 7**), analysis for VOCs was not required.

3.2.1.2 Groundwater

The investigation of groundwater consisted of the installation of eight monitoring wells (well AU, well AV, well AW, well AY, well AZ, well BV, and well CG) within and downgradient of the source area to evaluate the extent of dissolved-phase and SPH. The locations of the groundwater monitoring wells are shown on **Figure 9**. Following installation, groundwater monitoring (groundwater elevation measurements, SPH gauging and groundwater sampling) and interim SPH recovery activities were initiated. Groundwater monitoring and SPH recovery activities have continued since the completion of the RI activities. The following sections provide a summary of the groundwater investigation details.

3.2.1.2.1 Monitoring Well Installation

On November 8 and 9, 2004, PSEG installed monitoring wells well AU, well AV, well AW, well AY, and well AZ (Arcadis 2005b). In response to comments received on the SGS Unit 1 RIR (NJDEP 2006), PSEG installed monitoring well BV (Arcadis 2007) to monitor groundwater quality downgradient of the SPH plume and along the migration pathway (Service Water Lines). Additionally, in response to a Notice of Deficiency (NJDEP 2010) PSEG installed monitoring well CG. Monitoring wells were installed by a New Jersey licensed driller in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001. Upon completion, each monitoring well was properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the formation. All monitoring wells were surveyed by a New Jersey licensed surveyor. Additional details regarding the installation are provided in the SGS Unit 1 RIR (Arcadis 2006c). The purposes for the monitoring wells are as follows:

- Well AU was installed closest to the initial source of the diesel fuel oil release. Well AU was installed within the excavation opened to expose and repair the underground piping prior to backfilling. Due to the presence of extensive subsurface infrastructure encountered during the excavation, well AU could not be installed beyond a depth of approximately seven feet bgs. SPH was observed within the open excavation prior to backfilling and in well AU after installation was completed. The primary

purpose of well AU has been to facilitate SPH recovery using the Spill Buster® active product recovery unit. A summary of the SPH recovery efforts are presented in Section 3.2.3;

- Wells AW, AY, and BV were installed to delineate the extent of SPH downgradient of the source area based on knowledge of groundwater flow direction obtained from previously completed and unrelated investigations. Following installation, SPH fuel was detected in well AW. In response, a passive skimmer recovery device was installed within well AW. A summary of the SPH recovery efforts in well AW are presented in Section 3.2.3;

- Wells AV, AZ, and X were installed to horizontally delineate the extent of dissolved-phase constituents in groundwater adjacent to the source area.

- Well CG was installed following the detection of SPH in adjacent well AI. Well AI was installed as part of a separate and independent investigation. Further explanation of this detection is described in Section 3.2.3.

3.2.1.2.2 Groundwater Monitoring

Since monitoring wells were installed, PSEG has implemented a groundwater monitoring program. In 2004 and 2005 groundwater monitoring was performed quarterly, from 2006 through 2016 groundwater monitoring has been performed on a semi-annual basis, and in 2017 groundwater monitoring will be performed annually. Groundwater monitoring events consist of water level and SPH thickness measurements and groundwater sampling. The groundwater monitoring program has largely remained consistent with the exception of expanding the program to include collecting samples from wells AD, AB and AT as described below. The following sections provide summary of monitoring activities completed in 2016 to document that conditions remain protective of human health and the environment and delineation is still complete.

With the exception of a onetime detection in well AZ, measurable SPH is limited to the area of well AU and downgradient towards well AW. On February 16, 2005, PSEG initiated the operation of a groundwater remediation system (GRS) through groundwater extraction associated with an ongoing and unrelated groundwater remediation. The GRS included the use of well AO located approximately five feet to the east of well AZ. The location of well AO and AZ are shown on **Figure 9**. Due to the operation of the GRS and the resulting groundwater influence, SPH migrated in the direction of well AO and 0.09 feet of SPH was observed in well AZ. Immediately (i.e., same day) following the detection of SPH in well AZ, PSEG ceased the operation of the groundwater extraction pump in well AO. An organophilic adsorbent sock was placed in well AZ to recover any accumulated SPH. Since pumping from well AO was suspended, SPH has not been detected in well AZ. Sorbent socks have been deployed in well AZ to recover any residual SPH that may still be present.

Due to the sensitive nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples were collected from monitoring wells utilizing the low-flow sampling methodology. Samples collected from pumping wells, are collected directly from the discharge. Sample collection procedures, as well as quality control/quality assurance (QA/QC) sampling requirements, are outlined in the quality assurance project plan (QAPP) provided in **Appendix E**. Groundwater samples are

only collected from monitoring wells that do not indicate a measurable thickness (i.e., greater than 0.01 feet) of SPH. Well AU and well AW are not sampled due to the presence of SPH in these wells. Groundwater samples are analyzed for priority pollutant list VOCs and semi-volatile organic compounds (SVOCs).

On February 24, 2012, Arcadis personnel observed odors from the discharge water in well AB, a pumping well associated the GRS. Arcadis collected grab samples from each operational GRS pumping well: wells AN, S, AJ and AB. None of the samples contained SPH or a sheen. Arcadis then screened the headspace of the water samples with a photo-ionization detector (PID). Wells AN, S, and AJ were 0.0 parts per million (ppm), while well AB was 0.5 ppm. A visual inspection of the area surrounding well AB could not identify current or recent operations which may be the source of the PID detections in well AB's discharge water. In May 2012 Arcadis was conducting maintenance on the GRS and wells. During this maintenance, Arcadis noted that in addition to well AB, wells AD and AT also had an odor. Due to this, PSEG expanded the groundwater monitoring program to include sampling GRS pumping wells AD, AB, and AT for VOCs and SVOCs.

3.2.2 Results

The following sections present a summary of the soil sampling and groundwater monitoring results.

3.2.2.1 Soil

Analytical results from soil samples are presented on **Table 2** and shown on **Figure 7**. Analytical results of the soil samples submitted for TPHC analysis did not indicate concentrations greater than laboratory detection limits. The method detection limits ranged from 26 to 32 milligrams per kilogram (mg/kg).

Results of the soil investigation indicate that the extent of soil impacts is limited to the "smear-zone" where SPH has migrated, an approximate distance of 49 feet from the source area. The estimated extent to which SPH has migrated is shown on **Figure 7**. Locations for advancing soil borings are limited due to the presence of extensive subsurface infrastructure. Due to these limitations, the extent of diesel-related COCs in soil cannot be further refined.

3.2.2.2 Groundwater

Groundwater elevations measurements collected from 2004 through 2016 are presented on **Table 1**. Groundwater elevation contours generated from measurements collected during the December 2016 sampling event are shown on **Figure 8**.

Groundwater flow within the shallow, water-bearing unit appears to be controlled largely by the presence of large subsurface utilities. As shown on **Figure 8** groundwater flows predominately along the Service Water Lines from north to south. These results are consistent with historical measurements reported since 2004, which indicate that the water table slopes toward the south with a horizontal hydraulic gradient of approximately 0.019.

The extent of measurable SPH observed to date has been limited to well AU, installed within the source area, and well AW, installed immediately downgradient of the source area along the service water piping. SPH was detected during a single gauging event in well AZ and migrated to this area under the influence

of pumping in well AO. In January 2005 and December 2016, SPH thickness was measured in well AU at 1.75 feet and 0.03 feet, respectively. In December 2004 and December 2016, SPH thickness was measured in well AW at 3.07 feet and 0.01 feet, respectively. SPH measurements obtained from well AY, located to the south and downgradient of well AW along the service water pipes, provide delineation of the extent of SPH.

Analytical results from groundwater samples collected since December 2004 are presented on **Table 3.** A summary of the most recent groundwater sampling event (2016) is shown on **Figure 9**. A summary of analytical results, compared to the New Jersey GWQC for Class IIA aquifers is as follows:

- Benzene was detected at concentrations greater than the GWQC in monitoring wells AY and X, with concentrations ranging from 2.3 micrograms per liter (µg/L) through 10.2 µg/L.

- Select SVOCs were detected at concentrations greater than their respective GWQC in wells AV, AY, and X. Constituents included bis(2-Ethylhexyl)phthalate, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene. All of the select SVOCs have been historically detected at a concentration greater than the NJDEP GWQC at least one other time, except indeno(1,2,3-cd)pyrene.

- With the exception of an occasional detection of dissolved-phase constituents in groundwater, concentrations of VOCs and SVOCs are less than the NJDEP GWQC in monitoring wells immediately adjacent to the residual SPH source area.

3.2.3 Interim Remedial Measures

SPH recovery was performed at well AU and well AW. The recovery efforts completed to date include the operation and maintenance of the Spill Buster® active recovery system, the operation of a passive skimmer, and the use of sorbent socks. Recently, sorbent socks and the Spill Buster® were utilized in the wells for product recovery. These sorbent socks were removed and replaced during monthly visits. Use of these methods has resulted in the recovery of approximately 796.3 gallons of SPH through December 2016. The extent to which SPH has migrated to date has been generally controlled by the subsurface infrastructure located within the investigation area. With the repair of the diesel fuel underground conveyance piping, the ongoing SPH recovery efforts being conducted in well AU and well AW, when in operation (see Section 4), are successfully preventing further migration of SPH.

3.2.4 Recommendations

Based on the results of investigation activities and interim remedial actions completed to date, the following actions are proposed:

- Continue operation and maintenance of the Spill Buster® unit and absorbent socks in well AU and well AW, until SPH is less than 0.01 feet thick. Currently, scheduled maintenance of these systems is performed to ensure the timely change out of the accumulation tank and the proper operation of the unit;

- Annual groundwater monitoring will consist of the collection and analysis of groundwater samples from those wells not indicating the presence of SPH. The groundwater samples will be analyzed for

VOCs and SVOCs to evaluate the extent, if any, of dissolved-phase COCs. Annual Remedial Action Progress Reports will be prepared to update the LSRP on the status of SPH recovery efforts and groundwater analytical results;

- Establish a classification exception area (see Section 5); and
- Resubmit the RAWP to the NJDEP that proposes SPH recovery and groundwater remedial strategy.

Results of soil investigation activities completed to date indicate that soil impacts are limited to the source area of the release and the "smear zone" where the SPH has migrated. The further investigation of soil impacts is technically impracticable to complete due to the extensive subsurface infrastructure located within this area which if damaged could cause a significant impact on the operation of SGS. As such, PSEG had previously requested and had been approved (NJDEP 2006) of a variance from the TRSR, specifically N.J.A.C. 7:26E-4.1(b), which was used to base the need for future soil investigation and remediation on groundwater analytical data and constituent-specific soil partition coefficients. Following the decommissioning of the Station, PSEG will evaluate the need to complete further remediation of soil.

Based on the results of investigation activities completed to date in association with incident No. 04-08-02-2350-16, the soil and groundwater delineation is complete and consequently the RI is complete. PSEG will resubmit the RAWP for the remediation of soil and groundwater to correct NJDEP's records.

3.3 SGS Unit 2

The results of SGS Unit 2 RI field activities are documented in SGS Unit 2 RIR (Arcadis 2011b). These activities and conclusions were approved by NJDEP in a letter dated December 16, 2011. Since 2012, PSEG has monitored groundwater at the well adjacent to the single exceedance of NJDEP SRS values. Prior to the implementation of the LSRP program, groundwater monitoring results were documented and submitted the NJDEP in RAPRs. Subsequently, the LSRP reviews the results and RAPRs are kept on file. The following sections provide a summary of the RI investigation activities, results, and the current groundwater quality conditions. Specific details of the investigation activities and NJDEP correspondence are provided in **Appendix B**.

3.3.1 Investigation Activities

As presented in the revised SIR/RIWP (Arcadis 2010), the remedial investigation conducted in association with the SGS Unit 2 diesel release had the following four primary goals: 1) characterize the horizontal extent of diesel-related constituents in soil; 2) Evaluate for the presence of SPH(as defined in *Guidance for LNAPL Free Product Initial Recovery and Interim Remedial Measures* [NJDEP 2010]) and delineate its extent, if necessary; 3) Characterize dissolved-phase diesel-related constituents in shallow groundwater within the release area; and 4) to determine the need for further action.

The scope of work developed to achieve these objectives included the advancement of two soil borings to horizontally delineate TPHC impacts, the installation of four monitoring wells (well CC, well CD, well CE, and well CF), and the monitoring of water/SPH levels and the collection of groundwater samples from the four newly installed monitoring wells. The following sections include a summary of the results of these initial investigation activities.

3.3.1.1 Soil

In November 2010, PSEG advanced two soil borings to horizontally delineate TPHC detected in soil sample OFT-E (0-0.5) to the east and northeast. The locations of the soil borings relative to the initial boring are shown on **Figure 10.** Soil borings OFT-E+5 and OFT-NE are located approximately 5 feet to the east and northeast of boring OFT-E, respectively. Samples were collected from the 0-0.5 interval and analyzed for Extractable Petroleum Hydrocarbons.

3.3.1.2 Groundwater

The investigation of groundwater consisted of the installation of four monitoring wells (well CC, CD, CE and CF) to evaluate for the presence of SPH, and characterize dissolved-phase constituents in groundwater. **Figure 11** shows the locations of the monitoring wells. Following installation, groundwater monitoring activities (groundwater elevation measurements, SPH gauging and groundwater sampling) were initiated.

3.3.1.2.1 Monitoring Well Installation

In November 2010, PSEG installed monitoring wells CC, CD, CE and CF. Monitoring wells were installed by a New Jersey licensed driller in accordance with NJAC 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001. Upon completion, each monitoring well was properly developed to remove fine-grained materials that may have settled in and around the monitoring well during installation, and to ensure that the monitoring well is hydraulically connected to the formation. All monitoring wells were surveyed by a New Jersey licensed surveyor. Additional details regarding the installation are provided in the SGS Unit 2 RIR (Arcadis 2011b). The purposes for the monitoring wells are as follows:

- Monitoring well CC was installed down-gradient of the former excavation number 2.
- Monitoring well CD was installed at a location that TPH concentrations exceeded the NJDEP SRS.
- Monitoring well CE was installed along the diesel fuel line, north of the former excavation number 2.
- Monitoring well CF was installed near a temporary observation point (36).

3.3.1.2.2 Groundwater Monitoring

Following installation, monitoring wells were sampled to characterize water quality. Prior to the collection of groundwater samples from the wells, depth-to-water and SPH thickness measurements were collected using an electronic oil/water interface probe. Water levels and SPH thickness measurements are presented in **Table 1.**

Two-rounds of groundwater samples were collected using low-flow sampling methodology. The first round of groundwater sampling was conducted in December 2010 and January 2011. The second round of groundwater sampling was completed in February 2011, approximately one month following the initial round. Semi-annual groundwater monitoring continued through 2016 to document stable groundwater

conditions in well CD. Sample collection procedures, as well as QA/QC sampling requirements, are outlined in the QAPP included in **Appendix E**.

In accordance with the then current analytical requirements for diesel fuel contained within Table 2-1 of the TRSR groundwater samples were analyzed for volatile organic compounds plus library search (VOC+10) and semi-volatile organic compounds plus library search (SVOC+15).

3.3.2 Results

The following sections present a summary of the soil sampling and groundwater monitoring results.

3.3.2.1 Soil

Analytical results are presented on **Table 4** and shown on **Figure 10**. A summary of analytical results, compared to the NJDEP SRS is as follows:

- EPH was not detected in any of soil samples at a concentration greater than the NJDEP SRS of 5,100 mg/kg.

- EPH exceeded the 1,000 mg/kg contingency analysis trigger value in the parent and duplicate sample collected at location OFT-NE at concentrations of 1,070 mg/kg and 1,350 mg/kg, respectively.

  The contingency constituents (naphthalene and 2-methylnaphthalene) were detected at a concentration less than the NJDEP SRS.

Results of the soil investigation indicate that the release of diesel fuel has not caused a significant impact to soil and is limited to the source area immediately adjacent to the over fill tank.

3.3.2.2 Groundwater

A summary of the SPH gauging and groundwater elevation data is presented in **Table 1**. Groundwater elevation contours generated from measurements collected during the December 2016 sampling event are shown on **Figure 8**.

Groundwater flow within the shallow, water-bearing unit appears to be controlled largely by the presence of large subsurface utilities. As shown on **Figure 8** groundwater flows predominately along the Service Water Lines from east to west. These results are consistent with historical measurements reported since 2010, which indicate that the water table slopes toward the west with a horizontal hydraulic gradient of approximately 0.012. TPH has not been detected in any of the SGS Unit 2 monitoring wells.

Analytical results from groundwater samples collected since January 2011 are presented on **Table 5**. Monitoring well locations and results of the recent sampling events (June and December 2016) are shown on **Figure 11**. The analytical results were compared to the NJDEP GWQC. Accordingly, concentrations of VOCs and SVOCs were not detected above their respective GWQC in all the wells sampled. Analytical results for groundwater monitoring activities completed to date continue to indicate that no impacts to groundwater has occurred.

3.3.3 Recommendations

Based on the results of investigation activities completed to date in association with incident No. 10-0416-1649-11, the soil and groundwater delineation is complete and consequently the RI is complete. On September 9, 2011, PSEG submitted a RAWP to address the residual soil impacts at SGS Unit 2. On December 16, 2011, NJDEP approved the RAWP stating “The Department has determined that the submittals are in compliance with the TRSR, N.J.A.C. 7:26E and other applicable requirements.” PSEG will resubmit the RAWP through the online portal to correct NJDEP’s records.

4 DATA USABILITY

The data quality objectives of this RIR are to determine the potential influence of background conditions on groundwater quality at the Station. The following quality assurance protocols were implemented:

- Sampling and analyses were performed in accordance with the NJDEP Field Sampling Procedures Manual (August 2005) and in accordance with the quality assurance requirements in the TRSR (N.J.A.C. 7:26E-2.1). Additionally, these activities were completed in conformance with the procedures identified in the QAPP (**Appendix E**).
- All samples for groundwater contaminant analysis were submitted to a New Jersey certified laboratory with proper chain-of-custody (Accutest Laboratories, NJDEP Certification No. 12129).
- All sample holding times for the specified analyses were in conformance with laboratory standards and the NJDEP Field Sampling Procedures Manual.
- Groundwater analytical results are presented in a Reduced Laboratory Data Deliverable format that complies with NJAC 7:26E-2.1.

Laboratory non-conformance summaries are included in the laboratory reduced deliverable reports.

- Reporting Limits for target analytes are specified in the laboratory analytical reports.
- Laboratory reporting limits for the contaminants of concern meet the applicable NJDEP SRS and GWQC, and the analytical data are deemed adequate for the intended purpose.

In summary, all of the data generated during the RI are usable. Electronic copies of the relevant reduced laboratory data reports were submitted to NJDEP via email.

5 CLASSIFICATION EXCEPTION AREA

PSEG proposes to establish a groundwater CEA based on the localized presence of diesel fuel oil SPH and dissolved constituents intermittently detected in groundwater at SGS Unit 1. Since initially detecting SPH in 2004 and 18 years of groundwater monitoring, observations and analytical data support that SPH has not migrated beyond the localized area within the Service Water piping backfill and dissolved constituents have only intermittently exceeded the GWQC in wells surrounding the SPH. As described in Section 2.3, the vapor intrusion is not a concern. The perimeter of the CEA will conservatively encompass the monitoring well network and cover an area of approximately 0.27 acres. Remediation of the SPH is planned to occur during the decommissioning process. The current operating license for SGS Unit 1 is through 2036. As such, an indeterminate end date for the CEA is requested pending an extension to the operating license in accordance with the Nuclear Regulatory Commission's process for license renewal. Future land use is expected to continue to be non-residential and no significant facility modifications are anticipated. Groundwater monitoring will continue to ensure the protectiveness of the CEA. A CEA Fact Sheet Form and supporting documentation is provided as **Appendix F**.

6 REGULATORY TIMEFRAME

The regulatory timeframe for remedial action as described in the N.J.A.C. 7:26E will be followed (NJDEP 2012). Accordingly, the RAWP will be resubmitted by May 7, 2021, within one year of the earliest applicable requirement to remediate (pursuant to the 2012 NJDEP regulations at N.J.A.C. 7:26E-5.5 [NJDEP 2012]). The remedial actions will be summarized in an RAR and submitted by May 7, 2022 (pursuant to the 2012 NJDEP regulations at N.J.A.C. 7:26E-5.7 [NJDEP 2012]).

7 CONCLUSIONS

Results of the RI activities performed under the guidance and oversight of NJDEP (Case Manager, Linda Range) are summarized in this report. Details of these investigations were previously submitted to NJDEP. NJDEP either conditionally approved the reports (March 14, 2006 NJDEP letter to PSEG) or approved the reports without comment (December 16, 2011 NJDEP approval letter). PSEG subsequently corrected all deficiencies without further comment from NJDEP (December 16, 2011 NJDEP approval letter), however, NJDEP administrative records do not reflect that the RIR was completed. Furthermore, NJDEP approved the SGS Unit 1 interim remedial measures (March 14, 2006 NJDEP letter to PSEG) and the SGS Unit 2 RAWP (December 16, 2011 NJDEP approval letter). Additional detail on the case history (document submissions and approvals) is provided is Sections 1.1.1 and 1.1.2. On June 9, 2017 as directed by Raymond Strassler of NJDEP, PSEG developed this comprehensive RIR to document past activities so that the RIR is recorded as administratively complete. Based on results of previous investigations, sufficient data has been collected to determine the extent of constituents of concern (COCs) in soil and groundwater. Additionally, with the submission of the RIR, PSEG satisfies the requirement to complete a remedial investigation for these cases.

Results of RI investigation activities conducted at the Station have horizontally and vertically delineated constituents detected at concentrations greater than NJDEP SRS. PSEG will resubmit the RAWP to NJDEP, which presents the previously approved remedial actions.

For SGS Unit 1, historical and current groundwater analytical results obtained since 2004 indicate that petroleum related COC concentrations appear stable, with some modest fluctuation over time. Interim remedial activities at SGS Unit 1 has reduced the amount of recoverable SPH to less than 0.1 foot. The extent to which SPH has migrated to date has been controlled by the subsurface infrastructure located within the investigation area and is not predicted to migrate further.

TPH/EPH concentrations in soil at SGS Unit 2 are localized and current conditions are protective of human health and the environment. Groundwater impacts have not been detected above the GWQC.

	12/13/16	8.95	--	5.60	--	3.35	--

--	Separate-phase product was not detected in well at time of measurement.
NM	Measurement not collected.
NAVD 1988	North American Vertical Datum established in 1988.
ft btoc	Feet below the top of the well casing.
ft amsl	Feet above mean sea level (NAVD 1988).
*	A PVC riser was added to top of wellhead to facilitate installation of Spillbuster unit, accounting for change in wellhead elevation
**	Due to the operation of a groundwater extraction well (Well AO) in the vicinity of Well AZ, separate-phase product migrated in the direction of this well. Following the detection of separate-phase product in Well AZ, groundwater extraction from Well AO was discontinued.

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate va
---	No standard published
N	Parent environmental sample
FD	Blind duplicate
NA	Parameter was not analyzed

					Sample ID	OFT-E+5	OFT-NE	OFT-NE
					Sample Type Code	N	N	FD

Notes:

All concentrations detected above the laboratory detection limit are boldfaced.

Concentrations above the contingent trigger threshhold for total EPH (1,000 mg/kg) for analysis of naphthalene and 2-methylnaphthalene are shown in italics.

-- = sample not analyzed

mg/kg = milligrams per kilogram

EPH = extractable petroleum hydrocarbons

RDCSRS = Residential Direct Contact Soil Remediation Standard

NRDCSRS = Non-Residential Direct Contact Soil Remediation Standard

IGWSSL = Impact to Groundwater Soil Screening Level

ft bgs = feet below ground surface

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
---	No standard published
N	Parent environmental sample
FD	Blind duplicate
NA	Parameter was not analyzed

ANALYTICAL RESULT (mg/Kg)

1. DUE TO THE PRESSURE OF SEPARATE–PHASE DIESEL, SOIL SAMPLES WERE NOT OBTAINED FROM THE BORING ADVANCED WITHIN THE SOURCE AREA, SOIL BORING D–1.
2. SOIL SAMPLES WERE ANALYZED FOR TOTAL PETROLEUM HYDROCARBONS (TPHC). ANALYTICAL RESULTS OF THE OF TPHC ABOVE THE LABORATORY DETECTION LIMITS IN ACCORDANCE WITH NJAC 7:26E, THE SAMPLES WERE NOT ANALYZED FOR VOCs.
3. THE NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION FOR NONRESIDENTIAL DIRECT CONTACT SOIL CLEANUP CRITERIA STANDARD FOR TPHC'S IS 10,000 mg/kg.
4. UNITS ARE IN mg/kg (MILLIGRAMS PER KILOGRAM)

1 Introduction

ARCADIS, on behalf of PSEG Services Corporation (PSEG), has prepared this Remedial Investigation Workplan (RIWP) for the investigation of a diesel-fuel discharge that occurred at the PSEG Nuclear, LLC Salem Generating Station (the Station) located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. The Station location and layout are depicted on **Figures 1** and **2**, respectively. This Workplan has been prepared in accordance with Chapter 26E - Technical Requirements for Site Remediation (Technical Requirements).

1.1 Project Background

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the stormwater collection system just to the south of the Salem Unit 1 Fuel Handling Building. Investigation of the catch basin, which is identified as "Catch Basin 27" on **Figure 2**, revealed the presence of a red-dyed diesel fuel. At this time, PSEG notified the NJDEP through its spill hotline.

To prevent the migration of diesel fuel within the stormwater collection system, the storm drains upstream and downstream of Catch Basin 27 were temporarily blocked to isolate the affected section of piping. Further, a cover was placed over Catch Basin 27 to prevent rain water from entering. Investigations of the remainder of the stormwater system indicated that the diesel fuel had not migrated beyond Catch Basin 27 and the diesel fuel in the catch basin was removed.

Investigations into the source of the diesel fuel revealed the presence of underground piping adjacent to Catch Basin 27 that supplies diesel fuel from diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers. The location of the underground piping is identified on **Figure 2**. PSEG performed a pressure test on the underground piping and the results of the test revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. To pinpoint the location of the leak along this 300-foot section of piping, PSEG subcontracted Praxair Services, Inc. to perform a "Tracer Tight" gas analysis. The results of the test revealed the location of the leak was directly adjacent to Catch Basin 27. The results of the Tracer Tight gas analysis indicated that there were no other leaks along the 300-foot section of piping.

Excavation in the area of the leaking underground piping was initiated on August 23, 2004 by PSEG with the support of Clean Harbors, Inc. to repair the piping. During the excavation process, residual diesel fuel was observed on soil excavated from below the piping (approximately six feet below ground surface (bgs)). Soil excavated from adjacent to and around the piping was appropriately stockpiled by PSEG pending characterization and disposal. Separate-phase diesel fuel was observed on standing water within the

SII-SSA-0014-002281

excavation. Prior to backfilling, approximately 150 gallons of diesel fuel were recovered from the excavation.

Planned interim remedial measures designed to recover any remaining separate-phase diesel fuel include the installation of a Spill Buster® Product Recovery System. To facilitate the installation of a recovery well within the source area of the leak, a ten-inch diameter PVC sleeve was placed in the excavation before backfilling. As presented in Section 5.2.1, a six-inch diameter recovery well will be installed within the PVC sleeve, which will be removed following the installation of the well. The recovery well will then be fitted with the Spill Buster® system for product recovery. Additional information regarding the planned interim remedial actions is presented in Section 7.

1.2 Project Personnel

The primary personnel involved in the project are listed in **Table 1**. These personnel include the PSEG Project Manager, ARCADIS team members, and the project analytical laboratory (Accutest Laboratories). The PSEG Project Manager will be responsible for the overall project coordination and oversight and approval of PSEG and contractor work activities.

ARCADIS team members will be responsible for performing technical activities in accordance with the approved RIWP, supervising field subcontractors, and preparing technical reports. The ARCADIS Project Manager will be responsible for committing the necessary resources to this project, day-to-day operations, adherence to schedule, and work quality. The ARCADIS Field Team Leader will be responsible for the field implementation of the RI scope of work, and ensuring that the data collection procedures outlined in the project Quality Assurance Project Plan (QAPP) provided in **Appendix A**, are followed. The ARCADIS Site Health and Safety Officer will maintain and implement the project Health and Safety Plan provided in **Appendix B**.

Accutest Laboratories will be utilized for the project and is a New Jersey-certified laboratory for performing routine environmental and chemical analyses; its certification number is 12129. The laboratory is responsible for providing analytical services, including laboratory quality assurance and quality control (QA/QC). A detailed description of the analyses to be performed is provided in the QAPP.

1.3 Work Plan Organization

This RIWP contains eight sections, including this introduction:

- Section 2, provides an overview of the operating history of the Station and the regulation of its operations;

SII-SSA-0014-002282

- Section 3 provides a detailed description of the Station including topography, surface water features, climate, soil, geology and hydrogeology, and a detailed description of previous investigation activities;
- Section 4 provides the objectives for the remedial investigation;
- Section 5 provides a detailed scope of work designed to achieve the remedial investigation objectives;
- Section 6 presents the details of interim remedial actions that will be taken to recover separate phase diesel fuel through the proposed source area monitoring well;
- Section 7 outlines the reporting requirements for the remedial investigation and interim remedial actions; and,
- Section 8 provides publications referenced during the preparation of the RIWP.

2 Station History

The following sections provide relevant site information regarding the facility's operating history and a review of applicable regulations relating to operations at the Station.

2.1 Operating History

PSEG Nuclear LLC operates and is part owner of the Salem Generating Station located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. PSEG Nuclear LLC (57.41%) and Excelon (42.59%) jointly own the Salem Generating Station. The Salem Generating Station is situated adjacent to the Hope Creek Generating Station, also located on Artificial Island. Both the Salem and Hope Creek Generating Stations (the Stations) are located on the eastern bank of the Delaware River. The Salem Generating Station encompasses an approximate 26-acre portion of Artificial Island.

The Salem Generating Station is composed of two nuclear generating units (Units 1 and 2) and one distillate oil fueled combustion turbine unit (Unit 3). Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectively. The combustion turbine unit commenced operations in 1972. The nuclear generating units operate as base load units and the combustion turbine unit operates as a peaking unit. The Salem Generating Station has a combined generating capacity of approximately 2,400 MW. Over its operational life, the Salem Generating Station has experienced no significant changes in its operation.

SII-SSA-0014-002283

2.2 Regulatory Review

Regulatory oversight for the Salem Generating Station, and other nuclear generating stations, is provided by both federal and state agencies. These agencies ensure that the stations are designed, constructed, licensed and operate in a matter that maximizes the safe containment and management of radioactive materials. These agencies also ensure that sufficient funding mechanisms have been established, are adequately funded, and will be available to decommission the nuclear generating stations at the end of their life cycle.

On the federal and state levels, the United States Nuclear Regulatory Commission (USNRC) and the New Jersey Department of Environmental Protection Bureau of Nuclear Engineering (NJDEP-BNE) conduct licensing and oversight of the Station. Oversight by the NJDEP-BNE and USNRC includes periodic inspections and conducting environmental radiological monitoring.

3 Station Description

The following sections provide information regarding the setting of the Salem Generating Station, including land use, the environmental setting, precipitation and drainage, local geology and local hydrogeology.

3.1 Land Use

PSEG Nuclear LLC owns and/or controls an approximately 740-acre area of Artificial Island that is situated adjacent to and surrounds the Salem and Hope Creek Generating Stations. This area contains administrative and support facilities used by the Stations, the Hope Creek Switch Yard, the Salem Switch Yard, and undeveloped vacant land. With the exception of the Salem Generating Stations (Units 1 through 3) and the Salem Switchyard, the remaining acreage is considered to be the Hope Creek Generating Station.

The zoning classification for the Salem Generating Station is industrial. The land adjacent to the Salem Generating Station is zoned for industrial and residential or agricultural use.

3.2 Environmental Setting

The Salem Generating Station is located on a portion of Artificial Island that borders the Delaware Estuary. The Estuary, in the location of the Salem Generating Station, is a tidal, brackish river, located in an area designated as Zone 5 by the Delaware River Basin Commission.

The United States Army Corps of Engineers, beginning in the early twentieth century, created Artificial Island by depositing hydraulic dredging spoils within a diked area established around a natural sand bar that projected into the Delaware River. Prior to

SII-SSA-0014-002284

construction of the Salem Generating Station, the property was vacant, undeveloped, low-lying land.

3.3 Topography and Station Drainage

The topography at the Salem Generating Station is relatively flat with limited local relief. Topographic contours for the Station are included on **Figure 2**. Stormwater is managed in accordance with the Salem Generating Station New Jersey Pollution Discharge Elimination System (NJPDES) permit and Stormwater Pollution Prevention Plan. Stormwater is collected in storm drains and routed to the Delaware River for discharge. Stormwater from the major petroleum storage handling areas is routed to the oil/water separator prior to discharge.

3.4 Climate and Precipitation

Salem County is located in southwestern New Jersey. The county's climate is considered to be humid and temperate, as the climate in this county is readily influenced by its proximity to the Delaware Bay. Coastal storms are not uncommon in this region and can produce high winds and heavy rainfall, which can cause wind damage and flooding in low-lying areas.

Wind direction in this region is dependent upon the season; during the summer, winds are typically from the southwest while during the winter winds are commonly from the northwest. Temperatures vary by season and the maximum expected high temperature for a given year is 96 degrees Fahrenheit, while the minimum expected yearly low temperature is minus 2 degrees Fahrenheit. The average annual precipitation total is 39.9 inches.

3.5 Regional Geology

The Station is located in the Atlantic Coastal Plain Physiographic Province. This area is characterized by relatively flat to gently undulating terrain, underlain by unconsolidated sediments that increase in thickness to the southeast. These sediments range in age from Holocene to Cretaceous (0 to 146 million years old), are primarily comprised of clay, silt, sand, and gravel, and are generally classified as continental, coastal, or marine in nature. Published geologic mapping indicates that the basement rock beneath these sediments (in the area of the Station) is metamorphic schist of the Wissahickon Formation, which is Pre-Cambrian in age (570 to 900 million years old).

The unconsolidated overburden at the Salem and Hope Creek Generating Stations consists of approximately 25 to 40 feet of dredge spoils, engineered fill material (cofferdam), tidal marsh deposits and riverbed deposits. The engineered fill, composed mainly of silt, silty clay, sand, and gravel, replaced the dredge spoils within the cofferdam during the construction of the Station. Due to the composition and nature of the engineered fill, the

SII-SSA-0014-002285

hydraulic conductivity of this material is expected to be very low, thus limiting the extent and rate of groundwater movement. Below the engineered fill there is an approximate five-foot layer of tidal marsh deposits consisting of silty peat and organic silt and meadow mat. The tidal marsh deposits are semi-confining. Beneath the tidal marsh deposits are approximately ten feet of discontinuous Quaternary Age riverbed deposits consisting of sand and gravel. The engineered fill, the tidal marsh deposits and the riverbed deposits, combine to form the water table aquifer (see Section 3.6). Beneath the surface water aquifer, in order of increasing depth, are the following geologic formations:

Clay, Confining Unit – Beneath the shallow, riverbed and other deposits is a clay, confining unit that separates the shallow unit from the deeper Vincentown Formation. Conflicting geologic reports suggest that the clay, confining unit is either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits (USGS 1979 and 1999). Previous investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

Vincentown Formation – The Vincentown Formation occurs from a depth of approximately 55 feet bgs to a depth of 135 feet bgs and consists of a competent, greenish-gray, fine to medium sand with some silt, shell fragments, feldspar and glauconite.

Hornerstown Formation – The Hornerstown Formation is a highly glauconitic, clayey, dark green sand that contains small percentages of quartz grains and apatite pellets. The Hornerstown Formation unconformably overlies the Navesink Formation and is unconformably overlain by the Vincentown Formation. The Hornerstown Formation occurs from approximately 135 to 145 feet bgs.

Navesink Formation – The Navesink Formation is characteristically a glauconitic sand with varying amounts of silt and clay. It is brown or dark green to blue-black and has a shell bed at its base. The upper part of the formation is less glauconitic, more clayey, more micaceous, and lighter in color. The Navesink Formation conformably overlies the Mount Laurel Sand (USGS 1969). The contact with the overlying Hornerstown Formation is gradational. The Navesink Formation is encountered from approximately 145 to 170 feet bgs.

Mount Laurel-Wenonah Formation – The Mount Laurel-Wenonah Formation consists of a clayey, medium-grained sand with some gravel, feldspar and glauconite. In the vicinity of the Station, the Mount Laurel-Wenonah Formation is approximately 100 hundred feet thick and occurs from 170 to 270 feet bgs.

Beneath the Mount Laurel-Wenonah Formation, more than 1,000 feet of Upper Cretaceous sediments overlie the crystalline bedrock. The Upper Cretaceous sediments include in descending order: the Marshalltown Formation (gray, fine sand); the Englishtown Formation (yellow-brown, fine sand); the Woodbury Clay (dark gray, stiff, silty clay); the

Merchantville Formation (dark green clay); the Magothy Formation (coarse to fine silt with little fine sand); and the Raritan and Potomac Formations (interbedded sand, gravelly sand and clay).

3.6 Regional Hydrogeology

There are four primary water bearing formations (aquifers) underlying the Station: 1) the shallow, water table aquifer; 2) the Vincentown Formation; 3) the Mount Laurel-Wenonah Formations; and, 4) the Potomac-Raritan-Magothy Formations. The shallow, water-bearing unit, which consists of the dredge spoils, engineered fill, tidal marsh deposits and the discontinuous Quaternary riverbed deposits, occurs between approximately 10 to 40 feet bgs. In general, the dredge spoils, engineered fill and tidal marsh deposits are characterized by low permeability. Occasional lenses of sand within the dredge spoils may contain perched water within a few feet of the ground surface. The groundwater in the water table aquifer is generally brackish, with flow to the southeast and a gradient of approximately 0.007 feet/feet.

A clay, confining unit identified as either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits separates the shallow, water-bearing unit from the deeper Vincentown Formation. As stated previously, investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

The Vincentown Formation, which occurs from approximately 55 to 135 feet bgs, is a semi-confined to confined aquifer under artesian conditions. Groundwater in the Vincentown Formation generally flows from north to south with a gradient of approximately 0.003 feet/feet. Regionally, the Vincentown Formation is a water-producing aquifer, which supplies potable water to domestic wells in Salem County. Groundwater in the aquifer is moderately hard with high iron content. Saltwater-intrusions occur near the Delaware River, where water quality is brackish and non-potable.

The Hornerstown and Navesink confining units separate the Vincentown Formation from the Mount Laurel-Wenonah Formations. The Mount Laurel-Wenonah Formations occur from approximately 135 to 170 feet bgs. The Station has two potable and fire-water supply wells screened in this formation.

The deepest of the water bearing formations is the Potomac-Raritan-Magothy Formation. In Salem County, the Potomac-Raritan-Magothy Formation occurs at depths in excess of 500 feet bgs. This is the primary water producing aquifer for New Jersey. Four potable and fire-water supply wells at the Station are screened in the Potomac-Raritan-Magothy Formation at depths ranging from 800 to 1,100 feet bgs. The Potomac-Raritan-Magothy Formation is bounded by the Merchantville Formation above and below by the Wissahickon Schist basement rock. The crystalline basement rock of the Wissahickon

SII-SSA-0014-002287

Schist is not considered a productive aquifer and only locally transmits water from secondary porosity (i.e., fractures and faults).

4 Facility Construction and Local Geology and Hydrogeology

The construction of the Salem Generating Station has caused significant changes to the local geology and hydrogeology. Within the footprint of the cofferdam surrounding Units 1 and 2 (see Figure 2), the majority of original Artificial Island materials were removed to a depth of 70 feet bgs. The following sections, which contain information presented in a Remedial Investigation Report (RIR) previously prepared for a separate investigation conducted at the Station (ARCADIS 2004), describe the conditions at Artificial Island prior to the construction of the Station, and detail how the construction of the Station has altered the local geology.

4.1 Pre-Facility Construction

The Station is located on the southern tip of what was once a natural sand bar projecting into the Delaware River. The area between the sand bar and the mainland had been used as a dredge spoil deposit area. In 1899, a timber sheetpile wall was installed around the perimeter of the sand bar. Over the next 50 or so years the area was used as a spoil deposit area for material collected during the dredging of the Delaware River. Riprap was added to the perimeter when the timbers began to degrade. The area landward of Artificial Island has remained a tidal marsh.

4.2 Facility Construction

The construction of the Station has resulted in significant changes to the local geology. It was necessary to remove and rework much of the soil in the area of the Station in order to facilitate construction. For the purposes of this report, the description of the facility construction is limited to the area within the cofferdam; however, it should be noted that the local geology beyond the limits of the cofferdam was also significantly modified. The extent of the cofferdam is shown on **Figure 2**.

The cellular cofferdam, which encircled the excavation for all the Class I structures (e.g., containment, fuel handling, and auxiliary buildings), was constructed of interlocking sheet piling driven from an approximate depth of 23 feet below existing grade (approximately 77 feet plant datum [PD] or -12.92 feet above mean sea level [amsl NAVD 1988]). The cofferdam consists of 24 circular cells, approximately 60.5 feet in diameter with connecting arcs, that were advanced from this depth to approximately 10 feet into the Vincentown Formation to an elevation of 17 feet PD (-72.92 feet amsl). The cofferdam sections are of two different heights, 50 feet and 60 feet. The elevation of the top of the cofferdam is 77 feet PD (-12.92 feet amsl) on the north, south and west sides. The

SII-SSA-0014-002288

elevation of the eastern side is 67 feet PD (-22.92 feet amsl) providing access and a foundation for the return circulating water pipes and associated thrust block.

The inside area of the cofferdam sections were excavated to elevation 27 feet PD (-62.92 feet amsl). A vertical steel wall was added inside each individual cofferdam section to divide the sections approximately in half. The inner half of the individual cofferdam sections, or the section facing the building foundations, was then filled to the top with lean concrete. The area contained by the entire cofferdam structure was then excavated to the Vincentown Formation for placement of a lean concrete mat that served as the foundation for the construction of the structures within the cofferdam. During this stage of the excavation, qualified personnel visually inspected the bottom of the excavation to verify that the excavation had reached the top of the Vincentown Formation prior to placing any lean concrete.

Prior to the completion of the excavation, at approximately elevation 45 feet PD (-44.92 feet amsl), 15 exploratory borings were drilled through the remaining Kirkwood Formation and into the underlying Vincentown to verify the depth to the formation. These additional borings showed no measurable differences from the study borings. Based on a review of available documents, the top of the Vincentown Formation in the area of the cofferdam ranges between 27 and 30 feet PD (-62.92 to –65.92 feet amsl).

When the surface of the Vincentown Formation was reached, the area was cleared of loose soil and lean concrete was poured directly onto the exposed Vincentown Formation. Because the latter stages of the excavation were performed in freezing temperatures, a layer of material was left in place to insulate the Vincentown Formation until the concrete was ready to pour. In cases where the top of the Vincentown Formation did freeze prior to pouring of the concrete, the frozen soils were excavated or thawed prior to starting the pour. The station construction drawings indicate that the base of the first lean concrete pour was at 30 feet PD (-59.92).

The cofferdam serves as a basin in which the Class I structures were constructed. Prior to construction of the primary structures, a lean concrete mat ranging in thickness from 5 to 50 feet was placed on top of the Vincentown Formation for support of the structures. Following placement of the lean concrete, the Auxiliary Building, Fuel Handling Buildings and Reactor Containment Buildings were constructed. The remainder of the excavation within the cofferdam was then backfilled with structural fill meeting the design specifications of the Station.

4.3 Local Geology and Hydrogeology

The soils removed from within the cofferdam were not used to backfill the completed structure because the hydraulically placed fill and other riverbed deposits underlying Artificial Island did not meet the building design specifications for the Station. Therefore,

SII-SSA-0014-002289

it was necessary to import construction or structural fill to build the facility. The structural fill was placed between and around the Auxiliary Building, Fuel Handling Buildings, Units 1 and 2, portions of the cofferdam, above the return circulating water pipes, and from the top of the clay, confining-unit to the land surface in the portions of the area between the cofferdam and the circulating water discharge pipes.

The structural fill used at the station was obtained from a number of sources in New Jersey and Delaware. One fill source used in the area of this investigation was the Hinchner Pit. While the location of the borrow source was not identified, the material was described as yellowish-brown fine to medium sand with a trace of silt and clay.

Details of groundwater investigation activities historically completed at the facility indicate that groundwater elevations in the shallow, water-bearing unit within the limits of the cofferdam are generally higher than those outside the limits of the cofferdam. This is expected considering permeability differences that exist between the structural fill within the limits of the cofferdam and the hydraulic fill beyond the limits of the cofferdam, which result in a groundwater mound. Due to the mound, groundwater flows radially outward from the cofferdam. The observed mounding effect dissipates quickly. A groundwater elevation contour map for the shallow, water-bearing unit is presented on **Figure 3** (ARCADIS 2004). Beyond the limits of the cofferdam, groundwater flow is generally from the center of the island (northeast of the Salem Generating Station) towards the Delaware River.

5 Remedial Investigation Scope of Work

The investigation has the following four primary goals: 1) characterize the horizontal extent of diesel-related constituents in soil; 2) determine if separate-phase diesel fuel is present on the water table and delineate its extent; 3) characterize the extent of dissolved-phase diesel-related constituents in groundwater downgradient of the release area; and, 4) determine the need for further action. The following scope of work was developed to achieve the primary objectives of the remedial investigation.

5.1 Soil Investigation

The initial scope of work for investigating the extent of diesel-related constituents in soil consists of the advancement of four soil borings (Borings D-2 through D-5) for the collection of soil samples to characterize the extent of diesel-related constituents in soil beyond the source area. Due to the presence of separate-phase diesel fuel, a soil sample will not be obtained from the source area. Details regarding the proposed soil investigation are also presented on **Figure 4**.

SII-SSA-0014-002290

5.1.1 Collection of Soil Samples

Soil borings D-2 through D-5, identified on **Figure 4**, will be advanced to the depth of the water table for the purpose of sample collection. Prior to initiating soil sampling activities, a water level measurement will be obtained from Well X, located near the northwest corner of the Fuel Handling Building. The water level measurement from Well X will be used to determine the appropriate sample depth. The location of Well X, which was installed during a previous unrelated groundwater investigation, is shown on **Figure 4**. Due to the presence of extensive subsurface infrastructure within the investigation area, the soil borings will be advanced using vacuum excavation techniques. Soil encountered in the borings will be logged by an ARCADIS geologist, and soil boring logs will be prepared.

Soil samples will be obtained from each boring ahead of the vacuum excavation using a hand auger or equivalent handheld soil sampling tools. The samples will be obtained from one-foot above the water table to characterize the horizontal extent of diesel-related constituents in soil.

5.1.2 Soil Sample Analysis

The soil samples collected from the proposed soil boring will be submitted to Accutest Laboratories and will be analyzed for total petroleum hydrocarbons (TPHC). In accordance with New Jersey Administrative Code (N.J.A.C.) 7:26E, 25 percent of the samples indicating a TPHC concentration greater than 1,000 parts per million (ppm) will also be analyzed for volatile organic constituents (VOCs) including a library search.

5.2 Groundwater Investigation

The investigation of groundwater will consist of the installation of monitoring wells to evaluate the extent of dissolved-phase and separate-phase diesel fuel at and downgradient of the source area. The following sections provide the details of the proposed groundwater investigation scope of work.

5.2.1 Monitoring Well Installation

One groundwater/separate-phase product extraction well (Well AU) and four groundwater monitoring wells (Well AV, Well AW, Well AY, and Well AZ) are proposed. The collection of separate-phase product measurements and the collection and analysis of groundwater samples from the monitoring wells will provide data regarding the extent of separate-phase and dissolved-phase diesel fuel constituents in groundwater. Water-level measurements from the monitoring wells will be evaluated to confirm the direction of groundwater flow within the area of investigation. The locations and well construction details of the proposed groundwater monitoring wells are shown on **Figure 5** and are summarized in **Table 2**, respectively. The purposes for the monitoring wells are as follows:

SII-SSA-0014-002291

- Extraction Well AU will be installed within the PVC sleeve that was placed within the excavation around the underground piping prior to backfilling (see Section 1.2). Due to the presence of extensive subsurface infrastructure encountered during the excavation, Well AU can not be installed beyond a depth of approximately seven feet bgs. As stated previously, separate-phase diesel fuel was observed in the excavation and Well AU will be fitted with the Spill Buster® system to recover any remaining separate-phase diesel fuel in the source area. Details regarding the product recovery efforts are presented in Section 7;

- Monitoring Wells AV and AW will be installed at the locations of Soil Borings D-3 and D-2, respectively. Using vacuum excavation equipment, the boreholes of D-2 and D-3 will be advanced to approximately ten feet bgs. The monitoring wells will be installed with these boreholes in accordance with the proposed details outlined in **Table 2**. Based on observed groundwater elevations, the locations of Wells AV and AW were proposed to delineate the extent of separate-phase diesel fuel downgradient of the source area. If separate-phase diesel fuel is detected, groundwater samples will not be collected from these wells; and,

- Monitoring Wells AY and AZ will be installed at the locations of Soil Borings D-4 and D-5, respectively. Using vacuum excavation equipment, the boreholes of these borings will be advanced to approximately ten feet bgs. The monitoring wells will then be installed within the boreholes in accordance with the proposed details outlined in **Table 2**. The proposed locations of these monitoring wells were identified to characterize dissolved-phase diesel constituents in groundwater downgradient of the source area.

5.2.1.1 Proposed Well Details

Extraction Well AU will be constructed of six-inch diameter Schedule 40 PVC well screen and riser and Monitoring Wells AV, Well AW, Well AY, and Well AZ will be constructed of 4-inch diameter Schedule 40 PVC well screen and riser. A sand filter pack will be placed in the annular space around the screen interval followed by an appropriate bentonite seal and grouting material. Extraction Well AU will be completed at ground surface with a two-foot square flush-grade well vault to facilitate the installation of the Spill Buster® unit. Monitoring Well AV, Well AW, Well AY, and Well AZ will be completed with 12-inch round flush-grade manways.

A summary of the proposed well completion details (i.e., total depth, screened interval) is presented in **Table 3**. The total depth and screen interval for the proposed wells may vary depending on field observations and conditions encountered during the installation of the wells. NJDEP Bureau of Water Allocation Monitoring Well Records and well construction logs will be prepared following the completion of the monitoring wells.

SII-SSA-0014-002292

5.2.1.2 Well Permits

The wells will be installed per the requirements of New Jersey Administrative Code (NJAC) 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001, by a New Jersey-licensed well driller. Prior to installation of the wells, monitoring well permits will be obtained from the NJDEP.

5.2.1.3 Well Development

In accordance with N.J.A.C. 7:26E-4.4(g) [8], the proposed monitoring wells will be developed to yield a non-turbid discharge, where possible, following installation. The monitoring wells will be developed using a combination of surging and pumping techniques.

5.2.1.4 Survey

In accordance with N.J.A.C. 7:26E-4.4(g) [7], the Station monitoring wells will be surveyed by a New Jersey-licensed surveyor following installation as follows:

- The inner well casing will be surveyed to the nearest hundredth (0.01) foot in relation to the permanent, on-site datum and horizontally to an accuracy of one-tenth of a second latitude and longitude relative to the New Jersey State Planar Coordinate System.

- A permanent water-level measurement mark will be etched onto the top of the inner well casing to allow for accurate, consistent and comparable water-level measurements over time.

Following completion of the survey, the surveyor will complete a Monitoring Well Certification Form B for submittal to the NJDEP.

5.2.2 Groundwater Sampling

Following the installation of the wells, a groundwater sampling program will be initiated. The groundwater sampling program will involve the collection and analysis of groundwater samples from the proposed monitoring wells (Well AU, Well AV, Well AW, Well AY, and Well AZ) and from Well X. The following sections provide details regarding these activities.

5.2.2.1 Water-Level and Separate-Phase Product Measurements

Prior to the collection of groundwater samples from the wells, depth-to-water and separate-phase product thickness measurements will be collected using an electronic oil/water

SII-SSA-0014-002293

interface probe. The measurement data will be used along with the surveyed top of casing elevation data to calculate groundwater elevations for the wells. The groundwater elevation data will be analyzed to assess groundwater flow conditions at the Station. The separate-phase product measurements will be used to delineate the extent of product on the water table. Water-level and product measurement collection procedures are addressed in the QAPP (**Appendix A**).

5.2.2.2 Collection of Groundwater Samples

Following the installation and development of the wells, two-rounds of groundwater samples will be collected. The first round of groundwater sampling will be completed a minimum of two weeks following the well installation activities. Groundwater samples will only be collected from the wells that do not indicate a measurable thickness (i.e., greater than 0.01 feet) of separate-phase product. The second round of groundwater sampling will be completed three months following the initial round.

Due to the sensitive nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples will be collected utilizing the low-flow sampling methodology. Sample collection procedures, as well as quality control/quality assurance (QA/QC) sampling requirements, are outlined in the QAPP (**Attachment A**).

5.2.2.3 Groundwater Sample Analysis

The groundwater samples collected from the proposed monitoring wells will be submitted to Accutest for laboratory analysis. The groundwater samples will be analyzed for priority pollutant list semi-volatile organics (SVOCs) and VOCs including a library search.

5.3 Data Reduction and Analysis

Following completion of the Remedial Investigation field activities, field and analytical data will be reduced and evaluated to: 1) identify data gaps; 2) present a clear and concise summary of the investigation results; 3) provide recommendations for further investigation and remediation, if necessary. The reduction and evaluation of the field and analytical data will involve the activities described in the following sections.

5.3.1 Geographic Information System

ARCADIS will use the EQuIS data management system to manage environmental data collected during the remedial investigation. EQuIS is a comprehensive geo-environmental data management database, designed to store analytical test data and related data obtained during environmental site investigations, routine site monitoring, and hazardous waste remediation projects. EQuIS can be used for report and chart generation and is integrated with multiple statistical, numerical modeling and data visualization tools.

SII-SSA-0014-002294

Analytical data generated will be in the form of electronic data deliverables (EDD) from the analytical laboratory. Quality assurance/quality control (QA/QC) data will be entered as necessary to comply with regulatory requirements. The electronic database will not be subjected to a formal data validation process; however, the data will be reviewed for completeness and if data gaps are identified, they will be reported for discussion of how to address them.

5.3.2 Construct Water-Level Elevation Contours

Water-level elevation contours for the shallow water-table aquifer will be prepared to analyze horizontal groundwater flow direction and gradient.

5.3.3 Compile and Review Groundwater Analytical Data

As discussed in Section 5.3.1, the EQuIS data management system will be used to compile and manage groundwater analytical data collected at the Station. These data will be summarized and presented in table format and posted on figures as appropriate.

Historical groundwater analytical results for the monitoring wells will be evaluated to determine groundwater analytical trends for the wells.

5.4 Iterative Investigation Objective Process

As stated previously, following completion of the Remedial Investigation, data will be evaluated to: 1) identify data gaps; 2) present a clear and concise summary of the investigation results; 3) provide recommendations for further investigation and remediation, if necessary. Addenda to this RIWP will be prepared, accordingly, to address further investigation.

6 Reporting

Following completion of the Remedial Investigation, the data will be evaluated to determine if additional investigation activities are necessary for characterizing groundwater conditions at the Station. A Remedial Investigation Report (RIR) will be prepared that presents a comprehensive overview of investigation activities performed to date, and recommendations regarding future activities.

7 Interim Remedial Action

Free-phase diesel product will be removed from the subsurface by fitting Well AU with a Spill Buster® product recovery system. The Spill Buster® system is designed to remove only product (i.e., no water) with a down-well conductivity sensor and pump apparatus, an adjustable depth, wellhead auto-seek unit, and integrated control panel. Recovered product

SII-SSA-0014-002295

is conveyed to a nearby storage tank that is equipped with a high-level auto shut-off interfaced with the Spill Buster® control panel. The product storage tank will be staged within a secondary containment structure, which will be sized for storage tank fork-lift access. Product recovered by the Spill Buster® system will be periodically removed from the storage container at a frequency determined by the sustained product recovery flow rate. **Figure 6** shows the proposed product recovery equipment layout. If necessary, the Spill Buster® system setup can be modified to recover product from other wells.

1 Standard Operating Procedures

1. Introduction

ARCADIS, on behalf of PSEG Services Corporation (PSEG), has prepared this Quality Assurance Project Plan (QAPP) to provide guidelines to conduct, monitor, and document the quality of remedial investigation (RI) activities at the PSEG Nuclear, LLC Salem Generating Station (the Site). The RI activities are being conducted under the direction of the New Jersey Department of Environmental Protection (NJDEP) in accordance with the technical requirements of the NJDEP Site Remediation Program.

The purpose of this QAPP is to ensure that scientific data are acquired according to established methods and procedures designed to obtain results that are objective, true, repeatable, and accurate (of known accuracy). Specifically, this QAPP provides guidance and specifications to ensure that RI activities are planned and executed in a manner consistent with the following quality assurance objectives:

- Field determinations and analytical results are valid through adherence to NJDEP field procedures, NJDEP-approved analytical protocols, and calibration and preventive maintenance of equipment.
- Samples are identified and controlled through chain-of-custody procedures.
- Records are retained as documentary evidence of field activities and observations.
- Generated data are valid in accordance with respective NJDEP data validation guidelines.
- Evaluations of the data are accurate, appropriate, and consistent throughout the project.

The QAPP has been prepared in accordance with the NJDEP *Technical Requirements for Site Remediation* (NJDEP, 1999), the NJDEP *Field Sampling Procedures Manual* (NJDEP, 1992), and generally accepted standard industry quality assurance procedures. Throughout the QAPP, where testing procedures are referenced, the current or most recent method is the standard reference, unless otherwise noted. Specific Quality Assurance/Quality Control (QA/QC) requirements are defined for the components of the project scope identified in Section 2.1 (Project Scope).

This QAPP contains seven sections, including this introduction, as follows:

- Section 2 presents the project scope and quality assurance objectives.

- Section 3 identifies the project organization and the roles and responsibilities of key project personnel.
- Section 4 outlines the procedures for sample collection and acquisition of field data.
- Section 5 describes the sample analyses and the format for laboratory data deliverables.
- Section 6 presents the quality assurance requirements for sample collection.
- Section 7 describes the project quality control procedures

2. Project Scope and Quality Assurance Objectives

The overall objective of the RI is to delineate the extent of diesel-related constituents in soil and groundwater, and to determine the extent of separate-phase diesel fuel on the water table. To meet these objectives, soil borings will be advanced for the collection of representative soil samples and monitoring wells will be installed to collect separate-phase diesel fuel measurements and for the collection of groundwater samples. As presented in Section 5 of the RIWP, the proposed soil borings and monitoring wells will be advanced near the southwest corner of the Salem Unit 1 Fuel Handling Building to investigate the release of diesel fuel from underground piping.

2.1 Project Scope

In order to fulfill the project objective, a comprehensive scope of work for the RI was developed. In general, the scope of work includes the following components:

- Collection and analysis of representative soil samples from Soil Borings D-1 through D-5 to characterize soil quality.
- Installation and development of Monitoring Wells AU through AY.
- Collection and analysis of representative groundwater samples from proposed Monitoring Wells AU through AY and from existing Well X to characterize groundwater quality.
- Survey of the ground surface elevation, casing elevation and relative horizontal location of proposed Monitoring Wells AU through AY and existing Well X

SII-SSA-0014-002313

- Collection of water-level measurements from the Site monitoring wells and from select observation and production wells to assess groundwater gradient, flow direction, and rate of movement.

- Collection of separate-phase diesel fuel measurements from the proposed monitoring wells to assess the extent of separate-phase diesel fuel on the water table.

Details regarding the field implementation of these tasks, including sample collection, decontamination procedures, instrumentation calibration, and the handling of investigation derived-wastes are provided in Section 4 of this QAPP. Details regarding sample handling and analytical procedures, including the collection of QA/QC samples, are provided in Section 5 of this QAPP.

2.2 Quality Assurance Objectives

The overall quality assurance objective is to ensure that all data collected during the implementation of the RI are of known and acceptable quality and that the calculated concentrations for all target compounds accurately represent the sample matrix. Specific laboratory QA/QC procedures will meet or exceed the NJDEP reduced data deliverables and non-Environmental Protection Agency (EPA)/Contract Laboratory Program (CLP) protocols. The QA objective parameters (precision, accuracy, representativeness, completeness, and comparability) used to ensure that data of acceptable quality are obtained, are described in detail below.

2.2.1 Precision

Precision is a measure of mutual agreement among individual measurements of the same property, usually under prescribed similar conditions. Precision is best expressed in terms of standard deviation and/or relative percent difference (RPD). Various measures of precision exist depending upon the "prescribed similar conditions". The precision of an analytical method, field measurement, or sampling technique is measured through duplicate laboratory analyses, analyses of field replicate samples and/or by replicate sample measurements.

Measurements of the precision of laboratory-generated data are necessary to demonstrate the reproducibility of the data and precision of the analytical method. Precision is evaluated by calculating the RPD between duplicate analyses.

Field replicate samples will be analyzed at a rate of 1 in 20 samples for each analytical batch and/or as specified in the analytical protocols to be used for the Site sampling.

The acceptable range of precision for each parameter in the samples will be within that specified by the method used to analyze these parameters. In duplicate sample analyses where constituents are not detected or are present at estimated to low concentrations, professional judgment will be used in assessing precision.

The precision of sampling will be assessed through a comparison of blind field replicate sample results. However, due to the potential difficulty in attributing poor precision to any one handling and/or analytical event, measurements of precision obtained between field replicates will be used qualitatively.

2.2.2 Accuracy

Accuracy describes the degree of agreement of a measurement with an accepted reference or "true" value. Accuracy can also be described as a measure of the bias in an analytical system. Analytical accuracy will be determined from (1) the analyses of standard reference materials of known and traceable purity and quality: and (2) the analyses of blank and matrix samples fortified with representative analytes for the analytical fraction, if appropriate.

Accuracy of field measurements will be assured through calibration techniques and by the measurement of known reference standards. Acceptable limits of accuracy will be as described in the field procedure or as otherwise indicated by the manufacturer of the reference standard.

2.2.3 Representativeness

Representativeness expresses the degree to which data accurately and precisely represent the characteristics of a population, parameter variations at a sampling point, a process condition, or an environmental condition. The representativeness of the data will be assessed in three areas as follows: (1) the number of locations and samples sufficient to accurately depict Site conditions; (2) the sampling procedures that must be designed so that individual samples accurately represent the chemistry of the matrix from which they were collected; and (3) the appropriateness of the analytical method used to the type of sample obtained.

2.2.4 Completeness

Completeness is a measure of the amount of valid data obtained from any measurement system compared to the total amount of data required in the data set to satisfy the DQOs. Valid data are defined as data generated from samples that arrived at the laboratory intact, properly preserved, sampled, and handled, in sufficient quantity to perform the

requested analyses, and accompanied by a chain-of-custody record. Furthermore, samples must be analyzed within the specified recommended holding times and with the appropriate and relevant level of QC effort. The calculation for completeness will be performed after critical QC criteria have been reviewed, including assessments for precision and accuracy, and an evaluation of sample detection limits has been performed. These preliminary assessments and the evaluation of the completeness objective will be performed during data validation.

The goal of most field investigations and analytical programs is to achieve 100 percent completeness of all required data. However, even under closely controlled situations, circumstances occur in the field and laboratory and during review of the data that may reduce the final amount of valid data and preclude 100 percent completion. ARCADIS expects that the selected analytical laboratory will provide data meeting QC acceptance criteria of 95 percent or more for all samples tested using the NJDEP protocols.

The analytical methods selected were chosen to achieve specified detection limits in the samples. In the assessment of the completeness objective, an evaluation of the achieved sample reporting limits or sample sensitivity will be performed. Sensitivity may be defined as the minimum concentration of an analyte that can be measured and reported. In terms of samples, sensitivity is the lowest concentration of analyte(s) that can be reliably achieved within specified limits of method precision and accuracy. The evaluation of sensitivity and the assessment of whether the necessary quantitation limit(s) has been achieved to meet the DQOs will be made by comparing the sample reporting limits to the quantitation limits.

2.2.5 Comparability

Comparability expresses the confidence with which one data set can be compared to another. The comparability of the data is assured by using standard sampling and analysis procedures, and data reporting formats. The data obtained during the RI fieldwork will be analyzed and reported in a manner such that similar data sets can be compared to each other and individual comparisons can be made within each data set.

3. Project Organization and Responsibility

The primary personnel involved in the project are listed in **Table A-1**. These personnel include the NJDEP Contact, PSEG Project members, ARCADIS project members and the analytical laboratory. Other subcontractors that will identified for the completion of the RI scope of work will include a New Jersey-certified driller and a New Jersey-licensed surveyor.

The PSEG Project Manager will be responsible for the overall project coordination and oversight of work activities. Any changes in the PSEG Project Manager will be submitted to the NJDEP within 10 calendar days of the change.

The ARCADIS project personnel will be responsible for performing technical activities in accordance with the approved RIWP (including sampling QA/QC activities), supervising field subcontractors, and preparing technical reports. The ARCADIS project manager will be responsible for committing the necessary resources to this project, day-to-day operations, adherence to schedule, and work quality.

Data collected in the field will be verified by the ARCADIS field team leader and reviewed by the ARCADIS project manager. If QA issues requiring special attention are identified, the ARCADIS project manager will identify the appropriate corrective action(s) and implement them.

Accutest Laboratories will be utilized for the project and is a New Jersey-certified laboratory for routine environmental and chemical analyses; its certification number is 12129. The laboratory is responsible for providing analytical services, including laboratory QA/QC activities. Laboratory sample storage procedures and the laboratories' review and cross-check procedures for the elimination of errors during routine data transfer, in calculations, preparation of data deliverable packages, and off-line storage are provided in the laboratories' Quality Assurance Plans, which are available upon request.

4. Sample Collection and Field Data Acquisition Procedures

Soil and groundwater sampling will be conducted in accordance with the Standard Operating Procedures (SOPs) provided in **Attachment 1**. The SOPs, which include procedures for the installation of monitoring wells and the collection of soil and groundwater samples, were established in accordance with the NJDEP protocols contained in the *Field Sampling Procedures Manual* (NJDEP, 1992).

The following sections discuss monitoring well installation, sample collection and field data acquisition procedures for the components of the scope of work presented in Section 2.1 (Project Scope) of the QAPP, disposal of investigation-derived waste, and decontamination and calibration of field equipment. This section will be expanded, as necessary, to accommodate additional tasks that are identified through the course of the remedial investigation. A detailed description of the scope of work is provided in Section 5 of the RIWP. Prior to a field event, a detailed field or sampling memo will be prepared that describes in detail the scope of work (i.e., provides details regarding sample locations and analyses) to be accomplished during the specific field event.

SII-SSA-0014-002317

4.1 Well Installation

Wells will be installed per the requirements of New Jersey Administrative Code (N.J.A.C.) 7:9D, Well Construction; Maintenance and Sealing of Abandoned Wells, October 4, 2001, by a New Jersey-licensed well driller. Pursuant to N.J.A.C. 7:26E-1.6(d) [8], any variations from the well design specifications outlined in the NJDEP Field Sampling Procedures Manual will be presented to the NJDEP Case Manager for approval prior to the issuance of the well permit and prior to installation.

Due to the presence of abundant subsurface infrastructure within the area of investigation, the proposed monitoring wells will be installed using vacuum excavation techniques. The monitoring well installation standard operating procedure (SOP) is provided in **Attachment 1** of this QAPP.

4.1.1 Well Development

Pursuant to N.J.A.C. 7:26E-4.4(g) [8], monitoring wells will be developed to yield a non-turbid discharge, where possible, following installation.

The well development SOP is provided in **Attachment 1** of this QAPP.

4.1.2 Survey

Pursuant to N.J.A.C. 7:26E-4.4(g) [7], monitoring wells will be surveyed by a New Jersey-licensed surveyor following installation as follows:

- The inner well casing must be surveyed to the nearest hundredth (0.01) foot in relation to the permanent, on-site datum and horizontally to an accuracy of one-tenth of a second latitude and longitude.

- A permanent water-level measurement mark will be etched onto the top of the inner well casing to allow for accurate, consistent and comparable water-level measurements over time.

Following completion of the survey, the surveyor will complete a Monitoring Well Certification Form B for submittal to the NJDEP.

4.2 Soil Sampling

Representative soil samples will be collected at each of the proposed monitoring well locations as a part of the remedial investigation and the locations are shown on Figure

SII-SSA-0014-002318

3 of the RIWP. The sampling plan or memorandum will be provided to field personnel prior to initiating field activities.

The soil sampling SOP is provided in **Attachment 1** of this QAPP.

4.3 Groundwater Sampling

The locations of the site monitoring wells that may be sampled as a part of this remedial investigation are shown on Figure 3 of the RIWP. The list of monitoring wells that will be sampled during each sampling event will be identified in specific sampling plan or memorandum. The sampling plan or memorandum will be provided to field personnel prior to initiating field activities. The following sections provide the procedures that will be utilized during groundwater sample collection activities.

4.3.1 Water-Level, Light Non-Aqueous Phase Liquid Measurements and Well Sounding

The water-level, light non-aques phase liquid (LNAPL) measurement and well-sounding SOPs are provided in **Attachment 1** of this QAPP.

4.3.2 Sample Collection Procedures

Due to the sensitive nature of certain analytes being monitored and to ensure the quality and representative nature of the groundwater data, groundwater sampling procedures will utilize the low-flow sampling methodology.

The low-flow sample collection SOP is provided in **Attachment 1** of this QAPP.

4.4 Decontamination Procedures

Equipment and personnel decontamination areas will be established in a designated on-site area.

4.4.1 Personnel

Decontamination of personnel is discussed in the Project Health and Safety Plan.

4.4.2 Drilling Equipment

Large equipment, such as drill rigs and all ancillary equipment, will be decontaminated prior to the start and at the completion of the field activities. Decontamination will consist of a high-pressure hot water or "steam" wash and brushing to remove encrusted

material. Potable water obtained from fire hydrants or a local source located near the Site will be used.

All of the drill rig equipment and tools used will be pressure cleaned after the completion of each soil boring to minimize the potential for cross contamination. Special attention will be given to decontaminating downhole sampling devices prior to each use. Split-spoon samplers, hand tools, or specialized samplers, will be thoroughly cleaned under the direct supervision of an ARCADIS representative.

4.4.3 Non-Dedicated Sampling Equipment

For this investigation, non-dedicated sampling equipment that will require field decontamination may include the following:

- Split-spoon and hand tool sampling devices
- Submersible pump (well development)
- Electronic water-level indicator
- Electronic oil/water interface indicator
- Steel measuring tape

Non-dedicated sampling equipment will be decontaminated in the field in accordance with the procedures outlined in the equipment decontamination SOP provided in **Attachment 1**.

If gross contamination is suspected or visual contamination exists, the full eight-step decontamination procedure outlined in the *Field Sampling Procedures Manual* (NJDEP, 1992) will be followed.

4.5 Investigation Derived Waste Management

Three types of investigation-derived waste (IDW) will be generated during the RI activities:

- Debris, such as plastic and PPE
- Residual solids, such as drill cuttings

- Residual liquids, such as decontamination water, monitoring well development water, and monitoring well purge water

IDW generated during the RI will be handled and disposed of in accordance with local, state, and federal requirements. Documentation regarding the handling and disposal of IDW will be provided in the RI report.

4.6 Field Data and Notes

Field notebooks contain the documentary evidence for procedures performed by field personnel. Hard cover, bound field notebooks will be used because of their compact size, durability, and secure page binding. The pages of the field notebook will be numbered consecutively and will not be removed.

Entries will be made in waterproof, indelible blue or black ink. No erasures will be allowed. If an incorrect entry is made, the information will be crossed out with a single strike mark and the change initialed and dated by the team member making the change.

Each entry will be dated. Entries will be legible and contain accurate and complete documentation of the individual or sampling team's activities or observations made. The level of detail will be sufficient to explain and reconstruct the activity conducted. Each entry will be signed by the person(s) making the entry.

The following types of information will be provided for each sampling task, as appropriate:

- Project name and number
- Reasons for being on site or taking the sample such as quarterly sampling, resampling to confirm previous analysis, initial site assessment, etc.
- Date and time of activity
- Sample identification number
- Geographical location of the sampling point with reference to site (or other) facilities or a map coordinate system - sketches will be made in the field logbook when appropriate
- Physical location of the sampling point such as depth below ground surface or water surface

- Description of the method of sampling including procedures followed, equipment used, and any departure from the specified procedures; volume of water purged and water levels will be included for groundwater samples
- Description of the sample, such as physical characteristics, odor, etc.
- Results of field measurements, such as temperature, specific conductivity, pH, dissolved oxygen, organic vapors, etc.
- Readings obtained from health and safety equipment
- Weather conditions at the time of sampling and previous meteorological events that may affect the representative nature of a sample
- Photographic information including a brief description of what was photographed, the date and time, the compass direction of the picture, and the number of negatives on the roll (once the film has been developed, each slide or photographic print should be serialized corresponding to its notebook entry and labeled with the signature of the photographer, the time and date of the photograph, and site location.)
- Reference number from all serialized forms on which the sample is listed or labels which are attached to the sample, i.e., chain of custody forms, airbill numbers, etc.
- Other pertinent observations such as the presence of other persons on the site (those associated with the job or members of the press, special interest groups, or passers-by), actions by others that may affect performance of site tasks, etc.
- Names of sampling personnel and signature of persons making entries

4.7 Instrument Calibration and Maintenance

All calibration and maintenance procedures used in support of field activities and/or laboratory analyses will be performed in accordance with the methods and protocols described in the following sections.

4.7.1 Field Equipment

On-site field calibration activities include the use of calibration standards and field equipment checks, as appropriate, for the equipment being used. Field calibration

and/or field checking of each meter will be accomplished by following the procedures outlined in the operating manual for the instrument. At a minimum, field calibration and/or field equipment checking will be performed both prior to and after equipment use. Field calibration will be documented in the field notebook.

Equipment that fails calibration or becomes inoperable during use will be removed from service and segregated to prevent inadvertent utilization. The equipment will be properly tagged to indicate that it is out of calibration. Such equipment will be repaired and recalibrated to approved standards by qualified personnel. Equipment that cannot be repaired will be replaced.

Results of activities performed using field equipment that has failed recalibration will be evaluated by the Project Manager or his/her designee. If the activity results are adversely affected, the results of the evaluation will be documented, appropriate personnel notified, and a decision made of the validity of the results.

Off-site calibration and maintenance of field instruments will be conducted as appropriate throughout the duration of project activities. All field instrumentation, sampling equipment, and accessories will be maintained in accordance with the manufacturer's recommendations and specifications and established field equipment practice. Off-site calibration and maintenance will be performed by qualified personnel. A logbook will be kept to document that established calibration and maintenance procedures have been followed. Documentation will include both scheduled maintenance and unscheduled maintenance. The logbook will be kept with the equipment.

Health and safety instrumentation will be calibrated, maintained, and used by PSEG representatives who will provide radiological screening in accordance with the facility's Radiation Protection Program. Additional detail is provided in the Project HASP.

4.7.2 Laboratory Equipment

Laboratory calibration procedures will follow accepted NJDEP guidelines, as applicable to the specialty analytical equipment used and procedures performed. The methods selected in support of the field investigation were chosen based on the sample matrix, the specified list of target constituents, and the desired level of QA/QC deliverables. All other calibration procedures for laboratory equipment will be performed in accordance with instrument and/or manufacturers' specifications, and laboratory SOPs.

5. Sample Analysis and Laboratory Data Deliverable Format

A summary of the soil and groundwater analyses and methods is presented in **Table A-2**. Soil samples will be analyzed for the following parameters by the analytical laboratory:

- Total petroleum hydrocarbons
- Volatile organic compounds (VOCs) plus library search

Groundwater samples will be analyzed for the following parameters by the analytical laboratory:

- Priority pollutant base neutral scan plus library search
- Priority pollutant VOCs scan, including xylene, plus library search

Laboratory analytical data from the analytical laboratory will be reported in Reduced Laboratory Data Deliverables (NJDEP Regulatory Format IV as per Appendix A of N.J.A.C. 7:26E).

6. Sample Quality Assurance

6.1 Sampling Program

A summary of the analytical methods and a summary of the sampling program with respect to QA/QC for investigating groundwater are presented in **Tables A-2** and **A-3**, respectively. These summaries include the following quality assurance information: matrix type, number of samples to be collected, field blanks, analytical parameters and methods, duplicate samples, container volume and type, sample preservation and holding times.

6.2 Sample Labeling

Each sample collected will be assigned a unique identification number and placed in an appropriate sample container. Each sample container will have a sample label affixed to the outside with the date, time of sample collection and project name. In addition, this label will contain the sample identification number, analysis required, and chemical representatives added, if any. Documentation will be completed in waterproof ink.

6.3 Sample Designation

The following sections outline how specific sample types will be identified:

6.3.1 Soil Samples

The soil sample identification from which the sample was collected will be used to designate the sample identification (i.e., samples collected from Soil Boring D-1 will be identified as Boring D-1).

6.3.2 Monitoring Well Samples

The monitoring well identification from which the sample was collected will be used to designate the sample identification (i.e., samples collected from Monitoring Well AU will be identified as Well AU).

6.3.3 Duplicate Samples

Since the duplicate samples are "blind" to the laboratory, it will have a coded identity on its label and on the chain-of-custody record form. The actual sampling location will be recorded in the field notebook. The field sampling personnel will be responsible for notifying the Project Manager as to which samples are duplicates and how these samples are identified.

6.3.4 Field Rinsate Blanks and Trip Blanks

Field rinsate blanks will be identified as such, and their identification will include the date of sample collection (i.e., a field rinsate blank collected on 1 November 2004 will be identified as Rinsate Blank-11/01/04). Likewise, trip blanks will be identified as such and their identification will include the date the samples in the cooler were collected (i.e., a trip blank contained in a cooler of samples collected on 1 November 2004 will be identified as Trip Blank - 11/01/04).

6.4 Sample Handling

The analytical laboratories will provide pre-cleaned and prepared sample containers for this project. Special sampling containers and handling for the dissolved gas samples are detailed in **Attachment 2**. The laboratories will also prepare and supply the required QA/QC sample containers and reagent preservatives. Sample bottle containers, including the QA/QC sample containers, will be placed into metal or plastic coolers, and the coolers with the samples for major cations and anions analyses will be

filled with frozen "blue ice" packs or ice in Ziploc® bags (or equivalent) to maintain an ambient temperature of approximately four degrees Centigrade. These coolers will be received by the field sampling team within 24 hours of their preparation in the laboratories.

Samples collected in the field for laboratory analysis will be placed directly into the laboratory-supplied sample containers. Individual sample containers will be sealed by hand-tightening container lids.

Possession of samples collected in the field will be traceable from the time of collection until they are analyzed by an analytical laboratory or disposed. To maintain and document sample possession, chain-of-custody procedures as described in Section 6.7 will be followed. Samples will be packaged and shipped as described in Section 6.8.

6.5 Sample Preservation

Coolers containing the sample containers and associated QA/QC sample containers will be received at the laboratories within 24 hours of their shipment from the field. The temperature in the coolers containing major cation and anion samples will be maintained at a temperature of 4 (degrees) Centigrade while on-site and during shipment.

Sample preservation measures will be used to attempt to prevent sample decomposition by contamination, degradation, biological transformation, chemical interactions, and other factors during the time between sample collection and analysis. Steps taken to maintain in situ characteristics may include refrigeration of samples at approximately four degrees Centigrade, freezing, pH adjustment, and/or chemical fixation. Samples are preserved according to the requirements of the specific analytical method selected.

The preservation requirements for the analyses selected for this investigation are presented in presented in **Table A-3**. The analytical laboratories will add the required preservatives to the appropriate sample containers during preparation of the containers, i.e., before shipment to the field.

For preserved groundwater samples, the pH of the sample will be verified in the field prior to sample shipment using the following procedure:

- Place (pour or pipette) a small portion of the groundwater sample across a section of pH paper to verify that the pH of the sample is less than pH 2

- If the pH is greater than pH 2, add high purity HNO_3 to the sample container
- Repeat pH test to ensure pH of the sample is less than pH 2
- Seal container and place sample on ice for shipment

6.6 Level of Quality Control Effort

The sampling team will use several types of QA/QC samples to ensure and document the integrity of the sampling procedures and the laboratory sample-handling procedures, as well as, the validity of the measurement data. These samples include field duplicate samples (replicates), field rinsate blanks and trip blanks. The following sections provide information regarding these samples. **Table A-2** provides information regarding the required number of quality control samples per sampling event.

6.6.1 Duplicate Samples

An aqueous field duplicate sample will be collected to evaluate the reproducibility of the groundwater sampling technique. Duplicate samples will be collected at a rate of one duplicate sample per 20 monitoring wells sampled with at least one duplicate sample being collected per sampling event. The duplicate sample will be analyzed for the list of parameters required for the Site monitoring wells.

6.6.2 Trip Blanks

Analyte-free water will be obtained from the laboratory to be used for trip blanks. If necessary, this water can be verified as being analyte-free by reviewing the analytical results of method blanks run by the laboratory on the days the trip blanks were prepared and shipped. To assess whether cross-contamination of samples has occurred during the shipment of samples, the laboratory will provide one trip blank per cooler of samples. Trip blanks will be returned to the laboratory unopened with the same set of bottles they accompanied in shipment. Trip blanks will be analyzed for the list of parameters required for the Site monitoring wells.

6.6.3 Field Rinsate Blanks

Analyte-free water will be obtained from the laboratory to be used for field rinsate blanks. If necessary, this water can be verified as being analyte-free by reviewing the analytical results of method blanks run by the laboratory on the days the field blank water was bottled and shipped. Field rinsate blanks are run to assess whether cross-contamination of samples has occurred during sampling and to determine whether

decontamination procedures have been performed adequately. Following decontamination, field rinsate blank samples are prepared by pouring the analyte-free water over the field sampling device(s) that are required to be decontaminated between sampling locations (i.e., sample pumps). One field rinsate blank will be collected for each day of sampling. Field rinsate blanks will be preserved in the same manner as the aqueous samples and analyzed for the same parameters.

6.7 Chain-of-Custody Procedures

A program has been established for sample chain-of-custody (COC) that will be followed during sample handling activities in both field and laboratory operations. The primary purpose of COC procedures is to document the possession of the samples from collection through shipping, storage, analysis, data reporting, and disposal.

COC refers to the actual possession of the samples. Samples are considered to be in custody if they are within sight of the individual responsible for their security or locked in a secure location. Each person who takes possession of the samples, except the shipping courier, is responsible for sample integrity and safekeeping.

Standard chain-of-custody procedures are outlined as follows:

- COC will be initiated by the laboratories supplying the precleaned and prepared sample containers. COC forms will accompany the sample containers.

- At the time of sample collection, the COC form will be completed for the sample collected. The sample identification number, date and time of sample collection, analysis requested, and other pertinent information (e.g., preservatives) will be recorded on the form. All entries will be made in waterproof, indelible blue or black ink.

- Field samplers will be responsible for the care and custody of the samples collected until the samples are transferred to another party, dispatched to the laboratories, or disposed. The Field Team Leader will be responsible for enforcing COC procedures during field work.

- When the form is full or when all samples have been collected that will fit in a single cooler, the Field Team Leader will check the form for possible errors and sign the COC form. Any necessary corrections will be made to the record with a single strike mark, dated, and initialed. Each cooler will be accompanied by a separate COC form.

SII-SSA-0014-002328

- A shipping document will be completed for each cooler, and the shipping document number will be recorded on the COC form.

Samples will be packaged for shipment as described in Section 6.8 and dispatched to the laboratories with the appropriate COC form. A copy of the COC form will be retained by the sampling team for the project file, and the original will be sent with the samples. Bills of lading will also be retained as part of the documentation for the COC records.

When transferring custody of the samples, the individuals relinquishing and receiving custody will verify sample numbers and condition and document the sample acquisition and transfer by signing and dating the COC form.

Laboratory COC will be maintained throughout the analytical processes as described in the laboratories' Quality Assurance Plans. The analytical laboratory will return the original COC in the analytical data deliverable package.

6.8 Sample Shipment

6.8.1 Packaging

Sampled containers will be packed in Styrofoam® (or equivalent), bubble wrap, or vermiculite to minimize breakage and placed in metal or plastic coolers. Frozen blue-ice packs or ice in Ziploc® bags (or equivalent) will be placed around sample containers for major cations and anions. Additional cushioning material will be added to the cooler, if necessary. The COC and paperwork will be put in a Ziploc® bag (or equivalent) and placed on the top of the sample containers and ice or taped to the inside lid of the cooler. The cooler will be taped closed and signed custody seals will be affixed to two sides of the cooler. Laboratory address labels will be placed on top of the cooler.

6.8.2 Shipping

Standard procedures to be followed for shipping environmental samples to the laboratories are as follows:

- All environmental samples collected will be transported to the laboratory by field personnel, laboratory personnel, or courier or shipped through Federal Express or equivalent overnight service.

- Daily shipments will be sent whenever necessary to meet holding time requirements.

- The laboratories will be notified to be prepared to receive a shipment of samples. If the number, type, or date of shipment changes due to site constraints or program changes, the laboratories will be informed.

7. Quality Control Procedures

Sample quality control consists of those activities specifically conducted to ensure that the QA program described in Sections 4, 5, and 6 is being implemented according to the specified requirements, to assess the effectiveness of the sample QA program, to identify non-conformances, and to verify that any identified deficiencies are corrected. If any significant deviations from the QA program are documented, corrective action measure(s) will be immediately implemented and documented. For this RI, sample QC will consist of two activities: data validation and technical review. Each of these activities is described in the following sections.

7.1 Data Reduction

Data reduction will consist of summarizing the raw field and laboratory data into a format that will facilitate interpretation, analysis, and evaluation. Thus, the data will be presented in tables, well logs, illustrations, maps, and graphs, as appropriate. Laboratory data will be presented in formats similar to the laboratory deliverable.

Data collected in the field will be provided in the form of daily logs; task-specific logs for field measurements; illustrations; maps; and chain-of-custody records. Field personnel will complete all of the documentation listed above at the time of the collection, measurement, and analysis. The original field data will be relinquished to the Project Manager for the project file.

7.2 Technical Review

The reduction and analysis of data obtained through this RI, along with the conclusions/recommendations reached based on these data, will be reviewed to ensure the quality of the data and the validity of the conclusions/recommendations.

To ensure accurate transfer of laboratory data, the accuracy of electronic copies of analytical data provided by the laboratories will be verified by manually checking a minimum of 10 percent of the sample data to the hard copy laboratory data packages. Similarly, data that are reduced into tables and/or electronically reformatted to facilitate

data evaluation will be verified by manually checking a minimum of 10 percent of the sample data. If inaccuracies are detected, additional data will be checked and the appropriate corrective actions taken.

Data analysis will be reviewed by qualified individuals other than those performing the analysis. Preliminary or informal analysis or calculations may be performed by one or more originators and need not be completely checked but may be reviewed by the ARCADIS project manager. Final calculations and summary data tables will be made on calculation sheets or spreadsheets, respectively, that have signature blocks for peer review documentation.

Conclusions and/or recommendations will be reviewed by one or more peers of the professional who develops the conclusion/recommendation to ensure their accuracy on the basis of the data that have been acquired and the analysis that has been conducted. Technical reviews will be performed by professionals who have the necessary knowledge and skill to perform the review and who are not directly involved in the activity being reviewed. Technical reviews will be documented and this documentation retained in the project file.

SOP 3.0	Sample Handling Procedures
SOP 4.0	Equipment Decontamination Procedures
SOP 210	Soil Sampling Hand Tools
SOP 510	Overburden Monitoring Well/Piezometer Installation
SOP 530	Monitoring Well/Piezometer Development
SOP 540	Monitoring Groundwater, LNAPL and DNAPL Elevations in Monitoring Wells and Piezometers

STANDARD OPERATING PROCEDURE No. 1.0
WELL SOUNDING PROCEDURES
PSEG SALEM GENERATING STATION, SALEM, NEW JERSEY

The purpose of this standard operating procedure is to provide a uniform basis for sounding the site monitoring wells prior to sample collection. This procedure provides quality control steps necessary for obtaining reliable, representative total depth measurements and for ensuring continuity between field personnel. The practice of sounding wells provides valuable information including the following: (1) determining if the monitoring well is silting-in; and (2) eliminating confusion about well identity when there are several similar, unlabeled wells in close proximity. The following sections provide details regarding the procedures that must be followed when performing this task.

The depth to the bottom of the well will only be verified on an annual basis.

Required Equipment

The following is a list of equipment that will be necessary for implementing the well sounding procedure outlined below:

1. Personal protective equipment (e.g., latex or nitrile gloves, safety glasses, etc) as specified in the Site health and safety plan (HASP);

2. Field notebook –well sounding measurements, along with other sampling notes, will be recorded in the project field notebook (see Project Manager for obtaining the project field notebook). The field notebook is a hard cover, bound notebook;

3. Well keys and a map of well locations; and,

4. A weighted stainless steel measuring tape.

Procedures

1. Clean and decontaminate the stainless steel tape and weight as described in SOP 4.0 provided in **Attachment 4** of this QAPP;

2. Locate and identify the well to be sampled. Record pertinent information in field notebook, including date, well identification number, and weather;

3. Unlock protective casing and remove well cap. Note any observations such as noises, odors, etc.;

4. Identify the measuring point at the top of the well casing.

5. Position the stainless steel tape and weight over the open well and slowly lower the weight until it has reached the bottom of the well. The total depth of the well is then determined

by taking a reading directly from the tape at the measuring point. The depth of the well should then be recorded. Measurements are recorded to the nearest 0.01 of a foot.

6. Remove the stainless steel tape and weight from the well. Replace well cap and lock protective casing.

7. Decontaminate the stainless steel tape and weight as described above prior to moving to the next well.

STANDARD OPERATING PROCEDURE No. 2.0
LOW FLOW GROUNDWATER SAMPLE COLLECTION FROM MONITORING WELLS
PSEG SALEM GENERATING STATION, SALEM, NEW JERSEY

The purpose for describing this procedure is to provide a uniform methodology for the collection of good quality and representative groundwater samples at the PSEG Salem Generating Station – Unit 1 facility (the Site). Groundwater samples collected from the Site monitoring wells for laboratory analysis will be collected using a modified low-flow sample collection procedure. The United States Protection Agency (USEPA) Region 3 (Mid-Atlantic Region) has adopted a Standard Operating Procedure (SOP) for the collection of groundwater samples from monitoring wells using a low-stress minimal drawdown ground-water sample collection method (low-flow sampling). The low-flow sample collection methodology presented in the USEPA Region 3 SOP was incorporated in the development of this SOP, but was modified to accommodate for site-specific conditions (i.e., limited recharge) and the sensitivity of the analyses being performed (e.g., tritium and helium). The procedures outlined below reflect these modifications.

Required Equipment

The following is a list of equipment that will be necessary for implementing the low-flow sample collection procedure outlined below:

1. Personal protective equipment (e.g., latex or nitrile gloves, safety glasses, etc) as specified in the Site health and safety plan (HASP);

2. Field notebook - Groundwater quality parameter measurements, along with other sampling notes, will be recorded in the project field notebook (see Project Manager for obtaining the project field notebook). The field notebook is a hard cover, bound notebook;

3. Well keys and a map of well locations;

4. Electronic water level indicator – The Micropurge Basics Drawdown Meter (model MP30) serves dually as a drawdown meter and water level indicator. See operators manual for operating procedures;

5. Sampling pump and associated equipment - Dedicated sampling pumps and tubing will be utilized for each well. The sampling pumps are Micropurge ¾-inch diameter bladder pumps (model SP-¾-P) with a 1/8-inch ID polyethylene air influent and a ¼-inch ID polyethylene sample effluent. A Micropurge Basics Controller (model MP10), Micropurge Basics Drawdown Meter (model MP30), and a portable 12-volt DC Air Compressor Unit (model 3020) are required for operating the sampling pump;

6. Flow measurement supplies – Graduated cylinder and a stopwatch;

7. A properly calibrated Micropurge Basics Flow Cell Model MP20DT for monitoring pH (standard units), temperature (degrees Celsius), dissolved oxygen (milligrams per liter), conductivity (micromhos per centimeter), oxidation-reduction potential (millivolts), and turbidity (NTU);

8. Properly preserved and labeled laboratory supplied sample containers; and,

9. Decontamination equipment (i.e., deionized water, alcohol-based liquid detergent, spray bottles, buckets, scrub brushes, etc.)

Procedures

Sampling must begin at the monitoring well suspected of containing the lowest concentrations of sample constituents (generally upgradient or furthest from the site or suspected source), then proceed systematically to the monitoring wells suspected of containing the highest concentrations of sample constituents. The order for sampling the monitoring wells will be based on actual laboratory analytical results for those wells that have been sampled previously, or will be based on the proximity of the well to the source area. A sampling event specific Workplan, prepared by the Project Manager, will be provided to field personnel conducting the sampling events and will address sampling order. The following outlines the site-specific purging and sampling procedures for the collection of groundwater samples using the low-flow sample collection procedure:

1. Calibrate all field instruments (e.g., water quality meters, etc.) per manufacturer's guidelines;

2. Decontaminate all non-dedicated sampling equipment following the procedures outlined in the equipment decontamination procedures outlined in SOP 4.0 (Equipment Decontamination Procedures) provided in **Attachment 1** of this QAPP.;

3. Locate and identify the well to be sampled. Record pertinent information in field notebook, including date, well identification number, and weather;

4. Unlock protective casing and remove well cap. Note any observations such as noises, odors, etc.;

5. Using a decontaminated electronic water level indicator, gauge and record the water level in the well relative to the reference measuring point. Water levels should be collected according to the procedures outlined in SOP 540 (Monitoring Groundwater, LNAPL and DNAPL Elevations in Monitoring Wells and Piezometers) provided in **Attachment 1** of this QAPP;

6. Confirm the depth of the pump intake in the monitoring well. The pump intake should be at or slightly above the middle of the screened interval of the monitoring well. Sample construction details will be included with the sampling event specific Workplan provided to the sampling personnel;

7. Lower the Micropurge Basics Drawdown Meter probe to a depth below the water table and approximately one-foot above the top of the well screen. The Micropurge Basics Drawdown Meter will automatically deactivate the pump when the water table has been drawdown to a depth corresponding with the depth of the probe. The pump will automatically reactivate when the water table recharges. (Typically, low-flow sampling procedures suggest that the water table should not be drawn down more than 0.33 feet. However, due to site-specific conditions this is not practical). The Micropurge Basics Drawdown Meter is being used to allow for maximum drawdown without allowing the water table to drop below the top of the well screen. Due to the analyses being performed on the groundwater samples it is essential that **THE WATER TABLE MUST NOT DROP BELOW THE TOP OF THE WELL SCREEN**;

8. Connect the air influent line to the air compressor and the water effluent to the flow-through cell. The discharge line from the flow-through cell must be directed to a container (5-gallon bucket) for temporary storage of the purge water. Following the completion of the sampling event, PSEG personnel will evaluate the need for more permanent storage methods, or disposal requirements;

9. Activate the pump. The initial flow rate should be low (less than 100 milliliters per minute). Decrease the flow rate to minimize drawdown in the well yet maintain a steady flow. Measure the discharge rate of the pump with the graduated cylinder and stop watch. Continue measuring the discharge rate every five minutes during purging;

10. During the purging, monitor and record the water-quality indicator parameters every five minutes. The water-quality indicator parameters are pH, temperature, specific conductance, turbidity, dissolved oxygen and oxidation reduction potential. Purging must be conducted for a minimum of thirty minutes;

11. Sample collection can be initiated after the stabilization criteria have been achieved for three consecutive readings (+/- 0.1 for pH, +/- 3% for conductivity, +/- 10 mV for redox potential, and +/- 10% for turbidity and dissolved oxygen). Note: Dissolved oxygen and turbidity usually require the longest time to achieve stabilization. Achieving stabilization of turbidity reading within +/- 10% within a reasonable time frame may be difficult. If the stabilization criteria have not been achieved following two-hours, samples can be collected;

12. If during purging the water table draws down to the level of the Micropurge Basics Drawdown Meter probe, the pump will automatically deactivate. The Micropurge ¾-inch diameter bladder pumps contain a check valve that will not allow the water in the tubing and the flow-through cell to discharge back into the well. If the pump deactivates, allow the well to recharge and reactivate the pump. If the water table continues to drop and deactivate the pump, a sample can be collected following the purging of a minimum of two tube volumes (including the volume of water in the pump and flow-through cell), even if the stabilization criteria have not been achieved. This information should be noted in the field notebook;

13. The pump must not be removed from the well between purging and sampling. Collect samples at a flow rate of less than 100 milliliters per minute. The sample should be collected directly from the sample effluent prior to passing through the flow-through cell;

14. Disconnect tubing from the inlet of the flow-through cell and proceed to fill sample containers. All sample containers must be filled with minimal turbulence by allowing the groundwater to flow from the tubing gently down the inside of the container;

15. Complete remaining information on field forms and chain-of-custody, including sample collection time and sampler's initials;

16. Store samples in a manner consistent with the sampling handling procedures outlined in SOP 3.0 provided in **Attachment 1** of this QAPP.

17. Decontaminate non-dedicated sampling equipment (i.e., flow-through cell and electronic water-level meter). Discard disposable equipment in a plastic garbage bag; and,

18. Replace well cap and lock protective casing.

STANDARD OPERATING PROCEDURE No. 3.0
SAMPLE HANDLING AND SHIPMENT
PSEG SALEM GENERATING STATION, SALEM, NEW JERSEY

This procedure describes acceptable methodology for the handling and shipment of environmental samples to an analytical laboratory for chemical analyses. The purpose of this procedure is to provide a uniform and documented means of securely transporting environmental samples to the laboratory so as to preserve the integrity and quality of the sample(s).

Required Equipment

The following is a list of equipment that will be necessary for implementing the procedure outlined below:

1. Field notebook – Shipment details (e.g., time/date, shipping method, currier, etc.) must be documented in the field notebook. (see Project Manager for obtaining the project field notebook). The field notebook is a hard cover, bound notebook;

2. Packaging tape;

3. Mailing labels;

4. Chain-of-custody forms;

5. Chain-of-custody seals;

6. Shipping forms;

7. Ice; and,

8. Insulated cooler(s) or other appropriate sample storage container.

Procedures

1. Immediately upon collection, each sample shall be placed in an appropriate sample storage container. If required by the sample methodology, samples should be placed in a cooler with an adequate volume of ice to keep all samples in the cooler at approximately 4°C.

2. Using a new pair of latex or nitrile gloves, assemble all sample containers from the completed sampling event.

3. Locate, identify and record all types of containers for each sample identification number on a chain-of-custody form.

4. Subtotal the number of containers of similar types and then add them all together to get a total bottle count. Check similar bottle counts and total bottle counts with the number of samples present.

5. Check to make sure bottles are labeled properly and have clear protective tape (e.g., 2" width Scotch Tape) over them.

6. Wrap glass containers with bubble wrap packaging material.

7. Place some shock absorbing material (e.g., at least two layers of clean bubble wrap) in the bottom of the cooler to prevent direct contact of glass bottles with the bottom of the cooler.

8. Arrange bottles in cooler to prevent movement. Plastic bottles can fit in between other bottles to make the cooler contents stable.

9. If required, place ice in sealable bags and then double-bag to prevent leakage. Place the bags of ice or dry ice on the top of and around the samples.

10. The courier must be identified on the chain-of-custody. Place the top copy of the chain-of-custody in a sealable bag and secure, to the top of the inside of the cooler with tape.

11. Close lid and place custody seals over the lid/cooler joint and cover with clear tape so as to encircle the entire cooler.

12. If using commercial courier service (e.g., Federal Express, etc.), properly complete and address a shipping form and affix to the lid of the cooler. Samples should be delivered to the laboratory by the next morning.

13. Deliver to the laboratory within 3 days, or the morning after the end of the sampling event (depending on sample holding time requirements).

14. File a copy of the chain-of-custody form and the shipping form in the project file.

Call laboratory the next morning to confirm arrival of samples.

STANDARD OPERATING PROCEDURE 4.0
EQUIPMENT DECONTAMINATION
PSEG SALEM GENERATING STATION, SALEM, NEW JERSEY

The purpose for describing this procedure is to provide a uniform methodology for the decontamination of non-dedicated sampling equipment (e.g., split-spoon samplers, submersible pumps used during observation well development, electronic water-level indicators, etc.) during the implementation of the Phase IV Investigation at the PSEG SC Salem Generating Station facility (the Site). Because of the potential for the decontamination equipment to be a source of contamination, the equipment must be inspected prior to each use for signs of contamination and replaced frequently.

Required Equipment

The following is a list of equipment that will be necessary for implementing the decontamination procedures outlined below:

1. Personal protective equipment (e.g., latex or nitrile gloves, safety glasses, etc) as specified in the Site health and safety plan (HASP);

2. Field notebook – Equipment decontamination details (i.e., time, etc.) and observations will be recorded in the project field notebook (see Project Manager for obtaining the project field notebook). The field notebook is a hard cover, bound notebook;

3. Decontamination equipment:

    - Deionized water;
    - Alcohol-based liquid detergent (non-sudsing detergent such as Alconox);
    - Spray bottles;
    - Four five-gallon buckets;
    - Scrub brushes, etc.); and,
    - Plastic Sheeting.

Procedures

1. Don appropriate personal protective equipment (PPE) per the Site Health and Safety Plan (HASP).

2. Set up four 5-gallon buckets over plastic sheeting as follows: 1) one bucket with clean, potable water; 2) one bucket with a detergent and clean potable water solution; 3) two buckets with distilled water in each.

3. Pre-rinse field equipment in the bucket of clean, potable water. In the case of a submersible pump, circulate the rinse water through the pump.

4. Wash field instruments with a brush in the solution of Detergent and potable water. Also wash any portion of the tapes or cords that were below the top of the well casing.

5. If an oily residue or a substantial amount of sediment begins to accumulate in the pre-rinse or the Detergent solution, prepare new rinsewater or solution.

6. Double rinse the instruments with distilled water.

7. Store the instruments in a clean location until next use.

STANDARD OPERATING PROCEDURE 510

OVERBURDEN MONITORING WELL/PIEZOMETER INSTALLATION

1.0 PURPOSE AND APPLICABILITY

This SOP describes the method for installing single-, double-, and triple cased monitoring wells or piezometers in overburden soils. Monitoring wells and piezometers are installed to determine ground water elevations, monitor ground water elevation fluctuations, and to obtain ground water samples for field and laboratory analyses. Single-cased monitoring wells and piezometers are used in unconfined overburden aquifers. Double- or triple-cased monitoring wells and piezometers are used in confined overburden aquifers to seal off hydraulic units and eliminate the potential movement of contaminants into the confined aquifer through the borehole.

Specific project requirements as described in an approved site-specific Work Plan, Quality Assurance Project Plan (QAPP), or Health and Safety Plan (HASP) will take precedence over the procedures described in this document. Additionally, deviation from this SOP regarding materials and techniques is acceptable providing: 1) the impact of the deviation on data quality has been evaluated by the Project Manager and has been deemed to be acceptable; and 2) the deviation has been clearly documented in an approved site-specific Work Plan or Work Plan Addendum.

2.0 RESPONSIBILITIES

The New Jersey-licensed well driller is responsible for obtaining the required permits, maintaining copies of monitoring well/piezometer specifications and well permits on-site during field work, providing the necessary materials and equipment for drilling and installing the monitoring wells/piezometers, performing the drilling and monitoring well/piezometer installation, and decontaminating the drilling equipment (as appropriate) in accordance with the approved site-specific Work Plan or QAPP. The driller is also required to maintain an accurate daily written log of all materials encountered, record construction details for each well/piezometer, record the depth of each water-bearing zone, and submit this information to the NJDEP Bureau of Water Allocation.

The Project Manager is responsible for ensuring that a utility markout has been conducted prior to initiating drilling activities and for protecting utilities, as appropriate, during field work activities.

Field personnel are responsible for inspecting the construction and installation of the monitoring well/piezometer to ensure that the driller adheres to the well installation specifications described in the approved site-specific Work Plan and/or QAPP. In addition, field personnel are

© 2000 PSEG Services Corporation

responsible for recording all pertinent field data in the field log book or on appropriate forms, (e.g., monitoring well/piezometer construction diagram).

3.0 MATERIALS/EQUIPMENT

Equipment and materials used to install single-, double- and triple-cased monitoring wells/piezometers (in addition to the equipment provided by the driller) include:

- Weighted calibrated tape;
- Water level indicator or oil/water interface probe;
- Camera (optional);
- Personal Protective Equipment (PPE) as required by the site-specific HASP including PID/FID;
- Field forms: monitoring well/piezometer construction diagram, air monitoring log and/or other necessary health and safety documentation; and,
- Field log book.

4.0 METHOD

This section is divided into subsections on general information, marking-out underground utilities, decontamination, drilling methods, casings for double- or triple-cased monitoring wells/piezometers, monitoring well/piezometer installation, and preparation of construction diagrams.

4.1 General Information

- Specific drilling and installation equipment and methodology will be dictated by the geologic and hydrogeologic characteristics of the site, the nature of contaminants to be encountered, water elevations, and local and state regulations. Monitoring well/piezometer design will meet two basic criteria: (1) ground water must move freely into the monitoring well/piezometer, and (2) vertical migration of surface water or undesired ground water to the monitoring well/piezometer intake zone must be minimized.

- The requirements for screen, riser pipe, outer casing, filter pack and grout will be provided in the approved site-specific Work Plan and/or QAPP. (The material used for riser pipes and screens, e.g., PVC or stainless steel, will depend on a number of factors including the contaminants of concern in the ground water. The minimum screen and riser pipe diameter is 2 inches.)

© 2000 PSEG Services Corporation

- Prior to the start of drilling activities, field personnel will review the scope of work and health and safety requirements with the driller. Field personnel will also confirm that driller has obtained the required permits.

- Samples of subsurface soil may be obtained for logging stratigraphy or for chemical analyses during the advancement of borings to be completed as monitoring wells/piezometers using the procedures provided in SOP 221 - Collecting Soil Samples from Soil Borings.

- A mobile phone or some other form of communication (e.g., radio) will be kept in support vehicles when in remote locations.

- All field activities will be conducted using the appropriate level of protection specified in the site-specific HASP.

4.2 Marking-Out Underground Utilities

At least three (3) business days prior to beginning intrusive work, the Project Manager or his/her designee will call New Jersey's utility location service known as "New Jersey One Call" at 1-800-272-1000 to request a field mark-out of underground utilities at the site. The following information must be provided as part of this request:

- Exact location of project site including street address and nearest cross street;
- Type of work;
- Name of company making request (typically environmental consulting firm) and name and phone number for a contact person;
- Date field work starts; and,
- Other pertinent instructions (such as site access).

New Jersey One Call provides a case number for each request and a list of companies that it will notify. This information will be recorded for future reference.

New Jersey One Call will notify affiliate companies that have underground utilities in the project area. The individual companies will send representatives to the site to check utility locations if they deem it necessary. Sampling locations must be marked prior to obtaining clearance unless other arrangements are made with the utility representatives. Utilities usually indicate the location of their facilities using spray paint or stakes. Because maps of underground utilities on most private properties are not available, utilities typically mark the underground utility location to the point where it enters the private property.

Utility mark-outs are valid for ten (10) business days and, therefore, field work must be initiated within ten (10) business days from the effectivity of the mark-out. If field work does not commence within ten (10) business days, is temporarily interrupted, or the marks fade and a re-

© 2000 PSEG Services Corporation

mark-out is necessary, the original case number should be referenced when making a second or subsequent request to New Jersey One Call for the same project location.

It should be noted that: (1) some utilities and/or municipal agencies are not members of New Jersey One Call; and, (2) New Jersey One Call may not be able to provide information regarding all underground facilities (e.g., city water/sewer lines). Due diligence must be performed to identify any utilities that have not been contacted by New Jersey One Call but operate/maintain underground facilities at the site and these utilities contacted directly.

Additional information on the location of underground utilities may be located through:

- Information available from PSEG (including facility plans and personnel familiar with the site or former operations at the site);
- Site visit (obvious outlets, filling lines and pumps for underground tanks);
- Geophysical surveys (see SOP 110 - Geophysical Surveys); and,
- Hand excavation near utilities.

4.3 Decontamination

Equipment and tools used during drilling activities will be cleaned prior to work and between monitoring well/piezometer installations. For double- or triple-cased monitoring wells, equipment and tools will be decontaminated after each outer casing is set and before drilling the borehole for the associated inner casing. If a pre-drilling inspection reveals the presence of contamination such as visible chemical residue, additional decontamination will be conducted to remove the residue. All equipment and tools used during drilling will be cleaned prior to leaving the site. Cleaning of drilling equipment and tools will comply with the procedures detailed in the NJDEP Field Sampling Procedures Manual (May 1992) and the approved, site-specific QAPP.

Riser pipe and well screens will be pre-cleaned and manufacturer-sealed in protective plastic. If the protective plastic has been damaged, both screens and riser pipes will be decontaminated by "steam cleaning" prior to installation.

4.4 Drilling Methods

Boreholes to be used for monitoring well/piezometer installation must be a minimum of 4 inches greater than the casing to be installed. Drilling of the monitoring well/piezometer borehole may be accomplished by a variety of methods. The hollow-stem, continuous flight auger is one of the most widely used methods for installing monitoring wells/piezometers in overburden soils. No drilling fluids are used and the disturbance to geologic materials penetrated is minimal.

The second most popular method of drilling boreholes for installing monitoring wells/piezometers in overburden soils is the rotary-wash method. Rotary-wash methods may use potable water, a drilling mud (such as a potable water/bentonite mixture) or air during the drilling

© 2000 PSEG Services Corporation

process to maintain an open hole and to remove cuttings. Potable water is the preferred circulating substance, followed by use of an acceptable drilling mud. Air rotary should be avoided, if possible, due to the potential for air dispersion of contaminants brought up from the subsurface.

Care must be taken with mud-rotary techniques so that the drilling mud does not affect collection of representative ground water samples. If drilling fluids are used, no chemical additives will be mixed into the fluid to alter viscosity or lubricating properties. Potable water for drilling will be obtained from a source not impacted by site contaminants (e.g., municipal water supply). A sample of the potable water will be collected during the course of well installation and analyzed for the same parameters as the ground water samples.

Drill cuttings and/or spent fluids will be contained and disposed of in accordance with federal and state regulations and the approved, site-specific Work Plan and/or QAPP.

4.5 Casings for Double- or Triple-Cased Monitoring Wells/Piezometers

Double- or triple-cased monitoring wells/piezometers are essentially constructed the same as single-cased monitoring wells/piezometers with the addition of first installing steel casing(s) to seal off hydraulic units.

The outer casing(s) of a cased monitoring well/piezometer will be installed in a pre-drilled borehole. After the borehole has penetrated a minimum of 1 to 2 feet into a confining layer, the outer casing will be lowered to the bottom of the boring. It is preferable to then drive the outer casing a minimum of 1 foot below the drilled borehole and into the confining layer. The annular space is then filled with acceptable grouting materials (see Tables 1, 2 and 3 on p. 202 of the NJDEP Field Sampling Procedures Manual (May 1992)) via pressure grouting through a tremie pipe. Pressure grouting will require the use of a grout shoe or packer installed at the end of the outer casing to prevent the grout from moving up into the casing. The grout will be allowed to cure for a minimum of 12 hours to allow a seal to form between the casing and the surrounding stratum prior to advancing the borehole through the outer casing to the next hydrologic unit.

4.6 Monitoring Well/Piezometer Installation

With hollow-stem augering, the center bit will be removed once the target depth is reached and the auger will be raised approximately 6 inches above the bottom of the borehole, rotated slowly, and returned to the bottom of the borehole to facilitate removal of all material within the auger. With rotary drilling, the borehole will be flushed clear of material prior to monitoring well/piezometer installation.

The borehole will be checked for total open depth and may be extended by further drilling, if necessary, before any well construction materials are placed. If the tip of the monitoring well/piezometer is to be above the terminus of the borehole, backfilling of the borehole with clean sand to the well screen tip elevation will be required. Use of a grout plug to compensate

© 2000 PSEG Services Corporation

for overdrilling is not permitted. A heavy plumb bob or a calibrated tape will be used to determine the depth of the boring and the depth to the top of the backfill.

The monitoring well/piezometer screen and riser pipe will then be assembled. A bottom cap will be placed on the distal end of the well screen. In situations where dense, non-aqueous phase liquid (DNAPL) may be expected to accumulate (i.e., on confining layer or bedrock interfaces), the well screen may be extended a short distance (e.g., 1 to 2 feet) into the top of the confining unit or bedrock to aid in the detection and, possibly, the eventual recovery of DNAPL. Care must be taken to ensure that installation of well screens into confining units will not cause the confining unit to be breached during drilling and allow DNAPL to migrate deeper in the subsurface.

The well screen, riser pipe and bottom cap will be connected by flush-threaded joints. No glues or solvent are to be used on the joints. The length of the screened area and the gauge of the well screen or slots will be specified in the approved site-specific Work Plan and/or QAPP or will be determined in the field by the inspecting field personnel based on the grain-size distribution of the sediments. No more than 25 feet of well screen will be installed.

The well screen, riser pipe and bottom cap will be carefully placed into the borehole. (For multi-cased monitoring well/piezometers, the screen and riser pipe are set through the outer casing.) Care must be taken to ensure that the well screen and riser pipe are centered in the hole, straight, and vertical throughout. Centering will be accomplished with well centralizers.

The annular space surrounding the screened section of the monitoring well or piezometer and 2 feet above the top of the screen will be filled with clean silica sand (filter pack). No more than 5 feet of filter pack will be placed above the top of the monitoring well/piezometer screen. For multi-cased monitoring wells or piezometers, under no circumstance will the filter pack extend into a confining layer. The placement of a finer-grained filter pack on top of a coarser-grained filter pack is recommended. The fine-grained filter pack is used primarily to prevent the grouting material placed above it (see next paragraph) from seeping down into the well screen during installation.

The remainder of the borehole will be grouted to the ground surface using acceptable grouting materials (see Tables 1, 2 and 3 on pp. 198 or 202 of the NJDEP Field Sampling Procedures Manual (May 1992)) via pressure-grouting through a tremie pipe. The protective steel casing will be installed to a minimum of 3 feet below ground surface and securely set in concrete. A "weep hole" will be drilled in the portion of the riser pipe that is above ground to allow ventilation and pressure equilibrium. The monitoring well/piezometer will be fitted with a locking well seal and a protective steel casing cap with lock. Flushmount monitoring wells/piezometers are acceptable provided they have manholes, locking caps, and seals to prevent leakage of surface water into the monitoring well/piezometer. Bumper posts may be necessary for protection depending on the location of the monitoring well/piezometer.

© 2000 PSEG Services Corporation

The completed monitoring well/piezometer must prominently display and have permanently affixed the NJDEP permit number and site-specific designation. A die set will be necessary to tap these identification numbers to flushmount boxes.

The completed overburden monitoring well/piezometer will be developed in accordance with SOP 530 - Monitoring Well/Piezometer Development.

The top of the innermost casing will be surveyed to the nearest 0.01 foot by a New Jersey-licensed surveyor. The survey point will be the highest point of the casing. The survey point will be permanently marked on each monitoring well/piezometer.

4.7 Preparation of Construction Diagrams

Information relating to the construction of the monitoring wells/piezometers will be recorded on draft monitoring well/piezometer constructions diagrams or in the field log book (and transcribed later onto monitoring well/piezometer construction diagrams). Typical construction diagrams for single- and double-cased monitoring wells/piezometers are provided in Figures 1 and 2, respectively.

Information on monitoring well/piezometer installation to be recorded in the field includes:

- Monitoring well/piezometer identification number;
- NJDEP monitoring well permit identification number;
- Drilling company and name of driller;
- Date and time of completion;
- Inspector's name;
- Generalized soil descriptions with corresponding depths;
- Diameter of borehole;
- Depth of borehole;
- Diameter, length and type of riser pipe;
- Diameter, slot size, length, type of screen and depths to top and bottom of screen;
- Type of sand filter pack and depth to top of sand; and,
- Type of annular grout mix and depth interval.

© 2000 PSEG Services Corporation

5.0 QUALITY CONTROL

Elevation measurements will be checked repeatedly during well installation to ensure that the positions of well screen and filter pack, relative to ground water level, conform to project requirements. The depth to the top of each layer of packing (e.g., sand, grout, etc.) will be verified and adjusted if necessary to conform to the requirements of this SOP and the QAPP before the next layer is placed.

Adherence to the procedures described above may be verified through a field quality control audit. During a field quality control audit, the auditor carefully reviews equipment selection and use to ensure that appropriate equipment is utilized based on various factors including equipment capabilities. In addition, the auditor meets with key field staff to review sampling objectives of the site-specific Work Plan and results achieved, and makes recommendations. For example, care will be taken to minimize placement of monitoring wells in low lying areas like swales that will be likely to accumulate or have ponded water. The auditor submits a report summarizing results of the audit to the Project Manager. If corrective action(s) are required, the Project Manager is responsible for ensuring that the appropriate corrective action(s) are implemented and documented.

6.0 DOCUMENTATION

Documentation of observations and measurements obtained in the field will provide information on the proper construction and installation of the monitoring wells/piezometers and also provide a permanent record of the installation activities. These observations and measurements will be recorded with permanent ink in a bound weatherproof field log book with consecutively numbered pages. All documentation will remain in the project files following completion of the project.

The driller will maintain an accurate log of all materials encountered, record construction details for each monitoring well/piezometer, and record the depth to each water bearing zone. This information will be submitted to the NJDEP Bureau of Water Allocation.

Notes will be recorded daily when in the field. The information in the field book will include the following at a minimum:

- Project name and number;
- Name(s) of field personnel and their responsibilities;
- Drilling company and driller's name;
- Measurements (including length of screen, length of riser pipe, total depth of well and depth to stabilized water level);
- Observations (including stratal inconsistencies or gross contamination);
- Air monitoring readings (as required);
- Decontamination procedures; and,
- Weather conditions.

STANDARD OPERATING PROCEDURE 530

MONITORING WELL/PIEZOMETER DEVELOPMENT

1.0 PURPOSE AND APPLICABILITY

This SOP describes the methods to be utilized during overburden and bedrock monitoring well/piezometer development. Development is performed following monitoring well/piezometer installation to improve the hydraulic communication between the formation and monitoring well/piezometer and to help ensure that ground water samples are representative of the surrounding aquifer.

During the drilling process, the side of the borehole may become coated with clays or other fine sediments. This plugging action substantially reduces the hydraulic conductivity of the aquifer in the borehole and retards the movement of ground water into the monitoring well/piezometer. In addition, sediment may enter the filter pack or clog the screen slots during installation of the overburden monitoring well/piezometer materials. Development may also be required for monitoring wells/piezometers that have been left dormant for some time or have accumulated significant quantities of sediment in the monitoring well/piezometer, gravel pack or surrounding formation.

For overburden monitoring wells/piezometers, development is the process of flushing the aquifer and monitoring well/piezometer interface and cleaning the filter pack and the well screen slots to permit ground water to flow into the monitoring well/piezometer. Development is required to: (1) restore the natural hydraulic conductivity of the formation immediately adjacent to the borehole; (2) remove clay, silt and other fines from the filter pack and well screen so that subsequent ground water samples will not be abnormally turbid or contain undue suspended matter; (3) remove remnant drilling fluids and cuttings from the monitoring well/piezometer, filter pack and aquifer; and, (4) remove contaminants that may have been introduced during drilling.

For unscreened bedrock monitoring wells/piezometers, development is the process of flushing the rock wall to permit ground water flow into the monitoring well/piezometer. Development is required to: (1) restore the natural hydraulic conductivity of the formation exposed in the open borehole; (2) remove clay, rock chips, and fines from intersected fractures so that subsequent ground water samples will not be abnormally turbid or contain undue suspended matter; (3) remove remnant drill fluids and cuttings from the monitoring well/piezometer and aquifer; and, (4) remove contaminants that may have been introduced during drilling.

Specific project requirements as described in an approved site-specific Work Plan, Quality Assurance Project Plan (QAPP), or Health and Safety Plan (HASP) will take precedence over the procedures described in this document. Additionally, deviation from this SOP regarding materials and techniques is acceptable providing: 1) the impact of the deviation on data quality

© 2000 PSEG Services Corporation

has been evaluated by the Project Manager and has been deemed to be acceptable; and 2) the deviation has been clearly documented in an approved site-specific Work Plan or Work Plan Addendum.

2.0 RESPONSIBILITIES

The driller is responsible for providing all necessary equipment for monitoring well/piezometer development, performing the development, and decontaminating the development equipment (as appropriate) in accordance with the approved site-specific Work Plan and/or QAPP.

Field personnel are responsible for ensuring that all monitoring well/piezometer development is performed in accordance with the site-specific Work Plan and/or QAPP. In addition, field personnel are responsible for recording all pertinent data in the field log book.

3.0 MATERIALS/EQUIPMENT

Equipment and materials used to develop monitoring wells/piezometers (in addition to the equipment provided by the driller) include:

- Weighted calibrated tape or electric water level indicator;
- Personal Protective Equipment (PPE) as required by the site-specific HASP;
- Field forms: air monitoring log, and/or health and safety documentation; and,
- Field log book.

4.0 METHOD

The appropriate method for development of the monitoring wells/piezometer will be determined following the completion of monitoring well/piezometer installation or as specified in the approved site-specific Work Plan and/or QAPP.

The development process is best accomplished by causing the ground water collected inside the screen of an overburden well/piezometer (or open hole of a bedrock well/piezometer) to be moved vigorously in and out through the screen (or bedrock interface) in order to agitate the clay and silt and move these fines into the monitoring well/piezometer where they can be removed. Use of water other than the natural formation water is not recommended due to the possibility of contaminating the ground water. In the event that insufficient natural formation water is present to adequately develop the monitoring well/piezometer, potable water may be obtained from a nearby water supply such as a fire hydrant. If it is necessary to introduce potable water into any monitoring well/piezometer for development, chemical analyses of a sample of this water will be

© 2000 PSEG Services Corporation

performed to document the quality of water used for development and permission to utilize the source must be obtained.

Monitoring wells/piezometers will be developed until a relatively turbid-free discharge is observed flowing from the monitoring well/piezometer or a maximum of one hour, whichever occurs first. If one hour of development does not produce relatively turbid-free water and turbidity is suspected of impacting the quality of subsequent water samples, additional development may be necessary to clear the screen/rock wall of sediment. Any additional development will be as directed by the Project Manager.

All development water will be properly disposed of in accordance with applicable federal and state regulations and the approved site-specific Work Plan and/or QAPP.

The equipment and procedures for developing monitoring wells/piezometers are described in the subsections that follow. Any equipment used for monitoring well/piezometer development will be thoroughly decontaminated before development of each monitoring well/piezometer to prevent possible cross-contamination. Decontamination procedures will be in accordance with the NJDEP Field Sampling Procedures Manual (May 1992) and the approved site-specific QAPP.

4.1 Surge Block

A surge block is a round plunger with pliable edges (constructed of a material such as rubber belting) that will not catch on the well screen. Moving the surge block forcefully up and down inside the well screen causes the water to surge in and out through the screen, accomplishing the desired cleaning action. Close monitoring of the amount of pressure generated must be made to prevent damaging the well casing or screen.

Surge blocks should be used in cases where the monitoring well is installed in silty conditions to remove silt from around the well's filter pack. Surge blocking is also effective for re-developing wells that have not been sampled in over a year. Surge blocking, however, needs to be combined with removal of the fines -- the surge block agitates the fines around a well gravel pack so that the fines can be removed with either a bailer or a pump, as described below.

4.2 Bailer

A bailer that is heavy enough to sink rapidly through the water can be raised and lowered through the water column to produce an agitating action that is similar to that caused by a surge block. The bailer, however, has the added capability of removing turbid water and fines each time it is brought to the surface. Bailers can be custom-made and can be hand-operated in shallow monitoring wells/piezometers.

The bailer is an alternative method to the surge block for removing fines in the well and the surrounding gravel well pack.

© 2000 PSEG Services Corporation

4.3 Pumping

The use of a submersible pump or a centrifugal pump permits the removal of fine-grained materials or cuttings and allows fresh ground water to enter into the monitoring well/piezometer. In addition, the up and down movement of the submersible pump or tubing placed within the monitoring well/piezometer forces the water to flow through the well screen and sand pack/bedrock interface and facilitates the cleansing of fine-grained material. Pumping is most effective when used in combination with surge blocking, as described above.

Care must be exercised during pumping to prevent the monitoring well/piezometer from being pumped dry. To maintain a near static ground water elevation, periodically check the ground water elevations. Decrease the pumping/development rate as required to maintain a near static ground water elevation.

5.0 QUALITY CONTROL

Adherence to the procedures described above may be verified through a field quality control audit. During a field quality control audit, the auditor carefully reviews equipment selection and use to ensure that appropriate equipment is utilized based on various factors including equipment capabilities. In addition, the auditor meets with key field staff to review sampling objectives of the site-specific Work Plan and results achieved, and makes recommendations. The auditor submits a report summarizing results of the audit to the Project Manager. If corrective action(s) are required, the Project Manager is responsible for ensuring that the appropriate corrective action(s) are implemented and documented.

6.0 DOCUMENTATION

Documentation of observations and measurements obtained in the field will provide information on the proper development of the monitoring wells/piezometers and also provide a permanent record of the activities. These observations and measurements will be recorded with permanent ink in a bound weatherproof field log book with consecutively numbered pages. All documentation will remain in the project files following completion of the project.

Notes will be recorded daily when in the field. The information in the field book will include the following at a minimum:

- Project name and number;
- Name(s) of field personnel and their responsibilities;
- Measurements and observations (e.g., turbidity of water, odors (if present), sheen (if present), PID/FID readings);

© 2000 PSEG Services Corporation

- Volume of water removed and time required for development (including any starts and stops of bailing/pumping during development time);
- Method of development water disposal;
- Drum numbers (if water is contained in drums) and storage location;
- Decontamination procedures; and,
- Weather conditions.

STANDARD OPERATING PROCEDURE 540

MEASURING GROUND WATER, LNAPL AND DNAPL ELEVATIONS IN MONITORING WELLS/PIEZOMETERS

1.0 PURPOSE AND APPLICABILITY

This SOP presents the procedures for field personnel to measure ground water and non-aqueous phase liquid (NAPL) elevations in monitoring wells and piezometers. The procedures in this SOP are applicable to all monitoring wells and piezometers where artesian conditions are not encountered.

Numerous methods are available for measuring ground water and NAPL elevations in monitoring wells and piezometers including: weighted steel tape used with chalk, oil-sensing paste or water-sensing paste; popper; electric water level indicator; electronic-interface probe; ultrasonic probe; and pressurized air line. This SOP will focus on the use of the electric water level indicator (e.g., M-scope or Solinst) and the electronic-interface probe because they are: 1) the most widely used devices; 2) capable of measurement accuracy to the nearest 0.01 foot; and, 3) suitable for use under most circumstances.

The electric water level indicator is designed only for immersion in water, whereas the electronic-interface probe may be immersed in water or NAPL. For monitoring wells or piezometers with known or suspected presence of NAPL, the depths to and thicknesses of both light non-aqueous phase liquid (LNAPL) and dense non-aqueous phase liquids (DNAPL) should be measured using an electronic-interface probe. **An electric water level indicator cannot recognize the top of LNAPL.** For monitoring wells or piezometers with no known or suspected NAPL, an electric water level indicator should be used. If NAPL is observed on the water level indicator probe once it is retrieved, an electronic-interface probe should be used to determine the thickness(es) of NAPL and ground water elevation.

Specific project requirements as described in an approved site-specific Work Plan, Quality Assurance Project Plan (QAPP), or Health and Safety Plan (HASP) will take precedence over the procedures described in this document. Additionally, deviation from this SOP regarding materials and techniques is acceptable providing: 1) the impact of the deviation on data quality has been evaluated by the Project Manager and has been deemed to be acceptable; and, 2) the deviation has been clearly documented in an approved site-specific Work Plan or Work Plan Addendum.

© 2000 PSEG Services Corporation

2.0 RESPONSIBILITIES

Field personnel are responsible for the proper identification of monitoring wells and piezometers, accurate measuring and recording of data, and proper decontamination of the instruments used to obtain the measurements. Field personnel are also responsible for reporting to PSEG if LNAPL or DNAPL is observed in any monitoring well/piezometer that has not previously had evidence of LNAPL or DNAPL.

3.0 MATERIALS/EQUIPMENT

Equipment and materials used to measure ground water and NAPL elevations include:

- Map with monitoring well and piezometer locations and identification numbers;
- Monitoring well keys;
- Flashlight or mirror for sunlight reflection down well;
- Tools (i.e., socket wrenches, bolt cutters, pliers, screwdrivers);
- Spare locks;
- Electric water level indicator;
- Electronic-interface probe;
- Ground water elevation log sheet;
- Personal Protective Equipment (PPE) as required by the site-specific HASP;
- Decontamination supplies (as needed); and,
- Field log book.

4.0 METHOD

4.1 General Information

The depth to the top of LNAPL (if present), ground water, DNAPL (if present) and the bottom of the monitoring well or piezometer are measured to the nearest 0.01 foot from a surveyed reference point (usually the top of the riser pipe or inner casing, if double-cased). The differences in depth are used to calculate the thickness of the various separate phase layers.

The ground water elevation is calculated for each monitoring well or piezometer by measuring the depth to the ground water from the reference point and subtracting this depth from the surveyed elevation of the reference point. The presence of LNAPL can "depress" the ground water level in a monitoring well or piezometer. A formula used to correct the measured ground water elevation for the presence of LNAPL is provided in Section 4.3.

© 2000 PSEG Services Corporation

If the electric water level indicator or electronic-interface probe is used to measure the total depth of the monitoring well or piezometer, a correction factor usually needs to be added to the reading to account for the "zero" point being slightly above the tip of the probe.

If the well riser pipe height is adjusted for any reason, new survey information will be obtained for the top of the well riser pipe prior to performing ground water elevation calculations.

All activities will be conducted using the appropriate level of protection specified in the site-specific HASP.

4.2 Procedures for Measuring Ground Water, LNAPL and DNAPL Elevations

- Confirm the identification number of the monitoring well or piezometer and note the security and integrity of the well.
- Unlock and remove the monitoring well or piezometer cap.
- If required, obtain headspace vapor readings in accordance with the methods outlined in the site-specific HASP or with the general procedures contained in SOP 240 - PID Screening for Organic Vapors. Record the headspace vapor reading on the ground water elevation log or in the field log book. (A typical ground water elevation log is provided in Figure 1.)
- Locate the surveyed reference point. This should be a permanent point marked with an indelible marker or notch cut into the riser pipe. If a reference point is being established for the first time, the reference point is generally established on the north side of the riser pipe or inner casing, or the highest point on the top of the riser pipe or inner casing if it is uneven. The top of the protective outer casing or man hole/curb box should never be used due to its susceptibility to settlement, frost heave, etc. The new reference point should be surveyed prior to performing ground water elevation calculations.
- If using an electric water level indicator, gently lower the probe into the monitoring well or piezometer until the indicator light or buzzer indicates contact with the ground water. Care must be taken to ensure that the probe hangs freely and straight in the ground water monitoring well or piezometer. The probe should be repeatedly lowered and raised to obtain an exact measurement.
- If using an electronic-interface probe, gently lower the probe into the monitoring well or piezometer, stopping to measure the depth at each "interface". Care must be taken to ensure that the probe hangs freely and straight in the ground water monitoring well or piezometer. An electronic-interface probe generally operates by emitting an audible signal when it enters water and a different audible signal when it enters NAPL. In this way, the top of LNAPL, top of water and top of DNAPL can be measured. The probe should be repeatedly lowered and raised at each interface to obtain an exact measurement.
- Record the measurement(s) on the probe line graduated scale that correspond to the depth(s) indicated by the probe on the ground water elevation log or in the field log book. (A typical ground water elevation log is provided in Figure 1.)
- Replace the cap, and lock the monitoring well or piezometer.

© 2000 PSEG Services Corporation

- Decontaminate the electric water level indicator or electronic-interface probe in accordance with the procedures described in the approved site-specific QAPP.

4.3 CORRECTION FACTOR FOR THE PRESENCE OF LNAPL

The following formula will be used to correct the measured ground water elevation for the presence of LNAPL:

$$\mathbf{GWE_{corr} = GWE + (SG)\,(T)}$$

where:

GWE_{corr}	=	corrected ground water elevation
GWE	=	uncorrected ground water elevation
SG	=	specific gravity of the floating product
T	=	measured thickness of floating product

The specific gravity is best determined by laboratory analysis of the LNAPL (free product); however, in many cases, a reasonable value can be obtained from available chemical data for the product, if known. (Information on the specific gravity of LNAPL components is available in the most recent edition of the CRC Handbook of Chemistry and Physics.)

5.0 QUALITY CONTROL

Changes in electric water level indicator or electronic-interface probe line length and graduated scale markings as a result of use, depth, and temperature may reduce the accuracy of readings. Therefore, the accuracy of the measuring device will be checked periodically.

Adherence to the sampling procedures described above may be verified through a field quality control audit. During a field quality control audit, the auditor carefully reviews equipment selection and use to ensure that appropriate equipment is utilized based on various factors including equipment capabilities. In addition, the auditor meets with key field staff to review sampling objectives of the site-specific Work Plan and results achieved, and makes recommendations. The auditor submits a report summarizing results of the audit to the Project Manager. If corrective action(s) are required, the Project Manager is responsible for ensuring that the appropriate corrective action(s) are implemented and documented.

© 2000 PSEG Services Corporation

6.0 DOCUMENTATION

Documentation of observations and data acquired in the field will provide information on the proper acquisition of ground water LNAPL and DNAPL elevations in monitoring wells and piezometers and also provide a permanent record. These observations and data will be recorded with permanent ink in a bound weatherproof field log book with consecutively numbered pages. All documentation will remain in the project files following completion of the project.

Notes will be recorded daily when in the field. The information in the field book will include the following as a minimum:

- Project name and number;
- Name(s) of person(s) conducting the measuring;
- Ground water elevation log;
- Observations;
- Air monitoring readings (as required);
- Decontamination procedures; and,
- Weather conditions.

STANDARD OPERATING PROCEDURE 210

SOIL SAMPLING
USING HAND TOOLS

1.0 PURPOSE AND APPLICABILITY

This SOP describes methods to be utilized by field personnel for the collection of soil samples using hand tools. Soil sampling using hand tools is appropriate for collecting shallow soil samples as required by a site investigation, remedial investigation, or remedial action. Soil sampling using hand tools is also appropriate, in most cases, for collecting soil samples from waste soil stockpiles.

Specific project requirements as described in an approved site-specific Work Plan, Quality Assurance Project Plan (QAPP), or Health and Safety Plan (HASP) will take precedence over the procedures described in this document. Additionally, deviation from this SOP regarding materials and techniques is acceptable providing: 1) the impact of the deviation on data quality has been evaluated by the Project Manager and has been deemed to be acceptable; and 2) the deviation has been clearly documented in an approved site-specific Work Plan or Work Plan Addendum.

2.0 RESPONSIBILITIES

Field personnel are responsible for the proper decontamination of the hand tools; locating and documenting soil sample locations in accordance with the approved, site-specific Work Plan; ensuring that all standard procedures are followed; recording all pertinent data in a field log book; and, properly handling, storing and shipping the samples.

3.0 MATERIALS/EQUIPMENT

Equipment and materials used to collect soil samples with hand tools include:

- Stakes (and flagging tape as needed) for marking sampling location;
- Steel shovels, post hole diggers or hand augers (as needed);
- Small diameter coring devices (if analyzing for volatile organic compounds);
- Small electronic or manual scale (if analyzing for volatile organic compounds);
- Stainless steel trowels or spoons;
- Stainless steel bowls or trays (as needed);
- Personal Protective Equipment (PPE) as required by the site-specific HASP;
- Decontamination supplies (as needed);
- Ruler/tape measure;

© 2001 PSEG Services Corporation

- Laboratory-supplied sample containers;
- Sample labels;
- Shipment packing material (i.e., bubble wrap, vermiculite or Styrofoam pellets as needed);
- Packing tape;
- Cooler;
- Ice;
- Shipping labels;
- Field forms: chain-of-custody, air monitoring log and/or other necessary health and safety documentation; and,
- Field log book.

4.0 METHOD

Specific sampling equipment and methodologies to be employed will be dictated by the characteristics of the soil to be sampled, the number of soil samples required, and their analytical parameters. Soil samples collected at the ground surface may be obtained using a trowel, shovel or hand auger. Depending on the subsurface conditions, a hand auger may be used to extract soil samples up to approximately 5 feet below the surface.

All sampling activities will be conducted using the appropriate level of protection specified in the site-specific HASP. Before collecting each soil sample for field or laboratory analyses, a dedicated pair of clean rubber or latex gloves will be donned.

4.1 Samples To Be Collected From 0 Feet to 0.5 Feet Below Ground Surface

Soil samples to be collected from 0 feet to 0.5 feet below ground surface (bgs) will be obtained using the following procedures:

- If applicable, clear and remove vegetation and any surface debris such as rocks with a shovel or other tool that has been cleaned by washing with non-phosphate detergent/potable water, rinsing with potable water, and rinsing with deionized water.
- Collect the sample from the top 6 inches of soil using a decontaminated trowel/spoon. Laboratory decontaminated trowels/spoons are preferred. If laboratory-decontaminated trowels/spoons are not available so as to dedicate one trowel/spoon per sample location, the trowels/spoons will be field decontaminated between sampling points in accordance with procedures described in the site-specific QAPP.
- **Samples for volatile organic compound (VOC) analysis are generally <u>not</u> collected from the 0 feet to 0.5 feet interval. See "Surface Sample Collection" (p.138) of the NJDEP Field Sampling Procedures Manual (May 1992) for guidance on the sampling depth for VOC analysis.**

© 2001 PSEG Services Corporation

- If site-specific requirements include sampling for VOC analysis at this depth, obtain the sample for VOC analysis before other parameters using the sample collection procedures provided in Section 4.4 (includes collecting the sample with a small diameter coring device and field extraction/preservation of the soil sample).
- Homogenize the soil to be sampled for non-VOC analyses either *in situ* or in a decontaminated stainless steel bowl or tray.
- Place homogenized soil into laboratory-supplied sample container(s) and cap container(s).
- If applicable, replace the vegetative mat over the disturbed area.
- Label sample container(s).
- Complete chain of custody forms.
- Package and ship samples in accordance with preservation requirements (typically ice to achieve 4 degrees Celsius. See Section 4.4 for preservation of soil samples for VOC analysis, if collected).
- Record all appropriate data (including sample location, time and physical description in accordance with the "Protocol for Describing Soil and Coal Gasification Related Material" provided in Attachment 1) in field log book.

4.2 Samples To Be Collected From Deeper Than 0.5 Feet Below Ground Surface Using Shovel/Post Hole Digger

Soil samples to be collected from deeper than 0.5 feet bgs using a shovel or post hole digger will be obtained using the following procedures:

- If applicable, clear and remove vegetation and any surface debris such as rocks with a shovel or other tool that has been cleaned by washing with non-phosphate detergent/potable water, rinsing with potable water, and rinsing with deionized water.
- Excavate sampling location to the desired depth using a shovel or post hole digger that has been cleaned by washing with non-phosphate detergent/potable water, rinsing with potable water, and rinsing with deionized water. Temporarily stockpile excavated soil on plastic sheeting placed adjacent to the sampling location.
- Collect the sample from the next 6 inches of soil using a decontaminated trowel/spoon. Laboratory decontaminated trowels/spoons are preferred. If laboratory-decontaminated trowels/spoons are not available so as to dedicate one trowel/spoon per sample location, the trowels/spoons will be field decontaminated between sampling points in accordance with procedures described in the site-specific QAPP.
- **Collecting samples for VOC analysis using a shovel or post hole digger is <u>not</u> recommended. However, if site-specific requirements include sampling for VOC analysis, see "Surface Sample Collection" (p.138) of the NJDEP Field Sampling Procedures Manual (May 1992) for specific guidance on the techniques to be used when collecting soil samples for VOC analysis.**

© 2001 PSEG Services Corporation

- If VOC analysis is to be conducted at a particular sampling depth, obtain the sample for VOC analysis before other parameters using the sample collection procedures provided in Section 4.4 (includes collecting the sample with a small diameter coring device and field extraction/preservation of the soil sample).
- Homogenize the soil to be sampled for non-VOC analyses either *in situ* or in a decontaminated stainless steel bowl or tray.
- Place homogenized soil into laboratory-supplied sample container(s) and cap container(s).
- Using the shovel or post-hole digger, replace the soil temporarily stockpiled on the plastic sheeting adjacent to the sampling location. When all stockpiled soil has been replaced, tamp the soil to achieve proper grade.
- If applicable, replace the vegetative mat over the disturbed area.
- Label sample container(s).
- Complete chain of custody forms.
- Package and ship samples in accordance with preservation requirements (typically ice to achieve 4 degrees Celsius. See Section 4.4 for preservation of soil samples for VOC analysis, if collected).
- Record all appropriate data (including sample location, time and physical description in accordance with the "Protocol for Describing Soil and Coal Gasification Related Material" provided in Attachment 1) in field log book.

4.3 Samples To Be Collected From Deeper Than 0.5 Feet Below Ground Surface Using Hand Auger

Soil samples to be collected from depths below 0.5 feet bgs using a hand auger will be obtained using the following procedures:

- If applicable, clear and remove vegetation and any surface debris such as rocks with a shovel or other tool that has been cleaned by washing with non-phosphate detergent/potable water, rinsing with potable water, and rinsing with deionized water.
- Using a hand auger that has been cleaned by washing with non-phosphate detergent/potable water, rinsing with potable water, and rinsing with deionized water, auger to the desired depth. Remove the auger. Temporarily stockpile augered soil on plastic sheeting placed adjacent to the sampling location.
- Attach a decontaminated bucket auger to the auger rods and advance the bucket sampler into the next 6 inches of soil at the base of the boring.
- **Bucket auger sampling is <u>not</u> recommended for collecting undisturbed samples for VOC analysis. See "Bucket Auger" (p. 118) of the NJDEP Field Sampling Procedures Manual (May 1992) for technical guidance on the appropriate use of a bucket auger. However, if site-specific requirements include sampling for VOC analysis, see "Surface Sample Collection" (p. 138) of the NJDEP Field Sampling Procedures Manual (May 1992) for specific guidance on the techniques to be used when collecting soil samples for VOC analysis.**

© 2001 PSEG Services Corporation

- If site-specific requirements include sampling for VOC analysis at this depth, obtain the sample for VOC analysis before other parameters using the sample collection procedures provided in Section 4.4 (includes collecting the sample with a small diameter coring device and field extraction/preservation of the soil sample).
- Transfer the sample into laboratory-supplied sample containers using a decontaminated trowel/spoon. Laboratory decontaminated trowels/spoons are preferred. If laboratory-decontaminated trowels/spoons are not available so as to dedicate one trowel/spoon per sample location, the trowels/spoons will be field decontaminated between sampling points in accordance with procedures described in the site-specific QAPP.
- Replace the soil temporarily stockpiled on the plastic sheeting adjacent to the sampling location. When all stockpiled soil has been replaced, tamp the soil to achieve proper grade.
- If applicable, replace the vegetative mat over the disturbed area.
- Label sample container(s).
- Complete chain of custody forms.
- Package and ship samples in accordance with preservation requirements (typically ice to achieve 4 degrees Celsius. See Section 4.4 for preservation of soil samples for VOC analysis, if collected).
- Record all appropriate data (including sample location, time and physical description in accordance with the "Protocol for Describing Soil and Coal Gasification Related Material" provided in Attachment 1) in field log book.

4.4 Collection of Soil Samples for Analysis of Volatile Organic Compounds

Soil samples collected for analysis of volatile organic compounds must be handled in a manner which will minimize the loss of contaminants due to volatilization and biodegradation. Therefore, these samples should not be homogenized. Also, field extraction/preservation with methanol must be conducted to minimize the volatilization and/or degradation of contaminants during sample handling and transport.

General information on sample collection methodology is provided below:

- Soil sample collection must be performed with the use of a decontaminated small diameter coring device. A modified 10-30 ml disposable syringe or commercially available small diameter tube/plunger sampler is acceptable. The small diameter coring device must be capable of collecting the required amount of sample from larger diameter core samplers (split spoons, etc.) or from freshly exposed soils.

- If a modified disposable syringe is used, it can be prepared in-house by cutting off the injection tip. Depending upon the construction of the syringe, small air vents must be cut into the plunger or the rubber tip and the retaining post must be removed. These

© 2001 PSEG Services Corporation

alterations to the plunger will prevent air from being forced through or around the soil plug during subcoring and sample extrusion.

- The small diameter core sampler must be capable of delivering the sample directly into the sample container. The outer diameter of the core sampler must be smaller than the inner diameter of the sample container to avoid loss of sample and ease the soil transfer process. The sample from the small diameter core cannot be transferred to a secondary container such as another sample bottle, zip lock bag, aluminum foil, etc., prior to placement into the sample container with the methanol preservative.

- Use a small electronic balance or manual scale for measuring the weight of the soil in the syringe. The scale must be calibrated before use. The calibration should be checked intermittently during the sampling day to ensure accuracy of the weight measurements.

Procedures for the collection of soil samples for volatile organic compounds analysis are provided below:

- Tare weigh the small diameter core sampler.

- Using a decontaminated coring device, collect 10g ± 2g (8-12 grams) of sample (wet weight). Wipe the outside of the subcoring device to remove any adherent soil. The plunger of the coring device can be pulled back allowing the open barrel of the subcore to be inserted into the soil. Depending upon the soil texture, depth or moisture content, the subcore can be inserted straight into the soil, on an angle or multiple insertions can be performed to obtain the required sample weight.

- Quickly weigh the sample while contained in the small diameter core sampler. Excess soil sample can be removed from the coring device by extruding a small portion of the core and cleaning away with a decontaminated trowel or spatula. If soil weight is below the weight limit, obtain additional sample. Re-weigh after each addition or removal of sample to the subcore until the target weight is attained (8-12g). [NOTE: when sampling soils consisting of similar textures and water content, sample weight can be estimated based on volume of previously weighed samples from sampling or practice core sampling to determine sample weights. However, analytical results from a sample exceeding the weight maximums and minimums may be rejected and thus require resampling.]

- Immediately open the sample container and slowly extrude the soil core into the pre-weighed and pre-numbered sample container supplied by the laboratory performing the analysis. Avoid splashing methanol out of the sample container. Do not insert the small diameter coring device into the mouth of small diameter sample containers or immerse the small diameter soil coring device into the methanol.

© 2001 PSEG Services Corporation

- Ensure the threads on the sample container and cap are free of soil particles. Use a clean brush or paper towel to remove the particles off the threads. The presence of soil particles compromises the seal of the container resulting in loss of methanol which may invalidate the sample.

- Secure the lid of the sample container. Gently swirl the sample to mix and break up the soil aggregate until soil is covered with methanol. Do not shake.

- In order to report the sample results on a dry weight basis, collect one duplicate sample not preserved with methanol from each sample location for moisture determination. Tightly seal the container to prevent the loss of soil moisture. This sample does not require to be weighed or preserved with methanol. A small volume sample container (15 mls or less) may be used for this sample to avoid possible sample shortages.

- Do not attach any additional adhesive-backed labels or tape to the sample containers. Record sample numbers on container avoiding covering laboratory identification number. Labels with wire or rubber band attachments may be used provided they can be removed easily for sample weighing.

- After sample collection, immediately return the containers to an iced cooler in an upright position. Sample containers can be placed in separate ziplock bags to protect other containers in case of leakage during transport. The laboratory sample number or field sample identification number may be placed on the bag and cross-referenced on the chain of custody.

5.0 QUALITY CONTROL

Adherence to the sampling procedures described above may be verified through a field quality control audit. During a field quality control audit, the auditor carefully reviews equipment selection and use to ensure that appropriate equipment is utilized based on various factors including equipment capabilities. In addition, the auditor meets with key field staff to review sampling objectives of the site-specific Work Plan and results achieved, and makes recommendations. The auditor submits a report summarizing results of the audit to the Project Manager. If corrective action(s) are required, the Project Manager is responsible for ensuring that the appropriate corrective action(s) are implemented and documented.

Sample quality control will be ensured through the use of quality assurance/quality control (QA/QC) samples designed to help identify potential sources of sample contamination. Different types of QA/QC samples include field blanks, methanol trip blanks, and duplicate samples. The types of QA/QC samples required, procedures for collecting, and frequency of collection will be indicated in the site-specific Work Plan or QAPP. All QA/QC samples

© 2001 PSEG Services Corporation

will be labeled with QA/QC identification numbers and sent to the laboratory with the other samples for analyses.

6.0 DOCUMENTATION

Documentation of observations and data acquired in the field will provide information on the proper acquisition of samples and also provide a permanent record. These observations and data will be recorded with permanent ink in a bound weatherproof field log book with consecutively numbered pages. All documentation will remain in the project files following completion of the project.

Notes will be recorded daily when in the field. The information in the field book will include the following as a minimum:

- Project name and number;
- Sampler's name;
- Sampling observations (including a description of the sample in accordance with the "Protocol for Describing Soil and Coal Gasification Related Material" provided in Attachment 1);
- Air monitoring readings (as required);
- Decontamination procedures; and,
- Weather conditions.

1.3 Project Personnel

The personnel responsible for implementing the project Health and Safety Plan (HASP) are listed in **Table B-1**. These personnel include the PSEG Project Manager and the ARCADIS project members.

2 Introduction

ARCADIS, on behalf of PSEG Services Corporation (PSEG) at the Salem Generating Station (the Station), has prepared this Health and Safety Plan (HASP) to address potential health and safety concerns that may result from the initiation of the scope-of-work outlined in the Remedial Investigation Work Plan. Specifically, this HASP addresses potential health and safety concerns that may result during the following planned activities:

- Installation of monitoring wells;
- Development of monitoring wells;
- Measurement of water levels;
- Measurement of light non-aqueous phase liquid levels;
- Surveying monitoring well locations and elevations;
- Collection of soil samples;
- Collection of groundwater samples; and,
- Interim remedial actions.

This is a list of projected activities that will be performed at the Station during the implementation of the remedial investigation. This list and the corresponding sections of the HASP discussing potential health and safety concerns that may be encountered while performing these tasks will be modified as necessary.

During the implementation of the scope of work outlined in the Remedial Investigation Work Plan, ARCADIS personnel and their subcontractors will require the escort of PSEG personnel or other site access badged personnel when working on site, or ARCADIS trained personnel while performing field activities in areas that do not have restricted access. The escorts and site access badged personnel are trained and are aware of PSEG Salem Generating Station Health and Safety Program protocols and procedures. While implementing activities on site, the Salem Generating Station Health and Safety Program supercede the procedures outlined in this HASP. The purpose of this HASP is to assign responsibilities, specify mandatory operating procedures, establish personal protection standards, and provide for contingencies that may arise while performing work in areas of the Salem Generating Station or at an off site facility that do not require escorted access or when a PSEG Health and Safety Program protocol has not been developed or is less stringent than the protocols outlined herein. In these instances, the HASP addresses safety protocols that will be followed during field operations to minimize the potential for worker's exposure.

This HASP is prepared to inform field personnel, including contractors and subcontractors of ARCADIS, of potential hazards. However, each contractor or subcontractor must assume direct responsibility for the health and safety of its own employees. Subcontractors and visitors may review this HASP and follow its procedures at their own risk. ARCADIS assumes no liability for non-ARCADIS employees and/or personnel that elect to follow this HASP. Subcontractors that elect not to follow the conditions of this HASP must have a completed, site-specific HASP for use by their employees.

Subcontractors will receive a copy of the project HASP for use as a guideline and for reference. However, subcontractors performing onsite work will be responsible for the health and safety of their own employees. Each subcontractor will identify a lead individual responsible for checking that each of the firm's employees is in compliance with health and safety procedures. Prior to commencing with field activities, each subcontractor must review and sign the Compliance Agreement in the on site copy of the HASP (**Attachment 1**).

Personnel participating in field activities must be trained in the general and specific hazards unique to this job. They must meet medical examination requirements and other requirements as set forth in 29 Code of Federal Regulations 1910.120 or other Occupational Safety and Health Administration (OSHA) regulations, as applicable. Site personnel and visitors must follow the guidelines, rules, and procedures in this document. The Project Manager or Site Health and Safety Officer may impose any other procedures or prohibitions as deem necessary for safe operations.

This Health and Safety Plan (HASP) was prepared in accordance with the Occupational Safety and Health Administration Code of Federal Regulations Title 29 Part 1910 "Occupational Safety and Health Standards for General Industry" and Title 29 Part 1926 "Occupational Safety and Health Standards for the Construction Industry." This HASP should be used in conjunction with other safety related information provided by PSEG Services Corporation (PSEG) to ensure that all health and safety issues for the project are addressed.

3 Summary of Site Conditions

The PSEG Salem Generating Station is an approximate 26-acre area of Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. The Salem Generating Station is composed of two nuclear generating units (Units 1 and 2) and one distillate oil fueled combustion turbine unit. Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectfully. The combustion turbine unit commenced operations in 1972. The nuclear generating units operate as base load units and the combustion turbine unit operates as a peaking unit. The Salem Generating Station has a combined generating capacity of approximately 2,250 MW. Over its operational life, the Salem Generating Station has experienced no significant changes in its operation.

On the evening of August 2, 2004, diesel fuel was found in Catch Basin 27 located between the Unit One Fuel Handling Building and the Unit One Refueling Water, Auxiliary Feedwater, and Primary Water storage tanks. Investigations into the source of the diesel fuel revealed that a section of underground piping adjacent to Catch Basin 27 leaked and allowed diesel fuel to enter the catch basin. The scope of work presented in the Remedial Investigation Work Plan (Section 5), was developed to evaluate the extent of diesel-related constituents in soil and groundwater and to determine the extent of separate-phase diesel fuel on the water table.

4 Project Organization

4.1 ARCADIS Personnel

The project team will include and be supported by ARCADIS safety professionals, whose responsibility will include maintenance and implementation of the HASP. Project Organization with respect to health and safety consists of Mr. Peter Milionis, the ARCADIS Project Manager, and Mr. Bradley Pierce, the ARCADIS Site Health and Safety Officer. Additional health and safety personnel may be assigned as the project moves into the field phase. The health and safety responsibilities of key project personnel are discussed below:

1. Project Manager:

    - Initiates HASP implementation.
    - Reviews the HASP.
    - Ensure the availability of the proper personal protective equipment (PPE), adequate time and budget, and qualified personnel to perform site work in a safe manner.
    - Conducts accident investigations, as necessary.
    - Communicates with the Site Health and Safety Officer on site health and safety issues.
    - Allocates resources for immediate correction of identified unsafe work conditions.
    - Communicates with the client on health and safety issues.

- Conduct periodic field audits to verify compliance with the HASP.

2. Site Health and Safety Officer:

   - Ensures that HASP is implemented and maintained.
   - Maintains record keeping activities.
   - Present at all times during site activities.
   - Initiates applicable utility location activities and permitting.
   - Ensures that work performed on the site is conducted in a safe manner.
   - Ensures immediate correction of identified unsafe work environments.
   - Acquaints field personnel with potential hazards.
   - Checks that all field personnel have read and signed the on site copy of this document (**Attachment 1**).
   - Checks that all site personnel meet OSHA requirements regarding training, medical examinations, and fit testing.
   - Conducts accident investigations in conjunction with the Project Director and Project Manager, as necessary.
   - Checks that the guidelines, rules, and procedures in this document are followed for all site work.
   - Familiar with local emergency services.
   - Conducts a tailgate health and safety meeting before work startup and at least weekly thereafter. Additional tailgate meetings may be required for specific job tasks, site activities, or when visitors come to the site.
   - Checks that visitors have had hazardous waste site training and a medical examination within the past year.
   - Ensures all necessary permits and safety information provided by the client is disseminated to other site personnel and is maintained in an organized manner.
   - Maintains and inspects PPE, monitors work area hazards, and monitors the physical condition of site personnel.
   - Shut down operations that pose a potential threat to field personnel.
   - Effect evacuation of the site, if necessary.

The Site Health and Safety Officer will be responsible for health and safety throughout the field operations. The Site Health and Safety Officer will monitor work locations for proper procedures and will have the authority to stop work if health and safety procedures cannot be followed. In addition, the SHSO will be responsible for producing written reports of health and safety incidents, if any. Emergency contact information for the above listed personnel is provided in Section 14.2.

4.2 Contractors and Subcontractors

Subcontractors will receive a copy of the project HASP for use as a guideline and for reference. However, subcontractors performing onsite work will be responsible for the health and safety of their own employees. Subcontractors will also be responsible for providing their own PPE. Each subcontractor will identify a lead individual responsible for checking that each of the firm's employees is in compliance with health and safety procedures. Prior to commencing with field activities, each subcontractor must review and sign the on site copy of the HASP (**Attachment 1**).

Prior to the start of work, each subcontractor conducting onsite investigations will supply ARCADIS with documentation that onsite personnel under its control are participants in a medical monitoring program and have acceptable health and safety training. This documentation will be maintained with the subcontractor at the Site and will include the following:

- Name
- Training program attended, trainer, hours of training received
- Statement from an occupational physician certifying participation in an annual and post-employment medical surveillance program. The statement must include verification that the person is fit to wear a respirator.
- Documentation demonstrating successful respirator fit testing within the last year prior to Level C or Level B work activities.

4.3 Others

Other persons (visitors) who may enter the work areas or otherwise observe field activities should follow the guidelines, rules, and procedures in this document, and conduct work in a safe manner. Prior to entering the Site, such persons or visitors must supply the Site Health and Safety Officer with documentation consistent with those listed in Section 4.2 above and must attend a tailgate safety briefing given by the Site Health and Safety Officer. The Site Health and Safety Officer may restrict visitors from work areas if they do not have their own HASP or proper personal protective equipment (PPE). All visitors must review and sign the on site copy of the HASP (**Attachment 1**).

5 Planned Field Activities

Several types of field activities are planned. The level of health and safety protection varies according to the type of activity. Field activities are listed in Section 1. Descriptions of health and safety procedures associated with each of these activities, as well as recommended initial levels of PPE are addressed in

Section 10. The Site Health and Safety Officer, depending on conditions at the Site, may modify the recommended initial levels of PPE.

6 Hazard Evaluation and Mitigation

6.1 Chemical Hazards

Some components of diesel fuel, a petroleum product, are known carcinogens. Petroleum products are also flammable and combustible. Hazards posed by these materials include skin exposure, fire, and explosion. All on-site personnel will wear protective clothing and show caution when in areas where potential flammable and combustible liquids may be encountered. No smoking will be allowed in the vicinity of these materials. Petroleum products also may contain volatile organic compounds and semi volatile organic compounds.

6.2 Radiochemical Hazards

Due to the nature of the operations at the site, tritium and various gamma-emitting isotopes could be encountered during the RI activities. These contaminants can have harmful effects on the body if they are inhaled, absorbed through skin contact or ingested.

Worker exposure to external whole body ionization radiation will be controlled by time of exposure, distance from sources, and shielding, if necessary. PSEG radiation protection program personnel will monitor worker exposure to ionizing radiation throughout the implementation of the remedial investigation.

Beta emitters (i.e., tritium), especially low-energy type, generally transfer energy through the production of ion pairs. Simple clothing (long sleeved shirt, long pants, etc.) usually provides adequate protection from external low-energy alpha and beta emitters.

The potential exposure pathways for radiation at the site are inhalation, skin absorption (tritium only) and accidental ingestion. Inhalation could occur during monitoring well installation activities as the radionuclides become airborne with the drill cuttings. Work practices to minimize dust generation will greatly reduce the risk of inhalation exposure. In addition, up to half of tritium exposures occurs through skin absorption. This can occur when water or material contaminated with tritium comes in contact with the skin. PPE (e.g. gloves) will be used to prevent direct skin contact with the waste materials.

Accidental ingestion of the radionuclides is another potential pathway by which radiation can enter the body. Site rules prohibiting eating, smoking, drinking, or chewing gum or tobacco in the exclusion zone and contamination reduction zone should reduce the potential for exposure.

6.3 Biological Hazards

Biological hazards may include plants; infectious waste; rabid, agitated, or disease carrying animals or pets; poisonous snakes; and disease carrying or stinging insects (e.g., ticks, mosquitoes). Mitigation of these hazards may include the following:

- Learn to recognize plants, such as poison ivy, poison oak, and poison sumac;

- Wear long-sleeved shirts, sturdy trousers, and boots when working near plants to minimize the potential for skin contact;
- If exposed to plants, shower as soon as possible with a strong soap (e.g., Fels Naphtha). Launder clothing;
- Do not touch plants that have hairy leaves, milky sap, horny leaves, or fruit or seed pods;
- Do not touch infectious waste or any items suspected of being infectious waste;
- Do not approach or agitate animals, especially ones behaving strangely or foaming at the mouth;
- Use insect repellent to avoid contact with ticks, mosquitoes, and other insects, as necessary. Ticks may be carriers of Lyme Disease. Tuck the open ends of pant legs into socks to aid in preventing ticks from crawling up pant legs. Wear Tyvek suits or coveralls taping the open ends of the legs to safety boots. Conduct frequent "tick checks" in an attempt to locate and remove ticks prior to being bitten. Avoid contamination of field samples when using repellent;
- If possible, avoid contact with poisonous snakes or other reptiles by quietly walking away. If bitten, seek medical assistance immediately;
- Avoid contact with rodents because they are frequently hosts to fleas, which can carry typhus and other diseases. Rodent urine may also contain spirochetes, which are harmful to human health; and,
- Avoid encounters with stinging insects.

6.4 Physical Hazards

6.4.1 Slips, Trips and Falls

Care will be taken by all site personnel to exercise caution during work to prevent slips, trips, and falls. Mitigation of this hazard may be achieved through good housekeeping activities, use of proper foot protection, proper placement of equipment and power cords, and use of engineering controls (barricading, covering, removal, etc.) to prevent the hazard.

Any work performed by site personnel at an elevation 6 feet above ground surface shall require the use of appropriate fall protection equipment.

6.4.2 Fire and Explosive Atmospheres

Fires and explosions are not expected; however, ABC-rated fire extinguishers will be available at the Site. Drill rigs must have a 20-pound ABC-rated fire extinguisher. Fire extinguisher use is limited to fighting very small fires. Do not attempt to fight large fires.

Explosive or flammable material should only be stored in approved facilities as described in 27 CFR Section 181 and applicable state regulations. There will be no smoking allowed except in designated

locations and any sparking equipment will be kept at least 50 feet from explosive or flammable storage or where flammable liquid or vapor is present. The Site Health and Safety Officer may use a combustible gas indicator if he/she deems there is potential for explosive gas and obtain hot work permits if required by the facility.

6.4.3 Heat Stress

Symptoms of heat stress shall be monitored at temperatures above 80 degrees Fahrenheit. Heat stress involves three general categories: heat cramps, heat exhaustion, and heat stroke.

- Heat cramps usually occur first and generally include cramps in the abdomen and legs.
- Heat exhaustion is more serious and signals of this form of heat stress usually involve cool, moist, pale, or flushed skin, headache, nausea, dizziness, weakness, and exhaustion.
- Heat stroke is the most serious form of heat stress, and workers suffering from this condition should get immediate medical attention. The signals of heat stoke include red hot dry skin, changes in consciousness, rapid weak pulse, and rapid shallow breathing.

Early detection and safe work habits are the best measures for preventing heat stress hazards. At a minimum, ARCADIS personnel and others will adhere to the PSEG Heat Stress Program included as Attachment 2 while performing work in areas of the Salem Generating Station or at an off site facility. In addition, it is extremely important to drink plenty of fluids during hot weather, even when not thirsty, and to take rest breaks in order for the body to cool down. Site workers exhibiting any of the signs of heat stress above should take preventive measures including getting out of the heat, loosen any tight clothing, applying cool wet cloths, and for conscious victims, consumption of approximately 4oz of water every 15 minutes. If the victim refuses water, vomits, or starts to lose consciousness, seek immediate medical attention.

The sun is another hazard for which protection against sunburn and long-term risks to skin cancer are necessary. Site workers should use sunscreen or cover the exposed parts of their bodies to protect against harmful sunrays. It should be remembered that covering the body as protection against sunrays may increase the likelihood of heat stress hazards. Keeping alert of warning signs and taking prompt preventive measures is critical to preventing hazards associated with the sun and heat.

6.4.4 Cold Stress

Symptoms of cold stress should be monitored at temperatures below 50 degrees Fahrenheit. Two general categories of cold stress hazards include hypothermia and frostbite. Hypothermia occurs when the body cools down and its ability to stay warm fails. This condition is very serious and can cause death. Symptoms of hypothermia include shivering, numbness, glassy stare, apathy, and loss of consciousness. The temperature does not have to be below freezing for hypothermia to occur. If the conditions are right, hypothermia can occur when the temperature is near 50 degrees Fahrenheit. First aid for hypothermia includes removing any wet clothing, wrapping the victim in blankets and placing them in a warm place, and if the victim is conscious, slowly give them warm liquids. Avoid warming the victim too quickly since this can cause complication with the heart. Workers suffering from hypothermia should seek medical attention.

Frostbite is also a serious cold stress hazard and is caused by freezing of body parts, especially fingers and toes. Symptoms of frostbite include lack of feeling in the affected area, skin that appears waxy, is cold to the touch, or is discolored (flushed, white, yellow, or blue). To care for frostbite, the victim should be placed in warm water (not exceeding 105 degrees Fahrenheit) until the affected area looks red and feels warm. Loosely bandage the area with a dry sterile dressing. If fingers or toes are frostbitten, place cotton or gauze between them. Do not break any blisters and get prompt medical attention.

6.4.5 Acoustical Hazards

Acoustical hazards may be present during drilling and sampling activities. Proper NIOSH-approved hearing protection will be required during these activities.

6.4.6 Electrical and Utilities

Subsurface utilities may be present in work areas. In addition, overhead power lines may be present. Electrical generators, submersible pumps, and other electrical equipment may also be used as part of field activities. Mitigation of utility and electrical hazards may include, but are not limited to the following:

- Buried utilities should be located and marked before drilling or other intrusive activities;
- A minimum 10-foot clearance should be maintained from overhead power lines, although the utility company should be contacted for minimum clearance requirements;
- If unavoidably close to buried or overhead power lines, turn the power off, and lock and tag the circuit breaker;
- Properly ground electrical equipment. Use only three-wire grounded receptacles and extension cords;
- Avoid standing in water when operating electrical equipment;
- If equipment must be connected by splicing wires, make sure all connections are properly taped;
- Consider all wires live until locked and tagged out;
- Be familiar with specific operating instructions for each piece of equipment; and,
- Obtain permits, licenses, or right-of-entry required by local or state authorities;

6.4.7 Illumination

Proper illumination will be required for any activity conducted at the site. If work is to be performed after sunset or inside enclosed structures then auxiliary lighting will be used.

6.4.8 Hand and Power Tools

Hand and power tools present serious hazards especially to fingers and hands in addition to eye injury resulting from flying debris. All hand tools shall be inspected prior to use to ensure the tool is in good condition with good working parts, and is appropriate for the task. All power tools shall also be inspected similarly to hand tools and will also be inspected for proper wiring and grounding. Inspection to ensure all of the safety guards and switches provided by the manufacturer are present and in good working condition will also be conducted. If any hand tool does not meet the criteria specified in this section, it will be repaired by a properly trained individual or replaced.

The refueling of gasoline-powered equipment will not be performed while the equipment is in operation and the engine will be allowed to cool prior to refueling.

6.4.9 Heavy Lifting

Care shall be taken by all workers on site to perform work which does not cause excessive stress on the body. Objects should not be lifted in excess of the individual's ability to lift the object and proper lifting techniques should be used. These include holding the object close to the body, obtaining a secure grip, keeping the back straight, and lifting the object with the legs and not the back. Care will also be taken by all site workers to avoid working in positions that involve excessive or frequent twisting or stooping.

6.4.10 Inclement Weather

Severe weather presents a very real safety concern on this and any other job site. Work will not be performed during periods of lightning, heavy rain, or high winds. When lightning occurs, work at the site will not resume until 15 minutes after the last lightning has occurred or until judged safe by the Site Health and Safety Officer.

6.4.11 Heavy Equipment Operation

Mechanized equipment like drilling equipment, skid steers, trackhoes, bulldozers and backhoes represent serious hazards to site workers. Care shall be taken by all personnel to exercise caution when working with mechanized equipment to prevent clothing from being caught in moving parts, placing body parts in close vicinity to pinch points on equipment, or using the equipment on slopes or unstable surfaces in excess of manufacturer's recommendations. Site personnel, visitors, or other persons who are not performing necessary work shall remain at a distance of at least 15 feet from any moving part of the mechanized equipment and all workers within 15 feet of the equipment are required to wear, at a minimum, hard hats, safety glasses, steel-toed boots, and hearing protection, if applicable.

The Site Health and Safety Officer will inspect all mechanized equipment at the beginning of the field work for proper working condition and to ensure that all manufacturer supplied safety cutoff switches and protective guards are in place. Equipment that has deficiencies in these areas will not be used on this project until a properly trained individual makes the appropriate repairs. All equipment should be inspected daily to ensure proper working condition.

6.4.12 Vehicular Traffic

Work performed in or on the right-of-way of any city, county, state, or federal road shall be conducted in accordance with the Uniform Code of Traffic Control Devices issued by the US Department of Transportation. All site personnel shall wear an orange reflective vest during work in these areas. All traffic cones used in right-of-ways or to shift/detour traffic shall be at least 18 inches tall.

7 ARCADIS Health and Safety Programs

Required ARCADIS health and safety programs, including training and medical monitoring, respiratory protection, and hazard communication, are presented in this section.

7.1 Required Personnel Training

ARCADIS will provide training to its employees consistent with regulations promulgated by the Occupational Safety & Health Administration (OSHA). ARCADIS employees are required to receive the following training:

- Hazwoper 29 CFR 1910.120(e);
- Hazard communication 29 CFR 1910.1200 (h) (3);
- Personal protective equipment 29CFR 1910.138;
- Respiratory protection 29 CFR 1910.134; and
- Hearing conservation 29 CFR 1910.95.

A more detailed description of the ARCADIS health and safety training policy is provided in **Attachment 3**.

7.2 Management and Supervisory Training

In accordance with 29 CFR 1910.120(e)(4) and applicable state regulations, individuals who manage or supervise personnel engaged in hazardous waste operations at the site must receive 40 hours of offsite instruction and three days of field experience supervised by a trained supervisor. In addition, management and supervisory personnel shall receive an additional 8 hours of specialized training that addresses the safety and health program, training requirements, personal protective and respiratory equipment program, health hazard monitoring procedures, accident investigation, and emergency response procedures.

7.3 Refresher Training

Refresher training in accordance with 29 CFR 1910.120(e)(8) and applicable state regulations shall be completed at least annually following the completion of the individual's 40-hour or 24-hour training

course. Personnel will be required to attend the annual refresher training to maintain their qualifications for hazardous waste site operations.

7.4 Documentation

Training must be properly documented and kept readily available or onsite for reference by the Site Health and Safety Officer or designated representative. Personnel required to meet the training requirements must present evidence of this training at the Site. The Site Health and Safety Officer is responsible for checking before each activity to verify complete and current documentation.

7.5 Exempt Personnel

Exempt personnel requesting access to the work areas could include: personnel making deliveries or performing repairs to utilities, public or government officials, untrained visitors, or local residents. Individuals from these groups will not be required to comply with the training requirements as previously stated or the medical monitoring as discussed in Section 7.8. However, access will be limited to designated work, delivery, or observation areas to minimize potential exposure. Observation areas will be upwind from site operations, as determined on the basis of predominant wind direction, so as not to receive dust or chemical contaminants. Access to observation areas may be restricted by weather conditions or site activities. Approvals for exempting personnel, and decisions on access limitations for other personnel, will be handled on a case-by-case basis by the Site Health and Safety Officer in consultation with the ARCADIS Project Manager.

7.6 Tailgate Safety Meetings

A tailgate safety meeting shall be conducted each morning, or when (1) risks or hazards change, (2) new personnel arrive, or (3) site operations warrant indoctrination and training. The Site Health and Safety Officer or another qualified individual shall conduct safety meetings. Where procedural deficiencies are identified, additional safety meetings will be conducted to address the situation. The following should be addressed during the meetings:

- Review of planned activities
- Hazards suspected
- PPE required
- Communications
- Field personnel responsibilities
- Decontamination procedures
- Emergency procedures

Tailgate safety meetings will be documented on the appropriate form in **Attachment 4**.

7.7 Safety Inspections and Audits

The Site Health and Safety Officer will inspect the site daily to identify potential hazardous conditions or work areas. The Project Manager will visit the site periodically to evaluate whether work operations are being conducted in compliance with the protocols and procedures outlined in this HASP.

7.8 Medical Monitoring

A detailed description of the ARCADIS medical surveillance program is provided in **Attachment 5**.

7.9 Respiratory Protection Policy

A detailed description of the ARCADIS respiratory protection policy is provided in **Attachment 6**.

Site visitors, subcontractors, or others who may request entry into the work area must show proof of current (annual) respirator fit testing. Copies of this documentation will be kept readily available onsite, as applicable.

7.10 Hazard Communication

The principal goals of hazard communication are to inform ARCADIS employees about potential hazards associated with routinely used chemicals, and to identify appropriate procedures and protective equipment to be employed during chemical use and handling.

7.10.1 Container Labeling

ARCADIS requires that all containers of hazardous chemicals be labeled in accordance with OSHA regulations. Containers that must be labeled include tanks, pails, cans, drums, or other receptacles used to store chemicals for longer than one 8-hour shift. Periodic inspections will be performed to ensure that containers stored or used at the site are properly labeled.

7.10.2 Material Safety Data Sheets

Material Safety Data Sheets (MSDSs) are obtained when hazardous substances are purchased to conduct field activities. The MSDSs are kept at the support facility for field activities. The Site Health and Safety Officer must maintain and review all MSDSs for new information. Employees may request any or all MSDSs for review at any time. MSDSs for chemicals obtained to perform field activities will be included in **Attachment 7**.

7.11 Incident Reports

The Site Health and Safety Officer must complete an OSHA 101 form (**Attachment 8**) when an accident occurs. The completed form must be sent to the Project Manager within 24 hours of the incident. If a fatality, or 5 or more hospitalized injuries or illnesses occur as the result of a single incident, the Project Manager must contact the Corporate Health and Safety Officer immediately. All Site work activities will

cease, and work will not re-commence until an investigation of the incident is complete. The Corporate Health and Safety Officer must report the incident to OSHA within 48 hours of its occurrence.

7.12 Weekly Safety Report

The Site Health and Safety Officer will prepare a weekly safety report for submittal to PSEG throughout the implementation of the field work associated with the remedial investigation. The weekly safety report will provide PSEG with a summary of the field work completed during the week, a synopsis of each daily tailgate safety meeting, project safety-related concerns, action items to be addressed, status of previous action items, and the signed attendance lists for the daily tailgate safety meetings.

7.13 Personal Hygiene and Sanitation

In accordance with OSHA 29 CFR 1910.120(n), washroom and restroom facilities will be made available to field personnel. Additionally, potable water will be supplied to all field personnel.

7.14 General Work Practice Requirements

A copy of this HASP will be maintained on the Site at all times. The following work practices apply to all field activities on the Site:

- ARCADIS personnel conducting the field activities at the Site will be participants in the Company's Health and Safety Program, which includes mandatory OSHA training, medical surveillance, and respirator fit-testing;
- A supply of PPE will be kept onsite in sufficient quantity to enable field personnel to conduct their duties in a safe manner. The minimum level of PPE required for all field activities are long-sleeve shirts, long pants, steel-toe safety boots and nitrile gloves. Leather work gloves will be required for any activity involving the collection of debris;
- Daily tailgate safety meetings will be conducted to discuss hazards associated with tasks to be performed, personnel protection protocol, and emergency procedures;
- Personnel involved in the remediation work will be required to sign the HASP Compliance Agreement (**Attachment 1**).
- All underground utilities and structures will be marked out and cleared before any ground intrusive work begins. This will be recorded on the form provided in **Attachment 7**.
- No eating, drinking, or smoking will be permitted in contamination reduction or exclusion zones;
- No source ignition will be permitted in contamination reduction or exclusion zones areas unless cleared by the Project Manager or Site Health and Safety Officer;
- Work will cease during hazardous weather conditions such as thunderstorms or tornadoes;
- No unauthorized personnel shall enter or be permitted onsite at any time;

- The use and consumption of alcohol, illegal drugs, or drugs and other substances that could alter or impair coordination, judgment, or response time are strictly forbidden at the site;
- Vehicles must be parked away from piles of dried vegetation or any potentially combustible material, since heat from an exhaust system or catalytic converter might be sufficient to ignit the material; and,
- Site personnel should dress to present a neat appearance, commensurate with the work activity and conditions being undertaken.

7.15 Hand Signal Communication

Since verbal communication is not possible at all time, or can be interfered with due to heavy equipment and personnel protective equipment, the following set of universal hand signals may be used:

Universal Hand Signals

Signal	*Meaning*
Hand gripping throat	Unable to breathe
Grip partner's wrist or around waist	Leave work area immediately
Hand on top of head	Need assistance
Thumbs up	OK, I understand
Thumbs down	No

7.16 Emergency Evacuation Signal

In the event of an emergency requiring the evacuation of the work zone, the following emergency evacuation signal will be repeated every 30 seconds until all personnel are evacuated and accounted for:

- Two long horn blasts.

8 Contingency Planning

8.1 Confined Space Entry

A confined space is defined as a space or work area not designed or intended for normal human occupancy, having limited means of egress and poor natural ventilation; and/or any structure, including buildings or rooms that have limited means of egress. Confined spaces can serve as accumulation points for vapors or gases that could displace oxygen or create a toxic or explosive atmosphere. **Entry into**

confined spaces is forbidden under this scope of work. If work is required in a potential or recognized confined space, additional requirements are needed (permits, training, additional monitoring equipment and personnel) to conduct the work. Permits, plans and equipment needed to enter confined spaces also require approval from Corporate Health and Safety. If confined space entry becomes necessary, this HASP will be modified to include confined space entry procedures pursuant to OSHA 29 CFR 1910.120(b)(4)(ii)(I).

Other areas that do not classify as confined spaces but could serve as accumulation points for hazardous vapors should be thoroughly monitored to ensure a safe working environment. First, the area should be monitored for oxygen deficiency since combustible gas meters are dependent on the oxygen concentration. Second, the atmosphere should be tested for combustible gases. Finally, specific testing for toxic vapors (e.g., carbon monoxide, hydrogen sulfide, etc.) should be performed. The need to conduct such testing shall be determined by the Site Health and Safety Officer.

8.2 Excavations and Trenching

Trenching and excavation activities are not anticipated during the remedial investigation. If trenching and excavation activities become necessary, the HASP will be modified to include trenching and excavation procedures pursuant to OSHA 29 CFR 1910.120(b)(1)(3).

8.3 Handling Drums and Containers

In accordance with OSHA 29 CFR 1910.120(j), all hazardous substances and potentially contaminated materials shall be stored in drums or containers that satisfy Department of Transportation, OSHA and USEPA requirements. All drums and containers will be labeled for identification and transported to a central staging area identified by the Site Health and Safety Officer. Prior to movement of drums or containers, all employees exposed to the transfer operation shall be warned of the potential hazards associated with the contents of the drums or containers.

8.4 Spill Containment Program

The following sections provide guidance regarding emergency response to a chemical spill or accidental discharge of groundwater, including initial response to the incident and cleanup. Precautions you should take to minimize the likelihood of a spill are presented at the end of this section.

8.4.1 Initial Spill Response

When a spill occurs:

- Minimize or contain the flow by shutting off a valve, repairing the leak, righting an overturned barrel, or whatever action is appropriate. Remember that your safety is of primary concern. Only attempt emergency response actions if you can do so without injury or harm to yourself.
- Provide first aid to injured persons as needed.
- If the spill occurs on a porous surface (e.g., soil, gravel) mark the area in preparation for excavation if that is determined to be the appropriate response action. If the spill occurs on

concrete, asphalt, or similar material, use an absorbent material to contain the spill. Cover the area with soil, a tarp, plastic, or other appropriate material if the spilled material is volatile and cannot be cleaned up immediately.

- Call the Site Health and Safety Officer or the local emergency response organization (as applicable), to report the incident. See Sections 14.1 and 14.2 for emergency telephone numbers. If possible, two ARCADIS personnel should remain near the work area in a safe location at least 30 feet upwind of the spill until emergency response representatives arrive.

- Dependent on the location and chemical nature of the spilled liquid, initial response action may require donning Level C or Level B PPE.

8.4.2 Spill Site Decontamination

ARCADIS and subcontractor personnel involved in the response action will undergo limited personal decontamination upwind of the incident site. Further decontamination will be completed in the support zone. The Site Health and Safety Officer will authorize field personnel to leave the job site or continue work, as appropriate, and will provide guidance regarding decontamination and/or disposition of equipment and vehicles.

If personnel come in contact with fuel, they should remove and dispose contaminated PPE, change out of contaminated field clothing, and wash exposed skin with soap and water.

8.4.3 Cleanup Materials and Used Personal Protective Equipment Disposal

Materials used in spill cleanup must be containerized. The Field Operations Manager should assess whether the surficial material on which the spill is located requires treatment or removal and relay this information to the project manager.

Equipment and tools used during spill cleanup will be thoroughly cleaned.

8.4.4 Spill Prevention

To minimize the potential for a spill, you should follow these guidelines:

- Receive instruction concerning recognition of potential spill problems, preventative maintenance actions, and increased safety awareness.

- Inspect stored materials at the beginning of each work shift. The container condition, as well as any notation of leaks or staining that may be related to or an indication of a potential spill, will be recorded in a field logbook. Any abnormalities and steps taken to remedy the situation must be reported immediately to the Field Operations Manager.

- Inspect transfer vehicles and equipment at the beginning of each day. Equipment conditions, as well as any notation of leaks or staining that may be related to or indicative of a potential spill, will be recorded in a field logbook. Loose and or worn connections and worn hoses will also be

noted. Any abnormalities must be reported immediately to the Field Operations Manager and steps should be taken to remedy the situation before continuing transfer activities.

- Make sure materials being stored are compatible with the containers in which they are being stored. Materials that are likely to react when exposed together will not be stored in the same area. Caustics and corrosives will be stored in separate cabinets affixed with caution labels. Spillable items, if stored on shelves, will be no higher than 4 feet off the floor surface. (This height is to limit the potential for getting a toxic substance in the eyes).

- Store containers larger than 1 gallon separately from smaller quantities. Larger liquid storage containers will be stored in a warehouse and must have a secondary containment system. This system can be as simple as a liner with a berm constructed of 4-inch high boarding and should be able to contain an amount 10 percent greater than that of the original container.

- Transfer liquid with catch basins under each joint or valve or with the hose or pipe lined so that no liquid can escape.

8.5 Hot Work

Hot work activities (i.e., welding, cutting, electrical) are not anticipated during the remedial investigation. If hot work activities become necessary, the HASP will be modified to include trenching and excavation procedures pursuant to OSHA 29 CFR 1910.119(k), OSHA 1910.146, and OSHA 1926.64(k), et al as applicable.

9 Worker Monitoring Programs

9.1 Heat Stress Monitoring

Symptoms of heat stress shall be monitored at temperatures above 80 degrees Fahrenheit. The Site Health and Safety Officer will be responsible for monitoring Site workers if conditions warrant. Heat stress involves three general categories: heat cramps, heat exhaustion, and heat stroke. Symptoms of the three general categories of heat stress are identified in Section 6.4.3.

Early detection and safe work habits are the best measures for preventing heat stress hazards. One or more of the following control measures can be used to help control heat stress.

- Site workers will be encouraged to drink plenty of water throughout the day. They will be advised to slightly increase their salt intake by lightly salting their food;

- On-site drinking water will be kept cool to encourage personnel to drink frequently;

- A work regimen that will provide adequate rest periods for cooling down will be established, as required;

- All personnel will be advised of the dangers and symptoms of heat stroke, heat exhaustion, and heat cramps;

- Cooling devices such as vortex tubes or cooling vests should be used when personnel must wear impermeable clothing in conditions of extreme heat;
- Employees should be instructed to monitor themselves and coworkers for signs of heat stress and to take additional breaks as necessary;
- A shaded rest area must be provided. All breaks should take place in the shaded rest area;
- Employees shall not be assigned to other tasks during breaks;
- Employees shall remove impermeable garments during rest periods. This includes white Tyvek™ type garments; and
- All employees shall be informed of the importance of adequate rest, acclimation, and proper diet in the prevention of heat stress disorders.

9.2 Cold Stress Monitoring

Symptoms of cold stress should be monitored at temperatures below 50 degrees Fahrenheit. The Site Health and Safety Officer will be responsible for monitoring Site workers if conditions warrant. Two general categories of cold stress hazards include hypothermia and frostbite. The symptoms of cold stress are identified in Section 6.4.4.

Site workers will be protected from exposure to prevent a drop in the core body temperature. Lower body temperatures often result in reduced mental alertness, reduction in rational decision making, or loss of consciousness with the threat of fatal consequences. Site workers should be provided with warm clothing, such as mittens, heavy socks, etc., when the air temperature is below 45 degrees Fahrenheit. Protective clothing such as Tyvek or other disposable coveralls may be used to shield employees from the wind. When the air temperature is below 35 degrees Fahrenheit, the following work practices must be implemented:

- If the clothing of a Site worker might become wet on the job site, the outer layer of clothing must be water impermeable;
- If a Site worker's underclothing becomes wet in any way, the worker must change into dry clothing immediately. If the clothing becomes wet from sweating (and the employee is not uncomfortable), the employee may finish the task at hand prior to changing into dry clothing;
- Site workers must be provided with a warm (>65 degrees Fahrenheit) break area;
- Hot liquids such as soups or warm drinks shall be provided in the work area. The intake of coffee and tea should be limited due to their circulatory and diuretic effects;
- The buddy system shall be practiced at all times on the Site. Any Site worker observed with severe shivering shall leave the work area immediately;
- Site workers should dress in layers with thinner, lighter clothing worn next to the body;

- Site workers should avoid overdressing when going into warm areas of when performing strenuous activities; and

- Employees handling liquids with a high vapor pressure, such as gasoline, methanol, of hexane, shall take special precautions to avoid soaking of gloves and clothing with those materials.

9.3 Area and Personnel Monitoring

Area and personnel monitoring will be conducted in accordance with the procedures outlined in the Salem Generating Station Radiation Protection Program.

10 Personal Protective Equipment

PPE is required to be worn by workers for all onsite work and whenever there is potential to come into contact with contaminated soil, water, or hazardous substances or conditions. Based upon an evaluation of the hazards, all tasks will initially be performed in Level D protection. PSEG radiation protection program personnel, in accordance with the procedures outlined in the Salem Generating Station Radiation Protection Program, will conduct radiation protection monitoring. In the event that the established action levels are exceeded, the level of protection may be upgraded to Level C or Level B. PPE Levels may be upgraded or downgraded by the Site Health and Safety Officer as field conditions warrant, or by PSEG radiation protection program personnel.

The following is a description of the PPE required for each level:

Level D

- Hard hat
- Disposable coveralls
- Safety glasses, goggles, or face shield
- Steel-toe and shank, chemical-resistant boots
- Chemical-resistant gloves
- Hearing protection with a noise reduction rating (NRR) of 33 decibels, or greater

Level C

- Safety glasses, goggles, or face shield
- Hard hat
- Disposable coveralls

- Full face air purifying respirator equipped with organic vapor cartridges and dust filter
- Steel-toe and shank, chemical-resistant boots
- Chemical-resistant gloves
- Hearing protection with a noise reduction rating (NRR) of 33 decibels, or greater

Level B

- Safety glasses, goggles, or face shield
- Hard hat
- Disposable coveralls
- Supplied air respirator
- Steel-toe and shank, chemical-resistant boots
- Chemical-resistant gloves
- Hearing protection with a noise reduction rating (NRR) of 33 decibels, or greater

ARCADIS' Project Manager will ensure that the proper PPE is supplied to ARCADIS employees. Subcontractors and visitors will be required to supply their own PPE.

11 Work Zone and Site Control Measures

Zones will be established to prevent or minimize exposure of personnel to hazards by establishing boundaries to reduce migration of contaminants into clean areas. For this site, a three-zone approach will be used for most field activities. The zones will be identified during safety briefings and will be clearly marked by traffic cones, barricades, signs, or other means. These three zones shall be designated as the Support Zone, the Contamination Reduction Zone, and the Exclusion Zone. Work area entrance and exit shall be through controlled access points established for each work location.

11.1 Support Zone

The Support Zone is the clean area in which the possibility of encountering hazardous materials or conditions is minimal. Therefore, personal protective and respiratory equipment are not necessary. Inside the Support Zone, the following will be available: an effective means of communication, access to first aid supplies, a fire extinguisher, drinking water, and other appropriate support facilities. The Support Zone shall also serve as the main point of contact for visitor check-in and initiation of emergency services when necessary.

11.2 Contamination Reduction Zone

The Contamination Reduction Zone is the area where equipment and personnel are decontaminated before leaving the Exclusion Zone. Personnel will remove and/or decontaminate PPE, and place it in appropriate containers. Site vehicles and equipment will also be decontaminated in the Contaminant Reduction Zone. The Contaminant Reduction Zone will consist of a decontamination pad (temporary or permanent); a means of washing protective equipment, site vehicles, and equipment; containers for liquids, solids, and PPE; first aid supplies; an eyewash/emergency shower; and a fire extinguisher. Decontamination activities conducted in the Contaminant Reduction Zone will be performed in a manner consistent with the procedures outlined in Section 12 of this HASP.

Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases the probability of hand-to-mouth transfer and ingestion of material is prohibited in the Contaminant Reduction Zone.

11.3 Exclusion Zone

The Exclusion Zone includes the work activities at the Site (e.g., drilling, sampling, etc.). Only authorized, trained, and qualified personnel with the appropriate personal protection and respiratory equipment shall be admitted. Personnel entering the Exclusion Zone must use the buddy system. If a situation arises where the buddy system cannot be used, constant visual contact will be maintained with at least one other worker. The maximum distance for visual contact is 200 feet.

Work activities within the Exclusion Zone pose the greatest possibility of exposure to personnel and equipment. The Site Health and Safety Officer shall be responsible for controlling the access points and keeping bystanders and unauthorized personnel to a minimum. The Exclusion Zone will be clearly marked with flagging, barricade tape, traffic cones, or other signals to limit access.

A "hot line" will be established between the CRZ and the Exclusion Zone. Upon exiting the Exclusion Zone, no one will cross the "hot line" without first implementing decontamination procedures. For drilling, well installation, sampling, and other intrusive work, a central decontamination station will be established for decontamination of material and equipment. Unauthorized personnel will not be permitted to pass the "hot line." As the locations of field activities change, differing contaminant reduction and support zones may be established.

Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases the probability of hand-to-mouth transfer and ingestion of material is prohibited in the Exclusion Zone.

11.4 Work Zone Control

Work zone layouts and locations will be established by the Site Health and Safety Officer at the time of the work and will be demarcated with barrier tape, barrier ribbon, or other suitable warning devices, where necessary.

12 Decontamination Procedures

All personnel performing work tasks in the work areas must pass through the Contaminant Reduction Zone decontamination procedure, regardless of the work task or protection used. The equipment

decontamination pack is the primary corridor for passing between the exclusion and support zones. All equipment and tools used within the work area will also undergo decontamination. In accordance with the PSEG radiation protection program, final inspection of the equipment prior to leaving the work area is the responsibility of PSEG personnel.

12.1 Personnel Decontamination

The following decontamination procedure will be employed for those field activities requiring Level B and Level C protection. A similar procedure, with two fewer stations (Stations 4 and 6), will be used by personnel requiring Level D protection.

Station 1: Segregated Equipment Drop

Equipment used in the work area (tools, monitoring equipment, radios, clipboards, etc.) will be deposited on plastic drop cloths or in different containers with plastic liners. Tools and devices will be washed/wiped in a detergent solution and rinsed with clean water, then stored or serviced for reuse. Tools and similar field equipment may require a high-temperature water/stream wash. This station may be located adjacent to the CRZ decontamination line.

Station 2: Wash and Rinse Outer Garment, Boots, and Gloves

Outer boots and gloves will be scrubbed with a decontamination solution, consisting of detergent and water. Gloves, boots, and garment will be rinsed with a hand-pump spray bottle or in a plastic bucket or tub.

Station 3: Removal of Outer Gloves

Outer gloves and any accompanying tape will be removed. Tape should be placed in a container with a plastic liner. Reusable gloves will be cleaned and stored for future use.

Station 4: Cartridge/Bottle Change

If a worker leaves the exclusion zone to change respirator cartridges or supplied air bottles, Station 4 must be the last step in the decontamination procedure. After the worker's cartridges/bottles have been exchanged, the outer glove and boot covers are donned and joints taped, if required. The worker may then return to the exclusion zone.

Station 5: Removal of Boots and Outer Garment

Boots and outer garment will be removed. The outer, disposable, chemical-resistant garment should be deposited in a plastic-lined container. Reusable protective garments will be removed and stored for future use.

Station 6: Removal of Respiratory Protection

The respirator facepiece will be removed, and the respirator will be placed in a plastic-lined container for decontamination.

No personnel protective equipment worn on site will be taken off site without prior decontamination or proper disposal.

12.2 Equipment and Vehicles

Equipment will be washed with decontamination solution (i.e., detergent and water), rinsed with clean water, and if required, steam cleaned to the satisfaction of the Site Health and Safety Officer and/or the PSEG radiation protection program personnel prior to reuse. Vehicles will be decontaminated in a designated area. Support vehicles will be decontaminated as deemed necessary by the Site Health and Safety Officer and/or the PSEG radiation protection program personnel.

12.3 Decontamination Personnel

Personnel working the Contaminant Reduction Zone will wear, at a minimum, the same level of protection as the workers. In addition, face shields will be worn rather than safety glasses or goggles to protect personnel against splashing.

12.4 Decontamination Waste Disposal

Solid wastes (discarded protective clothing, tape, etc.) will be containerized and disposed of in an approved manner.

12.5 Equipment Needs

The following equipment may be used during the decontamination procedure:

Station 1:

- Plastic drop cloths
- Plastic 30- or 50-gallon containers

Station 2:

- Hand-operated garden-type sprayers
- Large tubs or wash containers (30- to 50-gallon capacity)
- Plastic buckets
- Brushes
- Decontamination solution

    1. Commercially available detergent

Station 3:

- Plastic liners
- Plastic containers (30- to 50-gallon capacity)

Station 4:

- Duct tape
- Respirator cartridges
- Supplied air bottles

Station 5:

- Plastic liners
- Plastic containers (30- to 50-gallon capacity)
- Detergent and/or boric acid for decontamination of respirators

Station 6:

- Plastic liners
- Plastic containers (30- to 50-gallon capacity)
- Bench
- Rack for boots

Other Equipment:

- Hand-operated garden-type hose sprayers or garden hose for vehicle and equipment washing and rinsing
- Steam cleaner
- Potable water supply
- Wash basins

12.6 Contaminant Containment

A housekeeping program will be implemented during the course of the work tasks to avoid the spread of any contaminants beyond the exclusion zone. The housekeeping program will include the following:

- Periodic policing of the work areas for debris, including paper products, cans, etc.
- Periodic changing of wash and rinse water for hands, face, and equipment.
- Periodic removal (weekly minimum) of all garbage bags and containers used to dispose of disposable clothing. Contaminated materials will be disposed of in an approved manner.
- Drill cuttings and development water generated during all drilling activities will be removed by PSEG.
- The decontamination pad shall be cleaned on an as-needed basis to reduce the potential for tracking contaminated media, dust, and dirt through the Contaminant Reduction Zone.

13 Community Health and Safety Considerations

In accordance with the PSEG radiation protection program for the Salem Generating Station, PSEG personnel will provide authorization prior to any equipment, personnel and samples leaving the Site.

14 Emergency Response

In the event of an emergency, the work site will be evacuated and the appropriate emergency phone numbers shall be called (Section 14.1). Work shall not resume at the site until the ARCADIS Project Manager and Site Health and Safety Officer have been notified of the emergency and they agree that the site is safe for continued work. If a serious injury occurs within a radiologically-controlled area, then the emergency will take precedence over the site action levels provided in the PSEG radiation protection program. The injured individual will be removed from the exclusion zone or radiologically controlled area by coworkers (if possible) for transport to the hospital. The Site Health and Safety Officer will accompany the injured worker and perform necessary contamination survey of the ambulance/vehicle after the individual is at the hospital for treatment.

14.1 Emergency Telephone Numbers

	Off Site	On Site*
Police Department/Security	(856) 935-0057 or 911	(856) 339-2222
Fire Department/Protection	(856) 935-0353 or 911	(856) 339-2800
Emergency Management	(856) 935-3382 or 911	(856) 339-2800
Ambulance	911	(856) 339-2800
Memorial Hospital of Salem	(856) 339-6059	

* Any emergency/incident on site requires immediate reporting to the on duty operating department at extension 3333, outside line (856) 339-3333.

14.2 Project Personnel Emergency Telephone Numbers

Tom C. Eng, Program Manager, ARCADIS, Inc.:

(201) 236-2233 (Office), (201) 417-3079(Mobile)

Peter Milionis, Project Manager, ARCADIS, Inc.:
(267) 685-1800 (Office), (215) 272-4635 (Mobile)

Bradley Pierce, Site Health and Safety Officer, ARCADIS, Inc.
(267) 685-1800 (Office), (215) 718-3580 (Mobile)

John P. Ronafalvy, Project Manager, PSEG
(856) 878-6930 (Office)

14.3 Location of the Memorial Hospital of Salem

The Memorial Hospital of Salem is located at 310 Woodstown Road in Salem, New Jersey. This hospital has confirmed that it is capable of treating chemical trauma victims.

14.4 Emergency Response for Fire and Explosions

If a small fire occurs, extinguish it with the fire extinguisher in the field vehicle (ABC-extinguisher). Remember to follow these directions to put out the fire:

- Aim at the base of the flame.
- Use the appropriate type of fire extinguisher when not using an extinguisher from the field vehicle (e.g., do not use a water type fire extinguisher for an electrical fire).
- Remember that the spray only lasts a few seconds.

If a large fire occurs at the work site, follow these instructions:

- Move flammable and combustible items, if possible, out of the path of the fire
- Call the fire department
- Do not attempt to put out a large fire with the field vehicle fire extinguisher
- Report the incident to the Field Operations Manager and possibly the Fire Department

If an explosion occurs, follow these instructions:

- Evacuate the site immediately
- If feasible, decontaminate yourself and others
- Do not address medical emergencies until you are out of danger

- Call the Site Health and Safety Officer, or local emergency response organization when you are out of danger to report the incident

14.5 Emergency Response for Severe Weather Conditions

This section specifies what you should do in the event of a severe weather emergency, including electrical storms, high winds, heavy rain or hail, and tornados.

Electrical Storms

- Seek shelter at the support facility or in the field vehicles
- Do not stand near or under high objects, such as trees and drilling rigs
- If possible, lower the drilling rig mast

High Winds

- Seek shelter at the support facility (if anchored) or in the field vehicles
- Do not drive high-profile vehicles at high speeds
- Park vehicles heading into the wind
- Don a respirator or wear safety goggles and a kerchief covering your nose and mouth

Heavy Rain or Hail

- Seek shelter at the support facility or in the field vehicles
- Do not attempt to drive a vehicle if you are in an area that is or has the potential for flooding unless you are moving out of a low area.

Tornadoes

- Seek shelter underground or in a closet, bathroom, or interior wall of a substantial building. Get under something sturdy and cover your head.
- Do not stay in a trailer or vehicle. Leave the trailer or vehicle and lie flat in the nearest ditch if substantial shelter is not available.
- Stay away from large areas of glass.
- Stay away from large unsupported roofs.

14.6 Emergency Response for Unforeseen Circumstances

In the event of an emergency as a result of unforeseen circumstances, follow these instructions:

- Evacuate the site immediately
- If feasible, decontaminate yourself and others
- Do not address medical emergencies until you are out of danger
- Call the Site Health and Safety Officer, or local emergency response organization when you are out of danger to report the incident

14.7 On-Site Emergency Equipment and Equipment Locations

A first aid kit equipped with adequate supplies for the anticipated hazards encountered on this project will be at the work site. Components of the first aid kit will be unitized to facilitate access to the needed supplies and keep components in the best possible conditions.

First aid kits for field use have water tight seals to retard moisture entry and metal housings. Care should be taken to keep the first aid kits clean and readily available to all site workers. The location and contents of the first aid kits on the job site shall be discussed in the initial safety meeting and daily "tailgate safety meetings. Additionally, bloodborne pathogens exposure control and decontamination procedures will be addressed during these meetings. The first aid kits are equipped with components to provide decontamination to workers exposed to bloodborne pathogens. First aid kits at the project site(s) for more than one week shall be inspected weekly by the Site Health and Safety Officer.

An eyewash will also be maintained in good condition onsite during field activities.

A minimum 10-pound or two 5-pound multipurpose ABC fire extinguisher(s) will be maintained during field activities in the work area. A fire extinguisher will also be maintained at the decon area if the work zone is not in close proximity to this area. The location of fire extinguishers will be discussed in the initial safety briefing for field activities and during daily "tailgate" safety meetings. Care will be taken to keep fire extinguishers easily accessible, clean, and protected from harsh physical environments which may impact the working condition of the fire extinguisher.

Other emergency equipment that will be maintained at the Site include the following: a vehicle for transport of personnel to a medical facility; and, a cellular telephone for contacting emergency response personnel.

14.8 Accident and Incident Reports

All job-related injuries and illnesses will be reported to the Site Health and Safety Officer. If medical attention is needed, the injured worker will be decontaminated, if possible, prior to leaving the site. The Site Health and Safety Officer will investigate the cause of the accident, and corrective measures will be taken before the work can resume. It will be the responsibility of the Site Health and Safety Officer to complete the accident reporting form, OSHA 101 **(Attachment 8)** for all injuries. The completed OSHA

101 form should be forwarded to the PSEG Project Manager and the ARCADIS Corporate Health and Safety Officer, within 6 days for recording into the OSHA 200 log. In the event of a fatality or three or more workers hospitalized as a result of a single incident, the Project Manager will contact the ARCADIS Corporate Administrator of Health and Safety immediately for OSHA reporting purposes.

15 Site Security

No unauthorized personnel shall be permitted to enter the work zone. Prior to initiating work, PSEG will be provided with a list of ARCADIS personnel that are authorized to enter the Site.

The work zone will be strictly controlled to ensure the protection of all workers and visitors. The Exclusion Zone will be maintained around all work areas. The size of the Exclusion Zone will be dependent upon the hazards associated with the task, professional judgment of the Site Health and Safety Officer, and site conditions. Generally, for the purposes of this scope of work, a 15-foot exclusion zone in all directions from the task activity should be sufficient. During work, all unnecessary personnel will remain outside the exclusion zone and all personnel inside the exclusion zone will be required to wear the appropriate level of PPE as prescribed in this HASP.

Should unauthorized personnel enter the work area, they will be asked to leave immediately.

ARCADIS Medical Surveillance Program

ARCADIS - Medical Surveillance Program

Summary

Applicability

This standard applies to the following ARCADIS staff:

Any employee who is exposed to hazardous substances or health hazards at or above recognized occupational health standards (Permissible Exposure Limit (PEL) or Threshold Limit Value (TLV)), without regard to the use of respirator, for 30 days a year or more;

Any employee who wears a respirator more than 30 days per year; and

Any employee who becomes ill or exhibits symptoms of possible exposure to health hazards from emergency response or hazardous waste operations.

General Requirements

This standard requires that employees subject to the standard receive medical examinations prior to a new assignment, annually while subject to the standard, when leaving the company, when no longer subject to the standard, and whenever an employee reports/develops symptoms indicating possible exposure or reports a possible exposure.

Exams can be given every two years as recommended or approved by the medical care provider.

The medical examinations are performed to monitor potential adverse health impacts from exposure to health hazards. The examinations also provide clearance for the employee to perform the duties of their job as they relate to the OSHA standards, and to use/wear personnel protective equipment (PPE).

Medical records are maintained confidentially by Corporate Health and Safety as required by this standard and standards related to specific hazardous substances.

Training

Training is required for all employees who fall under this standard as defined above.

Overview of HAZWOPER Medical Surveillance

It is ARCADIS' policy to comply with the requirements of the HAZWOPER standard as they relate to Medical Surveillance. The purpose of medical surveillance is to monitor the health of employees who are or may be exposed to hazardous substances.

Regulatory Guidance

- 29 CFR 1910.120 "Hazardous Waste Operations and Emergency Response"

- 29 CFR 1910.134 "Respiratory Protection"
- 29 CFR 1910.95 "Hearing Conservation"
- 29 CFR 1910.145 "Exposure to Hazardous Chemicals in Laboratories"
- 29 CFR 1910.138 "Personal Protective Equipment"

Other OSHA standards, such as occupational noise exposure or the hazardous substances listed in CFR1910, Subpart Z, may have specific medical surveillance requirements beyond the scope of this policy.

Participating Employees

The following employees will participate in the medical surveillance program:

- Any employee who is exposed to hazardous substances or health hazards at or above recognized occupational health standards (Permissible Exposure Limit (PEL) or Threshold Limit Value (TLV)), without regard to respirator use, for 30 days a year or more;
- Any employee who wears a respirator more than 30 days per year; and
- Any employee who becomes ill or exhibits symptoms of exposure to health hazards from emergency response or hazardous waste operations.

Confidentiality of Medical Records

Medical examinations are confidential and the specific results are discussed between the employee and examining physician only. ARCADIS receives a confirmation report and a clearance determination that pertains only to the capabilities of an individual to perform the duties of their job as they relate to the OSHA standard.

Retained Medical Provider

Continuum Health Management Solutions is the retained medical provider for the ARCADIS medical surveillance program. Continuum contracts with clinics to perform medical examinations that follow their protocols and any ARCADIS-specific program requirements.

For annual examinations, the local Continuum clinic notifies the applicable Office Administrator at least four weeks prior to an employee's examination due date. For exit or transfer examinations, the Office Administrator will coordinate the exam with the local Continuum clinic.

The Office Administrator should fax a completed "Continuum Authorization for Medical Examination" form by 5:00 PM the day before any scheduled examination. The employee must take a completed Continuum provided questionnaire to the examination.

Within four days of a baseline or annual examination, Continuum will either issue a Conditional Clearance or provide notice that has not been given. If conditional clearance is given, it is good for 20 days. If conditional clearance is not given, the physician may recommend additional testing which must be authorized by the Corporate Health and Safety Administrator.

Medical clearance or denial is all that is provided to the Corporate Health and Safety Administrator, but a full detailed medical report is sent to the employee's home. The employee may call Continuum's medical department at 800-229-3674 for any questions on medical issues. Questions about Continuum's service or procedures should be directed to the Corporate Health and Safety Administrator.

Medical Surveillance Examinations

Types and Frequency of Medical Examinations

The following list is what is required by the OSHA standard, but the examining physician may determine that more frequent evaluations/tests are medically necessary, and/or that a consultation is medically necessary.

- **Baseline Exam** – These are done upon hire or at the time an employee is assigned to a job that falls under this program.
- **Annual Exam** – An annual examination schedule is followed unless the attending physician recommends or approves an exam every two years.
- **Exposure Exam** – These exams should be done as soon as possible if an employee may have been exposed above the permissible or published exposure limits or has developed signs and symptoms indicating possible overexposure.
- **Transfer Exam** – If an employee is no longer subject to the medical surveillance program, a transfer exam will be conducted unless the employee had an annual examination within the preceding 6 months.
- **Exit Exam** - Employees leaving the company will be offered an exit medical exam unless they had an exam within the preceding 6 months. If an employee turns down an exit exam, he/she must sign a declination form. If an employee will not sign a declination form, document the date, time, employee's name, what the employee declined to sign and sign the documentation.

Components of the Medical Examination

The purpose of a medical surveillance program is to protect the health of the worker, and focuses on health and fitness related to the workplace. Wellness evaluations, such as mammograms or prostate exams, are not components of a medical surveillance exam or Continuum's standard protocol.

Physical Examination

The physical examination should cover the following topics:

- **Medical History** – This will include a review of any symptoms related to handling of hazardous substances and health hazards, a review of past illnesses and chronic diseases, and will identify individuals who may be vulnerable to particular substances and those with medically relevant lifestyle habits (for example, smoking or alcohol use).

- **Height and Weight** – The examining physician will address any concerns/issues regarding weight with the employee.

- **Vital Signs** – Irregularities in pulse, respiration or blood pressure may require further evaluation, and medical clearance could be denied based on these readings.

- **Vision** – The exam will measure eyesight and the employee's ability to wear PPE and perform related job duties. Any other issues regarding vision will need to be addressed by the employee's personal eye doctor.

During the physical examination, conditions will be noted that could increase susceptibility to heat stroke and that could affect PPE use. The examining physician will:

- Disqualify individuals.

- Note limitations concerning workers ability to use PPE.

- Recommend and provide additional testing regarding the ability to wear PPE.

- Make and provide a written determination regarding the ability to wear PPE.

Laboratory Tests

The examination includes comprehensive blood and urine tests. Any abnormal tests may require additional evaluation by either Continuum or the employee's personal physician.

Other Tests

- **Spirometry** – For this test of pulmonary function Continuum uses the NIOSH and ANSI recommendations for spirometry values. A failed test may be repeated once in the Continuum system, but if the second test is unacceptable, Continuum may recommend consultation with a pulmonologist (lung specialist).

- **Audiometry** – This test for hearing will be preceded by at least 14 hours without exposure to workplace noise or the use of hearing protectors. Additional information on audiometry is found in section 3.4.3.

- **EKG** – This test is done after age 40 and/or when the presence of two or more recognized cardiac risk factors have been identified. It is Continuum's policy that individuals over the age of forty with two or more risk factors also have a stress test.

- **Chest X-Ray** – Continuum will clearly state when further study is required.

Attachment 6

ARCADIS Respiratory Protection Policy

ARCADIS – Respiratory Protection Program

Summary

Applicability

The Respiratory Protection standard applies to any employee who is or may be required to wear a respirator. The voluntary use of respirators is prohibited.

General Requirements

Whenever possible, engineering controls and work practices will be used to reduce or eliminate hazards. If engineering controls are not feasible, or while they are being instituted, appropriate respirators will be used. Only NIOSH-certified respirators will be worn, and only authorized, trained, and medically qualified employees may use a respirator.

Only the respirator prescribed in the hazard analysis will be used for that work environment. Only air supplying respirators will be used in oxygen deficient environments, in environments in which there is an unknown hazardous substance/quantity of substance or in environments that are immediately dangerous to life or health (IDLH).

Written Program

Each office that requires respirator use will develop and implement a written Respiratory Protection Program that will be reviewed and updated/revised as necessary. Each office will also designate a qualified Program Administrator to oversee the program for that office. The written program will include information on the medical evaluation and training process and on procedures for the following:

- Respirator Selection
- Fit testing
- Proper use of respirators in routine and emergency situations
- Cleaning, disinfecting and storing of respirators
- Inspecting, repairing and discarding respirators
- Regularly evaluating the effectiveness of the program

All employees who use a respirator will have a medical evaluation prior to respirator fit testing and respirator use, and if deemed necessary by the program administrator, supervisor, physician or employee. Medical evaluations may cease if the employee is no longer required to use a respirator.

The primary purpose of fit testing is assure that the specific make, model, style, and size of respirator selected by the employee has the proper fit and is the one best suited for the employee. Fit testing also

reinforces respirator training by having employees review the proper way to put on, wear and take off the respirator.

Fit testing will occur prior to respirator use, annually, if the respirator fit is found to be unacceptable or if there any changes in the employee's physical condition that could alter the fit (e.g., facial scarring, facial hair growth, etc.). Fit testing will be done by the medical surveillance provider if this service is available. If not available, it will be done by an outside contractor or by an ARCADIS employee authorized by Corporate Health and Safety

Training

Training will be provided to any employee who is required to wear a respirator as part of his/her job prior to respirator use, annually, whenever there are changes in the workplace or type of respirator required, if there are inadequacies in the employee's knowledge or any other situation in which retraining appears necessary.

Although annual HAZWOPER training may be utilized to help meet compliance with the training portion of this standard, training will be specific to the type of respirator used and the conditions at the job/work site.

Overview of Respiratory Protection

It is ARCADIS' policy to comply with the OSHA's Respiratory Protection Standard as it relates to the work we do. There are also OSHA standards for specific substances that may have additional requirements regarding respiratory protection and should be consulted in conjunction with this policy.

Whenever possible, engineering controls and work practices will be utilized to reduce or eliminate respiratory hazards. If they are not feasible, or while they are being instituted, appropriate respirators will be used. If respirators are necessary, a written respiratory program will be developed and implemented.

The voluntary use of respirators is not permitted.

Regulatory Guidance

- 29CFR 1910.134 "Respiratory Protection"
- OSHA publication 3079, "Respiratory Protection" (revised 1998)
- OSHA's March 1998 "Major Requirements of OSHA's Respiratory Protection Standard"
- OSJA Directive CPL 2-2.54A, "Respiratory Protection Program Guidelines"
- NIOSH Publication 96-101, "Selection and Use of Particulate Respirators Certified Under 42CFR 84"

Definitions

Definitions relative to this standard are found in Attachment 5-1.

Written Respiratory Protection Program

A written Respiratory Protection Program will be developed, implemented and updated as necessary if employees are required to wear a respirator. As part of this program, each office will designate a qualified Program Administrator whom OSHA defines as someone who is qualified by appropriate training or experience to comprehend the complexity of the program. The Program Administrator will oversee compliance of the program and conduct the required program effectiveness evaluations.

Program Provisions

Each of the following will be included in the written Respiratory Protection Program, and will be described in greater detail throughout this section of the manual:

- Procedures for:
  - Respirator selection
  - Fit testing
  - Proper use of respirators in routine and emergency situations
  - Cleaning, disinfecting and storing or respirators
  - Inspecting, repairing and discarding respirators
  - Regularly evaluating the effectiveness of the program
- Medical evaluation process
- Training process
- A statement regarding the voluntary use of respirators

Program Evaluation

Evaluations will be conducted "as necessary" to ensure that the written program is being properly implemented and that employees are using respirators correctly. Be sure and document the date of the evaluation, your findings and any changes or corrections that are made. Attachment 5-2 is a checklist that may be of help in this evaluation.

In addition, employees who wear respirators will be "regularly" asked to identify any problems and to provide their views on the program's effectiveness. Document the date, what was done to correct any identified problems and what was found in regard to the following:

- Respirator fit and the ability to wear it without it interfering with worksite performance.

- Respirator selection and its appropriateness for relevant hazards.
- Respirator use and its appropriateness given worksite conditions.
- Proper respirator maintenance.

Respirator Selection

The written Respiratory Protection Program will include how respirators are selected. All respirators shall be NIOSH certified and used only as allowed by the NIOSH certification. Attachment 5-3 provides several websites regarding NIOSH certified respirators, and Attachment 5-4 provides descriptions and pictures of various respirators.

Hazard Identification

The selection of which NIOSH certified respirator is appropriate will be based on a hazard analysis. It will be performed by an employee who has the training and experience to recognize hazardous and potentially hazardous environments. If the exposure potential can not be identified, or if there is any doubt, the atmosphere will be considered **IDLH** (immediately dangerous to life and health). The analysis will include:

- Evaluation and identity of the respiratory hazards that will or may occur. It should include:
    - Monitoring method utilized
    - A reasonable estimate of employee exposure to respiratory hazards
    - Identity of airborne contaminants (particulate, biological, chemical, etc.)
    - Chemical state, physical properties, toxicity and concentration of the contaminant
    - Concentration of Oxygen
- Identification of relevant workplace and user factors such as heat/cold, duration of use and type of work being done.

General Considerations in Respirator Selections

Other points to consider when selecting the appropriate respirator:

- All oxygen-deficient atmospheres will be considered IDLH, and in no case will an air-purifying respirator be used in IDLH conditions.

- Consideration will be given to limits and characteristics of the respirator, employee comfort and employee mobility. For example, a tightly constrained area may not permit the use of self-contained breathing apparatus (SCBA) and working around obstructions or moving machinery that can snag hoses may limit the use of airline respirators.

- Consideration will be made of the nature and extent of the work, the work rate, and area to be covered. For example, the service life of air-supply respirators even under moderate work conditions

will be less than under a condition of rest, and higher breathing resistance of air-purifying respirators under conditions of heavy work may cause difficulty in breathing.

Breathing Air Quality and Use – Atmosphere-Supplying Respirators

This section applies to compressed air/oxygen and liquid air/oxygen used for supplied-air and SCBA respirators. Breathing air couplings must **not be compatible** with outlets for nonrespirable worksite air or other gas systems. Compressed and liquid oxygen will meet the U.S. Pharmacopoeia requirements. Compressed breathing air will meet at least the requirements for Grade D breathing air described in ANSI G-7.1-1989 to include:

- Oxygen content (v/v) of 19.5-23.5%
- Hydrocarbon (condensed) content of 5 milligrams per cubic meter of air or less
- Carbon monoxide (CO) content of 10 ppm or less
- Carbon dioxide content of 1,000 ppm or less
- Lack of noticeable odor

Cylinders

Cylinders used to supply breathing air will be tested and maintained per DOT's "Shipping Container Specification Regulations" (49CFR part 173 & 1788). They will also have a certificate of analysis from the supplier that it meets the requirements for Grade D breathing air. The moisture content in the cylinder can not exceed a dew point of -50°F (-45.6° C) at 1 atmosphere of pressure.

Compressors

For compressors that are not oil-lubricated, the carbon monoxide levels will not exceed 10ppm, and if they are oil-lubricated, a high temperature or carbon monoxide alarm, or both, will be used to monitor carbon monoxide levels. Compressors used to supply breathing air will be constructed and situated so as to:

- Prevent entry of contaminated air into the system.
- Minimize moisture content so that the dew point at 1 atmosphere pressure is 10°F (5.56°C) below the ambient temperature.
- Have a tag at the compressor that contains the most recent date and signature of the person who performed the change.
- Have suitable in-line air-purifying sorbent beds and filters that are maintained and replaced/refurbished per manufacturer's instructions.

General Considerations

Some general considerations regarding breathing gases:

- Compressed oxygen cannot be used in respirators that have previously used compressed air.
- Oxygen concentrations greater than 23.5% should only be used in equipment designed for oxygen service or distribution.
- Breathing gas containers will be marked per NIOSH certification standard 42CFR Part 84.
- No asphyxiating substance will be introduced into breathing air lines.

Selection of Respirators for IDLH Atmospheres

The following respirators will be used in atmospheres that are IDLH or in atmospheres in which the exposure hazard is not known:

- A full facepiece pressure demand SCBA certified by NIOSH for a minimum service life of thirty minutes; or
- A combination full-facepiece pressure demand supplied-air respirator (SAR) with auxiliary self-contained air supply.

If the respirator is provided for **escape only** from an IDLH atmosphere, it will be NIOSH-certified for escape from the atmosphere in which it will be used.

Selection of Respirators for Atmospheres that are not IDLH

Respirators used in non-IDLH atmospheres will be appropriate for the chemical state and physical form of the contaminant. If the respirator will be used for protection against gas and vapors, one of the following will be supplied:

- An atmosphere-supplying respirator; or
- An air-purifying respirator provided that:
    - It is equipped with a NIOSH certified end-of-service-life indicator (ESLI); or
    - If no ESLI is appropriate for the working conditions, a change schedule will be implemented.

If the respirator will be used against particulates, one of the following will be supplied:

- An atmosphere-supplying respirator; or

- An air-purifying respirator equipped with either a NIOSH certified high energy particulate air (HEPA) filter or NIOSH certified filter for particulates; or
- An air-purifying respirator equipped with any NIOSH certified filter for particulates if the contaminant consists primarily of particles of at least 2 micrometers.

Selection of Particulate Respirators

To select the correct respirator for protection against particulates, the following conditions will be known:

- The identity and concentration of the particulates in the workplace air.
- The OSHA or MSHA permissible exposure limit (PEL), the NIOSH recommended exposure limit (REL), or other occupational exposure limit for the contaminant.
- The hazard ratio (HR) (i.e., airborne particulate concentration divided by the exposure limit).
- The Assigned Protection Factor (PF) for the class of respirator. The APF should be greater than the HR.
    - The APF of a respirator is the minimum anticipated level of protection provided by each type of respirator that is properly fitted and worn correctly by a trained user. OSHA currently sets APFs in some substance-specific standards. A table that lists respirator classes/types and the corresponding NIOSH APF is provided as Attachment 5-5.
- The IDLH concentration, including oxygen deficiency.

Respirator Filters

Filters for air-purifying respirators will be selected in accordance with manufacturer recommendations for the contaminant of concern. All should be legibly labeled and color coded with the NIOSH approval label and the label will not be removed.

Filter Classes and Efficiency Categories

The N, R and P series filters are the three classes of filters for non-powered air-purifying particulate respirators:

- N series: **N**ot resistant to oil - can be used in environments where oil particles are **not** present in the atmosphere.
- R series: **R**esistant to oil – can be used in atmospheres where oil particles are present.
- P series: Oil **P**roof – can be used in atmospheres where oil particles are present for more than 8 hours.

There are three filter efficiency categories—95%, 99%, and 99.7%. The higher the filter efficiency, the lower the filter leakage. For example, a filter marked N95 would mean an N-series filter that is at least 95% efficient.

Change Schedule

Each filter (canister/cartridge) will remain in its original sealed package until it is needed. Each will be equipped with an end-of-service-life indicator (ESLI) that NIOSH certified for the contaminant. If there is no ESLI appropriate for conditions, a change schedule will be established that will ensure that they are changed before the end of their service life. The respirator program will provide the information and data relied upon to make this determination.

Cartridges will be changed after each use. Filters will be changed when discoloring of the filter media is evident and will be changed based on the most limiting factor below:

- Prior to expiration date
- Manufacturer's recommendations for use and environment
- When requested by employee
- When contaminate odor is detected
- When restricted air flow has occurred as evidenced by increased effort by the user to breathe normally

Respirator Fit Testing

The written Respiratory Protection Program shall indicate that an appropriate fit testing program has been implemented. Employees must be medically evaluated and found eligible to wear the respirator selected **prior** to fit testing.

Fit testing will be done by the medical surveillance provider if this service is available. If not available, it will be done by an outside contractor or by an ARCADIS employee authorized by Corporate Health and Safety.

The primary purpose of fit testing is to assure that the specific make, model, style, and size of respirator selected by the employee has the proper fit and is the one best suited for the employee. Fit testing also reinforces respirator training by having wearers review the proper way to put on, wear and take off the respirator.

Fit Testing Requirements

Employees will be fit tested with the same make, model, style and size of respirator that will be used at the worksite. Employees will pass either a qualitative or quantitative fit test (QLFT or QNFT) as defined in CFR 1910. Attachment 5-6 contains a brief description of the QLFT and QNFT, and Attachment 5-7 contains an outline of fit testing preliminary steps.

Fit testing is required for all negative or positive pressure tight-fitting facepiece respirators, and will be performed:

- Before an employee wears a respirator in the work environment.
- Whenever a different respirator facepiece is used.
- At least annually thereafter.

Retesting is required if the employee finds the fit of the respirator to be unacceptable and whenever there are changes in a employee's physical condition that could affect the fit of the respirator (e.g., facial scarring, dental changes, cosmetic surgery or an obvious change in body weight, etc.).

Proper Use of Respirators

The written Respiratory Protection Program will include procedures for the proper use of respirators during routine and emergency situations. Employees will use their respirators only under the conditions specified by the respiratory protection program and the training they receive. They will not be used in a manner that has not been certified by NIOSH or its manufacturer.

Facepiece Seal Protection and Check

Employees will not be allowed to wear tight-fitting respirators if they have facial hair that comes between the sealing surface of the facepiece and the face or that interferes with valve function, or any condition that interferes with the face-to-facepiece seal or valve function.

If an employee wears corrective glasses or goggles or other personal protective equipment, it will be worn in a manner that does not interfere with the face-to-facepiece seal.

For all tight-fitting respirators, employees will perform a user seal check each time they put on the respirator using the procedures outlined in Attachment 5-8, or the procedures recommended by the respirator manufacturer if they are as effective.

Continuing Respirator Effectiveness

Surveillance will be maintained of the work area conditions and the degree of employee exposure and stress so that respirator effectiveness can be assessed on an ongoing basis.

Employees will leave the respirator use area:

- To wash their faces and respirator facepieces as necessary to prevent eye or skin irritation associated with respirator use.
- To replace the respirator or the filter, cartridge, or canister elements.

- If they detect vapor or gas breakthrough, changes in breathing resistance or leakage of the facepiece, and the respirator must be replaced or repaired before returning to the respirator use work area.

Procedures For Respirator Use In IDLH Atmospheres

In IDLH atmosphere situations, at least one person will be located outside the IDLH atmosphere. In addition visual, voice, or signal line communication will be maintained between the person in and the person outside the IDLH atmosphere. The person located outside the IDLH atmosphere will be trained to provide effective emergency rescue, and will be equipped with pressure demand, other positive SCBA or supplied-air respirator with auxiliary SCBA and:

- Appropriate retrieval equipment if it will not increase the overall risk; or
- Equivalent means for rescue where retrieval equipment is not required as noted above.

The appropriate supervisor will be notified before the person located outside the IDLH atmosphere enters the IDLH atmosphere to provide emergency rescue. Once notified, the supervisor will provide assistance appropriate to the situation.

Maintenance and Care of Respirators

The written Respiratory Protection Program will include procedures that address inspection, cleaning and disinfecting, storage and repair of respirators.

Inspection of Respirators

All respirators will be inspected according to the schedule outlined below:

- Respirators used routinely will be inspected before each use and during cleaning;
- SCBAs will be inspected before each use, during cleaning and monthly; inspection will include making sure that the regulator and warning devices function properly;
- Respirators that are maintained for emergency use will be inspected monthly and in accordance with the manufacturer's recommendations; and
- Emergency escape-only respirators will be inspected before being taken to the work site.

Documentation of respirator inspections will include checks on the following (two sample checklists are found in Attachment 5-9):

- Respirator function.
- Tightness of connections and condition of parts (e.g., facepiece, head straps, valves, connecting tube and filters, canisters or cartridges).

- Pliability and any deterioration of any elastic or elastic-type parts.
- Condition of the regulator.
- Proper functioning of warning devices.
- If air and oxygen cylinder are fully charged. Cylinders will be recharged when the pressure falls to 90% of the manufacturer's recommended pressure level.

Respirators maintained for emergency-use will be certified by documenting the date of the inspection, the signature of the inspector, the findings and any remedial action taken and the serial number or other identifier. This information will be on a tag or label that is kept with the respirator or as part of paper or electronic files.

Cleaning and Disinfecting of Respirators

Respirators will be cleaned and disinfected as outlined in **Attachment 5-10**, or as recommended by the manufacturer so long as it is of equivalent effectiveness. Maintain documentation that this was done according to the following schedule:

- As often as necessary to maintain a sanitary condition if used exclusively by one employee.
- Each time before it is worn if used by more than one employee.
- After each use if maintained for emergency use.
- After each use if used for fit testing.

Storage of Respirators

All respirators will be stored or packed to protect them from deformation of a facepiece or exhalation valve, contamination, damage, dust, sunlight, extreme temperatures, excessive moisture, and damaging chemicals.

Emergency respirators will be kept accessible to the work area and stored in compartments/covers clearly marked as containing emergency respirators and as instructed by the manufacturer.

Repairs

Documentation of repairs/adjustments will be maintained. Respirators that fail an inspection or are defective, will be removed from service and discarded or repaired/adjusted as noted below.

- Repairs/adjustments will be made only by persons appropriately trained to perform such operations.
- Only the respirator manufacturer's NIOSH-approved parts designed for the respirator will be used.

- Repairs will be made according to the manufacturer's recommendations and specifications for the type and extent of repairs to be performed.

- Reducing and admission valves, regulators, and alarms will be adjusted/repaired only by the manufacturer or technician trained by the manufacturer.

Medical Evaluation Process

Because using a respirator may place a physiological burden on an employee that may vary depending upon the type of respirator and workplace conditions, the written Respiratory Protection Program will include what medical evaluation process we have implemented at ARCADIS. All employees who use a respirator as defined under this standard will participate in the company's medical monitoring program (section 3.3.5). Medical evaluations may cease if the employee is no longer required to use a respirator.

A physician or other licensed health care professional will perform the evaluation using a medical questionnaire as defined in CFR 1910.134, App C or an equivalent medical examination. A follow-up medical examination may be given depending upon the answers to the questionnaire and/or medical examination.

Timeframe Of Medical Evaluations

Medical evaluations will take place according to the following schedule:

- Prior to fit testing and use at the work site

- When an employee reports medical signs/symptoms that may be related to his/her ability to use a respirator

- When a physician, supervisor or the respirator Program Administrator suggests/requests an evaluation

- When information such as observations made during fit testing or program evaluation indicate a need

- When a change occurs in workplace conditions that may result in a substantial increase in the physiological burden placed on an employee (e.g., physical work effort, protective clothing, temperature, etc.)

Written Medical Opinion

The physician or other licensed health care professional will determine and provide a written opinion as to the employee's ability to use a respirator. This opinion will contain:

- Whether or not the employee is medically able to use the respirator.

- Any limitations on respirator use.

- The need for follow-up medical evaluations.
- A statement that the employee was provided with a copy of the written recommendation.

Employee Training

The written Respiratory Protection Program will include a section on the training program that will be provided prior to respirator use, annually, when changes in the workplace or respirator make the training obsolete, when inadequacies are found in the employee's knowledge or use of PPE, or any other situation in which retraining appears necessary.

Training Content Requirements

Training will ensure that employees can demonstrate, at a minimum, knowledge of the following:

- Why the respirator is necessary and its limitations and capabilities
- How improper fit, usage, or maintenance can compromise the protective effect of the respirator, and how to recognize the signs and symptoms that may limit or prevent the effective use of respirators
- How to use the respirator effectively in emergency situations, including when it malfunctions
- How to inspect, put on and remove, use, and check the seals of the respirator
- Proper procedures for maintenance and storage of the respirator
- The general requirements of this standard

Other Training Considerations

Training does not need to be repeated for a new employee if he/she can provide documentation of training within the 12 months prior.

Although annual HAZWOPER training may be utilized to help meet compliance with the training portion of this standard, training will be specific to the type of respirator used and the conditions at the job/work site.

Recordkeeping

Written information regarding medical evaluations, fit testing and the respiratory protection program will be maintained. Each office that falls under this standard will maintain their own written Respiratory Protection Program and corresponding documents (e.g., respirator inspection documentation).

The written medical opinion regarding respirator use and fit testing will be maintained in the employee files by the Corporate Health and Safety Manager/Administrator.

State Plans

The following states have standards that may exceed those of the federal Respiratory Protection standard. If your office or work location is in one of these states, please review the regulation and modify accordingly.

- Alaska – Section 1030
- California – Chapter 4, Subchapter 7
- Michigan – Health Standards and Safety Standards for General Industry
- Minnesota – CFR 1910.1000 - 1989 PEL's
- North Carolina – 13 NCAC 7F.0100
- Oregon – Division 2
- Washington – 296-24 & 296-62

ATTACHMENT 6-1
ARCADIS – RESPIRATORY PROTECTION – DEFINITIONS
(From CFR1910.134(b))

Air-purifying respirator means a respirator with an air-purifying filter, cartridge, or canister that removes specific air contaminants by passing ambient air through the air-purifying element.

Atmosphere-supplying respirator means a respirator that supplies the respirator user with breathing air from a source independent of the ambient atmosphere, and includes supplied-air respirators (SARs) and self-contained breathing apparatus (SCBA) units.

Canister or cartridge means a container with a filter, sorbent, or catalyst, or combination of these items, which removes specific contaminants from the air passed through the container.

Demand respirator means an atmosphere-supplying respirator that admits breathing air to the facepiece only when a negative pressure is created inside the facepiece by inhalation.

Emergency situation means any occurrence such as, but not limited to, equipment failure, rupture of containers, or failure of control equipment that may or does result in an uncontrolled significant release of an airborne contaminant.

Employee exposure means exposure to a concentration of an airborne contaminant that would occur if the employee were not using respiratory protection.

End-of-service-life indicator (ESLI) means a system that warns the respirator user of the approach of the end of adequate respiratory protection, for example, that the sorbent is approaching saturation or is no longer effective.

Escape-only respirator means a respirator intended to be used only for emergency exit.

Filter or air purifying element means a component used in respirators to remove solid or liquid aerosols from the inspired air.

Filtering facepiece (dust mask) means a negative pressure particulate respirator with a filter as an integral part of the facepiece or with the entire facepiece composed of the filtering medium.

Fit factor means a quantitative estimate of the fit of a particular respirator to a specific individual, and typically estimates the ratio of the concentration of a substance in ambient air to its concentration inside the respirator when worn.

Fit test means the use of a protocol to qualitatively or quantitatively evaluate the fit of a respirator on an individual. (See also Qualitative fit test QLFT and Quantitative fit test QNFT.)

Helmet means a rigid respiratory inlet covering that also provides head protection against impact and penetration.

High efficiency particulate air (HEPA) filter means a filter that is at least 99.97% efficient in removing monodisperse particles of 0.3 micrometers in diameter. The equivalent NIOSH 42 CFR 84 particulate filters are the N100, R100, and P100 filters.

Hood means a respiratory inlet covering that completely covers the head and neck and may also cover portions of the shoulders and torso.

Immediately dangerous to life or health (IDLH) means an atmosphere that poses an immediate threat to life, would cause irreversible adverse health effects, or would impair an individual's ability to escape from a dangerous atmosphere.

Loose-fitting facepiece is a respiratory inlet covering designed to form a partial seal with the face.

Negative pressure respirator (tight fitting) means a respirator in which the air pressure inside the facepiece is negative during inhalation with respect to the ambient air pressure outside the respirator.

Oxygen deficient atmosphere means an atmosphere with an oxygen content below 19.5% by volume.

Positive pressure respirator means a respirator in which the pressure inside the respiratory inlet covering exceeds the ambient air pressure outside the respirator.

Powered air-purifying respirator (PAPR) means an air-purifying respirator that uses a blower to force the ambient air through air-purifying elements to the inlet covering.

Pressure demand respirator means a positive pressure atmosphere-supplying respirator that admits breathing air to the facepiece when the positive pressure is reduced inside the facepiece by inhalation.

Qualitative fit test (QLFT) means a pass/fail fit test to assess the adequacy of respirator fit that relies on the individual's response to the test agent.

Quantitative fit test (QNFT) means an assessment of the adequacy of respirator fit by numerically measuring the amount of leakage into the respirator.

Respiratory inlet covering means that portion of a respirator that forms the protective barrier between the user's respiratory tract and an air-purifying device or breathing air source, or both. It

may be a facepiece, helmet, hood, suit, or a mouthpiece respirator with nose clamp.

Self-contained breathing apparatus (SCBA) means an atmosphere-supplying respirator for which the breathing air source is designed to be carried by the user.

Service life means the period of time that a respirator, filter or sorbent, or other respiratory equipment provides adequate protection to the wearer.

Supplied-air respirator (SAR) or airline respirator means an atmosphere-supplying respirator for which the source of breathing air is not designed to be carried by the user.

Tight-fitting facepiece means a respiratory inlet covering that forms a complete seal with the face.

User seal check means an action conducted by the respirator user to determine if the respirator is properly seated to the face.

ATTACHMENT 6-2
ARCADIS – RESPIRATORY PROTECTION - RESPIRATORY PROGRAM CHECKLIST

A. Program Administrator

1. _____ A written policy acknowledges employer and employee responsibility, and assigns program
responsibility, accountability, and authority.

2. _____ A Program Administrator has been designated who can coordinate all aspects of the program at the jobsite.

3. _____ Feasible engineering controls or work practices have been implemented.

4. Written procedures/statements covering the various aspects of the respirator program, including:
   - _____ respirator selection;
   - _____ purchase of MSHA/NIOSH certified equipment;
   - _____ medical aspects of respirator usage;
   - _____ issuance of equipment;
   - _____ fitting;
   - _____ training;
   - _____ maintenance, storage, and repair;
   - _____ inspection;
   - _____ use under special condition; and
   - _____ work area surveillance.

B. Program Operation

1. Respiratory protective equipment selection
   - _____ Work area conditions and worker exposures have been properly surveyed.
   - _____ Selections have been made by individuals knowledgeable of proper selection procedures.
   - _____ Only certified respirators are purchased and used which provide adequate protection for the specific hazard and concentration of the contaminant.
   - _____ Medical evaluation has been done to determine the user's ability to wear the selected respiratory protective equipment.
   - _____ Where practical, respirators have been issued to the users for their exclusive use.

2. Respiratory protective equipment fitting:
_____ Users are given the opportunity to try on several respirators to determine the best fit.
_____ Fit testing is done at appropriate intervals.
_____ Users who require corrective lenses are properly fitted.
_____ Users are prohibited from wearing contact lenses when using respirators.
_____ The facepiece-to-face seal tested is tested appropriately.
_____ Workers are prohibited from wearing respirators when they have facial hair or other characteristics may cause face seal leakage.

3. Respirator use in the work area
_____ Respirators are being worn correctly (i.e., head covering over respirator straps).
_____ Employees are keeping respirators on all the time while in the work area.

4. Maintenance of respiratory protective equipment

Cleaning and Disinfecting
_____ Respirators are cleaned and disinfected after each use when different people use the same devices, or as frequently as necessary for devices issued to individual users.
_____ Proper methods of cleaning and disinfecting are utilized.

Storage
_____ Respirators are stored so that they are protected from dust, sunlight, heat, excessive cold or moisture, or damaging chemicals.
_____ Respirators are stored in a proper storage facility to prevent them from deforming.
_____ Storage in lockers/tool boxes permitted only if respirator is in carrying case or carton.

Inspection
_____ Respirators are inspected before and after each use and during cleaning.
_____ Employees are instructed in inspection techniques.
_____ Respiratory protective equipment designated as "emergency use" is inspected at least monthly (in addition to after each use).
_____ A record is kept of the inspection of "emergency use" respiratory protective equipment.
_____ SCBA cylinders are inspected weekly to ensure that they are fully charged.

Repair
_____ Replacement parts are those approved by the manufacturer of the respirator.
_____ Repairs are made by manufacturers or manufacturer-trained individuals.

5. Special Use Conditions

_____ Procedures have been developed for respiratory protective equipment usage in atmospheres immediately dangerous to life or health.

_____ Procedures have been developed for equipment usage for entry into confined spaces.

6. Training

_____ Users are trained in proper respirator use, cleaning, and inspection.

_____ Users are trained in the basis for selection of respirators.

_____ Users demonstrate competency in all required areas of training.

Note any deficiencies and the action taken to correct same (include date the corrective action was taken):

ARCADIS – RESPIRATORY PROTECTION - RESOURCE GUIDE FOR NIOSH CERTIFIED RESPIRATORS

1. PARTICULATE RESPIRATORS CERTIFIEDUNDER 42 CFR PART 84

(http://www.cdc.gov/niosh/p84intro.html)

NOTICE
Only Non-powered Particulate Respirators are listed here!
Call 1-800-35-NIOSH for listings of other Certified Respirators

On July 10, 1995, a new NIOSH certification program for respirators went into effect. This regulation, 42 CFR Part 84, replaced the long standing regulation 30 CFR Part 11. (Commonly referred to as Part 84 and Part 11, respectively.) The new Part 84 covers all respirator types (self-contained breathing apparatus, air-line respirators, gas and vapor respirators, powered air-purifying respirators, etc.) but only the standards for non-powered, particulate respirators have changed from the provisions of the old Part 11.

The respirators listed here are ONLY non-powered (negative pressure) particulate respirators that have been tested and certified by NIOSH under provisions of the new Part 84. Many other respirator types, such as particulate filters in combination with gas and vapor cartridges, have been certified under provisions of Part 84 but are not included in this listing. Inquiries about other respirators may be made to 1-800-35-NIOSH. This list is updated periodically as additional non-powered, particulate respirators are certified.

2. CERTIFIED EQUIPMENT LIST (http://www.cdc.gov/niosh/celintro.html)

Introduction

The National Institute for Occupational Safety and Health, under the authorization of the Federal Mine Safety and Health Act of 1977 and the Occupational Safety and Health Act of 1970, provides a testing approval and certification program assuring commercial availability of safe personal protective devices and reliable industrial hazard measuring instruments. NIOSH develops improved performance regulations, tests and certifies (or approves) devices, and purchases approved and certified products on the open market to verify quality of manufacture.

The Certified Equipment List (CEL), a database of all certified respirators and coal mine dust personal sampler units, may be accessed on-line, or it may be downloaded. The on-line, searchable database is updated monthly. The downloadable CEL is updated semi-annually, as of March 31 and September 30.

ATTACHMENT 6-4
ARCADIS – RESPIRATORY PROTECTION - TYPES OF RESPIRATORS
(from Safetyinfo.com, "Respiratory Protection Fact Sheet")

Air Purifying Respirators have filters, cartridges, or canisters that remove contaminants from the air by passing the ambient air through the air-purifying element before it reaches the user.

- **Particulate Respirators**
  a. Capture particles in the air such as dust, mists and fumes.
  b. Do not protect against gases or vapors.
  c. Generally become more effective as particles accumulate on the filter and plug spaces between fibers.
  d. Filters should be replaced when user finds it difficult to breath through them.

- **Gas & Vapor Respirator**
  a. Are normally used when there are hazardous gases and vapors in the air.
  b. Use chemical filters (called cartridges or canisters) to remove dangerous gases or vapors.
  c. Do not protect against airborne particles.
  d. Are made to protect against specific gases or vapors.
  e. Provide protection only as long as the filter's absorbing capacity is not depleted.
  f. The service life of the filter depends upon many factors and can be estimated in various ways.

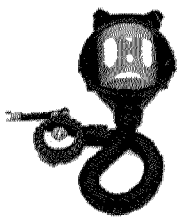
- **Combination Respirators**
  a. Are normally used in atmospheres what contain both gas and particulate hazards.
  b. Have both particulate and gas/vapor filters.
  c. May be heavier.

Air Supplying Respirators - supply clean air directly to the user from a source other than the air surrounding the user.

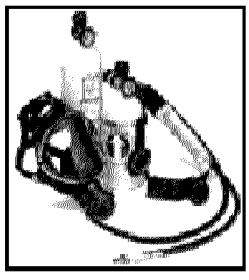
- **Air Supplied Respirators (also called airline respirators)**
  a. Makes use of a hose to deliver clean, safe air from a stationary source of compressed air.

  b. Provides clean air for long periods of time and are light weight for the user.

  c. Limits the range of user-mobility and
  d. Normally used when there are extended work periods required in atmospheres that are not immediately dangerous to life and health (IDLH).



- **Combination Respirators**
  a. Have an auxiliary self-contained air supply that can be used if the primary supply fails
  b. The self-contained portion can be small since it only needs to supply enough air for escape
  c. Can be used for entry into confined spaces
  d. Are normally used when there are extended work periods required in atmospheres that ***are or may be*** (IDLH)



- **Self Contained Breathing Apparatus (SCBA)**
  a. Consists of a wearable, clean-sir supply pack.
  b. Does not restrict movement with a hose connection.
  c. The closed-circuit type can provide air up to 4 hours.
  d. The open-circuit type can provide air for 30-60 minutes.
  e. Normally used when there is a short-time need to enter and escape from atmospheres which **are or may be** (IDLH).

ARCADIS – RESPIRATORY PROTECTION
RESPIRATOR FIT TESTING PROTOCOL & PROTOCOL DESCRIPTIONS

Qualitative (QLFT) or **Quantitative** (QNFT) fit testing must be administered using OSHA-accepted protocol in CFR1910.134, AppA.

- QLFT testing involves the introduction of a harmless odiferous or irritating substance into the breathing zone around the respirator. If no odor or irritant is detected, a proper fit is indicated.

- QNFT testing offers more accurate, detailed information as it uses instrumentation to quantify the fit of a respirator.

QLFT may only be used to fit test negative-pressure air-purifying respirators that must achieve a fit factor of 100 or less.

If the fit factor, as determined by QNFT fit testing, is equal or greater than 100 for tight-fitting half facepieces, or equal to or greater than 500 for tight-fitting full facepieces, then the QNFT has been passed with that respirator.

Fit testing of tight-fitting atmosphere-supplying respirators and tight-fitting powered air-purifying respirators will be accomplished by performing QLFT or QNFT in the negative pressure mode, regardless of the mode of operation (negative or positive pressure) that is used for respiratory protection.

ATTACHMENT 6-7
ARCADIS – RESPIRATORY PROTECTION
PRELIMINARY STEPS IN RESPIRATOR FIT TESTING

Prior to the commencement of the fit test, the employee must be given a description of the fit test and a description of the exercises that he or she will be performing during fit testing.

Prior to the actual fit test, the employee must be shown how to put on a respirator, position it on the face, set strap tension, and determine an acceptable fit.

Next, the employee must be allowed to choose a respirator from a sufficient number of models and sizes so that he/she can find an acceptable and correctly fitting respirator.

The employee must be fit tested with the same make, model, style, and size of respirator that will be used.

Employees assigned more than one respirator must be fit tested for each respirator assigned.

Fit testing must take into account the position of the mask on the face, nose, and cheeks and if there is room for eye protection and room to talk.

Once an acceptable respirator is found, a user seal check must be conducted as outlined in Attachment 5-8.

The respirator to be tested must be worn for at least five minutes before the start of the fit test.

ATTACHMENT 6-8
ARCADIS – RESPIRATORY – USER SEAL CHECK PROCEDURES
(from CFR 1910.134 App B-1 Mandatory)

The individual who uses a tight-fitting respirator is to perform a user seal check to ensure that an adequate seal is achieved each time the respirator is put on. Either the positive and negative pressure checks listed in this appendix, or the respirator manufacturer's recommended user seal check method shall be used. User seal checks are not substitutes for qualitative or quantitative fit tests.

I. Facepiece Positive and/or Negative Pressure Checks

A. Positive pressure check
Close off the exhalation valve and exhale gently into the facepiece. The face fit is considered satisfactory if a slight positive pressure can be built up inside the facepiece without any evidence of outward leakage of air at the seal. For most respirators this method of leak testing requires the wearer to first remove the exhalation valve cover before closing off the exhalation valve and then carefully replacing it after the test.

B. Negative pressure check
Close off the inlet opening of the canister or cartridge(s) by covering with the palm of the hand(s) or by replacing the filter seal(s), inhale gently so that the facepiece collapses slightly, and hold the breath for ten seconds. The design of the inlet opening of some cartridges cannot be effectively covered with the palm of the hand. The test can be performed by covering the inlet opening of the cartridge with a thin latex or nitrile glove. If the facepiece remains in its slightly collapsed condition and no inward leakage of air is detected, the tightness of the respirator is considered satisfactory.

II. Manufacturer's Recommended User Seal Check Procedures

The respirator manufacturer's recommended procedures for performing a user seal check may be used instead of the positive and/or negative pressure check procedures provided that the employer demonstrates that the manufacturer's procedures are equally effective.

[63 FR 1152, Jan. 8, 1998]

ATTACHMENT 6-9
ARCADIS – RESPIRATORY PROTECITON – RESPIRATOR INSPECTION CHECKLISTS
(from Safetyinfo.com)

Air Purifying Respirator Inspection
Inspect Before Each Use and When Cleaning

Location: _____ Date: _____

Inspected By: _____ Make / Model #: _____

	Signature of person conducting Inspection
Satisfactory Functional Test of Respirator	
Facepiece: Clean, not distorted, no tears, no cracks	
Head Harness: Clean, no tears, no cracks no missing pieces. No loss of elasticity. No wear from buckle.	
Lens: Clean & Clear, no cracks, sealed to mask	
Exhalation Valve: Clean, good seal, no tears, tight fitting	
Inhalation Valve: Clean, good seal, no tears, tight fitting	
Canister/Filter: Clean, no defects, tight fitting	
Respirator Cleaned	

If any defects are found **DO NOT USE RESPIRATOR.**
Turn the respirator in to your supervisor immediately for repair or replacement.

ASR / SCBA Respirator Inspection
Inspect Before Each Use, When Cleaning and Monthly

Location: _____ Date: _____

Inspected By: _____ Unit #: _____

	Signature of person conducting Inspection
Functional check of ASR / SCBA	
Alarm: Works Properly	
Regulator: Functions Properly	
Facepiece: Clean, not distorted, no tears, no cracks	
Elastic Parts: Pliable no deterioration	
Head Harness: Clean, no tears, no cracks no missing pieces. No loss of elasticity. No wear from buckle.	
Lens: Clean & Clear, no cracks, sealed to mask	
Exhalation Valve: Clean, good seal, no tears, tight	
Inhalation Valve: Clean, good seal, no tears, tight	
Cylinder: No dents or gouges, fits tightly in band	
Cylinder: Hydro Test Date _____	
Gage: Cylinder >90% full, check gage face, indicator	
Harness: Clean, no wear, fully extended	
Demand Valve O-ring: clean, no tears, seated properly	
ASR / SCBA: Cleaned and reassembled after inspection & drying	

If any defects are found **DO NOT USE RESPIRATOR.**

Turn the respirator in to your supervisor immediately for repair or replacement.

ATTACHMENT 6-10
ARCADIS – RESPIRATORY PROTECTION - RESPIRATOR CLEANING PROCEDURES

(from CFR 1910.134, App B-2, Mandatory)

These procedures are general in nature, and the employer may use the cleaning recommendations provided by the manufacturer of the respirator(s) provided such procedures are as effective as those listed here. Equivalent effectiveness means that the procedures used must ensure that the respirator is properly cleaned and disinfected in a manner that prevents damage to the respirator and does not cause harm to the user.

A. Remove filters, cartridges, or canisters. Disassemble facepieces by removing speaking diaphragms, demand and pressure- demand valve assemblies, hoses, or any components recommended by the manufacturer. Discard or repair any defective parts.

B. Wash components in warm (43 deg. C [110 deg. F] maximum) water with a mild detergent or with a cleaner recommended by the manufacturer. A stiff bristle (not wire) brush may be used to facilitate the removal of dirt.

C. Rinse components thoroughly in clean, warm (43 deg. C [110 deg. F] maximum), preferably running water. Drain.

D. When the cleaner used does not contain a disinfecting agent, respirator components should be immersed for two minutes in one of the following:

1. Hypochlorite solution (50 ppm of chlorine) made by adding approximately one milliliter of laundry bleach to one liter of water at 43 deg. C (110 deg. F); or,
2. Aqueous solution of iodine (50 ppm iodine) made by adding approximately 0.8 milliliters of tincture of iodine (6-8 grams ammonium and/or potassium iodide/100 cc of 45% alcohol) to one liter of water at 43 deg. C (110 deg. F); or,
3. Other commercially available cleansers of equivalent disinfectant quality when used as directed, if their use is recommended or approved by the respirator manufacturer.

E. Rinse components thoroughly in clean, warm (43 deg. C [110 deg. F] maximum), preferably running water. Drain. The importance of thorough rinsing cannot be overemphasized. Detergents or disinfectants that dry on facepieces may result in dermatitis. In addition, some disinfectants may cause deterioration of rubber or corrosion of metal parts if not completely removed.

F. Components should be hand-dried with a clean lint-free cloth or air-dried.

G. Reassemble facepiece, replacing filters, cartridges, and canisters where necessary.

H. Test the respirator to ensure that all components work properly.

OSHA Form 101 – Incident Report

Occupational Safety and Health Administration
Supplementary Record of
Occupational Injuries and Illnesses

U.S. Department of Labor

This form is required by Public Law 91-596 and must be kept in the establishment for 5 years.
Failure to maintain can result in the issuance of citations and assessment of penalties.

Case or File No.

Form Approved
O.M.B. No. 1218-0176

See OMB Disclosure Statement on reverse.

Employer

1. Name

2. Mail address (No. and street, city or town, State, and zip code)

3. Location, if different from mail address

Injured or Ill Employee

4 Name (First, middle, and last) | Social Security No.

5. Home address (No. and street, city or town, State, and zip code)

6. Age | 7. Sex (Check one) Male ☐ Female ☐

8. Occupation (Enter regular job title, not the specific activity he was performing at the time of injury.)

9. Department (Enter name of department or division in which the injured person is regularly employed, even though he may have been temporarily working in another department at the time of injuiry.)

The Accident or Exposure to Occupational Illness

If accident or exposure occurred on employer's premises, give address of plant or establishment in which it occurred. Do not indicated department or division within the plant or establishment. If accident occurred outside employer's premises at an identifiable address, give that address. If it occurred on a public highway or at any other place which cannot be identified by number and street, please provide place references locating the place of injury as accurately as possible.

10. Place of accident or exposure (No. and street, city or town, State, and zip code)

11. Was place of accident or exposure on employer's premises? Yes ☐ No ☐

12. What was the employee doing when injured? (Be specific. If he was using tools or equipment or handling material, name them and tell what he was doing with them.)

13. How did the accident occur? (Describe fully the events which resulted in the injury or occupational illness. Tell what happened and how it happened. Name any objects or substances involved and tell how they were involved. Give full details on all factors which led or contributed to the accident. Use separate sheet for additional space.)

Occupational Injury or Occupational Illness

14. Describe the injury or illness in detail and indicate the part of body affected. (E.g., amputation of right index finger at second joint; fracture of ribs; lead poisoning; dermatitis of left hand, etc.)

15. Name the object or substance which directly injured the employee. (For example, the machine or thing he struck against or which struck him; the vapor or poison he inhaled or swallowed; the chemical or radiation which irriatated his skin; or in cases of strains, hernias, etc., the thing he was lifting, pulling, etc.)

16. Date of injury or initial diagnosis of occupational illness | 17. Did employee die? (Check one) Yes ☐ No ☐

Other

18. Name and address of physician

19. If hospitalized, name and address of hospital

Date of report	Prepared by	Official position

OSHA No. 101 (Feb. 1981)

(See Next Page/Reverse)

SUPPLEMENTARY RECORD OF OCCUPATIONAL INJURIES AND ILLNESSES

To supplement the Log and Summary of Occupational Injuries and Illneses (OSHA No. 200), each establishment must maintain a record of each recordable occupational injury or illness. Worker's compensation, insurance, or other reports are acceptable as records if they contain all facts listed below or are supplemented to do so. If no suitable report is made for other purposes, this form (OSHA No. 101) may be used or the necessary facts can be listed on a separate plain sheet of paper. These records must also be available in the establishment without delay and at reasonable times for examination by representatives of the Department of Labor and the Department of Health and Human Services, and States accorded jurisdiction under the Act. The records must be maintained for a period of not less than five years following the end of the calendar year to which they relate.

Such records must contain at least the following facts:

1) About the employer - name, mail address, and location if different from mail address.

2) About the injured or ill employee - name, social security number, home address, age, sex, occupation, and department.

3) About the accident or exposure to occupational illness - place of accident or exposure, whether it was on employer's premises, what the employee was doing when injured, and how the accident occurred.

4) About the occupational injury or illness - description of the injury or illness, including part of the body affected, name of the object or substance which directly injured the employee; and date of injury or diagnosis of illness.

5) Other - name and address of physician; if hospitalized, name and address of hospital, date of report; and name and position of person preparing the report.

SEE *DEFINITIONS* ON THE BACK OF OSHA FORM 200.

OMB DISCLOSURE STATMENT

Public reporting burden for this collection of information is estimated to average 20 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Persons are not required to respond to the collection of information unless it displays a currently valid OMB control number. If you have any comments regarding this estimate or any other aspect of this information collection, including suggestions for reducing this burden, please send them to the OSHA Office of Statistics, Room N3644, 200 Constitution Avenue, NW, Washington, DC 20210

G Baseline Ecological Evaluation Report

1 Introduction

ARCADIS, on behalf of PSEG Services Corporation (PSEG), has prepared this Remedial Investigation (RI) and Interim Remedial Action Report (RAR) to present the details and results of soil and groundwater investigation activities conducted in association with the release of diesel fuel (Incident Number 04-08-02-2350-16) at the PSEG Nuclear, LLC Salem Generating Station (the Station). The Site is located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. The Station location and layout are depicted on **Figures 1** and **2**, respectively. The remedial investigation was conducted in accordance with the Remedial Investigation Work Plan (RIWP) that was submitted to the New Jersey Department of Environmental Protection (NJDEP) in January 2005. The scope of work outlined in the RIWP was designed to investigate the extent of diesel fuel constituents in the shallow, water-bearing unit at the Station.

This report has been prepared in accordance with New Jersey Administrative Code (N.J.A.C.) Chapter 26E - Technical Requirements for Site Remediation (Technical Requirements).

1.1 Project Background

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the stormwater collection system just to the south of the Salem Unit 1 Fuel Handling Building. Investigation of the catch basin, which is identified as "Catch Basin 27" on **Figure 2**, revealed the presence of a red-dyed diesel fuel (the red-dye is more typical of a recent release of diesel fuel). At this time, PSEG notified the NJDEP through its spill hotline.

To prevent the migration of diesel fuel within the stormwater collection system, the storm drains upstream and downstream of Catch Basin 27 were temporarily blocked to isolate the affected section of piping. Further, a cover was placed over Catch Basin 27 to prevent rain water from entering. Investigations of the remainder of the stormwater system indicated that the diesel fuel had not migrated beyond Catch Basin 27, no diesel fuel was released to the Delaware River, and the diesel fuel in the catch basin was removed.

Investigations into the source of the diesel fuel focused on the underground piping adjacent to Catch Basin 27 that supplies diesel fuel from the bulk storage tanks to diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers. The location of the underground piping is shown on **Figure 2**. PSEG performed a pressure test on this underground piping. The results revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. To pinpoint the location of the leak along this 300-foot section of piping, PSEG subcontracted Praxair Services, Inc. to perform a "Tracer Tight" gas analysis. The results of this test showed that the location of the leak was directly adjacent to Catch Basin 27.

The results of the Tracer Tight gas analysis indicated that there were no other leaks along the 300-foot section of piping.

Excavation in the area of the leaking underground piping was initiated on August 23, 2004 by PSEG with the support of Clean Harbors, Inc. to repair the piping. During the excavation process, residual diesel fuel was observed on soil excavated from below the piping (approximately six feet below ground surface (bgs)). Soil excavated from the piping area was stockpiled by PSEG pending waste characterization. Following characterization, the soil was disposed of by Clean Harbors. The soil disposal manifests are included as **Appendix A**. Separate-phase diesel fuel was observed on standing water within the excavation. Prior to backfilling, approximately 150 gallons of diesel fuel were recovered from the excavation. Disposal manifests for the diesel fuel are also included in **Appendix A**.

In November 2004, PSEG initiated remedial investigation and interim product recovery actions. In accordance with the scope of work presented within the RIWP, soil borings were advanced at locations downgradient of the source area to delineate the horizontal extent of diesel related constituents of concern in soil. The soil borings were converted to monitoring/product recovery wells to facilitate the collection of groundwater samples and for the recovery of separate-phase diesel, if present. Interim remedial actions completed to date include the installation of a Spill Buster® Product Recovery System, a passive product skimmer, and the use of absorbent socks. The sections of this report present relevant facility information, the details and results of the soil and groundwater investigation activities completed to date, and the details and results of product recovery efforts completed to date. These sections are followed by conclusions and proposed investigation and product recovery activities.

1.2 Report Organization

This report contains eleven sections including this introduction:

- Section 2 – Station History;
- Section 3 – Station Setting;
- Section 4 - Facility Construction Details and Local Geology and Hydrogeology;
- Section 5 – Remedial Investigation;
- Section 6 – Interim Remedial Actions;
- Section 7 – Baseline Ecological Evaluation;
- Section 8 – Conclusions
- Section 9 – Proposed Actions;

- Section 10 – Request for Variance; and,
- Section 11 - References

The Station History Section (Section 2) provides an overview of the operating history of the Station and applicable regulations governing these operations;

The Station Setting section (Section 3) provides a detailed description of the environmental setting of the Station including topography, surface water features, climate, soil, and regional geology and hydrogeology;

The Facility Construction Details and Local Geology and Hydrogeology section (Section 4) provides a detailed description of the construction of the facility and the resulting influence on local geology and hydrogeology;

The Remedial Investigation section (Section 5) provides the details and results of soil and groundwater investigation activities completed to date;

The Interim Remedial Action section (Section 6) presents the details of interim remedial actions completed to date:

The Baseline Ecological Evaluation section (Section 7) provides the details and results of a baseline ecological evaluation conducted in accordance with N.J.A.C. 7:26E-3.11;

The Conclusions section (Section 8) presents a summary of the findings of the remedial investigation; and,

The Proposed Actions section (Section 9) presents recommendations for further actions based on the investigation findings;

The Request for Variance section (Section 10) presents a request for variance from the Technical Requirements for Site Remediation (N.J.A.C. 7:26E); and,

The References section (Section 11) provides publications referenced during the preparation of this report.

2 Station History

The following sections provide relevant site information regarding the facility's operating history and a review of applicable regulations relating to operations at the Station.

2.1 Operating History

PSEG Nuclear LLC operates and is part owner of the Salem Generating Station located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. PSEG Nuclear LLC (57.41%) and Exelon (42.59%) jointly own the Salem Generating Station. The Salem Generating Station is situated adjacent to the Hope Creek Generating Station, also located on Artificial Island. Both the Salem and Hope Creek Generating Stations (the Stations) are located on the eastern bank of the Delaware River. The Salem Generating Station encompasses an approximate 26-acre portion of Artificial Island.

The Salem Generating Station is composed of two nuclear generating units (Units 1 and 2) and one distillate oil fueled combustion turbine unit (Unit 3). Commercial operations of Units 1 and 2 commenced in 1976 and 1981, respectively. The combustion turbine unit commenced operations in 1972. The nuclear generating units operate as base load units and the combustion turbine unit operates as a peaking unit. The Salem Generating Station has a combined generating capacity of approximately 2,400 MW. Over its operational life, the Salem Generating Station has experienced no significant changes in its operation.

2.2 Regulatory Review

Regulatory oversight for the Salem Generating Station, and other nuclear generating stations, is provided by both federal and state agencies. These agencies ensure that the stations are designed, constructed, licensed and operate in a matter that maximizes the safe containment and management of radioactive materials. These agencies also ensure that sufficient funding mechanisms have been established, are adequately funded, and will be available to decommission the nuclear generating stations at the end of their life cycle.

On the federal and state levels, the United States Nuclear Regulatory Commission (USNRC) and the New Jersey Department of Environmental Protection Bureau of Nuclear Engineering (NJDEP-BNE) conduct licensing and oversight of the Station. Oversight by the NJDEP-BNE and USNRC includes periodic inspections and conducting environmental radiological monitoring.

3 Station Setting

The following sections provide information regarding the environmental setting of the Salem Generating Station, including land use, the environmental setting, precipitation and drainage, local geology and local hydrogeology.

3.1 Land Use

PSEG Nuclear LLC owns and/or controls an approximately 740-acre area of Artificial Island that is situated adjacent to and surrounds the Salem and Hope Creek Generating Stations. This area contains administrative and support facilities used by the Stations, the Hope Creek Switch Yard, the Salem Switch Yard, and undeveloped vacant land. With the exception of the Salem Generating Stations (Units 1 through 3) and the Salem Switchyard, the remaining acreage is considered to be the Hope Creek Generating Station.

The zoning classification for the Salem Generating Station is industrial. The land adjacent to the Salem Generating Station is zoned for industrial and residential or agricultural use.

3.2 Environmental Setting

The Salem Generating Station is located on a portion of Artificial Island that borders the Delaware Estuary. The Estuary, in the location of the Salem Generating Station, is a tidal, brackish river, located in an area designated as Zone 5 by the Delaware River Basin Commission.

The United States Army Corps of Engineers, beginning in the early twentieth century, created Artificial Island by depositing hydraulic dredging spoils within a diked area established around a natural sand bar that projected into the Delaware River. Prior to construction of the Salem Generating Station, the property was vacant, undeveloped, low-lying land.

3.3 Topography and Station Drainage

The topography at the Salem Generating Station is relatively flat with limited local relief. Topographic contours for the Station are included on **Figure 2**. Stormwater is managed in accordance with the Salem Generating Station New Jersey Pollution Discharge Elimination System (NJPDES) permit and Stormwater Pollution Prevention Plan. Stormwater is collected in storm drains and routed to the Delaware River for discharge. Stormwater from the major petroleum storage and handling areas is routed to the oil/water separator prior to discharge.

3.4 Climate and Precipitation

Salem County is located in southwestern New Jersey. The county's climate is considered to be humid and temperate, as the climate in this county is readily influenced by its proximity to the Delaware Bay. Coastal storms are not uncommon in this region and can produce high winds and heavy rainfall, which can cause wind damage and flooding in low-lying areas.

Wind direction in this region is dependent upon the season; during the summer, winds are typically from the southwest while during the winter winds are commonly from the northwest. Temperatures vary by season and the maximum expected high temperature for a given year is 96 degrees Fahrenheit, while the minimum expected yearly low temperature is minus 2 degrees Fahrenheit. The average annual precipitation total is 39.9 inches.

3.5 Regional Geology

The Station is located in the Atlantic Coastal Plain Physiographic Province. This area is characterized by relatively flat to gently undulating terrain, underlain by unconsolidated sediments that increase in thickness to the southeast. These sediments range in age from Holocene to Cretaceous (0 to 146 million years old), are primarily comprised of clay, silt, sand, and gravel, and are generally classified as continental, coastal, or marine in nature. Published geologic mapping indicates that the basement rock beneath these sediments (in the area of the Station) is metamorphic schist of the Wissahickon Formation, which is Pre-Cambrian in age (570 to 900 million years old).

The unconsolidated overburden at the Salem and Hope Creek Generating Stations consists of approximately 25 to 40 feet of dredge spoils, engineered fill material (cofferdam), tidal marsh deposits and riverbed deposits. The engineered fill, composed mainly of silt, silty clay, sand, and gravel, replaced the dredge spoils within the cofferdam during the construction of the Station. Due to the composition and nature of the engineered fill, the hydraulic conductivity of this material is very low, thus limiting the extent and rate of groundwater movement. Below the engineered fill there is an approximate five-foot layer of tidal marsh deposits consisting of silty peat and organic silt and meadow mat. The tidal marsh deposits are semi-confining. Beneath the tidal marsh deposits are approximately ten feet of discontinuous Quaternary Age riverbed deposits consisting of sand and gravel. The engineered fill, the tidal marsh deposits and the riverbed deposits, combine to form the water table aquifer (see Section 3.6). Beneath the surface water aquifer, in order of increasing depth, are the following geologic formations:

Clay, Confining Unit – Beneath the shallow, riverbed and other deposits is a clay, confining unit that separates the shallow unit from the deeper Vincentown Formation. Conflicting geologic reports suggest that the clay, confining unit is either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits (USGS 1979 and 1999). Previous investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

Vincentown Formation – The Vincentown Formation occurs from a depth of approximately 55 feet bgs to a depth of 135 feet bgs and consists of a competent, greenish-gray, fine to medium sand with some silt, shell fragments, feldspar and glauconite.

Hornerstown Formation – The Hornerstown Formation is a highly glauconitic, clayey, dark green sand that contains small percentages of quartz grains and apatite pellets. The Hornerstown Formation unconformably overlies the Navesink Formation and is unconformably overlain by the Vincentown Formation. The Hornerstown Formation occurs from approximately 135 to 145 feet bgs.

Navesink Formation – The Navesink Formation is characteristically a glauconitic sand with varying amounts of silt and clay. It is brown or dark green to blue-black and has a shell bed at its base. The upper part of the formation is less glauconitic, more clayey, more micaceous, and lighter in color. The Navesink Formation conformably overlies the Mount Laurel Sand (USGS 1969). The contact with the overlying Hornerstown Formation is gradational. The Navesink Formation is encountered from approximately 145 to 170 feet bgs.

Mount Laurel-Wenonah Formation – The Mount Laurel-Wenonah Formation consists of a clayey, medium-grained sand with some gravel, feldspar and glauconite. In the vicinity of the Station, the Mount Laurel-Wenonah Formation is approximately 100 hundred feet thick and occurs from 170 to 270 feet bgs.

Beneath the Mount Laurel-Wenonah Formation, more than 1,000 feet of Upper Cretaceous sediments overlie the crystalline bedrock. The Upper Cretaceous sediments include in descending order: the Marshalltown Formation (gray, fine sand); the Englishtown Formation (yellow-brown, fine sand); the Woodbury Clay (dark gray, stiff, silty clay); the Merchantville Formation (dark green clay); the Magothy Formation (coarse to fine silt with little fine sand); and the Raritan and Potomac Formations (interbedded sand, gravelly sand and clay).

3.6 Regional Hydrogeology

There are four primary water bearing formations (aquifers) underlying the Station: 1) the shallow, water-bearing unit; 2) the Vincentown Formation; 3) the Mount Laurel-Wenonah Formations; and, 4) the Potomac-Raritan-Magothy Formations. The shallow, water-bearing unit, which consists of the dredge spoils, engineered fill, tidal marsh deposits and the discontinuous Quaternary riverbed deposits, occurs between approximately 10 to 40 feet bgs. In general, the dredge spoils, engineered fill and tidal marsh deposits are characterized by low permeability. Occasional lenses of sand within the dredge spoils may contain perched water within a few feet of the ground surface. The groundwater in the water table aquifer is generally brackish, with flow to the southeast and a gradient of approximately 0.007 feet/feet.

A clay, confining unit identified as either the Miocene Kirkwood Formation or the Pleistocene Van Sciver Lake Bed deposits separates the shallow, water-bearing unit from

the deeper Vincentown Formation. As stated previously, investigations conducted at the facility indicate that the clay, confining unit is laterally extensive beneath the Station.

The Vincentown Formation, which occurs from approximately 55 to 135 feet bgs, is a semi-confined to confined aquifer under artesian conditions. Groundwater in the Vincentown Formation generally flows from north to south with a gradient of approximately 0.003 feet/feet. Regionally, the Vincentown Formation is a water-producing aquifer, which supplies potable water to domestic wells in Salem County. Groundwater in the aquifer is moderately hard with high iron content. Saltwater-intrusions occur near the Delaware River, where water quality is brackish and non-potable.

The Hornerstown and Navesink confining units separate the Vincentown Formation from the Mount Laurel-Wenonah Formations. The Mount Laurel-Wenonah Formations occur from approximately 135 to 170 feet bgs. The Station has two potable and fire-water supply wells screened in this formation.

The deepest of the water bearing formations is the Potomac-Raritan-Magothy Formation. In Salem County, the Potomac-Raritan-Magothy Formation occurs at depths in excess of 500 feet bgs. This is the primary water producing aquifer for New Jersey. Four potable and fire-water supply wells at the Station are screened in the Potomac-Raritan-Magothy Formation at depths ranging from 800 to 1,100 feet bgs. The Potomac-Raritan-Magothy Formation is bounded by the Merchantville Formation above and below by the Wissahickon Schist basement rock. The crystalline basement rock of the Wissahickon Schist is not considered a productive aquifer and only locally transmits water from secondary porosity (i.e., fractures and faults).

4 Facility Construction Details and Local Geology and Hydrogeology

The construction of the Salem Generating Station has caused significant changes to the local geology and hydrogeology. Within the footprint of the cofferdam surrounding Units 1 and 2 (see Figure 2), the majority of original Artificial Island materials were removed to a depth of 70 feet bgs. The following sections, which contain information presented in a Remedial Investigation Report (RIR) previously prepared for a separate investigation conducted at the Station (ARCADIS 2004), describe the conditions at Artificial Island prior to the construction of the Station, and detail how the construction of the Station has altered the local geology.

4.1 Pre-Facility Construction

The Station is located on the southern tip of what was once a natural sand bar projecting into the Delaware River. The area between the sand bar and the mainland had been used as

a dredge spoil deposit area. In 1899, a timber sheetpile wall was installed around the perimeter of the sand bar. Over the next 50 or so years the area was used as a spoil deposit area for material collected during the dredging of the Delaware River. Riprap was added to the perimeter when the timbers began to degrade. The area landward of Artificial Island has remained a tidal marsh.

4.2 Facility Construction

The construction of the Station has resulted in significant changes to the local geology. It was necessary to remove and rework much of the soil in the area of the Station in order to facilitate construction. For the purposes of this report, the description of the facility construction is limited to the area within the cofferdam; however, it should be noted that the local geology beyond the limits of the cofferdam was also significantly modified. The extent of the cofferdam is shown on **Figure 2**.

The cellular cofferdam, which encircled the excavation for all the Class I structures (e.g., containment, fuel handling, and auxiliary buildings), was constructed of interlocking sheet piling driven from an approximate depth of 23 feet below existing grade (approximately 77 feet plant datum [PD] or -12.92 feet above mean sea level [amsl NAVD 1988]). The cofferdam consists of 24 circular cells, approximately 60.5 feet in diameter with connecting arcs, that were advanced from this depth to approximately 10 feet into the Vincentown Formation to an elevation of 17 feet PD (-72.92 feet amsl). The cofferdam sections are of two different heights, 50 feet and 60 feet. The elevation of the top of the cofferdam is 77 feet PD (-12.92 feet amsl) on the north, south and west sides. The elevation of the eastern side is 67 feet PD (-22.92 feet amsl) providing access and a foundation for the return circulating water pipes and associated thrust block.

The inside area of the cofferdam sections were excavated to elevation 27 feet PD (-62.92 feet amsl). A vertical steel wall was added inside each individual cofferdam section to divide the sections approximately in half. The inner half of the individual cofferdam sections, or the section facing the building foundations, was then filled to the top with lean concrete. The area contained by the entire cofferdam structure was then excavated to the Vincentown Formation for placement of a lean concrete mat that served as the foundation for the construction of the structures within the cofferdam. During this stage of the excavation, qualified personnel visually inspected the bottom of the excavation to verify that the excavation had reached the top of the Vincentown Formation prior to placing any lean concrete.

Prior to the completion of the excavation, at approximately elevation 45 feet PD (-44.92 feet amsl), 15 exploratory borings were drilled through the remaining Kirkwood Formation and into the underlying Vincentown to verify the depth to the formation. These additional borings showed no measurable differences from the study borings.

Based on a review of available documents, the top of the Vincentown Formation in the area of the cofferdam ranges between 27 and 30 feet PD (-62.92 to –65.92 feet amsl).

When the surface of the Vincentown Formation was reached, the area was cleared of loose soil and lean concrete was poured directly onto the exposed Vincentown Formation. The station construction drawings indicate that the base of the first lean concrete pour was at 30 feet PD (-59.92).

The cofferdam serves as a basin in which the Class I structures were constructed. Prior to construction of the primary structures, a lean concrete mat ranging in thickness from 5 to 50 feet was placed on top of the Vincentown Formation for support of the structures. Following placement of the lean concrete, the Auxiliary Building, Fuel Handling Buildings and Reactor Containment Buildings were constructed. The remainder of the excavation within the cofferdam was then backfilled with structural fill meeting the design specifications of the Station.

4.3 Local Geology and Hydrogeology

The soils removed from within the cofferdam were not used to backfill the completed structure because the hydraulically placed fill and other riverbed deposits underlying Artificial Island did not meet the building design specifications for the Station. Therefore, it was necessary to import construction or structural fill to build the facility. The structural fill was placed between and around the Auxiliary Building, Fuel Handling Buildings, Units 1 and 2, portions of the cofferdam, above the return circulating water pipes, and from the top of the clay, confining-unit to the land surface in the portions of the area between the cofferdam and the circulating water discharge pipes.

The structural fill used at the station was obtained from a number of sources in New Jersey and Delaware. One fill source used in the area of this investigation was the Hinchner Pit. While the location of the borrow source was not identified, the material was described as yellowish-brown fine to medium sand with a trace of silt and clay.

Details of groundwater investigation activities historically completed at the facility indicate that groundwater elevations in the shallow, water-bearing unit within the limits of the cofferdam are generally higher than those outside the limits of the cofferdam. This is expected considering permeability differences that exist between the structural fill within the limits of the cofferdam and the hydraulic fill beyond the limits of the cofferdam, resulting in a groundwater mound. Due to the mound, groundwater flows radially outward from the cofferdam. The observed mounding effect dissipates quickly. A groundwater elevation contour map for the shallow, water-bearing unit under ambient (i.e., non-pumping) conditions is presented on **Figure 3** (ARCADIS 2004). The groundwater elevation contour map was prepared using water level measurements obtained during a

previously completed and unrelated investigation at the facility. Beyond the limits of the cofferdam, groundwater flow is generally from the center of the island (northeast of the Salem Generating Station) towards the Delaware River.

Facility construction details and local geology are highlighted on cross section diagrams through various Station features (**Figures 4** and **5**). The cross sections provide details obtained during the remedial investigation, which are discussed in the following sections.

5 Remedial Investigation

As presented in the RIWP, the remedial investigation conducted in association with the diesel release had the following four primary goals: 1) to characterize the vertical and horizontal extent of diesel-related constituents in soil; 2) to determine if separate-phase diesel fuel was present on the water table and to what extent; 3) to characterize the extent of dissolved-phase diesel-related constituents in groundwater downgradient of the release area; and, 4) to determine the need for further action. The scope of work developed to achieve these objectives included the advancement of four soil borings at various locations downgradient of the source of the diesel release for collecting soil samples, the installation of five monitoring wells, and the monitoring of water/product levels and the collection of groundwater samples from six monitoring wells (the five recently installed monitoring wells and one existing monitoring well. The following sections provide the details and results of these investigation activities.

5.1 Soil Investigation

Soil investigation activities were completed between November 8th and 9th 2004 and consisted of the advancement of four soil borings (Borings D-2 through D-5) for the collection of soil samples. The locations of the soil borings relative to the source of the diesel release are identified on **Figure 6**. Due to the presence of diesel-fuel oil, soil samples were not taken from the source area soil boring (D-1). Prior to initiating soil sampling activities, a water level measurement was obtained from Well X, located adjacent to the northwest corner of the Fuel Handling Building (see **Figure 6**) to determine the appropriate depth for sample collection. Soil samples were obtained from the borings at a depth of six inches above the water table as measured in Well X. A second sample was obtained from Soil Boring D-4 to evaluate the vertical distribution of diesel related constituents of concern in soil.

Due to the extensive, facility-critical infrastructure within the area of investigation, both the boring locations and advancement methods were limited. Soil Borings D-2 through D-5, advanced at accessible locations beyond the source area of the diesel release to the south and west, were advanced using vacuum excavation equipment to ensure that, if encountered, subsurface infrastructure would not be damaged. Soil samples were obtained

from each boring ahead of the vacuum excavation using a hand auger. The soil samples were submitted to Accutest Laboratories, of Dayton, New Jersey, and were analyzed for total petroleum hydrocarbons (TPHC). In accordance with N.J.A.C. 7:26E-2.1(d), soil samples were also placed on hold for volatile organic compounds (VOCs) analysis pending the TPHC results. Based on the results of the TPHC analysis, which are summarized in **Table 1**, analysis for VOCs was not required per N.J.A.C 7:26E-2.1(d). Copies of the laboratory reports and the associated HazSite deliverables for the soil samples are included in **Appendix B**. Further details regarding the analytical results are as follows:

- Analytical results of the soil samples submitted for TPHC analysis did not indicate concentrations above laboratory detection limits. The method detection limits ranged from 26 to 32 milligrams per kilogram (mg/kg).

- Results of the soil investigation indicate that the release of diesel fuel has not migrated a significant distance beyond the source area and that diesel related constituents of concern in soil are likely limited to the source area and the "smear-zone" where separate phase diesel has migrated. The estimated extent to which separate-phase diesel has migrated is shown on **Figure 8**. Locations for advancing soil borings are limited due to the presence of extensive subsurface infrastructure. Due to these limitations, the extent of diesel-related constituents of concern in soil can not be further refined.

5.2 Groundwater Investigation

The investigation of groundwater consisted of the installation of five monitoring wells within and downgradient of the source area to evaluate the extent of dissolved-phase and separate-phase diesel. Following installation, product gauging and groundwater sampling were initiated, including the gauging and sampling of six monitoring wells (the five newly installed wells, and one previously existing monitoring well). The following sections provide a summary of the groundwater investigation details and results.

5.2.1 Monitoring Well Installation

Five groundwater monitoring wells (Well AU, Well AV, Well AW, Well AY, and Well AZ) were installed between November 8 and 9, 2004. The five monitoring wells were installed using vacuum excavation techniques due to the extensive subsurface utilities and/or infrastructure described in the previous section. The locations and well construction details of the groundwater monitoring wells are shown on **Figure 3** and are summarized in **Table 2**, respectively. NJDEP Bureau of Water Allocation Monitoring Well Records, well construction logs, and boring logs are included in **Appendix C**. The purposes for the monitoring wells are as follows:

- Well AU was installed within a temporary PVC sleeve that was placed within the excavation opened to expose the underground piping prior to backfilling. Due to the presence of extensive subsurface infrastructure encountered during the excavation, Well AU could not be installed beyond a depth of approximately seven feet below ground surface (bgs). Separate-phase diesel fuel was observed within the open excavation prior to backfilling and in Well AU after installation was completed. The primary purpose of Well AU has been to facilitate product recovery using the Spill Buster® active product recovery unit. Details regarding these product recovery efforts are presented in Section 6;

- Monitoring Wells AV and AW were installed at the locations of Soil Borings D-3 and D-2, respectively. Using vacuum excavation equipment, the boreholes of D-2 and D-3 were advanced to approximately ten feet bgs and the monitoring wells were installed within the borehole. Wells AV and AW were installed to delineate the extent of separate-phase diesel fuel downgradient of the source area based on knowledge of groundwater flow direction obtained from previously completed and unrelated investigations. Following installation, separate-phase diesel fuel was detected in Well AW. In response, a passive skimmer product recovery setup was installed within Well AW. Details regarding the product recovery efforts for this well are presented in Section 6;

- Monitoring Wells AY and AZ were installed at the locations of Soil Borings D-4 and D-5, respectively. Using vacuum excavation equipment, the boreholes of D-4 and D-5 were advanced to approximately ten feet bgs and the monitoring wells were installed within the borehole. These wells were installed to delineate the extent of dissolved-phase diesel constituents in groundwater downgradient of the source area.

Monitoring Well AU was designed for use as a product recovery well and is constructed of six-inch diameter Schedule 40 PVC well screen and riser. Well AV, Well AW, Well AY, and Well AZ were constructed of 4-inch diameter Schedule 40 PVC well screen and riser. A sand filter pack was placed in the annular space around the screen interval followed by an appropriate bentonite seal and grouting material. Well AU was completed at ground surface with a two-foot square flush-grade well vault to facilitate the installation of the Spill Buster® unit. Well AV, Well AW, Well AY, and Well AZ were completed with 12-inch round flush-grade manways.

A summary of the well completion details (i.e., total depth, screened interval) is presented in **Table 2**. The total depth and screen interval for the monitoring wells were field-constructed based on the facility-related subsurface infrastructure observed at each location. Therefore, well construction details varied slightly from the specifications presented in the RIWP. In accordance with N.J.A.C. 7:26E-4.4(g) [8], the proposed monitoring wells were

developed to yield a non-turbid discharge following installation. The monitoring wells were developed using a combination of surging and pumping techniques. In the instances where separate-phase diesel fuel was observed following installation (Wells AU and AW), product was removed from the well using a disposable bailer prior to development. In accordance with N.J.A.C. 7:26E-4.4(g) [7], the Station monitoring wells were surveyed by a New Jersey-licensed surveyor. Monitoring Well Certification Form Bs are provided in **Appendix D**.

5.2.2 Groundwater Monitoring

Following the installation of the wells, quarterly groundwater monitoring was initiated with events completed in December 2004 and March 2005. Quarterly groundwater monitoring events consist of the gauging of water levels and separate-phase product and the collection and analysis of groundwater samples from Well AV, Well AW, Well AY, Well AZ, and Well X. The following sections provide details regarding these activities.

5.2.2.1 Water Level and Separate-Phase Product Measurements

Prior to the initiation of groundwater sampling activities, water-level and separate phase product measurements were obtained from each monitoring well. Water-level and separate phase product measurements were also collected during routine maintenance of the Spill Buster® unit and the other product recovery methods discussed in Section 6. A summary of the product gauging and groundwater elevation data is presented in **Table 3**.

With the exception of a one time detection of product in Well AZ, measurable product is limited to the area of Well AU and downgradient towards Well AW. On February 16, 2005, PSEG initiated the operation of a groundwater extraction system associated with an ongoing and unrelated groundwater remediation. The groundwater extraction system includes the use of Well AO located approximately five feet to the east of Well AZ. The location of Well AO, as well as groundwater elevation contours observed on March 23, 2005 during the operation of the groundwater extraction system, is shown on **Figure 7**. Due to the operation of the groundwater extraction system and the resulting groundwater elevation contours, separate-phase product migrated in the direction of Well AO and 0.09 feet of product was observed in Well AZ. Immediately (i.e., same day) following the detection of separate-phase product in Well AZ, the operation of the groundwater extraction pump in Well AO ceased. An organophilic adsorbent sock was placed in Well AZ to recover any accumulated product. Since pumping from Well AO was ceased, separate-phase product has not been detected in Well AZ. Sorbent socks have been deployed in Well AZ to recover any residual product that may still be present.

The extent to which product has migrated to date has been controlled by the subsurface infrastructure located within the investigation area. As shown on the facility cross sections

(**Figures 4** and **5**), the foundation for the primary water storage tank located to the west of Well AU has limited the migration of separate phase product in this direction. Conversely, the service water piping that runs to the south from Well AU and the source area likely provided a preferential pathway for the migration of separate phase product towards Well AW. With the repair of the diesel fuel underground piping, the ongoing product recovery efforts being conducted in Well AU and Well AW will control further migration of product. Separate phase product measurements obtained from Well AY, located to the south and downgradient of Well AW along the service water pipes, provide delineation of the extent of separate phase product.

5.2.2.2 Monitoring Well Sampling

Depth-to-water and separate-phase product thickness measurements were collected using an electronic oil/water interface probe prior to initiating sampling activities. Groundwater samples were only collected from monitoring wells that did not indicate a measurable thickness (i.e., greater than 0.01 feet) of separate-phase product. Well AU and Well AW were not sampled during either sampling event due to the presence of separate phase product in these wells. In accordance with the Station's operating permit, a grab groundwater sample was also collected from wells being sampled prior to initiating sampling activities for radionuclide screening, which is required prior to releasing the samples from the facility for offsite analysis. Based on the results of the radionuclide screening the groundwater sample from Well AZ was not submitted for laboratory analysis during the March 2005 event. On April 18, 2005, ARCADIS personnel returned to the Site in an effort to obtain a groundwater sample from Well AZ for laboratory analysis and again the sample could not be released from the facility based on the results of the radionuclide screening.

Due to the sensitive nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples were collected utilizing the low-flow sampling methodology. Sample collection procedures, as well as quality control/quality assurance (QA/QC) sampling requirements, were outlined in the RIWP. The groundwater biogeochemical parameters and sampling logs are included in **Table 4** and **Appendix E**, respectively. Groundwater samples were submitted to Accutest Laboratories of Dayton, New Jersey. The groundwater samples were analyzed for priority pollutant list semi-volatile organics (SVOCs) and VOCs including a library search. The laboratory report and HazSite deliverables for the groundwater monitoring events are included as **Appendix F**. The analytical results for the groundwater samples taken in December 2004 and March 2005 are summarized in **Tables 5** and **6**, and indicate the following:

- The analytical results of the groundwater samples collected during the December 2004 and March 2005 sampling events indicated that concentrations of diesel

related constituents of concern (both VOC and SVOC) were below the New Jersey Groundwater Quality Criteria for Class IIA aquifers (GWQC).

- Of the VOCs, only tetrachloroethene was detected above the laboratory detection limit. The groundwater sample collected from Well X in December 2004 indicated a tetrachloroethene concentration of 0.87 µg/l (micrograms per liter, equivalent to parts per billion), which is below the GWQC for tetrachloroethene (1 µg/L). Tetrachloroethene was below the laboratory detection limit in the groundwater sample collected from Well X in March 2005. The detection of tetrachloroethene in Well X appears to be an anomaly and may have been a result of laboratory contamination.

- With the exception of the groundwater samples collected from Well AV, which is located to the east of the service water pipes, the SVOC constituents were below laboratory detection limits. Analytical results of the groundwater samples collected from Well AV indicated concentrations of the following SVOCs above laboratory detection limits but below their respective GWQC: acenaphthalene, carbozole, fluorine, 2-methylnaphthalene, naphthalene, and phenanthrene. The detection of these constituents is consistent with a diesel release.

6 Interim Remedial Actions

The extent of product observed to date has been limited to Well AU, installed within the source area, and Well AW, installed immediately downgradient of the source area along the service water piping. Separate phase product was detected during a single gauging event in Well AZ and migrated to this area under the influence of pumping in Well AO. Product recovery efforts completed to date have included the installation of the Spill Buster® active product recovery system in Well AU and Well AW at different times, the installation and operation of a passive skimmer in Well AW, and the installation of sorbent socks within Well AZ. The following sections provide the details and results of product recovery efforts completed to date.

6.1 Product Recovery Details

Following installation of the monitoring wells, water-level and product gauging activities were initiated to evaluate the extent of separate phase product in the subsurface and to evaluate product recovery methods. As presented in the RIWP, a Spill Buster® unit was installed in the source area well (Well AU) to facilitate product recovery. The Spill Buster® system is designed to remove only product (i.e., no water) with a down-well conductivity sensor and pump apparatus, an adjustable depth, wellhead auto-seek unit, and integrated control panel. Recovered product is conveyed to a nearby storage tank that is equipped with a high-level auto shut-off interfaced with the Spill Buster® control panel.

Based on the initial water-level and separate phase product measurements, the Spill Buster® unit, was instead installed in Well AW due to the greater apparent thickness of separate-phase product. The Spill Buster® unit was installed on December 22, 2004 and product recovery efforts were initiated. Following the initial startup of the Spill Buster® unit, product recovery rates were monitored and it became apparent that, although Well AW indicated a greater product thickness, the recovery rate of product from this well (less than 0.25 gallons per day) was limited. On January 17, 2005, the Spill Buster® unit was transferred to Well AU. Operation of the Spill Buster® Unit in Well AU was much more effective than previous efforts in Well AW. Separate phase product recovery rates from Well AU have been maintained at an approximately two gallons per day. Discussions regarding the results of product recovery rates (e.g., cumulative product recovered to date) are presented in Section 6.2. With the continued presence of separate phase product and the limited product recovery rate in Well AW, a passive skimmer setup was installed on April 8, 2005.

As presented in section 5.2.2.1, separate-phase product was detected in Well AZ following the initiation of pumping in Well AO. Following this detection, pumping at Well AO was immediately discontinued and, since then, product has not been observed in Well AZ. Sorbent socks have been deployed in Well AZ to recover any residual product that may still be present; however, there has been no indication of additional product (i.e., sheen, sock staining, etc.) in Well AZ since the cessation of pumping.

6.2 Product Recovery Results

As presented in Section 6.1, product recovery efforts to date have consisted of the installation and operation of a Spill Buster® in Well AU and Well AW, the use of a passive skimmer in Well AW, and the deployment of sorbent socks within Well AZ. Operation of the Spill Buster® unit in Well AU has resulted in the recovery of approximately 190 gallons of separate phase product through April 8, 2005 at a consistent rate of approximately two gallons per day. **Figure 9** provides details regarding the cumulative product recovered with the Spill Buster® unit through April 8, 2005. Operation of the passive skimmer in Well AW has resulted in the recovery of approximately 0.5 to 0.75 gallons of separate phase product per week. The skimmer is retrieved from the well two to three times per week, and the recovered product is transferred to the storage tank utilized by the Spill Buster® unit.

7 Baseline Ecological Evaluation

In accordance with N.J.A.C. 7:26E-3.11, a baseline ecological evaluation was performed to identify the following: 1) constituents of potential environmental concern in soil and groundwater; 2) environmentally sensitive areas; and, 3) potential contaminant migration pathways. The results of the baseline ecological evaluation, which are presented in **Appendix G**, concluded that no further ecological evaluation is warranted.

8 Conclusions

The following detailed conclusions are based on the results of investigation activities and interim remedial actions completed to date:

- On August 2, 2004, a diesel fuel odor was observed in Catch Basin 27 just to the south of the Salem Unit 1 Fuel Handling Building. Investigation of the catch basin, revealed the presence of a red-dyed diesel fuel. Investigations into the source of the diesel fuel revealed the presence of underground piping adjacent to Catch Basin 27 that supplies diesel fuel from the bulk storage tank to diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers;

- PSEG performed a pressure test on the underground piping, which revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. The location of the leak along the 300-foot section of piping was pinpointed using a "Tracer Tight" gas analysis. After the location of the leak was pinpointed, an excavation was opened to expose and repair the leak. Soil excavated from adjacent to and around the piping and approximately 150 gallons of separate-phase product were removed and disposed;

- Soil investigation activities consisted of the advancement of four soil borings. Due to the presence of extensive, facility-critical infrastructure within the area of investigation, the boring locations were limited. Soil samples were submitted for TPHC analysis. Analytical results of the soil samples submitted for TPHC analysis did not indicate concentrations above laboratory detection limits. The method detection limits ranged from 26 to 32 milligrams per kilogram (mg/kg).

- Results of the soil investigation indicate that the release of diesel fuel has not migrated a significant distance beyond the source area and that diesel related constituents of concern in soil are likely limited to the source area and the "smear-zone" where separate phase diesel has migrated. The estimated extent to which separate phase diesel has migrated is shown on **Figure 8**. Due to the extensive subsurface infrastructure, locations for advancing soil borings are limited. Due to these limitations, the extent of diesel-related constituents of concern in soil must be inferred with the existing groundwater monitoring well network;

- The investigation of groundwater consisted of the installation of five monitoring wells within and downgradient of the source area to evaluate the extent of dissolved-phase and separate-phase diesel. Water-level and product gauging and groundwater sampling were completed following installation of the wells. These activities utilized six monitoring wells (the five newly installed wells, and one previously existing monitoring well);

- Water-level and product measurements indicate that the extent of measurable product is limited to the area of Well AU, located at the source area, and Well AW, located downgradient of the source area along the service water pipes. Measurable product was detected during a single gauging event in Well AZ. Product migrated to this well under the influence of unrelated groundwater pumping in Well AO, which has subsequently been discontinued;

- The extent to which product has migrated is controlled by the significant facility-related subsurface infrastructure. The foundation for the primary water storage tank located to the west of Well AU prevents the migration of separate phase product in this direction. The service water piping that runs to the south from Well AU provided a preferential pathway for the migration of separate phase product towards Well AW;

- Product recovery efforts completed to date have included the installation of the Spill Buster® in Well AU and initially in Well AW, the installation and operation of a passive skimmer in Well AW, and the installation of sorbent socks within Well AZ. Operation of the Spill Buster® unit in Well AU has resulted in the recovery of approximately 190 gallons of separate phase product through April 8, 2005 at a consistent rate of approximately two gallons per day. Operation of the passive skimmer in Well AW has resulted in the recovery of approximately 0.5 to 0.75 gallons of separate phase product per week;

- Groundwater samples were collected from those wells not indicating the presence of separate phase product in December 2004 and March 2005. The groundwater samples were analyzed for VOCs and SVOCs. Analytical results of the groundwater samples did not indicate concentrations of constituents of concern above applicable GWQC; and,

- Results of the baseline ecological evaluation concluded that no further ecological evaluation is warranted.

9 Proposed Actions

Based on the results of investigation activities and interim remedial actions completed to date, the following actions are proposed:

- Continue operation and maintenance of the Spill Buster® unit and passive skimmer in Well AU and Well AW, respectively, until measurable separate phase product is no longer detected. Currently, routine maintenance of these systems is performed to ensure the timely change out of the product storage tank and the proper operation of the units;

- Quarterly groundwater monitoring will be conducted concurrently with the product recovery efforts. The quarterly groundwater sampling will consist of the collection and analysis of groundwater samples from those wells not indicating the presence of separate phase product. The groundwater samples will be analyzed for VOCs and SVOCs to evaluate the extent, if any, of dissolved phase constituents of concern. Semi-Annual Remedial Action Progress Reports will be prepared to update the NJDEP with the status of product recovery efforts and groundwater analytical results. A summary of the schedule for the sampling and reporting activities is presented in **Table 7**;

- Following completion of the product recovery efforts (i.e., measurable separate phase product is no longer detected) eight consecutive rounds of quarterly sampling will be completed (assuming concentrations of constituents of concern are above applicable GWQC) as required by the Mann-Whitney U-Test. The analytical results from these sampling events will be evaluated to determine if there are decreasing analytical trends;

- Following completion of the eight consecutive rounds of quarterly sampling, PSEG will either: 1) propose no further action for groundwater if groundwater analytical results continue to be below applicable GWQC; or, 2) establish a classification exception area and prepare a Remedial Action Work Plan that proposes a groundwater remediation strategy.

10 Request for Variance

Results of soil investigation activities completed to date indicate that soil impacts are limited to the source area of the release and the "smear zone" where the separate phase product plume has migrated. The investigation and remediation of soil impacts is technically impracticable to complete due to the extensive subsurface infrastructure located within this area. As such, PSEG is requesting a variance from the Technical Requirements for Site Remediation, specifically N.J.A.C. 7:26E-4.1(b), and is proposing to base the need for future soil investigation and remediation on groundwater analytical data and constituent-specific soil partition coefficients. Following the completion of product recovery efforts and the eight quarterly groundwater sampling events associated with the Mann-Whitney U-Test, PSEG will evaluate if decreasing trends for dissolved-phase constituents are observed. If such a trend is established, PSEG contends that groundwater quality analytical data can be used to demonstrate that residual mass is not present within the subsurface and that no further action for soil is warranted. If decreasing trends are not observed, then PSEG will evaluate remedial alternatives and prepare a Remedial Action Work Plan.

Notes:

GWQC New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L Micrograms per liter (equivalent to parts per billion)
2.3 Bold value indicates compound is above the method detection limit.
U The compound was not detected at the indicated concentration.
J Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
-- No standard published
N Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the indication is based on a library search
NA Not analyzed
* Well AX is a blind duplicate of Well X
** Well AVD is a blind duplicate of Well AV

Table 7. Proposed Sampling and Reporting Schedule, PSEG Nuclear, LLC, Salem Generating Station, Hancock's Bridge, New Jersey.

Projected Date Work to be Completed	Jun-05	Jul-05	Aug-05	Sep-05	Oct-05	Nov-05	Dec-05	Jan-06	Feb-06	Mar-06	Apr-06	May-06
Semi-Annual Report Submission						X						X
Quarterly Groundwater Sampling Events[1]	X			X			X			X		

Notes:

1 Prior to initiating groundwater sample collection, depth-to-water and separate phase product thickness measurements will be collected from each monitoring well using an electronic oil-water interface probe.

Monitoring wells not indicating a measureable product thickness (i.e., greater than 0.01 feet) will be sampled utilizing low-flow sampling methods

Monitoring wells will be sample via low-flow techniques. Groundwater analysis will include volatile organic compounds by USEPA method 8260A and base neutrals via USEPA method 8270B.

ANALYTICAL RESULT (mg/Kg)

1. DUE TO THE PRESSURE OF SEPARATE–PHASE DIESEL, SOIL SAMPLES WERE NOT OBTAINED FROM THE BORING ADVANCED WITHIN THE SOURCE AREA, SOIL BORING D–1.
2. SOIL SAMPLES WERE ANALYZED FOR TOTAL PETROLEUM HYDROCARBONS (TPHC). ANALYTICAL RESULTS OF THE OF TPHC ABOVE THE LABORATORY DETECTION LIMITS IN ACCORDANCE WITH NJAC 7:26E, THE SAMPLES WERE NOT ANALYZED FOR VOCs.
3. THE NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION FOR NONRESIDENTIAL DIRECT CONTACT SOIL CLEANUP CRITERIA STANDARD FOR TPHC'S IS 10,000 mg/kg.
4. UNITS ARE IN mg/kg (MILLIGRAMS PER KILOGRAM)

CONSTITUENT OF CONCERN; ANALYTICAL RESULT; SAMPLE DATE

1. PRIOR TO INITIATING GROUNDWATER SAMPLE COLLECTION, DEPTH–TO–WATER AND SEPARATE PHASE PRODUCT THICKNESS MEASUREMENTS ARE COLLECTED FROM THE INDIVIDUAL WELLS USING AN ELECTRONIC OIL–WATER INTERFACE PROBE.
2. MONITORING WELLS NOT INDICATING A MEASURABLE THICKNESS OF SEPARATE PRODUCT (I.E., GREATER THAN 0.01 FEET) WERE SAMPLED UTILIZING LOW–FLOW SAMPLING METHODS.
3. GROUNDWATER SAMPLES ARE ANALYZED FOR PRIORITY POLLUTANT SEMI–VOLATILE AND VOLATILE ORGANICS INCLUDING A LIBRARY SEARCH.
4. UNITS ARE IN ug/l – MICROGRAMS PER LITER (EQUIVALENT TO PARTS PER BILLION) CONCENTRATIONS ARE ONLY SHOWN FOR THOSE CONSTITUENTS DETECTED ABOVE THE LABORTORY DETECTION LIMITS.

Disposal Manifests

Fax Transmittal Form

To:

Attention: Brad Pierce

Fax Number: 267-685-1801

From: Albert W. Fisher

Company: PSE&G

Phone Number: 856-224-9109

Fax Number: 856-224-1574

Comment:

Brad the following shipping paper and scale ticket is for the soil removed from the Salem fuel oil line leak. The soil (approximately 2 cu/yds) was placed into the 20-cu/yd container utilized for minor on site spill cleanup. A total of 9.96 cu/yds was shipped to Casie Pro Tank for disposal. Of the 9.96 cubic yard shipped only 2 cu/yds was attributed to the fuel line leak.

ACCUTEST.

General Chemistry Case Narrative/Conformance/Non-Conformance Summary

	NO	YES
1. Blank levels below reporting limits?		✓
If no, list analytes above reporting limits:		
2. Spike blank or lab control data within acceptable limits?		✓
If no, list analytes outside of acceptable limits. Refer to QC summary for additional comments:		
3. Matrix Spike data within acceptable limits?		✓
If no, list analytes outside of acceptable limits. Refer to QC summary for additional comments:		
4. Matrix duplicate data within acceptable limits?		✓
If no, list analytes outside of acceptable limits. Refer to QC summary for additional comments:		
5. Samples prepared and analyzed within holding time?		✓
If holding times were not met, list analytes where holding times were exceeded and explain:		
6. All analytical criteria met (calibrations, CCV checks, etc.)?		✓
If no, list affected samples and elements:		

Additional Comments:

Datum: NAVD 1988

Installation Date(s): June 11, 2003

Drilling Method: Vacuum Excavation

Drilling Contractor: CT&E Environmental Services, Inc

Drilling Fluid: Not Applicable (NA)

Development Technique(s) and Date(s): Peristaltic pump on June 11, 2003. Development was considered complete when turbidity in discharge was reduced/eliminated.

Fluid Loss During Drilling: 0 gallons

Water Removed During Development: 5 gallons

Static Depth to Water: 8.7 feet below M.P.**

Pumping Depth to Water: NA feet below M.P.**

Pumping Duration: 0.2 hours

Yield: NA gpm Date: NA

Specific Capacity: NA gpm/ft

Well Purpose: Well installed to monitor groundwater quality.

Remarks: Due to extensive underground utilities within the location of the monitoring well, vacuum excavation equipment was used to advance the well boring.

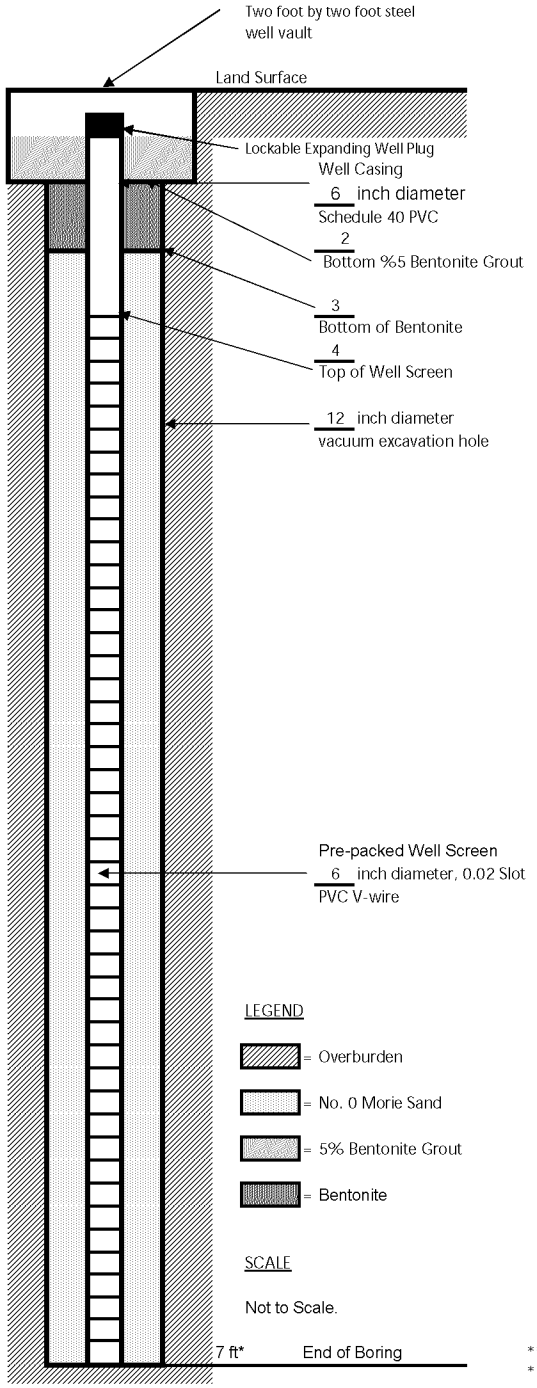
Prepared by: Jon Rutledge

** M.P. Measuring Point. Top of 2-inch PVC well casing unless otherwise noted.
* Depth Below Land Surface

ARCADIS

Well Construction Log

(Unconsolidated)



Well Identification: Well AU

Project/No.: PSEG Nuclear, LLC - Salem Generating Station/NP000603.0001

Site Location: Salem Generating Station - Artificial Island

Town/City: Hancock's Bridge

County: Salem State: New Jersey

Permit No.: 3400007375

Land-Surface Elevation: 9.44 feet [X] Surveyed

Top-of-Casing Elevation: 8.46 feet [ ] Estimated

Datum: NAVD 1988

Installation Date(s): November 9, 2004

Drilling Method: Vacuum Excavation

Drilling Contractor: Uni - Tech Drilling Co., Inc.

Drilling Fluid: Not Applicable (NA)

Development Technique(s) and Date(s): Surge block and submerisble pump on November 10, 2004. Development was considered complete when turbidity in discharge was reduced/eliminated.

Fluid Loss During Drilling: 0 gallons

Water Removed During Development: ~10 gallons

Static Depth to Water: 5.21 feet below M.P.**

Pumping Depth to Water: NA feet below M.P.**

Pumping Duration: 0.2 hours

Yield: NA gpm Date: 11/10//04

Specific Capacity: NA gpm/ft

Well Purpose: Well installed to facilitate separate phase product recovery.

Remarks: Due to extensive underground utilities within the location of the monitoring well, vacuum excavation equipment was used to advance the well boring.

Prepared by: Deric Kearns

** M.P. Measuring Point. Top of 2-inch PVC well casing unless otherwise noted.

Reduced Laboratory Data Deliverables
For
Non-USEPA/CLP Methods

Title/Cover Page

Table Of Contents

Section 1 General

A. Results Summary
B. Chain of Custody
C. Sample Tracking Chronicle/Method References

Section 2 GC/MS Support Data (grouped by fraction)

A. Conformance/Non-conformance Summary
B. Method Blank Summary
C. Blank Spike Summary
D. Matrix Spike/Matrix Spike Duplicate Summary
E. Tune Results Summary
F. Internal Standard Summary
G. Surrogate Recovery Results Summary
H. Calibration Summary (sorted by Instrument)
I. Initial Calibration Check Summary
Continuing Calibration Check Summary
J. Sample and Blank Chromatograms, Quant Reports, Mass Spectra, and Library Search Data

Section 3 GC Support Data

A. Conformance/Non-conformance Summary
B. Method Blank Summary
C. Blank Spike Summary
D. Matrix Spike/Matrix Spike Duplicate Summary
E. Surrogate Recovery Results Summary
F. Calibration Summary (sorted by Instrument)
Initial Calibration Check Summary
Continuing Calibration Check Summary
G. Retention Time Shift Summary
H. Sample, Blank and Multi-peak Standard Chromatograms and Quant Reports

Section 4 Metals Support Data (sorted by Instrument Type-ICP, Furnace, Flame, and Mercury)

A. Conformance/Non-conformance Summary
B. Initial and Continuing Calibration Blank
C. Initial and Continuing Calibration Checks
D. High and Low Check Standards
E. Interfering Element Check Standards
F. Method Blank Summary
G. Matrix Spike and Duplicates Summary
H. Blank Spike and Lab Control Sample Summary
I. Serial Dilution Summary

Section 5 General Chemistry/Petroleum Hydrocarbon Support Data

A. Conformance/Non-Conformance Summary
B. Batch Quality Control Summary
Method Blank and Spike Blank Results Summary
Duplicate Results Summary
Matrix Spike Results Summary
C. Raw Data and IR Spectra (Petroleum Hydrocarbons)
D. Raw Data and Run Record (Hexavalent Chromium)

GC/MS Analysis Case Narrative/Conformance/Non-Conformance Summary

Fraction Volatile

	NO	YES
1. Chromatograms Labeled/Compounds Identified *(Field Samples and Method Blanks)*		✓
2. GC/MS Tune Meet Criteria		✓
3. GC/MS Tuning Frequency – Performed every 24 hours for 600 series and 12 hours for 8000 series.		✓
4. GC/MS Calibration – Initial and Continuing Calibration Meet Method Requirements		✓
5. GC/MS Calibration Requirements		
a. Calibration Check Compounds		✓
b. System Performance Check Compounds		✓
6. Blank Contamination	✓	
If yes, the sample result is qualified with a "B".		
7. Surrogate Recoveries Meet Criteria		✓
If the requirement is not met, refer to the Surrogate Summary for comment.		
8. Matrix Spike/Matrix Spike Duplicate Recoveries Meet Criteria		✓
If the requirement is not met, refer to MS/MSD Summary for comment.		
9. Internal Standard Area/Retention Time Shift Meet Criteria		✓
If the requirement is not met, refer to the Internal Standard Summary for comment.		
10. Extraction Holding Time Met		N/A
If the holding time is not met, refer to the Sample Result page for comment.		
11. Analysis Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		

12. Volatile Sample Preservation – pH should be < 2. *List any non-compliant samples below:*

GC/MS Analysis Case Narrative/Conformance/Non-Conformance Summary

Fraction Semi - Volatile

	NO	YES
1. Chromatograms Labeled/Compounds Identified *(Field Samples and Method Blanks)*		✓
2. GC/MS Tune Meet Criteria		✓
3. GC/MS Tuning Frequency – Performed every 24 hours for 600 series and 12 hours for 8000 series.		✓
4. GC/MS Calibration – Initial and Continuing Calibration Meet Method Requirements		✓
5. GC/MS Calibration Requirements		
a. Calibration Check Compounds		✓
b. System Performance Check Compounds		✓
6. Blank Contamination	✓	
If yes, the sample result is qualified with a "B".		
7. Surrogate Recoveries Meet Criteria		✓
If the requirement is not met, refer to the Surrogate Summary for comment.		
8. Matrix Spike/Matrix Spike Duplicate Recoveries Meet Criteria		✓
If the requirement is not met, refer to MS/MSD Summary for comment.		
9. Internal Standard Area/Retention Time Shift Meet Criteria		✓
If the requirement is not met, refer to the Internal Standard Summary for comment.		
10. Extraction Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		
11. Analysis Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		

12. Volatile Sample Preservation – pH should be < 2. *List any non-compliant samples below:*

Reduced Laboratory Data Deliverables
For
Non-USEPA/CLP Methods

Title/Cover Page

Table Of Contents

Section 1 General

A. Results Summary
B. Chain of Custody
C. Sample Tracking Chronicle/Method References

Section 2 GC/MS Support Data (grouped by fraction)

A. Conformance/Non-conformance Summary
B. Method Blank Summary
C. Blank Spike Summary
D. Matrix Spike/Matrix Spike Duplicate Summary
E. Tune Results Summary
F. Internal Standard Summary
G. Surrogate Recovery Results Summary
H. Calibration Summary (sorted by Instrument)
I. Initial Calibration Check Summary
Continuing Calibration Check Summary
J. Sample and Blank Chromatograms, Quant Reports, Mass Spectra, and Library Search Data

Section 3 GC Support Data

A. Conformance/Non-conformance Summary
B. Method Blank Summary
C. Blank Spike Summary
D. Matrix Spike/Matrix Spike Duplicate Summary
E. Surrogate Recovery Results Summary
F. Calibration Summary (sorted by Instrument)
Initial Calibration Check Summary
Continuing Calibration Check Summary
G. Retention Time Shift Summary
H. Sample, Blank and Multi-peak Standard Chromatograms and Quant Reports

Section 4 Metals Support Data (sorted by Instrument Type-ICP, Furnace, Flame, and Mercury)

A. Conformance/Non-conformance Summary
B. Initial and Continuing Calibration Blank
C. Initial and Continuing Calibration Checks
D. High and Low Check Standards
E. Interfering Element Check Standards
F. Method Blank Summary
G. Matrix Spike and Duplicates Summary
H. Blank Spike and Lab Control Sample Summary
I. Serial Dilution Summary

Section 5 General Chemistry/Petroleum Hydrocarbon Support Data

A. Conformance/Non-Conformance Summary
B. Batch Quality Control Summary
Method Blank and Spike Blank Results Summary
Duplicate Results Summary
Matrix Spike Results Summary
C. Raw Data and IR Spectra (Petroleum Hydrocarbons)
D. Raw Data and Run Record (Hexavalent Chromium)

GC/MS Analysis Case Narrative/Conformance/Non-Conformance Summary

Fraction Volatile

	NO	YES
1. Chromatograms Labeled/Compounds Identified *(Field Samples and Method Blanks)*		✓
2. GC/MS Tune Meet Criteria		✓
3. GC/MS Tuning Frequency – Performed every 24 hours for 600 series and 12 hours for 8000 series.		✓
4. GC/MS Calibration – Initial and Continuing Calibration Meet Method Requirements		✓
5. GC/MS Calibration Requirements		
a. Calibration Check Compounds		✓
b. System Performance Check Compounds		✓
6. Blank Contamination	✓	
If yes, the sample result is qualified with a "B".		
7. Surrogate Recoveries Meet Criteria		✓
If the requirement is not met, refer to the Surrogate Summary for comment.		
8. Matrix Spike/Matrix Spike Duplicate Recoveries Meet Criteria		*1/ ✓
If the requirement is not met, refer to MS/MSD Summary for comment.		
9. Internal Standard Area/Retention Time Shift Meet Criteria		✓
If the requirement is not met, refer to the Internal Standard Summary for comment.		
10. Extraction Holding Time Met		N/A
If the holding time is not met, refer to the Sample Result page for comment.		
11. Analysis Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		

12. Volatile Sample Preservation – pH should be < 2. *List any non-compliant samples below:*

Additional Comments: *1. See footnote for detail.

IS 1 = Tert Butyl Alcohol-D9
IS 2 = Pentafluorobenzene
IS 3 = 1,4-Difluorobenzene
IS 4 = Chlorobenzene-D5
IS 5 = 1,4-Dichlorobenzene-d4

(a) Upper Limit = +100% of check standard area; Retention time +0.5 minutes.
(b) Lower Limit = -50% of check standard area; Retention time -0.5 minutes.

Volatile Surrogate Recovery Summary

ACCUTEST

GC/MS Analysis Case Narrative/Conformance/Non-Conformance Summary

Fraction Semi Volatile

	NO	YES
1. Chromatograms Labeled/Compounds Identified *(Field Samples and Method Blanks)*		✓
2. GC/MS Tune Meet Criteria		✓
3. GC/MS Tuning Frequency – Performed every 24 hours for 600 series and 12 hours for 8000 series.		✓
4. GC/MS Calibration – Initial and Continuing Calibration Meet Method Requirements		✓
5. GC/MS Calibration Requirements		
a. Calibration Check Compounds		✓
b. System Performance Check Compounds		✓
6. Blank Contamination	✓	
If yes, the sample result is qualified with a "B".		
7. Surrogate Recoveries Meet Criteria		✓
If the requirement is not met, refer to the Surrogate Summary for comment.		
8. Matrix Spike/Matrix Spike Duplicate Recoveries Meet Criteria		✓
If the requirement is not met, refer to MS/MSD Summary for comment.		
9. Internal Standard Area/Retention Time Shift Meet Criteria		✓
If the requirement is not met, refer to the Internal Standard Summary for comment.		
10. Extraction Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		
11. Analysis Holding Time Met		✓
If the holding time is not met, refer to the Sample Result page for comment.		
12. Volatile Sample Preservation – pH should be < 2. *List any non-compliant samples below:*

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client:	Arcadis Geraghty & Miller	**Job No**	N93379
Site:	PSEG, Hancock's Bridge, NJ	**Report Date**	4/5/2005 11:51:07 AM

4 Sample(s), 1 Trip Blank(s) and 1 Field Blank(s) were collected on 03/15/2005 and were received at Accutest on 03/16/2005 properly preserved, at 4 Deg. C and intact. These Samples received an Accutest job number of N93379. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section of this report.

Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix AQ **Batch ID:** VA2990

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) N93391-3DUP, N93391-4MS were used as the QC samples indicated.
- Blank Spike Recovery(s) for Chloromethane are outside control limits.
- VA2990-BS for Chloromethane: High percent recoveries and no associated positive found in the QC batch.

Extractables by GCMS By Method SW846 8270C

Matrix AQ **Batch ID:** OP19692

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) N93090-14MS, N93090-14MSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for 3,3'-Dichlorobenzidine are outside control limits. Probable cause due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for 3,3'-Dichlorobenzidine are outside control limits. Probable cause due to matrix interference.
- OP19692-MS for 3,3'-Dichlorobenzidine: Outside of in house control limits.

The Accutest Laboratories of New Jersey certifies that all analysis were performed within method specification. It is further recommended that this report to be used in its entirety.The Accutest Laboratories of NJ, Laboratory Director or assignee as verified by the signature on the cover page has authorized the release of this report(N93379).

Instrument Performance Check (BFB)

Job Number: N93379
Account: AGMPAL Arcadis Geraghty & Miller
Project: PSEG, Hancock's Bridge, NJ

Sample:	VA2990-BFB	Injection Date:	03/21/05
Lab File ID:	A94433.D	Injection Time:	23:18
Instrument ID:	GCMSA		

m/e	Ion Abundance Criteria	Raw Abundance	% Relative Abundance		Pass/Fail
50	14.95 - 40.0% of mass 95	9949	20.5		Pass
75	30.0 - 60.0% of mass 95	24779	51.2		Pass
95	Base peak, 100% relative abundance	48440	100.0		Pass
96	5.0 - 9.0% of mass 95	3309	6.8		Pass
173	Less than 2.0% of mass 174	0	0.0	(0.0) [a]	Pass
174	50.0 - 150.0% of mass 95	48235	99.6		Pass
175	5.0 - 9.0% of mass 174	3419	7.1	(7.1) [a]	Pass
176	95.0 - 101.0% of mass 174	47427	97.9	(98.3) [a]	Pass
177	5.0 - 9.0% of mass 176	3074	6.3	(6.5) [b]	Pass

(a) Value is % of mass 174
(b) Value is % of mass 176

This check applies to the following Samples, MS, MSD, Blanks, and Standards:

1. Introduction

ARCADIS prepared this Baseline Ecological Evaluation (BEE) for the PSEG Nuclear, LLC Salem Generating Station (the Site) located in Hancock's Bridge, New Jersey (**Figure 1**). The BEE was conducted in accordance with the New Jersey Department of Environmental Protection's (NJDEP's) tiered approach for conducting ecological evaluations and ecological risk assessments. The BEE comprises Tier I, which is a screening process required for all NJDEP Site Remediation Program (SRP) sites. The objectives of the BEE are to ensure that all sites are assessed for potential ecological effects and that sites without ecological concern are quickly eliminated from further, more rigorous site-specific investigation. Only those sites that have the potential for adverse ecological effects are retained for further investigation and/or risk assessment at the Tier II level. It is only at the Tier II level that definitive estimates of risk and the basis for determining clean-up goals are provided.

In accordance with NJDEP guidance (Hamill and Demarest 1997) and regulations N.J.A.C. 7:26E-3.11 (Technical Requirements for Site Remediation [Technical Requirements]; N.J.A.C. 7:26E-3.11), this BEE evaluates the co-occurrence of (a) chemicals of potential ecological concern (COPECs); (b) environmentally sensitive areas; and (c) chemical migration pathways at the Site. Existing site documents and analytical data, along with the results of a site reconnaissance, are used together to document these conditions.

The Site is located on a 740-acre parcel adjacent to the Delaware River, in Hancock's Bridge, New Jersey. The Salem Generation Station consists of two nuclear generating stations. A third nuclear generation station is located to the north at the adjoining Hope Creek Generating Station (ARCADIS 2005). This BEE is specific to the area of the diesel fuel release (Incident No. 04-08-02-2350-16), which occurred just to the south of the Salem Unit 1 Fuel Handling Building. The remainder of the Site is an operating nuclear generating station and was not evaluated as a part of this BEE.

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the storm water collection system just south of the Salem Unit 1 Fuel Handling Building (ARCADIS 2005). A pressure test on the underground diesel line was performed and revealed the leak was within a 300-foot section of piping. A "Tracer Tight" gas analysis was performed and the approximate location of the leak was identified. An excavation was opened around the piping to expose and repair the piping. The excavation was backfilled with clean fill material. The diesel leak area consists of asphalt covered drive and a gravel area adjacent to and south of the Salem Unit 1 Fuel

Handling Building (see Section 3.2). The leak occurred approximately 300 feet from the Delaware River.

2. Chemicals of Potential Ecological Concern

According to NJDEP guidance (Hamill and Demarest 1997) and regulations (N.J.A.C. 7:26E-3.11), COPECs should be identified based on their ability to biomagnify or bioaccumulate and/or the presence of maximum measured concentrations greater than ecotoxicologically-based benchmarks or screening values. In general, BEEs identify COPECs only for those impacted environmental media that are accessible to ecological receptors (e.g., surface soil, sediment, and surface water). Analytical data for the CEA area are available only for subsurface soil (Table 1) and groundwater (Table 2).

Currently, no impacted soils remain in the diesel leak area. The source has been temporarily mitigated, prior to implementation of the final remedy. Impacted soils were excavated from around the leak area and backfilled with clean fill (ARCADIS 2005). All historic soil sampling locations were at depths of at least 3.5 feet below ground surface (bgs) and were collected during the installation of monitoring wells AW through AZ (Figure 3). Soil sampling results are presented in Table 1, in the interest of completeness. However, all impacted soils have either been excavated or are covered by pavement or buildings, thus precluding ecological exposures to chemicals in subsurface soil. Therefore, no COPECs are identified for subsurface soil.

Groundwater monitoring activities at the Site have focused on volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCS). Table 2 summarizes the most recent analytical data for groundwater at the site, including the results of the December 2004 and March 2005 groundwater sampling events.

The Technical Requirements do not list any criteria or guidelines for use in selecting COPECs in groundwater, presumably because of the limited potential for ecological receptors to contact groundwater. It is only upon discharge of groundwater to surface water that ecological receptors could theoretically contact COPECs. Groundwater from this site discharges to the Delaware River, which is located approximately 300 feet from the diesel leak area. Given this distance and the relatively low concentrations of constituents detected in groundwater, concentrations are likely diluted to non-detectable concentrations prior to discharge to the Delaware River. Groundwater monitoring confirms that groundwater impacts are confined to a limited area of the Site. Separate-phase product has only been detected in Wells AU and AW, the two wells closest to the location of the leak. SVOCs have only been detected in Well-AV, located approximately 30 feet west-southwest of the leak area. VOCs have only been detected in Well X,

located adjacent to the fuel handling building. Well X is approximately 20 feet east-southeast of the diesel leak area, more than 300 feet from the river.

To ensure the conservatism of this BEE, ARCADIS compared average and maximum downgradient concentrations in groundwater to the lower value of the chronic marine and freshwater values listed in the National Oceanographic and Atmospheric Administration's Screening Quick Reference Tables (NOAA SQuiRTs) (Table 3). New Jersey Surface Water Quality Standards are not an appropriate basis for selecting COPECs at this Site, because those chemicals detected in groundwater only have standards established to protect human health, rather than aquatic organisms. In contrast, NOAA SQuiRTs are based on protection of aquatic organisms and, therefore, serve as appropriate ecological screening criteria. Other potential sources of ecologically-based surface water screening values, including the Delaware River Basin Committee and the U.S. Environmental Protection Agency's (USEPA's) Ambient Water Quality Criteria (AWQC) also lacked values for the compounds detected at the CEA.

Because there are no data from groundwater wells between the Well-AV and the Delaware River, the use of maximum detected groundwater concentrations represents worst case conditions. Average concentrations are more likely to reflect actual concentrations as groundwater migrates to and discharges to the Delaware River. As illustrated in Table 3, with one exception, the maximum concentrations of constituents detected in groundwater are less than the NOAA SQuiRTs values. That one exception is phenathrene, which was detected in two of nine samples. The two samples were duplicate samples and thus represent a single round of sampling at a single well. The average concentration of phenanthrene was below the NOAA SQuiRT value. Thus, following dilution and attention as the groundwater migrates to the river, as well as mixing within the river, exposures of aquatic life within the river to phenanthrene are expected to be well below the screening level.

In addition to considering concentrations relative to screening criteria, it is necessary to evaluate the bioaccumulative/biomagnifying potential of detected constituents. Based on NJDEP's guidance regarding biomagnifying compounds in sediment (NJDEP, 2005d) and the logarithms of the octanol water partitioning coefficients (log Kow values), dibenzofuran is the only detected compound in groundwater with the potential to bioaccumulate. Dibenzofuran was detected as an estimated concentration below the detection limit (J-qualified) in three out of nine samples. Given its low prevalence, low detected concentrations, and the likelihood of dilution and attenuation as it travels from groundwater to the Delaware River, it does not warrant inclusion as a COPEC.

No samples have currently been taken from wells AU and AW due to the presence of separate phase diesel in the well. This product is being actively remediated by a Spill Buster® unit which removes the separate phase diesel on a periodic schedule. Proof that this technique is working is illustrated by the lack of BTEX detected above the reporting limit in surrounding wells (Table 1). Further evidence to support this is that no TPH was detected in soil removed during well instillation (Table 2). The evidence shown above of and the continued active remediation of free product, no exposure pathways are open.

Based on the above information, no COPECs are selected for groundwater. As previously noted, the absence of accessible surface soil on the site precludes identification of any COPECs in soil. Thus, there are no COPECs in any media at this Site.

3. Environmentally Sensitive Area

The second element of the BEE is the documentation of any environmentally sensitive areas present on-site or immediately adjacent to the Site. Environmentally sensitive areas, as defined in N.J.A.C. 7:1E-4.10, include:

- River channels;
- Lakes and ponds;
- Reservoirs;
- Bays and estuaries;
- Cranberry bogs;
- Coastal wetlands;
- Interior wetlands;
- Beaches;
- Deciduous forest;
- Coniferous forest;
- Mixed forest; and
- Brush land and scrubland.

Based on a site reconnaissance conducted on April 26, 2005, information provided in technical reports on the Site, and a search of the NJDEP Geographic Information System (GIS) database, this section describes ecological habitat types and potential environmentally sensitive areas at the Site and within a one-half mile radius of the Site.

3.1 Site Setting and Land Use

A site location map is shown on **Figure 1**. As previously noted, the Site is located on a 740-acre parcel adjacent to a brackish reach of the Delaware River. The Site is bounded to the south and west by the Delaware River, to the north by Hope Creek Generation Station, and to the east by undeveloped land. Land surrounding the site is zoned for industrial, residential, and agricultural uses (ARCADIS 2005). However, there are no homes located within several miles of the station. As illustrated on the GIS

map provided in **Attachment A**, no natural heritage priority sites are located within one-half mile of the site.

3.2 Characterization of Environmentally Sensitive Area

Environmentally sensitive areas located within and adjacent to the Site were characterized during a site reconnaissance conducted on April 26, 2005. The Site reconnaissance was conducted by ARCADIS scientists familiar with the Site. No environmentally sensitive areas were identified within the diesel leak area. The cover in the immediate vicinity of the leak area is limited to dirt and gravel, with various sparsely growing grasses, approximately one to two inches in height (**Attachment B**, Photographs 1, 2 and 3). Cover in the surrounding area is comprised of asphalt, gravel, concrete and buildings (**Attachment B**, Photographs 4-10).

Environmentally sensitive areas located near the diesel fuel leak area include the Delaware River, the associated riparian buffer along the river, and extensive wetlands. The Delaware River basin and its tributaries drain an area of approximately 1,341 square miles (NJDEP 2005a, 2005b, 2005c). The Salem Generation Station is located on a reach of the river known as the Central Delaware River. The Central Delaware River and its tributaries drain an area of approximately 274 square miles (NJDEP 2005b). From the Site, the Delaware River flows into the Delaware Bay and the Atlantic Ocean, approximately 50 miles away.

The Delaware River and its tributaries provides habitat for numerous aquatic and terrestrial species, including aquatic birds [e.g., ospreys (*Pandion haliaetus*), great egrets (*Ardea alba*) mallards (*Anas platyrhynchos*)] and reptiles and amphibians [e.g., Eastern painted turtle (*Chrysemys picta*)]. Bird species observed during the Site reconnaissance included numerous bank swallows, a gull, an American robin, a common crow, and a great egret. In addition, the river provides habitat for many fish species, including striped bass (*Morone saxatulus),* bluefish (*Pomatomus salatrix)*, and Atlantic shad (*Alosa sapidissima.*).

The majority of land immediately adjacent to the river in the vicinity of the Site is classified as forest by NJDEP GIS. However, the area is in fact dominated by wetlands, with an estimated canopy cover of less then five percent at the time of the April 2005 site visit. The sandy soil is approximately 100 percent vegetated, with various native and exotic grasses. Arrow arum (*Peltandra virginica*), golden ragwort (*Senecio aureus*) and phragmites (*Phragmites austalis [communi])* are abundant and stabilize the banks. Limited areas within one-half mile of the Site are also characterized as mowed lawn and service roads.

3.3 NJDEP Geographic Information System Search Results

As part of the evaluation of the presence of environmentally sensitive area, the NJDEP GIS database was searched. The following data layers were downloaded for land within approximately one-half mile of the Site:

- Coastal centers
- Hydrography
- Natural Heritage priority sites
- Lakes
- 1995/97 Land use/landcover
- Linear wetlands
- Streams
- Wetlands

The GIS map is presented in **Attachment A**. Data layers that contain relevant information on the area searched include: the 1995/97 land use/land planning data layer, the streams data layer, and the wetlands area with Cowardin classifications data layer. Other features listed in the NJDEP GIS database, such as Natural Heritage priority sites, are not located within the area searched.

4. Migration Pathways to Environmentally Sensitive Areas

The third element of the BEE is an evaluation of the potential for COPECs to migrate from the source to receptors that may be present in environmentally sensitive areas identified above. In order for a pathway to be complete, the following five components must be present: (a) COPECs in environmental media; (b) a source of release of COPECs; (c) a migration pathway that allows the COPEC to move from its source to a point of possible contact; (d) an exposure point, where the receptor may come into contact with the COPEC; and (e) an exposure pathway, through which the receptor receives an absorbed dose of the COPEC. If one of these five components is not present, exposure of the receptor to COPECs is not physically possible.

Because COPECs were not identified for the diesel leak area, no pathways are complete, and exposure of ecological receptors to site-related COPECs is not possible. No COPECs were identified in soil, as all constituents have either been excavated or are covered by pavement or buildings. Although groundwater from the diesel leak area discharges to the Delaware River, there are no COPECs for groundwater and the groundwater-to-surface water migration pathway is incomplete.

The finding of no complete pathways is supported by the lack of evidence of potential effects in environmentally sensitive areas. For example, none of the following were observed during the site inspection:

- Stressed or dead vegetation;
- Discolored soil, sediment, or water;
- Absence of biota in a specified area of the system as compared to other similar area of the same system; or
- Presence of a seep or discharge.

5. Summary and Conclusions

In accordance with NJDEP guidance (Hamill and Demarest 1997) and regulations (N.J.A.C. 7:26E-3.11 of the NJDEP Technical Requirements), this BEE evaluates the co-occurrence of (a) COPECs; (b) environmentally sensitive areas; and (c) chemical migration pathways.

COPECs were not identified in either soil or groundwater at the diesel fuel leak area. Although SVOCs and VOCs have been detected in groundwater, concentrations in groundwater are below appropriate ecologically-based screening criteria for surface water. As a result of dilution and attenuation during transport, the concentrations that potentially discharge to surface water will be even lower. Thus, aquatic organisms are not expected to be exposed to harmful chemical concentrations. COPECs were not selected for soil because impacted soils either have been excavated or are covered by pavement or buildings. Therefore, no contact with ecological receptors is possible. Although the Site is largely surrounded by the Delaware River and its associated riparian corridor and wetlands, the NJDEP GIS database did not identify any Natural Heritage priority sites within one half mile of the Site. Because no COPECs are present at the CEA area, no further ecological evaluation is warranted.

Dear Mr. Pantazes:

A review of the above referenced submittals has been completed by this office in conjunction with the Bureau of Ground Water Pollution Abatement. Comments and questions are as follows:

CASE HISTORY

The Salem Generating Station is part of a nuclear complex on 740 acres of Artificial Island, located on the eastern side of the Delaware River. The unconsolidated overburden at the facility consists of approximately 25.0-40.0 feet (ft.) of dredge spoils, engineered fill material, tidal marsh deposits and river bed deposits. For structural stability, engineered fill replaced the existing material within a ring of cofferdams sunk 10.0 ft. into the Vincentown Formation. The cofferdams are 24 interlocking sheet-piling cells constructed in a ring around what would be the Auxiliary Building, the Fuel Handling Building, and the Reactor Containment Building. The excavated area was then filled with 5.0-50.0 ft. of concrete prior to facility construction.

The spill originated from a leak in the underground piping that services the diesel/generator storage tanks located in the Auxiliary Building, and the boilers for the service water and the circulating water. Diesel fuel was detected in Catch Basin 27 and

subsequent investigations led to the repair of the pipe and removal of approximately 150 gallons of diesel from the excavation.

Ground water is shallow and is generally higher within the cofferdam area, which creates a slight mounding effect. A total of six (6) monitoring wells have been installed for delineation and recovery purposes. Monitoring wells are designated MW-X, MW-AU, MW-AV, MW-AW, MW-AY and MW-AZ, and product recovery is being implemented in wells MW-AU, MW-AW, and MW-AZ. Product is being recovered with at "Spill Buster" in MW-AU, through the installation of a passive skimmer in MW-AW, and through the use of sorbent socks in MW-AZ.

The RIR contains ground water monitoring data from July, August, and October 2005. Dissolved constituents of diesel fuel have been identified in three (3) of the wells sampled. July 2005 data indicates benzene was detected above the Ground Water Quality Standard (GWQS) in MW-X, at a concentration of 2.3 ppb. Benzene was not detected above the GWQS in the August and October sampling rounds. Base Neutral results indicate that several compounds were identified above their respective detection limits in wells MW-AV and MW-AW.

PROPOSAL

The proposal is to continue product recovery in MW-AU, MW-AW, and MW-AZ through the means currently used, until measurable separate phase product is no longer detected. Quarterly monitoring, including gauging all wells and sampling the wells that do not contain product for VO+10 and B/N+15, is proposed until measurable product is no longer detected. After the recovery operations have been completed, eight (8) consecutive quarterly rounds of ground water monitoring will be collected and evaluated by the Mann-Whitney U-Test to determine if a Classification Exception Area (CEA), or No Further Action (NFA) is appropriate for the site.

RECOMMENDATIONS

The proposal is conditionally acceptable. Since the product has moved preferentially along the utility lines, an additional horizontal delineation well shall be installed south of monitoring well MW-AY, outside the cofferdam structure.

Monitoring wells shall be installed in accordance with N.J.A.C. 7:9D. Once the required well installations have been completed, construction details and Form A & B Monitoring Well Certification Forms for all monitoring wells shall be submitted.

New and existing monitoring wells shall be analyzed for VO's + 10, and B/N+15. In the event that the wells contain Separate Phase Product and/or sheens, the information shall be recorded and the wells do not need to be sampled. Field parameters such as temperature, DO, pH, and specific conductance shall be recorded on the well sampling

sheets. Additional monitoring wells may be required pending ground water analytical results or receipt of information related to contaminant transport.

BASELINE ECOLOGICAL EVALUATION

As indicated, a diesel odor was noted in Catch Basin 27, south of Salem Unit 1 Fuel Handling Bldg. Upon discovery, both up & down gradient drains were blocked, and diesel removed from the basin. Additional information is needed, however, as to the pathway and extent the discharge traveled prior to discovery, as well as what impacts were experienced along that pathway. Did the discharge enter a body of water? Were sediments, soil or vegetation along the route affected?

If you have any questions, please contact this office.

Sincerely,

Linda S. Range

1. Introduction

ARCADIS U.S., Inc. (ARCADIS), on behalf of PSEG Services Corporation (PSEG), has prepared this Remedial Action Progress Report (RAPR) to present the details and results of ongoing groundwater monitoring and product recovery activities being conducted at the PSEG Nuclear, LLC Salem Generating Station (the Station). The Station is located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. The Station location and layout are depicted on **Figures 1** and **2**, respectively.

Groundwater monitoring and product recovery activities are being conducted in accordance with the scope of work proposed in the Remedial Investigation Report (RIR) that was submitted to the New Jersey Department of Environmental Protection (NJDEP) in June 2005. The remedial investigation was conducted to determine the extent of constituents of concern in soil and groundwater associated with a release of diesel fuel (Incident Number 04-08-02-2350-16). This RAPR covers activities completed at the Station between June 2006 and December 2006. These activities include the installation of an additional monitoring well, the completion of quarterly groundwater monitoring activities in June 2006, September 2006, and December 2006, and the ongoing operation of the product recovery systems in Wells AU and AW. These activities are discussed in Sections 3, 4, and 5, respectively, followed by the proposed schedule for the upcoming reporting period (January through June 2007).

2. Project Background

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the stormwater collection system just to the south of the Salem Unit 1 Auxiliary Building. Investigation of the catch basin, which is identified as "Catch Basin 27" on **Figure 2**, revealed the presence of a red-dyed diesel fuel (the red-dye is more typical of a recent release of diesel fuel). At this time, PSEG notified the NJDEP through its spill hotline.

Investigations into the source of the diesel fuel focused on the underground piping adjacent to Catch Basin 27 that supplies diesel fuel from the bulk storage tanks to diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers. The location of the underground piping is shown on **Figure 2**. PSEG performed a pressure test on this underground piping. The results revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. To pinpoint the location of the leak along this 300-foot

section of piping, PSEG subcontracted Praxair Services, Inc. to perform a "Tracer Tight" gas analysis. The results of this test showed that the location of the leak was directly adjacent to Catch Basin 27. The results of the Tracer Tight gas analysis indicated that there were no other leaks along the 300-foot section of piping.

Excavation in the area of the leaking underground piping was initiated on August 23, 2004 by PSEG with the support of Clean Harbors, Inc. to repair the piping. During the excavation process, residual diesel fuel was observed on soil excavated from below the piping (approximately six feet below ground surface (bgs)). Separate-phase diesel fuel was observed on standing water within the excavation. Prior to backfilling, approximately 150 gallons of diesel fuel were recovered from the excavation.

In November 2004, PSEG initiated remedial investigation and interim product recovery activities. As presented in the Remedial Investigation Work Plan (RIWP) submitted to the NJDEP in January 2005, soil borings were advanced at locations downgradient of the source area to delineate the horizontal extent of diesel related constituents of concern in soil. Due to the presence of extensive, facility-critical infrastructure within the area of investigation, the boring locations were limited. Soil samples collected from the borings were submitted for total petroleum hydrocarbons (TPHC) analysis. Analytical results of the soil samples did not indicate concentrations of TPHC above laboratory detection limits. Results of the soil investigation indicated that the release of diesel fuel had not migrated a significant distance beyond the source area and that diesel related constituents of concern in soil were likely limited to the source area and the "smear-zone" where separate phase diesel had migrated.

The soil borings were converted to monitoring/product recovery wells to facilitate the collection of groundwater samples and for the recovery of separate-phase diesel, if present. Water-level and product gauging and groundwater sampling were completed following installation of the wells. These activities utilized six monitoring wells (the five newly installed wells, and one previously existing monitoring well). The locations of the monitoring wells are shown on **Figure 2**. Water-level and product measurements indicated that the extent of measurable product is limited to the area of Well AU, located at the source area, and Well AW, located downgradient of the source area along the service water pipes. Measurable product was detected during a single gauging event in Well AZ.

The extent to which product has migrated is controlled by the significant facility-related subsurface infrastructure. The foundation for the primary water storage tank located to the west of Well AU has prevented the migration of separate phase product in this

direction. The service water piping that runs to the south from Well AU provided a preferential pathway for the migration of separate phase product towards Well AW. To delineate the extent of separate phase product to the south of Well AW along the service water piping, an additional monitoring well was installed in December 2006, as required by the NJDEP. Details regarding the monitoring well installation are included in Section 3. Product recovery efforts completed to date have included the installation of a Spill Buster® Unit in Well AU, the installation and operation of a passive skimmer in Well AW, and the installation of sorbent socks within Well AZ. Details regarding the ongoing product recovery efforts are presented in Section 4.

Since the installation of the monitoring wells, groundwater monitoring activities have been completed on a quarterly basis. During the sampling events, groundwater samples are collected from wells that do not indicate the presence of separate phase product. The groundwater samples are submitted to a laboratory and are analyzed for VOCs and SVOCs. The details of groundwater monitoring activities completed during the reporting period and the results of groundwater monitoring activities completed to date are presented in Section 3 and Section 4.

3. Monitoring Well Installation

In accordance with NJDEP correspondence dated 17 March 2006, an additional groundwater monitoring well (Well BV) was installed on 5 December 2006. The NJDEP correspondence, prepared in response to the June 2005 Remedial Investigation and Interim Remedial Action Report, stated the following:

> *"Since the product has moved preferentially along the utility lines, an additional horizontal delineation well shall be installed south of monitoring well MW-AY, outside the cofferdam structure."*

The monitoring well was installed using vacuum excavation techniques due to the extensive subsurface utilities and infrastructure located within the area of investigation. The location and well construction details of the groundwater monitoring well is shown on **Figure 2** and are summarized in **Table 2**, respectively. NJDEP Bureau of Water Allocation Monitoring Well Records, well construction logs, and boring logs are included in **Appendix C**. The monitoring well was developed using a combination of surging and pumping techniques. In accordance with N.J.A.C. 7:26E-4.4(g) [7], the monitoring well was surveyed by a New Jersey-licensed surveyor. The Monitoring Well Certification Form B is provided in **Appendix C**. Well BV was not sampled during the reporting period, but will be gauged and sampled during the next scheduled

sampling event (March 2007). Diesel fuel was not observed during monitoring well installation.

4. Quarterly Groundwater Monitoring

During the reporting period quarterly groundwater monitoring activities were completed in June 2006, September 2006, and December 2006. Details regarding the sampling activities are presented in **Table 1**. The monitoring well network associated with the quarterly gauging and sampling activities consists of the following six monitoring wells: Well X; Well AU; Well AV; Well AW; Well AY; and Well AZ. A summary table of well construction details for these wells is presented in **Table 2**. Quarterly groundwater monitoring activities consist of the gauging of groundwater and separate-phase product levels and the collection and analysis of groundwater samples from those wells that do not contain separate-phase product. The following sections provide the details and results of the gauging and sampling activities.

4.1 Water Level and Separate-Phase Product Measurements

Prior to the initiation of groundwater sampling activities, water-level and separate phase product measurements were obtained from each monitoring well using an electronic oil/water interface probe prior to initiating sampling activities. Water-level and separate phase product measurements were also collected during routine maintenance of the product recovery systems. A summary of historic product gauging and groundwater elevation data is presented in **Table 3**. With the exception of a one time detection of product in Well AZ, measurable product is limited to the area of Well AU and downgradient towards Well AW, consistent with the last reporting period. The extent to which product has migrated to date has been controlled by the subsurface infrastructure located within the investigation area. With the repair of the diesel fuel underground piping, the ongoing product recovery efforts being conducted in Well AU and Well AW, when in operation (see Section 5), are successfully preventing further migration of product. Separate phase product measurements obtained from Well AY, located to the south and downgradient of Well AW along the service water pipes, provide delineation of the extent of separate phase product.

4.2 Monitoring Well Sampling

As discussed above, quarterly groundwater monitoring activities were completed in June 2006, September 2006, and December 2006. During these sampling events, groundwater samples were only collected from monitoring wells that did not indicate a

measurable thickness (i.e., greater than 0.01 feet) of separate-phase product. For this reason, Well AU and Well AW were not sampled during the reporting period.

Due to the nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples are collected utilizing low-flow sampling methodology. Sample collection procedures, as well as quality assurance/quality control (QA/QC) sampling requirements, were completed in accordance with the Quality Assurance Project Plan (QAPP) presented in the January 2005 RIWP. Groundwater sampling logs for the samples collected during the reporting period are included in **Appendix A**. Groundwater samples were submitted to Accutest Laboratories of Dayton, New Jersey. The groundwater samples were analyzed for priority pollutant list volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) including a library search. Laboratory reports and HazSite deliverables for the groundwater monitoring events are included as **Appendix B**. Analytical results of the groundwater samples collected during the reporting period, as well as analytical result of groundwater samples collected since the initiation of investigation activities, are discussed in the following section.

4.3 Analytical Results

A summary of historic analytical results for groundwater samples collected from the monitoring wells, including those collected in June 2006, September 2006, and December 2006, is presented in **Tables 4** and **5**. A figure showing all constituent detections during the three sampling events is provided as **Figure 3**. Analytical results of these samples indicate the following:

- The analytical results of the groundwater samples collected to date indicate that other than benzene in one well, concentrations of diesel related constituents of concern (both VOC and SVOC) were below their respective GWQC.

- Benzene continued to be detected above its GWQC in groundwater samples collected from Well X in September 2006 and December 2006. Well X was not sampled during the June event due to insufficient available groundwater. During the September and December sampling events, benzene was detected at concentrations of 10.2 µg/l (micrograms per liter, equivalent to parts per billion) and 6.9 µg/L, which is above the GWQC for benzene of 1 µg/L.

- With the exception of groundwater samples collected from Well AV SVOCs consistent with a diesel release have not been detected at concentrations above

laboratory detection limits, but significantly below GWQS. Analytical results of the groundwater samples collected from Well AV indicate concentrations of acenaphthene, fluorene, 2-methylnaphthalene, and naphthalene above laboratory detection limits. The detection of these constituents is consistent with a diesel release. Analytical results of the groundwater samples collected from Well AY, which is located to the east of the service water pipes, indicate a concentration of bis(2-Ethylhexyl)phthalate above laboratory detection limits. This analyte was also detected in the associated method blank and is not indicative of a diesel fuel release.

- Analytical results of groundwater monitoring activities completed to date continue to indicate that impacts associated with the release of diesel fuel from the bulk storage tanks are limited to the area of separate-phase product, which extends down gradient from the source area to Well AW.

5. Ongoing Product Recovery

Consistent with historic observations, the extent of separate-phase product is limited to Well AU, installed within the source area, and Well AW, installed immediately downgradient of the source area along the service water piping. Product recovery efforts completed to date have included the operation and maintenance of the Spill Buster® product recovery system in Well AU and the operation of a passive skimmer in Well AW. Operation of the Spill Buster® unit in Well AU to date has resulted in the recovery of approximately 650 gallons of separate phase product through 11 December 2006. **Figure 4** provides details regarding the cumulative product recovered with the Spill Buster® unit through December 11, 2006. Operation of the passive skimmer in Well AW has resulted in a limited amount of recovery of separate phase product during the reporting period due to low water levels that were observed. The skimmer is retrieved from the well one to two times per week, and any recovered product is transferred to the storage tank utilized by the Spill Buster® unit.

Product recovery rates had decreased from approximately two gallons per day (gpd) to 0.5 gpd during the last reporting period. The recovery rate during this reporting period continued to decrease with product recovery rates of less than 0.1 gpd. The decrease in product recovery rates likely coincide with a decrease in available product within the vicinity of Well AU. To maximize product recovery in Wells AU and AW, the Spill Buster® unit was removed from Well AU in January 2007 and was installed in Well AW, which indicated greater product thicknesses over the reporting period. A sorbent sock has been installed in Well AU to recover residual diesel fuel within the vicinity of

the well. Product recovery system maintenance will continue to be performed on a routine basis and will include the removal and reinstallation of new sorbent socks from Well AU. Use of the Spill Buster® unit, the passive skimmer, and the sorbent socks will be adaptively managed to ensure that product recovery rates are maximized.

6. Proposed Actions

Based on the results of investigation activities and interim remedial actions completed to date, the following actions are proposed for the upcoming reporting period of January through June 2007:

- Due to the extremely low recovery rates in Well AU, the Spill Buster® unit was transferred to AW where there is more available product for recovery. A sorbent sock will was placed in AU to recover the remaining product. This transition occurred in January 2007. The operation and maintenance of the Spill Buster® unit and the maintenance of the sorbent sock will continue until measurable separate phase product is no longer detected. Routine maintenance of the system will continue to be performed to ensure the timely change out of the product storage tank and the proper operation of the unit. Use of the Spill Buster® unit, the passive skimmer, and the sorbent socks will be adaptively managed to ensure that product recovery rates are maximized;

- Due to the consistent analytical results of groundwater samples that have been collected from the monitoring wells since December 2004, PSEG is proposing that collection of groundwater samples be reduced to a semi-annual basis with samples collected in March and September. Groundwater monitoring will be conducted concurrently with the product recovery efforts. The groundwater monitoring will continue to consist of the collection and analysis of groundwater samples from those wells not indicating the presence of separate phase product. The groundwater samples will be analyzed for VOCs and SVOCs to evaluate the extent, if any, of dissolved phase constituents of concern. Semi-Annual Remedial Action Progress Reports will continue to be prepared to update the NJDEP with the status of product recovery efforts and groundwater analytical results;

- Following completion of the product recovery efforts (i.e., measurable separate phase product is no longer detected) eight consecutive rounds of quarterly sampling will be completed (assuming concentrations of constituents of concern are above applicable GWQC) as required by the Mann-Whitney U-Test. The

analytical results from these sampling events will be evaluated to determine if there are decreasing analytical trends; and,

- Following completion of the eight consecutive rounds of quarterly sampling, PSEG will either: 1) propose no further action for groundwater if groundwater analytical results continue to be below applicable GWQC; or, 2) establish a classification exception area and prepare a Remedial Action Work Plan that proposes a groundwater remediation strategy.

7. Groundwater Monitoring Program Details and Schedule

Following completion of the next groundwater monitoring event, currently scheduled for March 2007, groundwater analytical results will be reported to the NJDEP in a RAPR covering January through June 2007 activities.

Groundwater Monitoring:

Semi-Annual events (VOCs and SVOCs)…….....March 2007

Reporting:

Remedial Action Progress Report……January 2007 through June 2007

Tables

Table 01. Summary of Sampling Activities Completed During the Reporting Period (June 2006 through December 2006), PSEG Nuclear, LLC, Salem Generating Station, Hancock's Bridge, New Jersey.

Sampling Event	Wells Sampled[1]	Wells Not Sampled
June-06	MW-AV MW-AY[3] MW-AZ	MW-AU[2] MW-AW[2] MW-X[4]
September-06	MW-AY[3] MW-AV MW-AZ MW-X	MW-AU[2] MW-AW[2]
December-06	MW-AY[3] MW-AV MW-AZ MW-X	MW-AU[2] MW-AW[2]

Notes

1 If sampled, groundwater samples were submitted to laboratory for VOCs and SVOC analysis using methods 8260b and 8270c, respectively.

2 Samples were not collected due to detection of separate-phase liquid.

3 Insufficient volume of water was available within well column to sample via low-flow; collected sample with bailer.

4 Sample was not collected due to insufficient volume of available water.

Notes

--	Separate-phase product was not detected in well at time of measurement.
NM	Measurement not collected.
NAVD 1988	North American Vertical Datum established in 1988.
ft btoc	Feet below the top of the well casing.
ft amsl	Feet above mean sea level (NAVD 1988).
*	A PVC riser was added to top of wellhead to facilitate installation of Spillbuster unit, accounting for change in wellhead elevation
**	Due to the operation of a groundwater extraction well (Well AO) in the vicinity of Well AZ, separate-phase product migrated in the direction of this well. Following the detection of separate-phase product in Well AZ, groundwater extraction from Well AO was discontinued.

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
2.3	Bold value indicates concentration is above the method detection limit.
2.3	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value. where the indication is based on a library search
NA	Not analyzed
*	Well AX is a blind duplicate of Well X
**	Well AVD is a blind duplicate of Well AV
***	Well VV is a blind duplicate of Well AV

Notes:

GWQC New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L Micrograms per liter (equivalent to parts per billion)
5.0 Bold value indicates concentration is above the method detection limit.
U The compound was not detected at the indicated concentration.
J Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
-- No standard published
N Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds where the indication is based on a library search
NA Not analyzed
* Well AX is a blind duplicate of Well X
** Well AVD is a blind duplicate of Well AV
*** Well VV ia blind duplicate of Well AV

2-Methylnaphthalene	NS	<2.1 U	2.2	1.3 J
Naphthalene	300	1.6 J	2.1	2

CONSTITUENT OF CONCERN — SAMPLE DATE — ANALYTICAL RESULT

1. PRIOR TO INITIATING GROUNDWATER SAMPLE COLLECTION, DEPTH–TO–WATER AND SEPARATE PHASE PRODUCT THICKNESS MEASUREMENTS WERE COLLECTED FROM THE INDIVIDUAL WELLS USING AN ELECTRONIC OIL–WATER INTERFACE PROBE.
2. MONITORING WELLS NOT INDICATING A MEASURABLE THICKNESS OF SEPARATE PRODUCT (I.E., GREATER THAN 0.01 FEET) WERE SAMPLED UTILIZING LOW–FLOW SAMPLING METHODS.
3. GROUNDWATER SAMPLES WERE ANALYZED FOR PRIORITY POLLUTANT SEMI–VOLATILE AND VOLATILE ORGANICS INCLUDING A LIBRARY SEARCH.
4. UNITS ARE IN ug/l – MICROGRAMS PER LITER (EQUIVALENT TO PARTS PER BILLION) CONCENTRATIONS ARE ONLY SHOWN FOR THOSE CONSTITUENTS DETECTED ABOVE THE LABORTORY DETECTION LIMITS.

Case #04-08-02-2350-16

BFO File Number: 17-04-08

Dear Mr. Suey:

The New Jersey Department of Environmental Protection (Department) has completed review of the Progress Reports received on February 28, 2008, September 26, 2007, March 5, 2007 and August 7, 2006. The Department has determined that the Progress Reports are in compliance with the Technical Requirements for Site Remediation, N.J.A.C. 7:26E and other applicable requirements. The Department hereby approves the Progress Reports, effective the date of this letter. Based upon the benzene exceedences noted in MW-X in the June and December sampling events, however, **sampling is to be conducted in the months of June and December,** rather than March and September.

Pursuant to the schedule applicable to the site you shall submit a Progress Report by September 30, 2008. Please submit the document by that date, or submit a written request for an extension at least 2 weeks prior to the due date. Failure to submit the

Progress Report in accordance with the schedule may result in the initiation of MOA Termination. For your convenience, the regulations concerning the Department's remediation requirements can be found at http://www.state.nj.us/dep/srp/regs/ .

Thank you for your cooperation in this matter. If you have any questions, call Linda Range at (609) 584-4155.

Sincerely,

William H. Dunfee, Section Chief

1. Introduction

ARCADIS U.S., Inc. (ARCADIS), on behalf of PSEG Nuclear LLC (PSEG), has prepared this Remedial Action Progress Report (RAPR) to present the details and results of ongoing groundwater monitoring and product recovery activities being conducted at the PSEG Nuclear, LLC Salem Generating Station (the Station). The Station is located on Artificial Island in Lower Alloways Creek Township, Salem County, New Jersey. The Station location and layout are depicted on **Figures 1** and **2**, respectively.

Groundwater monitoring and product recovery activities are being conducted in accordance with the scope of work proposed in the Remedial Investigation Report (RIR) that was submitted to the New Jersey Department of Environmental Protection (NJDEP) in June 2005. The remedial investigation was conducted to determine the extent of constituents of concern in soil and groundwater associated with a release of diesel fuel (Incident Number 04-08-02-2350-16).

This RAPR includes activities completed at the Station from July 2010 through February 2011 including the completion of the semiannual groundwater monitoring activities conducted in December 2010 through February 2011 and the ongoing operation of the Separate-Phase Hydrocarbons (SPH) recovery systems in Wells AU and AW. These activities are discussed in Sections 3, 4 and 5 respectively, followed by the proposed schedule for subsequent reporting periods.

2. Project Background

On August 2, 2004, PSEG personnel observed a diesel fuel odor in a catch basin associated with the storm water collection system just to the south of the Salem Unit 1 Auxiliary Building. Investigation of the catch basin, which is identified as "Catch Basin 27" on **Figure 2**, revealed the presence of a red-dyed diesel fuel (the red-dye is more typical of a recent release of diesel fuel). At this time, PSEG notified the NJDEP through its spill hotline.

Investigations into the source of the diesel fuel focused on the underground piping adjacent to Catch Basin 27 that supplies diesel fuel from the bulk storage tanks to diesel/generator storage tanks located within the Auxiliary Building and to the service water and circulating water boilers. The location of the underground piping is shown on **Figure 2**. PSEG performed a pressure test on this underground piping. The results revealed the leak was in an approximate 300-foot section of the piping extending south from the Auxiliary Building. To pinpoint the location of the leak along this 300-foot

section of piping, PSEG subcontracted Praxair Services, Inc. to perform a "Tracer Tight" gas analysis. The results of this test showed that the location of the leak was directly adjacent to Catch Basin 27. The results of the Tracer Tight gas analysis indicated that there were no other leaks along the 300-foot section of piping.

Excavation in the area of the leaking underground piping was initiated on August 23, 2004 by PSEG with the support of Clean Harbors, Inc. to repair the piping. During the excavation process, residual diesel fuel was observed on soil excavated from below the piping (approximately six feet below ground surface (bgs)). SPH was observed on standing water within the excavation. Prior to backfilling, approximately 150 gallons of diesel fuel were recovered from the excavation.

In November 2004, PSEG initiated remedial investigation and interim product recovery activities. As presented in the Remedial Investigation Work Plan (RIWP) submitted to the NJDEP in January 2005, soil borings were advanced at locations down gradient of the source area to delineate the horizontal extent of diesel related constituents of concern in soil. Due to the presence of extensive, facility-critical infrastructure within the area of investigation, the boring locations were limited. Soil samples collected from the borings were submitted for total petroleum hydrocarbons (TPHC) analysis. Analytical results of the soil samples did not indicate concentrations of TPHC above laboratory detection limits. Results of the soil investigation indicated that the release of diesel fuel had not migrated a significant distance beyond the source area and that diesel related constituents of concern in soil were likely limited to the source area and the "smear-zone" where SPH had migrated.

The soil borings were converted to monitoring/product recovery wells to facilitate the collection of groundwater samples and for the recovery of SPH, if present. Water-level and product gauging and groundwater sampling were completed following installation of the wells. These activities utilized six monitoring wells (the five newly installed wells, and one previously existing monitoring well). The locations of the monitoring wells are shown on **Figure 2**. Water-level and product measurements indicated that the extent of measurable product is limited to the area of Well AU, located at the source area, and Well AW, located down gradient of the source area along the service water pipes. Measurable product was detected during a single gauging event in Well AZ. In April 2009, SPH was also observed in Well AI. This well is not sampled as part of the diesel remediation and investigation program.

The extent to which product has migrated is controlled by the significant facility-related subsurface infrastructure. The foundation for the primary water storage tank located to the west of Well AU has prevented the migration of SPH in this direction. The service

water piping that runs to the south from Well AU provided a preferential pathway for the migration of SPH towards Well AW. To delineate the extent of SPH to the south of Well AW along the service water piping, an additional monitoring well, Well BV, was installed in December 2006, as required by the NJDEP. In a June 21, 2010 Notice of Deficiency (NOD) to PSEG, the NJDEP required the installation of a shallow monitoring well adjacent to Well AI to delineate separate phase product (SPH) observed in April 2009. In addition, the NJDEP required the submission of a proposal for an active remediation system to recover SPH at the Station. In December 2010 well CG was installed to fulfill this requirement, details below in section 3. In January and February 2011 well CG was gauged for presence of separate phase product and sampled for VOCs and SVOCs, details below in section 4. Product recovery efforts completed to date, also presented in Section 4, have included the installation of a Spill Buster® Unit in Wells AU and/or AW, the installation and operation of a passive skimmer in Well AW, and the installation of sorbent socks within Wells AZ and AU.

Groundwater monitoring activities were completed on a quarterly basis following the installation of the monitoring wells through December 2007. However, in the Remedial Action Progress Report dated February 2008 PSEG recommended moving from quarterly groundwater sampling to semiannual sampling. In a March 24, 2008 letter, the NJDEP approved reducing groundwater monitoring to semi-annual events, completed in June and December. During the sampling events, groundwater samples are collected from wells that do not indicate the presence of SPH. The groundwater samples are submitted to a laboratory and are analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). The details of groundwater monitoring activities completed during the reporting period and the results of groundwater monitoring activities completed to date are presented in Section 4.

3. Well CG Installation

In accordance with the previous Remedial Action Progress Report dated September 20, 2010, an additional groundwater monitoring well (Well CG) was installed on December 22, 2010. The monitoring well was installed in order to verify delineation of separate phase product in the area of well AI.

The monitoring well was installed using vacuum excavation techniques due to the extensive subsurface utilities and infrastructure located within the area of investigation. The location and well construction details of the groundwater monitoring well is shown on **Figure 2** and are summarized in **Table 2**, respectively. NJDEP Bureau of Water Allocation Monitoring Well Records, well construction logs, and boring logs are included in **Appendix C**. The monitoring well was developed using a combination of

surging and pumping techniques. In accordance with N.J.A.C. 7:26E-4.4(g) [7], the monitoring well was surveyed by a New Jersey-licensed surveyor. The Monitoring Well Certification Form B is provided in **Appendix C**. Well CG was sampled twice during the reporting period and details are below. Diesel fuel was not observed during monitoring well installation.

4. December 2010 through January 2011 Semiannual Groundwater Monitoring

On December 15, 2010 and January 21, 2011, semi-annual groundwater monitoring activities were conducted. Details regarding the sampling activities are presented in **Table 1**. The monitoring well network associated with the semi-annual gauging and sampling activities consists of the following seven monitoring wells: Well X, Well AU, Well AV, Well AW, Well AY, Well AZ, Well BV, and Well CG. A summary table of well construction details for these wells is presented in **Table 2**. Semiannual groundwater monitoring activities consist of the gauging of groundwater and SPH levels and the collection and analysis of groundwater samples from those wells that do not contain SPH. The following sections provide the details and results of the gauging and sampling activities.

4.1 Water Level and Separate Phase Product Measurements

Prior to the initiation of groundwater sampling activities, water-level and SPH measurements were obtained from each monitoring well using an electronic oil/water interface probe. Water-level and SPH measurements were also collected during routine maintenance of the product recovery systems. A summary of historic product gauging and groundwater elevation data is presented in **Table 3**. With the exception of a onetime detection of product in Well AZ and a recent detection in Well AI, measurable product is historically limited to the area of Well AU and down gradient towards Well AW, consistent with the previous reporting period. The extent to which product has migrated to date has been generally controlled by the subsurface infrastructure located within the investigation area. With the repair of the diesel fuel underground piping, the ongoing product recovery efforts being conducted in Well AU and Well AW, when in operation (see Section 4), are successfully preventing further migration of product. SPH measurements obtained from Well AY, located to the south and down gradient of Well AW along the service water pipes, provide delineation of the extent of SPH. After the recent installation of Well CG, SPH gauging was performed. No SPH was ever detected in this well, so the expansion of the remedial system to the southern portion of the well network is not needed.

4.2 Monitoring Well Sampling

As discussed above, semiannual groundwater monitoring activities were completed in December 2010 and January 2011. During this sampling event, groundwater samples were only collected from monitoring wells that did not indicate a measurable thickness (i.e., greater than 0.01 feet) of SPH. As such, Wells AU and AW were not sampled during the reporting period.

Due to the nature of the analytes being monitored and to ensure the quality of the groundwater data, groundwater samples are collected utilizing low-flow sampling methodology. Due to insufficient water in the wells and slow recharge rates, select wells need to be sampled with a disposable bailer to enable collection of sufficient sample volumes. Wells AY and X were sampled with a bailer during the December 2010 event. Sample collection procedures, as well as quality assurance/quality control (QA/QC) sampling requirements, were completed in accordance with the Quality Assurance Project Plan (QAPP) presented in the January 2005 RIWP. Groundwater sampling logs for the samples collected during the reporting period are included in **Appendix A**. Groundwater samples were submitted to Accutest Laboratories, a NJDEP certified laboratory, of Dayton, New Jersey. The groundwater samples were analyzed for priority pollutant list VOCs and SVOCs including a library search. Laboratory reports and HazSite deliverables for the groundwater monitoring events are included as **Appendix B**. Analytical results of the groundwater samples collected during the reporting period, as well as analytical results of groundwater samples collected since the initiation of investigation activities, are discussed in the following section.

4.3 Analytical Results

Tables 4 and **5** presents groundwater analytical results for VOCs and SVOCs obtained since December 2004 from monitoring wells utilized in the Salem Unit 1 diesel investigation. **Figure 3** illustrates the locations of monitoring wells and constituent detections during the recent sampling event. The following summary compares analytical results to the NJDEP Groundwater Quality Standards (GWQS) listed at New Jersey Administrative Code (N.J.A.C.) 7:9C. Analytical results of these samples indicate the following:

- Benzene was detected in monitoring well CG, just above the GWQS of 1 microgram per liter (µg/l) with a concentration of 1.1 µg/l.

- Concentrations of VOCs and SVOCs were not detected above their respective GWQS in Wells AV, AZ, BV, and X.

- Analytical results for groundwater monitoring activities completed to date continue to indicate that impacts associated with the release of diesel fuel from the bulk storage tanks are limited to the area of SPH, which extends down gradient from the source area to Well AI.

5. Ongoing Product Recovery

SPH recovery continues at Well AU, installed within the source area, and Well AW, installed immediately down gradient of the source area along the service water piping. SPH recovery includes the intermittent operation and maintenance of the Spill Buster® product recovery system, the operation of a passive skimmer, and the use of sorbent socks. Use of these methods has resulted in the recovery of approximately 718.9 gallons of SPH to date. During the reporting period, approximately 4.6 gallons of SPH were recovered. Due to the absence of SPH in the recently installed Well CG, there is no need to expand the remedial system at this time.

6. Future Actions

Based on the results of investigation activities and interim remedial actions completed to date, the following actions are planned for the upcoming reporting period, February 2011 through June 2011:

- PSEG will continue to collect groundwater samples on a semiannual basis with the next event to be conducted in June 2011. Groundwater monitoring will continue to consist of the collection and analysis of groundwater samples from those wells not indicating the presence of SPH. Groundwater samples will be analyzed for VOCs and SVOCs to evaluate the extent, if any, of dissolved phase constituents of concern. In addition, product recovery efforts will remain ongoing.

- Semiannual Remedial Action Progress Reports will continue to be prepared to update the NJDEP with the status of product recovery efforts and groundwater analytical results;

- Following completion of the product recovery efforts (i.e., measurable SPH is no longer detected) eight consecutive rounds of quarterly sampling will be completed (assuming concentrations of constituents of concern are above applicable GWQC) as required by the Mann-Whitney U-Test. The analytical results from these

sampling events will be evaluated to determine if there are decreasing analytical trends; and,

- Following completion of the eight consecutive rounds of quarterly sampling, PSEG will either: 1) propose no further action for groundwater if groundwater analytical results continue to be below applicable GWQC; or, 2) establish a classification exception area and prepare a Remedial Action Work Plan that proposes a groundwater remediation strategy.

7. Groundwater Monitoring Program Details and Schedule

Following completion of the next semiannual groundwater monitoring event, currently scheduled for June 2011, groundwater analytical results and the results of product recovery efforts will be reported in Remedial Action Progress Report February through June 2011. The anticipated schedule for the groundwater monitoring program through the next reporting period is summarized below.

Groundwater Monitoring:

Semiannual event (VOCs and SVOCs)	June 2011

Reporting:

Remedial Action Progress Report January 2011 through June 2011	November 31, 2011

Table 01. Summary of Sampling Activities Completed During the Reporting Period (Semiannual, December 2010 through February 2011), PSEG Nuclear, LLC, Salem Generating Station, Hancock's Bridge, New Jersey.

Sampling Event	Wells Sampled*	Wells Not Sampled
Dec-10 through Feb-11	MW-AY MW-AZ MW-BV MW-X MW-AV MW-CG	MW-AU MW-AW

Notes

* Groundwater samples analyzed for VOCs and SVOCs analysis using methods 8260b and 8270c, respectively.

	12/14/10	8.85	--	5.25	--	3.60	--
Well CG	1/21/11	8.95	--	5.17	--	3.78	--
	2/17/11	8.95	--	5.24	--	3.71	--

--	Separate-phase product was not detected in well at time of measurement.
NM	Measurement not collected.
NAVD 1988	North American Vertical Datum established in 1988.
ft btoc	Feet below the top of the well casing.
ft amsl	Feet above mean sea level (NAVD 1988).
*	A PVC riser was added to top of wellhead to facilitate installation of Spillbuster unit, accounting for change in wellhead elevation
**	Due to the operation of a groundwater extraction well (Well AO) in the vicinity of Well AZ, separate-phase product migrated in the direction of this well. Following the detection of separate-phase product in Well AZ, groundwater extraction from Well AO was discontinued.

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
---	No standard published
N	Parent environmental sample
FD	Blind duplicate

SII-SSA-0014-003053

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
---	No standard published
N	Parent environmental sample
FD	Blind duplicate

SII-SSA-0014-003054

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
---	No standard published
N	Parent environmental sample
FD	Blind duplicate

SII-SSA-0014-003055

Notes:

GWQC	New Jersey Groundwater Quality Criteria for Class IIA aquifers.
ug/L	Micrograms per liter (equivalent to parts per billion)
5.0	Bold value indicates concentration is above the method detection limit.
27.0	Bold and shaded concentrations are above the applicable New Jersey Groundwater Quality Criteria for Class IIA aquifers.
U	The compound was not detected at the indicated concentration.
J	Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.
---	No standard published
N	Parent environmental sample
FD	Blind duplicate

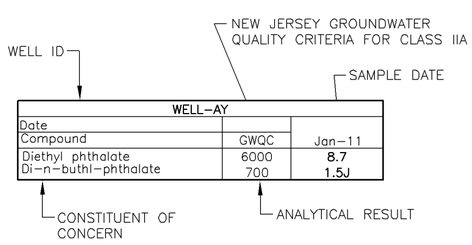
- NS — NO STANDARD
- J — ESTIMATED VALUE
- 1.1 — BOLD AND GRAY-SHADED VALUES ARE ABOVE THEIR RESPECTIVE GWQC.
- -- — NO GROUNDWATER QUALITY CRITERIA AVAILABLE
- * — AVERAGE OF PARENT AND BLIND DUPLICATE CONCENTRATION



NOTES:

1. PRIOR TO INITIATING GROUNDWATER SAMPLE COLLECTION, DEPTH-TO-WATER AND SEPARATE PHASE PRODUCT THICKNESS MEASUREMENTS WERE COLLECTED FROM THE INDIVIDUAL WELLS USING AN ELECTRONIC OIL-WATER INTERFACE PROBE.
2. MONITORING WELLS NOT INDICATING A MEASURABLE THICKNESS OF SEPARATE PRODUCT (I.E., GREATER THAN 0.01 FEET) WERE SAMPLED UTILIZING LOW-FLOW SAMPLING METHODS.
3. GROUNDWATER SAMPLES WERE ANALYZED FOR PRIORITY POLLUTANT SEMI-VOLATILE AND VOLATILE ORGANICS INCLUDING A LIBRARY SEARCH.
4. UNITS ARE IN ug/l – MICROGRAMS PER LITER (EQUIVALENT TO PARTS PER BILLION) CONCENTRATIONS ARE ONLY SHOWN FOR THOSE CONSTITUENTS DETECTED ABOVE THE LABORTORY DETECTION LIMITS.
5. WELL AO IS A PUMPING EXTRACTION WELL UTILIZED IN A SEPARATE INVESTIGATION.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JA64438
Site:	PSEG-Diesel, Salem, NJ	**Report Date**	1/10/2011 11:33:25 A

On 12/17/2010, 4 Sample(s), 1 Trip Blank(s) and 2 Field Blank(s) were received at Accutest Laboratories at a temperature of 2.3 C. Samples were intact and properly preserved, unless noted below. An Accutest Job Number of JA64438 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix: AQ **Batch ID:** V2A4429

- All samples were analyzed within the recommended method holding time.
- Sample(s) JA65148-1MS, JA65148-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Matrix: AQ **Batch ID:** V3D2360

- All samples were analyzed within the recommended method holding time.
- Sample(s) JA64438-1MS, JA64438-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Matrix: AQ **Batch ID:** V3D2361

- All samples were analyzed within the recommended method holding time.
- Sample(s) JA64509-8MS, JA64509-8MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Extractables by GCMS By Method SW846 8270C

Matrix: AQ **Batch ID:** OP47365

- All samples were extracted within the recommended method holding time.
- Sample(s) JA64353-2MS, JA64353-2MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Blank Spike Recovery(s) for Hexachlorocyclopentadiene are outside control limits. High percent recoveries and no associated positive found in the QC batch.
- Matrix Spike Recovery(s) for 2-Methylnaphthalene, 4-Nitroaniline, Atrazine, Caprolactam, Dibenzofuran, Hexachlorocyclopentadiene are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for 4-Nitroaniline, Atrazine, Caprolactam, Dibenzofuran, Hexachlorobutadiene, Hexachlorocyclopentadiene, Hexachloroethane, 3-Nitroaniline are outside control limits. Outside control limits due to matrix interference.
- RPD(s) for MS/ MSD for 3-Nitroaniline are outside control limits for sample OP47365-MSD. Outside of in house control limits.
- OP47365-BS1 for Hexachloroethane: Outside of in house control limits, but within reasonable method recovery limits.
- OP47365-MS for Hexachlorobutadiene: Outside of in house control limits, but within reasonable method recovery limits.
- OP47365-MS for Hexachloroethane: Outside of in house control limits, but within reasonable method recovery limits.

Extractables by GCMS By Method SW846 8270C BY SIM

Matrix: AQ **Batch ID:** OP47365A

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JA64353-2MS, JA64353-2MSD were used as the QC samples indicated.
- Matrix Spike / Matrix Spike Duplicate Recovery(s) for Fluorene, Hexachlorobenzene, Naphthalene, Phenanthrene are outside control limits. Outside control limits due to matrix interference.
- Matrix Spike Duplicate Recovery(s) for Acenaphthene are outside control limits. Outside of in house control limits, but within reasonable method recovery limits.
- JA64438-5 for Terphenyl-d14: Outside of in house control limits, but within reasonable method recovery limits.

Accutest certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting Accutest's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

Accutest Laboratories is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by Accutest Laboratories indicated via signature on the report cover
